A few weeks ago the death occurred in British Columbia of Mr. Francis J. Deane, a man who several years ago was most energetic and successful in the publication of mining news of British Columbia. While he had for many years previously been engaged in newspaper work, in the Coast cities of the province and afterwards as publisher and editor of the Kamloops "Inland Sentinel," it was in connection with his valuable work of establishing the Nelson "Daily News" and bringing it up to the position of a newspaper of high character and wide circulation that he was best known throughout the important mining districts of Kootenay and Boundary. He made for the "Daily News" an excellent reputation for the mining news printed in it. He developed the weekly statistical column, showing the ore production of the two most important producing districts in British Columbia, and during the years in which as proprietor and editor he directed that newspaper, accuracy was his first aim, and it was seldom, if ever, the "boomer" of the objectionable and untruthful kind managed to make use of the columns of his newspaper. It was Mr. Deane, too, who first suggested to Mr. E. Jacobs the idea of an annual mining review for a special New Year edition of the "Daily News," and arranged with that mining writer to supply the requisite data for that widely-read review.

Apart from the particular work above outlined and the markedly good service thereby rendered to the mining industry of the province, Mr. Deane was highly esteemed. Mr. Fred C. Moffatt, barrister, of Nelson, long Mr. Deane's right-hand man in the editorial department of the "Daily News," lately contributed to that newspaper the following appreciative tribute to his deceased friend:

"Mr. Deane was of a reticent disposition, but no one who knew him at all intimately could fail to admire and respect him. The man who met him in the ordinary course of business, perhaps, never appreciated the sterling qualities which underlay his retiring manner, but all who had the advantage of close association with him liked him. He had the faculty of so attaching to himself the affection of the members of his staff that there were few who would not have gone to great personal inconvenience to serve him. I think that this was shown by the manner in which 'The Daily News' came through the ordeal in the early years of this century when this country, sparsely populated and suffering from a period of depression, made it necessary for herculean efforts to keep the paper going; to Mr. Deane's splendid personal qualities which caused his staff to put their best efforts into their work on account of their strong personal attachment for him must be attributed largely the fact that the paper was carried hrough the bad times."

# THE TRANSMISSION OF POWER BY COTTON ROPES

*By E. EDWARD HART, M.A.*

A Paper Read Before the Association of Engineers-in-Charge

(Continued from issue of May 15)

(a) In Vol. CXVI of the Minutes of the Proceedings of the Society of Civil Engineers, some tests made by Mons. Fauguier show that belts are 2 per cent. better than ropes. But he used ropes 1 9-16-in. diameter on a pulley 2 ft. 10¼-in. diameter, and ran them at the excessive speed of 5,376 ft. per minute, and could not, therefore, expect to get good results from the ropes.

(b) In the well-known experiments made at Lille in 1894, Manilla ropes 1¾-in. diameter were tested against belts, and at a speed of 4,000 feet per minute it was found that there was less slip with the ropes than with the belts, but that the difference between the efficiency of belt and rope-gearing was inappreciable. Unfortunately, these tests were not as complete as they might have been.

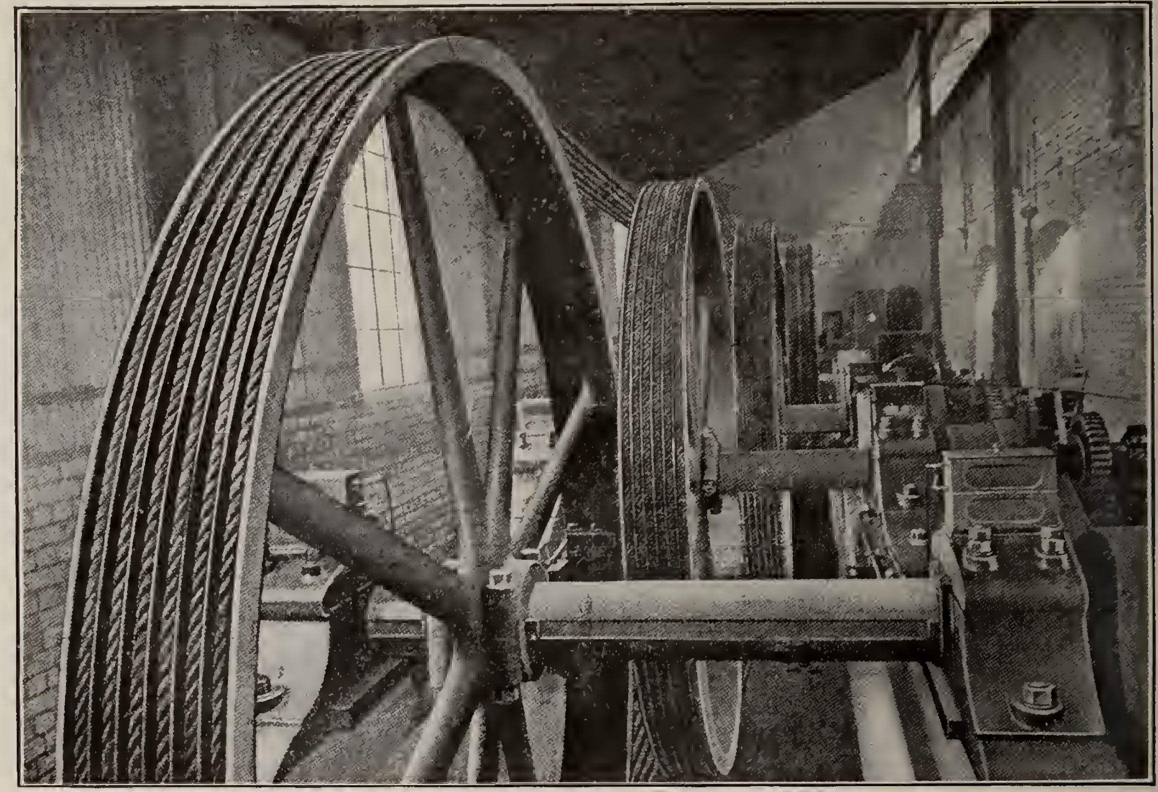
(c) In a more recent test of a 150 h.p. motor, running at 900 revolutions per minute driving spinning frames, the total electrical power developed by the motor was

119 h.p. during the period of the test. This was found to be expended as follows:

| | |
|---|---|
| In motor | $12\frac{1}{2}$ h.p. |
| In main driving ropes | $1\frac{1}{2}$ h.p. |
| In net shaft friction | 6 h.p. |
| In belts to machines | 7 h.p. |
| In machines | 92 h.p. |

In these three instances, the ropes used were not all made of cotton, though probably they were so in the first and last cases mentioned.

(d) A series of experiments was undertaken a few years ago by Prof. Ewing to ascertain what loss occurs in the transmission of power by ropes through the work which is expended upon the rope itself. The work is spent partly in bending and unbending it, and partly on getting it into and out of the grooves of the pulleys on which the rope runs. The ropes tested were the resistance of pulleys, and the imperfect elasticity of the band driving the system from the motor. These values were deducted from those observed when the rope was in action. A series of values of R (the resistance in lbs.) and S (the static tension in the rope) was taken for both diameters of rope on both sets of pulleys. And it was found that when these values were plotted out on squared paper the values of R in relation to S at any one speed were represented by a straight line. The experiments showed that R increases with the speed, by amounts which are proportional to the increase of speed (within the limits tested). Hence it is easy to infer the values of R for higher speeds if we assume the same law to hold good. It was noticed, too, that of the whole work expended on the rope, a large part depended on the tension. This indicates that the work of jamming the rope into the groove and pulling it out again is relatively large, and that this



**View of a Heavy Service Drive**

Lambeth Cotton ropes, four-strand, of 1-in. and $1\frac{1}{4}$-in. diameters, and they were both run on pairs of 2 ft. 6 in. and 3 ft. 6 in. diameter pulleys. One pulley was slung vertically under the other in a lever frame, so that any desired tension might be set up in the ropes by adding weights to the lever arm. The system was driven by an electric motor set on a cradle dynamometer through a fine endless band, and the resistance R due to the jamming of the rope in and out of the grooves, and also that due to the bending and unbending of the rope, was measured by the weights required to be applied to a lever arm on the cradle dynamometer to prevent it from tilting. A fine and very flexible cord was first substituted for the rope, and a preliminary series of experiments made under various speeds and loads. The readings obtained corresponded to that part of the resistance due to axle friction, air constitutes an important source of loss of power in driving by ropes. The results showed that at any given speed and for any given pair of pulleys, R increases at a uniform rate when the tension is increased. The resistance is made up of two terms, a constant (independent of the tension) and a term proportional to the tension. So that a formula $R = a + b S$ is applicable to all cases (a and b being constants). Further, a and b depend upon the speed, and they both increase in a uniform manner with increase of speed. Further, both a and b are greater for the thicker ropes on the same pulley. They are also greater for the smaller pair of pulleys, when the same rope is tested on pulleys of different diameters.

For a 1-in. diameter rope on a pair of pulleys 3 ft. 6 in. in diameter, at a speed of 4,950 ft. per minute, $R = 0.57 + .0101 S$.

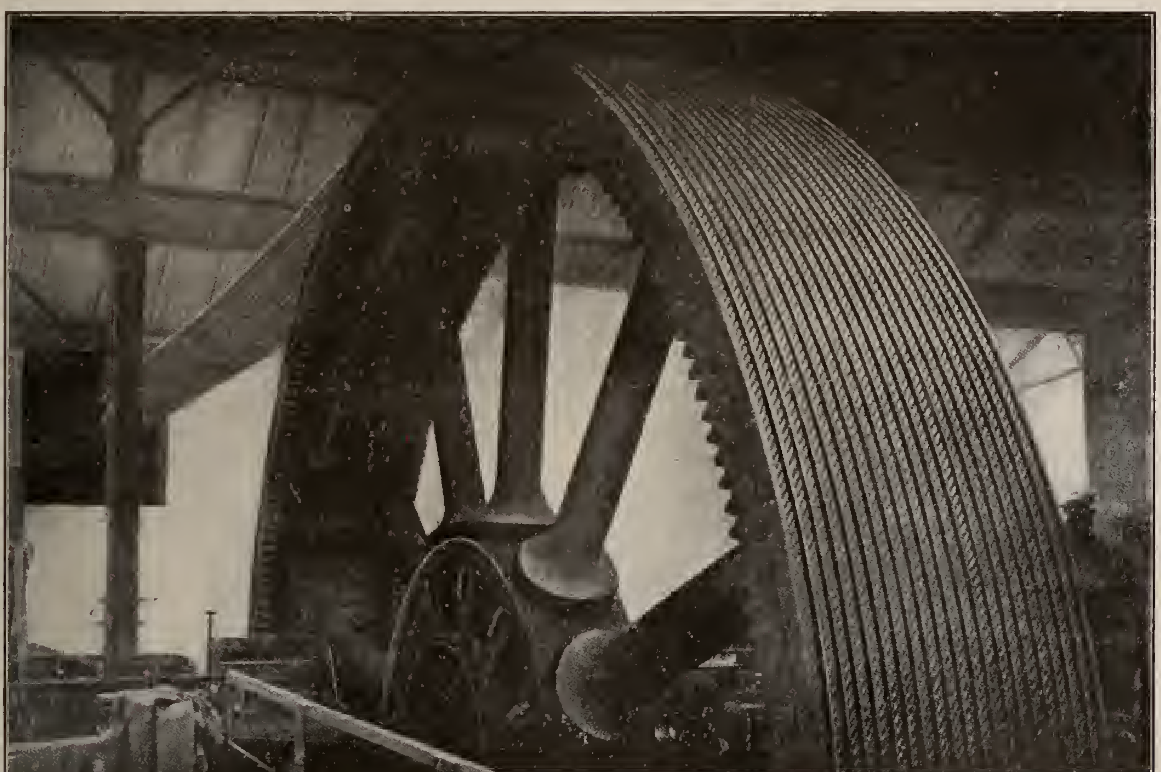
For a 1¼-in. diameter rope under the same conditions as to speed and pulleys, $R = 1.16 + .0112\ S$.

In applying these formulae to practical cases in which the tension is different on the two sides of the rope, Prof. Ewin says, "It appears proper to take S as the greater of the two tensions, for this determines the extent to which jamming of the rope into the groove will take place."

To find the actual percentage of power lost on any given drive. Take, for example, this 1-in. diameter rope running at 4,950 ft. per minute on a pair of pulleys 3 ft. 6 in. in diameter with a static tension S of 100 lbs. Then $R = .57 \times .0101 \times 100 = 1.58$ lbs.

To find the gross tension in the rope, we must add the centrifugal tension set up in it at this speed to the static tension, which in this case equals 59 lbs., so that the gross tension would be about 159 lbs. Prof. Ewing goes on to say: "From such data as I have been able to obtain, it appears that a 1-in. diameter rope, under these conditions, will generally transmit an effective driving force of about 70 lbs., corresponding to 10.7 h.p. Hence, the percentage of power lost is $\frac{1.58 \times 100,}{70}$ or 2¼ per cent." A similar calculation shows that a -¼-in. diameter rope, under exactly the same conditions as above, loses about 2¾ per cent. of the power transmitted. These results agree reasonably closely with the empirical formula of Prof. J. J. Flather, of Purdue University, for losses due to bending in hemp ropes, which embodies the ideas of Eytelwein and Reulaux on the same subject, viz., that $R = \frac{34}{100} P$, provided that the diameter of the smallest pulley is not less than 30d. For a 1-in. diameter rope, this gives R = 3 per cent. of the driving force.

It will be seen from these results that, provided the pulleys are of reasonable diameter, and the rope is properly constructed, there is no need to take into account any losses of power due to the rope itself. But if, on the contrary, ropes are set to work around very small pulleys in relation to their diameters, or made to work out of their natural position by means of guide pulleys, or turned round corners, or compelled to make reverse bends, the loss of power is very great. The use of small pulleys is in most cases influenced by the velocity ratios required; but it should always be borne in mind that, besides the power lost in each rope by the reduction of the arc of contact on the small pulley, there is also a large percentage of power lost by bending the rope round such a small arc. How severe this bending is may often be seen by the comparison of the interior of a rope that has been working sometimes for only a few hours round a small pulley, with one that has worked for years on a properly-designed drive. Whilst the yarn in the latter is as good as on the day it was put in, the inner strands of the former are broken up into short pieces, cut clean in two as if with a knife. By altering the turns or construction of the rope, it is often possible to considerably improve the life of a rope on such a drive; yet when all has been done that can be done, the state of the rope when it is taken off clearly shows how great an amount of power has been wasted, i.e., expended in destroying the rope, instead of being transmitted to the driven pulley. In many instances, of course, there are insuperable difficulties in the way of a good drive, and the ropemaker has to do his best by careful fitting of the grooves, trying different types of rope, etc., to make the drive a success. But frequently, by a little forethought and "judicious dodging," the engineer-in-charge may change a very awkward drive into a very passable one.



**A Drive Showing Twenty Single Strands.**

### Ideals of a Rope Drive.

Though not always attainable, the following conditions should be aimed at by any one desirous of a satisfactory rope installation. Let the pulleys be not less than 30 times the diameter of the rope used, let them be equal in diameter if possible, and as large in diameter as may be, their ratio not to be greater than 5 to 1. Aim at having a distance of not less than 25 ft. between the pulley faces, and the drive horizontal, with the slack on the top side. Speed to be from 2,000 to 4,000 ft. per minute. Give about 4 to 6 ft. clearance under both sides of the rope, taking great care that the ropes have no chance of rubbing against anything. Allow 2 or 3 inches clearance between the bearing foundations and the sides of the pulleys, so as to leave the rope splicer room to get the ropes on without damaging them. See that the pulleys are in line, true, concentric, and balanced, that their grooves are all exactly alike, and that the ropes are of the same diameter. Do not overload the drive, and see that the engine runs steadily, and that the load is an even one. Avoid where possible, the introduction of gear wheels between the prime mover and a rope drive. Do not let the ropes get wet, let them be properly lubricated, and do not have them too light. Put all the ropes on at one possible after they are fixed. Get an experienced rope time, and pull full load on them as soon as reasonably splicer to splice and fix the ropes, and avoid the use of carrier pulleys, rollers, and angular drives as much as possible. Speaking generally, it is possible to comply with all, or nearly all, of these conditions. And where this is the case, the mill engineer often forgets, for many years, all about his ropes, as they give him no trouble. There are drives, however, which present difficulties to those who have to deal with them, and although I do not wish to unduly emphasize them, as they are of comparatively rare occurrence, yet a few hints as to their solution may not be out of place.

(To be continued.)

# GRAPHITE

By Edson S. Bastin.

(Advance Chapter from Mineral Resources of the U.S.)

### INTRODUCTION.

The origin, properties and uses of graphite were fully discussed in the report on the production of graphite in 1911. As copies of that report may be had on application, this information will not be repeated here. The 1911 report contained also a summary of existing knowledge in regard to the graphite deposits of the island of Ceylon and an index and bibliography of the more important publications dealing with the character, uses and origin of graphite and its occurrence in the United States.

A considerable quantity of material is produced in Bartow County, Ga., which cannot properly be classed as graphite, but is rather a slate carrying from 2 to 15 per cent. of carbon, probably in part graphite. It is ground for use as a filler and drier in fertilizers. In 1909 the production of this material was included in the statistics under the heading "Amorphous graphite," but as it is not adapted for any of the purposes for which higher grades of amorphous graphite are used and as these higher grades are never used as fertilizer filler, it is deemed best not to include this material under the name graphite.

The bulk of the graphite consumed in this country continues to be derived from foreign deposits. In 1912 the quantity of graphite imported into the United States for consumption was 25,643 short tons, valued at $1,709,337. In contrast to this the total domestic production was 2,445 short tons of natural graphite, valued at $207,033, and 6,448 short tons of manufactured graphite, valued at $830,193.

### PRODUCTION AND IMPORTS. NATURAL GRAPHITE.

#### Production.

In 1912, as in 1911, the total production of crystalline graphite came from Alabama, New York and Pennsylvania. All of this crystalline graphite was of the variety known in the trade as "flake" graphite that occurs as small flakes disseminated, through crystalline schists, from which it is separted by more or less complicated milling processes. The production of crystalline graphite in the United States has decreased continuously since 1909 as is shown in the accompanying table. This decrease resulted mainly from the closing of numerous graphite properties, very few new properties having begun operation during the same period. The destruction by fire of the mill of the Allen Graphite Co., at Quenelda, Ala., was the cause of a part of the decrease in 1912.

Amorphous graphite was produced during the year by three firms, located in Michigan, Nevada and Wisconsin. The Michigan product is a slate carrying 25 to 30 per cent. of graphite and is all consumed by one firm in the manufacture of paints. The Nevada and Wisconsin products were very small. All the firms reported decreased production as compared with 1911.

Further details in regard to various properties are given in the summary by States and Territories.

**Production of Natural Graphite, 1908-1912.**

| Years. | Amphorous. Quantity. Short tons. | Amphorous. Value. | Crystalline. Quantity. Pounds. | Crystalline. Value. | Total. Quantity. Short tons. | Total. Value. |
|---|---|---|---|---|---|---|
| 1908 | 1,443 | $75,250 | 2,288,000 | $132,840 | 2,587 | $208,090 |
| 1909 | *5,096 | 32,238 | 6,294,400 | 313,271 | 8,243 | 345,509 |
| 1910 | 1,407 | 39,710 | 5,590,592 | 295,733 | 4,202 | 335,443 |
| 1911 | 1,223 | 32,415 | 4,790,000 | 256,050 | 3,618 | 288,465 |
| 1912 | 673 | 19,344 | 3,543,771 | 187,689 | 2,445 | 207,033 |

*Includes Georgia graphitic slate.

On account of the small number of producers, figures of production by States cannot be published without revealing individual productions.

### Imports.

In 1912 there was a slight increase in the quantity of graphite imported from each of the four countries, Ceylon, Mexico, Canada and Chosen (Korea) (via Japan). The total value of the graphite imported was $1,709,337, as compared with a total value of $1.037,226 for the domestic product, both natural and artificial.

The imports of graphite into the United States in 1911 and 1912 by countries are shown in the following table:

**Imports of Graphite for Consumption into the United States, 1912, by Countries, in Short Tons.**

| Country. | Quantity. | Value. |
|---|---|---|
| Ceylon | 16,791 | $1,379,587 |
| Mexico | 3,518 | 163,107 |
| Canada | 2,688 | 122,216 |
| Japan (Chosen via Japan) | 1,574 | 22,875 |
| Austria-Hungary | 473 | 8,971 |
| Italy | 468 | 7,450 |
| Germany | 102 | 2,669 |
| Other countries | 29 | 2,462 |
| Total | 25,643 | $1,709,337 |

The following table shows the imports for consumption of graphite from 1908 to 1912, inclusive:

**Imports for Consumption of Graphite Into the United States 1908-1912 in Short Tons.**

| Years. | Quantity. | Value. |
|---|---|---|
| 1908 | 11,456 | $ 762,367 |
| 1909 | 21,367 | 1,854,459 |
| 1910 | 25,235 | 1,872,592 |
| 1911 | 20,702 | 1,495,729 |
| 1912 | 25,643 | 1,709,337 |

As Ceylon continued to furnish most of the graphite consumed in this country, the following table is given to show the distribution of the Ceylon product. From the early days of the industry up to 1901, Great Britain consumed more Ceylon graphite than any other country. In 1901 the United States assumed the first place, with Great Britain second until 1909, when Germany took second place. The distribution of graphite exports from Ceylon for one year in each of these trade periods is given below:

**Exports of Graphite from Ceylon in Short Tons.**

| Destination | 1885* | 1902 | 1912† |
|---|---|---|---|
| Great Britain | 7,670 | 7,586 | 5,348 |
| United States | 3,074 | 15,244 | 15,460 |
| Germany | 67 | 3,833 | 8,057 |
| Belgium | .... | 1,096 | 2,874 |
| Other countries | 187 | 453 | 824 |
| Total | 10,998 | 28,212 | 32,563 |

*Figures from Ceylon Government Blue Book.

†Advance figures issued by the Ceylon Chamber of Commerce.

Some importations of flake graphite were received from Canada and of amorphous graphite from Mexico and from Chosen (Korea). As practically all of the Korean output is shipped via Japanese ports, it is reported in the custom house returns as coming from Japan, but so far as can be learned little or no graphite is produced for exportation in Japan proper. The Ceylon deposits and industry were described at some length and the Korean deposits were briefly referred to in the report on the production of graphite in 1911.

Some small shipments of graphite from Madagascar are reported to have been received in this country during the year and some larger shipments are now on their way. The following information in regard to the graphite industry of Madagascar is taken from a report† by James G. Carter, United States Consul at Tamatave:

**Exports of graphite from Madagascar, 1909-1912.**

| | Quantity. Metric tons. | Value. |
|---|---|---|
| 1909 | 200 | $14,320 |
| 1910 | 554 | 55,713 |
| 1911 | 1,281 | 86,188 |
| 1912 (first half) | 1,121 | 60,246 |

†Dail Cons. and Trade Repts. Jan. 29, 1913, pp. 516-517.

### WORLD'S PRODUCTION.

The world's production of graphite for the year 1910 was as follows:

**World's Production of Graphite, 1910, in Short Tons.***

| Country. | Quantity. | Value. |
|---|---|---|
| United States | 4,202 | $335,443 |
| Canada | 1,392 | 74,083 |
| Mexico | 2,571 | 36,207 |
| Russia | .... | ...... |
| Germany | 8,174 | 76,404 |
| Austria | 36,520 | 281,220 |
| Norway | 882 | 8,575 |
| Sweden | 1,526 | 1,844 |
| France | 606 | 5,353 |
| Italy | 13,790 | 74,808 |
| Japan | 162 | 5,202 |
| Chosen (Korea) | .... | 56,719 |
| India | 4,761 | 99,661 |
| Queensland | .... | ...... |
| Ceylon | 35,310 | 2,577,600 |
| Madagascar | 601 | 21,218 |
| South Africa | 40 | 6,755 |

*Mines and quarries: General Report with Statistics, pt. 4. London.

### MANUFACTURED GRAPHITE.

The following table shows the production of manufactured graphite by the International Acheson Graphite Co., at Niagara Falls, N.Y., for the years 1908-1912, inclusive:

**Production and Value of Manufactured Graphite, 1908-1912.**

| Years. | Quantity. Pounds. | Value. | Average price per pound. Cents. |
|---|---|---|---|
| 1908 | 7,385,511 | $502,667 | 6.80 |
| 1909 | 6,664,017 | 480,000 | 7.20 |
| 1910 | 13,149,100 | 945,000 | 7.20 |
| 1911 | 10,144,000 | 664,000 | 6.55 |
| 1912 | 12,896,347 | 830,193 | 6.44 |

### INDUSTRY BY STATES AND TERRITORIES.

**Alabama.**—The plant of the Quenelda Graphite Co. (formerly the Allen Graphite Co.), at Quenelda, was destroyed by fire, but is now being rebuilt with a capacity for handling 400 tons of crude material in 10 hours. No production was reported for 1912.

The Ashland Graphite Co.'s plant, about 4½ miles west of Ashland, was idle during 1912. Some of the persons interested in this company are engaged, under the name of the Alabama Graphite Co., in developing a graphite deposit of similar character in the near vicinity. A mill was erected and began operations in August, 1912.

Alaska.—During the year the Uncle Sam Alaska Mining Syndicate opened a new property in the Kigluaik Mountains, Port Clarence mining district. According to a description obtained through the courtesy of the manager of this company the property comprises nine locations of claims and two mill site locations nearly two miles (10,168 feet) south of Graphite Bay, a branch of the Imuruk Basin. The elevation is about 500 feet above sea level. The graphite occurs associated with schists and gneisses which strike east and west and have steep dips. The richer graphite portions can, it is claimed, be readily separated by hand sorting. Some graphite has been shipped to Everett, Wash., where a small mill is being erected for its treatment.

At the property of the Alaska Graphite Co., also in the Port Clarence district, development work was in progress during the latter part of 1912, but no graphite was shipped.

**California.**—A company known as the California Graphite Co. was incorporated in January, 1913, to develop a graphite deposit near Saugus, in Los Angeles County. The material is similar in general to some of the graphitic schists of the eastern United States and it is planned to erect a mill at an early date.

**Colorado.**—Some development work was in progress during 1912 on a new graphite property near the summit of Italian Mountains, in Gunnison County, Colo. The deposits are near the head of Cement Creek and are about 10 miles from the railroad. A company formed for their development is known as the Colorado Graphite Mining and Manufacturing Co. with office in Denver. According to a private report made to this company by S. C. Robinson, mining engineer, there appear to be three parallel "veins" of graphite about 50 feet apart, lying parallel to the inclosing beds of stratified rock, which here stands nearly vertical. The middle "vein" is the largest and has a width of 4 to 6 feet. All development has thus far consisted in open-cut mining. This locality lies either within or just east of the area covered by the Anthracite-Crested Butte folio (No. 9) of the Geologic Atlas of the United States. Within this area coal occurs in the Cretaceous formations. Though normally bituminous, it has locally been altered to anthracite as a result of dynamic metamorphism or of the proximity if igneous rocks. The occurrence of graphite as a result of still more intense alteration is therefore not at all surprising.

The mine of the Federal Graphite Co., near Turret, in Chaffee County, was idle in 1912.

**Idaho.**—Graphitic schists are known to occur on Salmon River, near Grangeville, Idaho, and analysis of a specimen showed 7.6 per cent. of fixed carbon.

**Massachusetts.**—Graphite has not been produced in Massachusetts for some years. Mr. F. C. Husbands states that at the famous Sturbridge mine (described in the report on the production of graphite in 1911) the main lode has been prospected for over half a mile west from the shore of Lead Mine Pond, for most of this distance to a depth of 50 to 60 feet. One lump, mostly graphite, taken out about 1904 weighed about 510 pounds.

**Michigan.**—In Michigan the Detroit Graphite Co., whose mine is near L'Anse, Bargara County, was the only producer. The material is a graphitic slate, which is ground for paint pigment.

**Montana.**—At the property of the Crystal Graphite Co., near Dillon, Mont., development work was continued during 1912 at the tunnel workings, a new drift being driven on one of the veins and a winze sunk.

**Nevada.**—The Black Lead Mining Co. continued operations at Carson, Nev., its product being ground, but not refined, and sold for paint pigment and as foundry facings.

Mr. E. Edwin, of Ludwig, Lyon County, reports the discovery of a graphite deposit in that county. He states that the graphite deposit is between 4 and 5 feet thick and is traceable on the surface for several hundred feet. A specimen sent to the Survey was an amorphous graphite of good quality.

**New Mexico.**—A large body of amorphous graphite occuring in the canyon of Canadian River about seven miles southwest of Raton, in Colfax County, has been described by W. T. Lee.* This graphite has been formed by the metamorphism of coal through the effect of igneous rocks intruded into it.

**New York.**—In New York the firms operating were the American Graphite Co. (Joseph Dixon Crucible Co.), at Graphite, Warren County; the Empire Graphite Co., at Greenfield, Saratoga County; the Sacandaga Graphite Co., at Conklingville, Saratoga County, and the International Acheson Graphite Co., at Niagara Falls. The Macomb Graphite Co., at Pope's Mills, St. Lawrence County, was idle in 1912, and the Crown Point Graphite Co., at Crown Point, Essex County, has been idle since the fall of 1910.

**North Carolina.**—A few tons of graphitic schist were mined at Barretts Mountain, in Alexander County, but none was refined or shipped.

**Pennsylvania.**—The only firms operating in Pennsylvania during the year were Pettinos Bros., at Byers, and the Rock Graphite Mining and Manufacturing Co., at Chester Springs. The Eynon Graphite Co., with mine and mill near Coventryville, which took over the property of the Imperial Graphite Co., continued experimental and development work.

**Wisconsin.**—The Wisconsin Graphite Co., at Stevens Point, in Portage County, reported a small production. The material is a graphitic slate and is ground for use mainly as a paint pigment.

## MARKETS AND PRICES.

The prices paid by crucible makers and others for Ceylon graphite during 1912 were approximately as follows:

**Prices of Ceylon Graphite at New York City in 1912.**

| | Cents per pound. | |
|---|---|---|
| Ordinary lump: | | |
| Best | 8¼ to | 10 |
| Medium | 7 | 8 |
| Poor | 5½ | 7 |
| Dust: | | |
| Best | 3 | 3½ |
| Medium | 2½ | 2¾ |
| Poor | 1⅞ | 2⅛ |
| Chip: | | |
| Best | 5¼ | 7 |
| Medium | 4½ | 6 |
| Poor | 3½ | 4½ |
| Flying dust: | | |
| Best | 2 | 2¼ |
| Medium | 1¾ | 2 |
| Poor | 1¼ | 1½ |

In general the range in prices was somewhat greater than in 1911, and during the last half of 1912 there was a notable advance in prices.

* Lee, W. T., Graphite near Raton, N. Mex.; Bull. U.S. Geol. Survey No. 530-L, 1912.

The average price of Korean graphite during the year was about $25 a short ton, c.i.f. New York City. Most of this material is used for stove polish and foundry facings.

Most of the domestic producers of graphite who were operating during the year reported that market conditions were good. The prices for American flake graphite were very variable, but the following table will give some idea of their general range.

**Prices of Domestic Flake Graphite in 1912, f.o.b. mills.**

| | Cents per pound. | |
|---|---|---|
| Best crucible flake | 5½ to | 7½ |
| Medium grade flake | 4 | 6½ |
| Inferior grade flake | 2½ | 4 |
| Dust | ¾ | 3 |

In general the prices appear to be slightly higher than in 1911.

# PERSONAL AND GENERAL

Mr. William Watson, recently returned to British Columbia from New York.

Mr. G. M. Colvocoresses has spent some time in the Sudbury district, aid in the country to the north.

Mr. Kirby Thomas, of New York, was in Toronto about the middle of May.

Mr. A. B. Willmott, of Toronto, has accepted an important consulting position with the Lake Superior Corporation. He will still maintain his office in Toronto.

Mr. Clifford E. Smith, mining engineer, Toronto, recently visited Cobalt and Gowganda.

Mr. C. B. Burchell, formerly manager of the Maritime Coal, Heat and Power Co., Nova Scotia, has accepted a special commission to make certain professional examinations in Europe. Mr. Burchell will be absent for six months.

The Roberts & Shaefer Company, coal machinery engineers and contractors, Chicago, have added to their firm Mr. Willis E. Holloway and Mr. Paul W. Holstein. Both these gentlemen have had extensive experience in designing and installing coal handling equipment and conveying machinery.

Mr. Geo. Watkin Evans, consulting coal mining engineer, Seattle, has been selected to make an examination as to the commercial possibilities of the Matanuska coal fields of Alaska for the United States Bureau of Mines. Mr. Evans left Seattle on May 18th.

Mr. Erich Meurer, mining engineer, of Cologne, Germany, is in Canada looking into the market for Cobalt ores.

Mr. Chas. A. Banks, manager for the Jewel Syndicate, has returned to the Jewel mine, in Boundary district of British Columbia, from a visit to England, where he conferred with his directors relative to the future operations of the syndicate's mine and 15-stamp mill.

Mr. W. F. Best, of Victoria, B.C., is spending the field season in Strathcona Park, a little-known mountainous part of Vancouver Island, in which it is thought probable valuable metalliferous deposits may be found.

Mr. J. W. Brewer has been examining mining property in the Coast district of British Columbia, to report on it for the owners.

Dr. D. D. Cairnes is expected, according to a report published in Vancouver, to visit Silver Creek and vicinity, in Atlin mining division, to ascertain what are the prospects for the opening there of a payable placer gold field.

The Edmonton Bulletin has printed the following among its news items: Hr. Howard D. Cameron, M.E., C.E., formerly superintendent of the War Eagle mine at Rossland, B.C., is back in Edmonton after an extended trip into the Pembina coal fields country, Alberta.

Mr. Chas. Camsell, of the Geological Survey of Canada, during the ensuing field season, will visit what is now known as Leadville camp, formerly Summit camp, on the Tulameen side of the Hope mountains divide.

Mr. James Cronin has retired from the management of the Standard Silver Lead Mining Co.'s mine and concentrating mill in Silverton camp, Slocan Lake District, B. C.

Mr. A. W. Davis, of the Consolidated Mining and Smelting Co.'s mining engineering staff, was lately in Leadville camp, Tulameen district, looking over mineral claims there.

Mr. Ivan de Lashmutt has been appointed manager for the Standard Silver-Lead Mining Co., and will have his headquarters at Silverton, B. C.

Mr. W. B. Dornberg, of Spokane, Washington, manager for the Treasure Mountain Silver-Lead Co., which has during the last two years done a lot of development work on its group of claims in the Tulameen-Hope district, was a recent visitor to the Coast cities —Victoria and Vancouver.

Mr. W. J. Elmendorf, general manager for the Portland Canal Tunnels, Ltd., has gone to Glacier Creek, Portland Canal mining division, to spend the fine-weather season there, superintending the work of driving the 2,300-foot crosscut tunnel his company has in hand. About one-half the distance has been driven since operations were commenced last autumn.

Mr. Evan Evans, one of the Provincial Government mine inspectors, who for the last three months has been relieving Mr. James McGregor, of Nelson, mine inspector for West Kootenay and Boundary districts, has returned to East Kootenay, Mr. McGregor having resumed duty after his vacation.

Mr. A. S. Hamilton, master mechanic for the Western Fuel Company, at Nanaimo, Vancouver Island, is the inventor of the "Nanaimo" safety cap box, for the safe-keeping of dynamite caps in readiness for being affixed to fuse. Two of these boxes—one a locked box and the other a smaller one without lock, the latter suitable for the use of prospectors—were shown and described at the meeting of the Western Branch of the Canadian Mining Institute held at Rossland, B.C., on May 22nd and 23rd.

Mr. Robert R. Hedley has returned to Vancouver from examining mining property on Moresby Island of the Queen Charlotte group, British Columbia. Mr. Hedley is arranging to develop one of the properties on which he saw a promising showing of copper ore.

Mr. A. G. Larson, of Vancouver, B.C., is making a periodical visit of inspection to the Slocan Star, Lucky

Jim, and other mines in Kootenay district, in the capacity of consulting engineer to the companies owning them, respectively.

Mr. R. H. Ley, formerly practising as a custom assayer at Nelson, B.C., and now with the Giant Powder Co., Inc., was recently knocked down and injured by an automobile, in Vancouver.

Mr. Richard Marsh, some years ago connected with mining in Rossland camp, and since then at Spokane and Republic, Washington, has been appointed superintendent of the Yankee Girl gold mine, at Ymir, B.C., in place of Mr. Ivan DeLashmutt who is now manager for the Standard Silver-Lead Mining Company.

Mr. R. G. McConnell, of the Geological Survey of Canada, will shortly visit the Britannia copper mine, near Vancouver, B.C., to obtain data concerning that important mine for the information of the International Geological Congress excursion party to visit the Canadian West next August.

Mr. H. J. C. McDonald, resident superintendent at the Granby Consolidated Company's Hidden Creek mines, Observatory Inlet, has been paying a visit to Phoenix, Boundary District, B.C.

Mr. R. G. McFarlane, of Sudbury, was in Nelson, B.C., last month, visiting with relatives.

Mr. J. M. Turnbull, of the Consolidated Mining and Smelting Company's mining engineering staff, is in the Skeena district, British Columbia, examining mining properties.

Mr. W. J. Watson, manager for the Tyee Copper Company, has arrived in London where he went to discuss with the directors matters in connection with the company's future operations in British Columbia.

Mr. Bruce White is stated to have gone to the Slave Lake country to investigate the mineral resources of that region. He has been mining in British Columbia, chiefly in Slocan and other parts of West Kootenay, for a number of years.

Mr. R. P. Williams, of Vancouver, B.C., for years representative in Western Canada of the Canadian Rand and Jenckes Machine Companies, was recalled to New York recently to consider business offers that may require his removal to that city.

Mr. F. R. Wolfe is manager for the Florence Mining Company, which is operating a small mine in Ainsworth mining division, British Columbia.

Mr. J. A. Whittier, for years mining in Slocan District, has for some time past been resident in Vancouver, B.C.

Mr. H. C. Bellinger, general manager of the Great Cobar, Ltd., left San Francisco, California, on May 6th by the S.S. Ventura on his return to Cobar, New South Wales, Australia. In its April number, The Mining Magazine, London, England, said editorially: "Owing to the interruption to smelting during the Easter holidays, the March returns from Great Cobar are disappointing. So was the special meeting, called to enable Mr. H. C. Bellinger to address the shareholders. He explained the difficulty of obtaining an adequate supply of labour, and confirmed the estimates previously made, but gave no fresh information. In his reticence he was wise. Great Cobar has had enough said and promised about it, and if the performance has repeatedly fallen short of the promise, it is only fair to say that Mr. Bellinger deserves more sympathy than blame. He has proved his technical skill abundantly, and, so it seems to us, also his patience and loyalty, for no mine manager during the last three years has had to face repeatedly so many difficulties, due to no fault of his own. The labour troubles at Great Cobar would have broken the spirit of any ordinary man. We shall be glad to chronicle the success of the enterprise for his sake, as well as that of the proprietors." Mr. Bellinger's many friends in Canada will gladly "second the motion."

---

## PRINCIPLES OF MINE VALUATION

By JAMES R. FINDLAY

(Concluded from last issue.)

It is a curious thing, which anyone can observe by watching stock quotations, that the prices of mining stocks vary almost parallel with the price of the metal itself. When copper metal goes down, copper stocks go down. I always used to think that this was illogical, but I have come to the conclusion now that the public, which bases its valuations on present commercial conditions, has been more logical, on the whole, than the mining engineer, who has laid so much stress upon the life of a mine and the uncertainties of its future.

The question of the life of a mine is not to be overlooked, by any means. In many cases that is the most vital factor, particularly in the case of gold mines, because there fluctuation of price does not enter. Take, for instance, the Goldfield Consolidated. There is a property which has been making a spectacular showing in dividends, but it has always been recognized that its life was uncertain; and now, in spite of the fact that for two years it has been paying very large dividends, the price of the stock has been so low that the dividends have equalled 50 per cent. of its market value. Recently the stock has been selling for $1.75 per share; the actual dividends paid during the past year have been $1.60 per share. Now, if the mine were valued in the way some copper mines are valued, paying dividends, say, at the rate of 6 per cent. of the selling price, the price to be put on Goldfield stock would be $20 per share. In that mine the whole question centers on the length of its life. I speak of it because this is so contrary to usual experience. I do not know of any other case in which the public has been warned, or has become convinced of a mine's exhaustion so long in advance.

On the other hand, there are some mines with an expectation of long life which cannot show any ore reserves at all. Certain mines at Tintic, Utah, which I should be willing to value on an assumed life of five or ten years, do not show ore reserves for even three months. The reason is that those bodies grew in a fashion which prevents the ore reserves from being developed. They occur in an immense mass of limestone, through which mineralizing solutions have gone, and have been diverted by various intersecting fissures. These orebodies are irregular, sometimes small and sometimes swelling up to large size; sometimes they go down vertically four or five hundred feet, forming a pipe, then abruptly go off horizontally for four or five hundred feet, and then up again, then shooting to the right or to the left. If nothing were known about the persistence of those orebodies, one would be justified in being exceedingly skeptical about the future; but the experience of 30 years has shown that those deposits, in spite of their irregularities, are exceedingly persistent. In making his valuation the intelligent engineer will of course consider this fact a pronounced asset.

# SOME CHARACTERISTICS OF THE GOLD BEARING VEINS OF NOVA SCOTIA

By E. PERCY BROWN, Norfolk, N. S.

The accompanying sketch, a cross-section of the workings of the Brookfield Mining Company, Queens Co., N. S., taken from a survey made by the writer in 1898, shows the three distinct classes of veins which occur in Nova Scotia.

These veins are known locally as "Main," "Fissure" and "Angular," and while it is admitted that these designations are indefinite and confusing, yet until a more scientific system of classification has been adopted, the use of the local terms is, perhaps, permissible.

The main veins "A" are usually considered as typical of the gold measures of Nova Scotia and they lie inter-bedded conformably between the slate and quartzite.

The fissure vein "B" cuts the strata both in strike and dip, the strike of the fiussure at this place is about east and west, that of the strata north-east and south-west. The dip of the strata is 69° north, while the vein dips about 63° south. Throughout its course the dip and strike of the vein are almost independent of the rock traversed.

The angular vein "C" lies in the hanging wall of the fissure and by some might be considered a part of it. This is, however, not the case, for it is just as distinct in its characteristics as are the others. It joins the fissure at the point "D" and almost touches it again at "B." This vein changes its direction with each stratum that it crosses as can be seen in the sketch. It traverses the quartzite almost at right angles while it runs with the bedding of the slate. In crossing a large belt of "semi-whin" (i.e. intermediate between slate and quartzite) the course of the vein is intermediate between the angle at which it would cross a belt of slate and that at which it would cross a belt of quartzite.

It can thus be seen how distinct are the characteristics of the three veins. And if we consider the three from a genetic standpoint, it may give us yet a further insight into their distinctive points.

We are all familiar with the idea of the process of gradual folding of the strata during which the main or interbedded veins are supposed to have been formed. During this folding or subsequent to it, we may readily imagine that the rock gave way in certain favourable directions due to powerful stresses set up in the rock by the action of folding or by some independent force shearing the rocks already folded. Thus would the so-called fissure veins be formed.

Probably during the formation of the fissure or perhaps after its formation, but before the crevice had been filled, if that vein point is permissible, a portion of the hanging wall gave way and as it were dropped into or towards the fissure. Thus the angular vein may have been formed.

It may be noted that opposite the position of the angular the fissure vein is small and irregular.

Many will say that the above is an old story and that everyone familiar with gold mining in Nova Scotia recognizes these different veins. Doubtless this is so, but I have noticed that the three classes are continually confused. Only a few weeks ago I read an article in the leading Mining Journal of Canada on the Gold Fields of Nova Scotia wherein the writer stated repeatedly that there were but two kinds of gold-bearing veins in Nova Scotia, interbedded and cross-veins.

I wish to make as sharp a distinction as possible between the fissure and angular veins. Both are "cross-veins" i.e. they cut across the bedding of the strata, but there the similarity ceases. The course of the fissure, as I have shown above, is almost independent of the rock traversed. Several of these veins have been traced for considerable distances. A "gouge," "hulk" or salvage usually occurs on one wall or both.

The course of the angular is extremely irregular and usually extends but a comparatively short distance. As a rule there is no seam between the quartz of these veins and the country rock.

The angulars are usually associated with main or fissure veins and often form a network of quartz frequently connecting one vein with another. They are sometimes quite large and may extend for some distance in a straight line, particularly if the nature of the country rock remain the same. In this case they are usually made up of coarse grained white (bull) quartz.

There will be no need to give examples of main veins as many of these are well known to all interested in the gold fields of Nova Scotia.

Perhaps the best example of the fissure vein is found in the District of Leipsigate, Queens Co., Mr. E. R. Faribault, the painstaking and efficient geologist of Nova Scotia, to whom we owe what tabulated information we possess regarding Nova Scotia gold fields, says, in the Report of the Geological Survey, 1904:

"One fissure vein, the Leipsigate, owing to its permanency and size and the uniformity of its ore values has made the district famous. In many respects it is probably the most typical true fissure vein in the Province and gives promise of being one of the best producers. It is situated in the most southerly part of the district, some 1,200 feet south of the lake, and has been traced for 9,000 feet, of which 4,350 feet have already been opened in three different sections. . . ."

Several other examples of this class of vein exist in the Province and have been developed in two cases at least to considerable extent, but the data bearing on most of these is practically nil. A number of veins of the Angular class have been worked, usually in connection with the working of some interbedded veins, and data in these cases is also lacking.

Doubtless the most important question regarding our gold measures is the location of pay shoots. Some well-defined zones have been followed to considerable depths, 1,000 feet or over, though the finding and following of these was often due more to good luck than good management. How many more there may be throughout the Province we cannot say. How many of the rich outcrops which have been cut on the surface and worked to depths of 200 or 300 feet continue in depth we do not know.

It would appear that each class of vein must be studied by itself as the occurrence of the paystreak seems to be different in each kind of vein.

In some districts the enriched portion of the main lode occurs at a definite distance from the dome or axis of the anticline. That portion of the vein where it begins to curve rapidly or as it is sometimes called

the "shoulder" often contains the highest value. As the apex of the dome pitches in a certain direction the enriched portion continues approximately parallel with it and a pay shoot is formed. In some cases it has been noticed that where the dome broadens the zone of enrichment recedes from the axis and where it narrows the zone approaches the axis.

In other cases the pay zones on the interbedded veins appear to be formed by some irregularity in the folding by which a crumple has been made in the belt. Even when this irregularity is very slight it seems to exert a great influence on the distribution of values. Then again enrichment on these veins occurs where angulars join them, as indeed is often the case, either at a shoulder or in the case of a crumple as described above.

In the case of fissure lodes the presence of angulars also seems to affect the values, but the pay shoots on these veins seem to depend mainly on the intersection of favourable strata. As an example, the pay shoot on the fissure vein shown in the sketch occurred at and just below its junction with the main vein (A) and its accompanying band of slate. This stratum of slate, particularly in the upper levels, was soft, black and well mineralized. Two other main lodes were cut by the fissure at A′ and A″, though these were very small near the surface. The pay-shoot continued for a distance of some 2,000 feet to follow these intersections (vide Map of Brookfield Gold Mining District, E. R. Faribault, Dominion Geological Survey).

The pay streaks on the fissure vein of Leipsigate are well described by Mr. Faribault in the report before referred to (Dominion Geological Survey, 1904). He says, "It has been observed that the ore shoots occur at the intersection of the vein with certain strata of soft rock which are apparently more favourable to fracturing, infiltration and deposition of gold. This important feature, already observed in several other fissure veins, deserves much attention in mining. These intersections are necessarily continuous for great lengths and a succession of them probably recur in depth. It should, therefore, follow that the ore shoots are quite extensive in length and that those already developed are likely to be underlaid by a succession of others. This should encourage development to a much greater extent."

There is an old saying that the worse the wall of the mine, the better the values. This I have found to be remarkably true in many cases of both interbedded and fissure veins.

The enrichment of the angular lodes seems to be more irregular and uncertain usually occurring, however, at the intersection of favourable strata, or where the angular cuts interbedded or fissure lodes.

This question of pay shoots seems to the writer to be a most vital one and it is most important that all available data concerning values and peculiarity of structure met with underground should be carefully recorded from the earliest start of the mine. In a new district this is particularly true and should not be lost sight of.

In Nova Scotia one can see many cases where thousands of dollars could have been saved had such records been kept, and mines which have been ruined by improper development might still have been yielding steady returns.

The late Dr. Henry Yuill Hind, writing on the Waverley Gold District, Nova Scotia, as far back as 1869 (less than ten years after the discovery of gold in Nova Scotia), says:

"It is much to be regretted that no reliable data exist from which diagrams showing the auriferous zones on these leads can be constructed. The circumstance of the quartz from all being mixed before crushing makes it impossible to collect the necessary observations." And, again:

"Plans of all the workings are also essential, showing at least monthly progress. . . . . but if no monthly plan of workings is kept on record, all is confusion. With the single exception of a plan and section made some years ago by Mr. Bell, together with a lithographed plan of the whole district, showing the position of the several properties, I was unable to obtain any plan of surface workings, much less any plan of the underground workings, and the agents of the different companies uniformly informed me that none to their knowledge were in existence."

Had Dr. Hind's advice been followed throughout Nova Scotia the history of gold mining here might have been different. I believe that to-day a careful study and correlation of all data and available information regarding underground workings, structure, values and so forth should be made in the interests of the industry.

## MINING DIVIDENDS

Messrs. Thompson, Towle & Co., of New York City, have compiled and published a statement showing the production, estimated earnings, and dividends of the important copper mines of the United States, Mexico, and Canada. Only two companies operating in Canada are included, namely, the British Columbia Copper Co. and the Granby Consolidated M. S. & P. Co., both in British Columbia. The Britannia was either overlooked or the corresponding particulars of operations and results were not obtainable. The published particulars for 1912 follow, with estimated approximate figures for 1913 shown in brackets: British Columbia Copper Co., number of issued shares, 591,709; par value \$5; copper produced, 11,146,000 lbs. (12,000,000 lbs.); cost per pound, 12.86 cents (10 cents); earnings per share, 72 cents (with copper at 15 cents a lb., \$1.01; earnings each one cent change, 20 cents a share); amount and date of last dividend, 15 cents a share, January 15, 1913. Remarks: Cost in 1912 due principally to lower grade ore treated. Granby Consolidated: Number of issued shares, 149,648; par value, \$100; copper produced, 22,630,000 lbs. (22,000,000 lbs,) cost per pound, 9.50 cents( 9.50 cents); earnings per share \$10.60 (with copper at 15 cents a lb., \$8.09; earnings each one cent change, \$1.47 a share); amount and date of last dividend, \$1.50, March 1, 1913. Remarks: Company owns Hidden Creek property. Has \$1,500,000 convertible bonds. Estimated production, cost, and earnings per share when reduction plants shall have been brought up to capacity: Production, 45,000,000 lbs.; cost 9½ cents; earnings per share, with copper at 12 cents, \$6.84, at 13 cents, \$9.58, at 14 cents, \$12.31, at 15 cents, \$15.05, at 16 cents \$17.78, at 17 cents \$20.52.

Metallurgical and Chemical Engineering, New York, printed in its May number a two-page illustrated account of a complimentary dinner given on the evening of April 19 by the chemists of the United States to Dr. William H. Nichols, the president of last year's

International Congress of Applied Chemistry, and to Dr. Bernhard C. Hesse, the secretary of the Congress, as a mark of their appreciation and affection. The dinner was held at the Chemists' Club in New York City, and some 225 men assembled to do honour to their guests. The following excerpt from that journal's account of the proceedings may interest, among others, readers of the Canadian Mining Journal in Canada who are interested in the Granby Consolidated M. S. and P. Co., of which, among his many activities, Dr. Nichols is president:

"Dr. Wilder D. Bancroft, of Cornell University, spoke as past-president of the American Chemical Society, and of the American Electrochemical Society. He spoke exceedingly well, both concisely and to the point. Starting with a funny church collection story, he passed to a review of the success of the Congress—for it was a great success—and of the men who made it such. Morris Loeb lost his life at it. Dr. Rosegarten nearly did. Mr. Matheson produced a surplus and Dr. Hesse gave up a year and a half of his life to produce thirty volumes of transactions and a great many tons of literature. And as to Dr. Nichols' work as president, if we should ever go again through such a Congress in our lifetime (which Heaven forbid) and if we should be forced to get along without Dr. Nichols as president (which Heaven forbid), we might think in poetry:

Twinkle, twinkle, little star,
Riding on a trolley car.
Trolley car went off the track.
Gee, I wish we had our Nickels back."

Among other speakers was Dr. David T. Day, of Washington, D.C., who, in order that Dr. Nichols and Dr. Hesse should take with them into later life the memory of the appreciation and affection of their American fellow chemists, presented in the name of the American chemists, to Dr. Nichols, a counterpart in silver of the desk set in the Royal Treasury in London, and to Dr. Hesse a silver loving cup.

The Traylor Engineering and Manufacturing Company, with works at Allentown, Pennsylvania, U.S.A., announces that it is now building three 50 by 360-in. water jacket copper-smelting furnaces for the Granby Consolidated Mining, Smelting & Power Co., Ltd., these being only a part of a very large order received from that company.

The United States Congress has authorized the expenditure of $2,596,000 for a building to accommodate the Geological Survey, the Bureau of Mines, the Reclamation Service, and the Indian Office, all bureaus of the Interior Department. Plans for construction will go forward at once.

# THE DOME ANNUAL REPORT

The annual report of the Dome Mines Company for the period Nov. 30, 1911, to March 31, 1913, was presented by Mr. Ambrose Monell, the president, at a meeting of the shareholders in Toronto on May 27th.

The most important feature of the meeting was the decision to increase the capital from $3,500,000 to $5,000,000 in $10 shares. However, the new shares will be issued only as actually required for increasing the capacity of the mill. The mill at the present time contains only forty stamps. It is proposed to instal sixty more stamps, and to add the necessary subsidiary machinery.

During the period covered by the report the mill handled 101,812 tons of ore. The average gross value of the ore was $10.25 per ton. The net profit per ton was $5.009. As pointed out by Mr. Monell, there is every reason to expect a considerable reduction in operating costs. The labour troubles of the past, and the large proportion of development work being done have necessarily enhanced the expenditure per ton of ore mined and milled. Also, the cost of power has been very considerably cut. Relatively cheap hydro-electric power is now available.

As mentioned above, the tonnage milled was 101,812 tons. The total yield by amalgamation was $460,581.62. The yield by cyanidation was $483,513.31. The total value was $1,043,994.93. The actual percentage of extraction was most creditably high, standing at 95.63 per cent.

The mining and milling costs were made up as follows:—

| | |
|---|---|
| Mining cost per ton | $1.31 |
| Crushing cost per ton | .24 |
| Milling cost per ton | 2.11 |
| General | 1.29 |
| Total | $4.95 |

Altogether 128,015 tons were mined; 102,836 tons were sent to the mill. The difference was waste.

Judging from the tenor of the annual report great pains have been taken not to over-estimate the ore reserves. Where positive assertions are made they have been substantiated with the utmost care. Mr. Mein estimates the ore developed above the 45-foot level, as at March 31, 1913, at 315,528 tons, carrying gold to the value of $7.50 per ton. Added to this quantity there is a further reserve of 250,000 tons between the 45-foot and the 100-foot levels. Mr. Mein has abstained from placing any definite value upon this body. He states that much more work must be done before it can be properly estimated.

The following is a brief tabulation of the total general expenditures and earnings:—

| | | |
|---|---|---|
| Mining costs | $157,666 27 | |
| Milling | 214,788 15 | |
| General works expenses | 131,096 72 | |
| | | $503,551 14 |
| Gross earnings | | $540,443 79 |
| **Selling Expenses—** | | |
| Bullion, shipping | $1,663 96 | |
| Bullion insurance | 1,551 51 | |
| Bullion refining | 2,623 07 | |
| | | $ 5,838 54 |

| | | |
|---|---|---|
| General expenses | | 24,649 15 |
| Net earnings | | 509,556 10 |
| **Written Off—** | | |
| Development | $61,087 20 | |
| General charge | 53,516 21 | |
| Fire loss | 24,124 47 | |
| | | $138,727 88 |
| Transferred to balance sheet | | $371,228 22 |

It is quite worthy of note that 93,581 tons of all the ore milled came from surface "glory-holes."

Harking back to the question of ore reserves, it may be mentioned here that, by horizontal measurement, 46,750 square feet of ore has been exposed on the 100-foot level. Until further work has been done below this level this ore is given no definite place in the reserves.

Certain diamond drilling results were also mentioned in Mr. Mein's report.*

| Borehole.* | Length of mineralized ore. | Assay value. |
|---|---|---|
| No. 12 | 57 ft. | $7.18 |
| No. 13 | 168 ft. | 4.15 |
| No. 20 | 478 ft. | 3.69 |
| No. 23 | 273 ft. | 4.56 |

His own explanation of the inferences to be drawn from these results is as follows:

"Selected portions of these great lengths of core, of course, would show considerably higher results than the foregoing averages. But a classification into higher and lower grade cannot be reasonably attempted until the trend of the zones or lenses to be followed in mining is more fully proven by development in the region of these borehole intersections. For examples: 97 ft. of the 273 ft. of ore in No. 23, averaged $6.41 and 44 ft. of No. 20 assayed $10. Too much weight, however, should not be attached to the assay values of borehole intersections, which are commonly unreliable as samples for valuation, though very important as a guide to development.

"In shaft No. 2 itself the ore body was cut at a depth of 172 ft., which had not been indicated in any of the boreholes. Sampling results averaged $4.87 for a distance of 85 ft., with the bottom of the shaft still in ore at a depth of 257 ft. The strike of the miners interrupted the sinking of the shaft and a crosscut was started south. This crosscut is now in 200 ft. and averages $5.39 throughout its entire length. Including borehole No. 23, which lies above the crosscut on the west side, we have, therefore, in this vertical plane, representing the extension of our declared ore values three sides in ore showing: 85 ft. of the shaft averaging $4.87, 200 ft. of the crosscut averaging $5.39, 97 ft. of borehole averaging $6.41.

"Immediately to the west (200 ft.) borehole No. 20 intersected 478 ft. of ore, averaging $3.69, of which 75 ft. showed $5.15 per ton.

"All new results obtained on the deeper extensions of the famous Dome of rich quartz that marked the outcrop of the veing give us further hope that a longer life with an increasing scale of operations on a lower grade of ore may be confidently anticipated."

For this moderate and careful policy, Mr. Mein deserves all possible credit. He is deliberately taking the risk of misinterpretation. Doubtless there are numberless parasites of the stock market who will be only too glad to interpret his statements in the most depressing manner. Just here a comparison between the Hollinger and the Dome is illuminating.

| | Hollinger. | Dome. |
|---|---|---|
| Ore reserves, tons | 644,540 | 509,556 |
| Average value, per ton for the 250,000 tons below the 45-foot. | $21 44 | $7 53 |
| Apparent net profit per ton | $14 70 | $2 58 |
| Apparent net value of ore reserves | 9,474,738 | 1,314,654 |
| Market value of mine, taking Hollinger at $17 a share and at $15 a share | $10,200,000 | $5,250,000 |

None of the Executive officers of the Dome Mines Company receives a salary.

# SPECIAL CORRESPONDENCE

## NOVA SCOTIA

### MINERS' RELIEF SOCIETIES.

There has been discussion in the Nova Scotia Lower House regarding the Provincial Workmen's Compensation Act, and the statement has been made that the miners of the province would be better off under the provisions of the Act than they are under the present system of relief societies. It must be admitted that not every colliery company has placed its house in order in this regard, but the workmen of those companies who have properly constituted relief societies are distinctly better off as they are. In drawing a corollary between European countries and Nova Scotia it must not be forgotten that in the older countries friendly societies exist on a scale of great magnitude, and that there also exists a vast organization of humanitarian institutions, such as hospitals, asylums, and the much maligned and despised "poorhouses" that every European civilization has to maintain. Many of these institutions are richly endowed by benefactions of forgotten centuries. In Nova Scotia, however, conditions up to the present time have fortunately not necessitated public benefaction or state provision on a large scale, but in the large industrial towns of the Province rural conditions are changing to urban conditions, and the presence of the poor and indigent is being forced on the attention of a population which hitherto has not apprehended the meaning of poverty or the stigma attaching to the "workhouse," the "Bastile," as it is bitterly designated in many parts of England. Yet even in England, the operations of the Compensation Act have demonstrated the inadequacy of the hitherto existing provision against sickness, and the Compensation Act was followed by the National Insurance Act. The miners' relief societies in Great Britain have one by one given up the ghost, have wound up their affairs and made final provision for the dependents on the funds.

In Nova Scotia, the relief societies are the only real provision the miner has against sickness. What few friendly societies exist do not welcome the miner into their ranks, and the insurance companies looks askance at him. Both are mistaken in supposing the miner to be an undesirable risk, but that does not help the miner. The Relief Society affords relief in both sickness and accident, two-thirds of the benefits disbursed being for disability caused by sickness and only one-third for accident. The cost of the present system to the coal companies is greater than the burden they would have to assume under a workmen's compensation act. It must be accepted, from European experience, that the operation of a Compensation Act which places the entire burden on the employer, will also extinguish the relief societies, and will in turn require supplementary legislation to create the provision against sickness, of which the miner will be deprived by the passing of the relief societies now exist, must be prepared to tread a force a compensation act where properly constituted relief societies no wexist, must be prepared to tread a long and devious road leading maybe in a different direction to that imagined.

## MINE RESCUE APPARATUS ON THE "FREE LIST."

The changes in the customs tariff announced by the Minister of Finance include "miners' rescue appliances, designed for emergency use in mines, where artificial breathing is necessary in the presence of poisonous gases, and automatic resuscitation apparatus for artificial breathing, to aid in the saving of human life." These are placed on the free list. For some time past the duty on mine rescue apparatus has been rebated upon application, but it is much more satisfactory to have these appliances placed definitely on the free list, as they are in every other country of importance. The provincial laws of several of the Western Provinces compel the provision of rescue appliances at mines, and it may be asked whether the Federal Government could in any case collect customs duties on articles which are required by law to be provided, when such articles are not manufactured in Canada.

## DOMINION COAL OUTPUTS.

The Glace Bay mines produced 200,000 tons in the first half of May. The output was a little restricted by absenteeism, not unnatural in the first days of springtime. The output for the month should reach 405,000 tons, which will place the production for the five months ending May 30th approximately 170,000 tons in advance of 1912 over the same period. St. Lawrence shipments obtained a good start through the favourable weather of the latter half of April.

The S.S. "Glace Bay" became a total wreck off Mistaken Point, near Trepassey Bay, Newfoundland, on the 2nd May. Very many stout ships have met their end in this inhospitable vicinity. The "Glace Bay" was a new ship, of 10,000 tons cargo capacity, specially constructed for the coal freighting trade, and was on a long-term charter to the Dominion Coal Company. The loss will be to the owners, but the Coal Company will lose the services of a fine vessel during the coming shipping season. It is worth a question whether that portion of the coast immediately westward of Cape Race could not be protected by submarine bells. The "Glace Bay," like a majority of the Dominion Coal Company's fleet, was fitted with a submarine bell equipment. Lighthouses are helpless in a Newfoundland fog, and fog-horns are notoriously misleading at times, in fact, the "Glace Bay" is stated, on newspaper authority, to have been misled by a locomotive whistle. The Canadian Government maintain the Cape Race Light, and the suggestion just made may be worth consideration.

**Sorting High-Grade Ore at Foster-Tough**—(See Opposite Page.)

## INTERCOLONIAL COAL CO., WESTVILLE, N.S.

There has been a troublesome fire in the Drummond Colliery of the Intercolonial Coal Co. for some weeks past, but it is now stated by the management that it will be only a brief period before the fire will be completely under control.

It is also stated that the company contemplate the re-opening of the old Scott pit, and vigorous development of the workings in the bottom coal in the Drummond Colliery. It is hoped to attain a daily output of 2,000 tons from all sources of supply.

As the workings of the Drummond slope and Acadia slopes have both long since passed through the point where it was supposed there existed a displacement in the strata of 2,600 feet, without any disturbance being actually encountered, some interesting speculations become possible on the structure of the Pictou coalfield. If the Geological Survey could delegate a competent paleontologist to make a systematic study of the coal seams in Nova Scotia, and their adjoining strata, some knotty points regarding correlation of seams might be cleared up. Discussions as to the relative identity of seams in Nova Scotia coalfields have been going on for fifty years, and the same uncertainty still exists in many cases.

# ONTARIO

### PORCUPINE, SWASTIKA AND KIRKLAND LAKE.

The fact that one unit of each power plant has been repaired so that it is again running has relieved the situation in the gold camp. After the breakdown of the Sandy Falls plant there was not a kilowatt in camp, and all those without auxiliary steam plants had to shut down. The Hollinger mill was shut down for some time. Now the first unit of the Sandy Falls plant has been repaired, the Hollinger is supplied. The Dome has been running its entire plant with steam, but will benefit by the fact there will now be available 1,500 horse power from Wiawaiten Falls.

At the annual meeting of the Dome Mining Company this month it is anticipated that the announcement will be made that ore reserves warrant the addition of another 60 stamps to the present mill, bringing its daily capacity up to about a thousand tons per day. This will more than double the capacity of the present plant. How this addition will be financed has not yet been made public, but it is probable that it may be undertaken by increasing the capitalization from $3,500,000 to $5,000,000.

The five-stamp mill at the Foster mine at Gull Lake, near Swastika, is now running. The stamps were first dropped on May 12th, and the first run was made on May 14th. On May 15th, the mill commenced to run regularly. The ore is coming from the dump. It is estimated that there are 2,000 tons broken and raised.

The high grade ore will continue to be handpicked and shipped. The little plant will treat 15 tons per day.

**No. 3 Vein Foster-Tough Claim, Kirkland Lake**

The Lucky Cross mill, of Swastika, commenced actual treatment of ore about May 1st, since which time the mill has been in practically continuous operation.

Assays of the head made by the company's assayer for one week ran $25 to the ton but the ore in this instance came from a rich spot on the 200-foot level, and is too high to be representative. The tailings leaving the mill during the same period gave a value of only 31 cents, showing an extraction of better than 98 per cent. About twenty tons are being treated daily, but this will be gradually increased.

It is expected that the additional battery of five stamps will be operated about the middle of June.

The final payment for the control of the City of Cobalt was made on May 16th. Though negotiations have been conducted through the house of Aemelius Jarvis & Son, in Toronto, it is an open secret that they are buyers for interest associated with the Cobalt Townsite. As the issued capital of the City of Cobalt Mining Company is $1,500,000, and the deal was for 80 per cent. of the stock at 55 cents a share, the whole transaction would represent $660,000. One hundred thousand dollars was paid.

## COBALT, SOUTH LORRAIN, GOW GANDA, AND ELK LAKE.

The production of the McKinley-Darragh-Savage mines for the month of April was 171,028 ounces. The mill treated 4,600 tons. While this production is considerably larger than that for the previous month, it is less than the general average for last year. This is explained by the fact that no high grade has been mined for the past two or three months to sweeten the usual milling ore and also that there has been no attempt to keep up the usual amount of silver ore from the Savage. A little more high grade has just been encountered on a stope on the No. 1 Swamp vein. At the 160-foot level it is now showing four or five inches of high grade.

The addition to the McKinley-Darragh mill is running and 75 tons per day is being brought over the aerial tramway from the Savage to the mill. In a few days when a new tube mill is working a further 35 tons of ore will be treated from the McKinley itself, making the daily record of the mill 275 tons. Each bucket on the aerial tramway from the Savage to the McKinley mill has a capacity of 700 pounds, and thus can be transported ten tons an hour. Previously for several years the Savage ore has been jigged in the rock house at the mine, the fines going to the dump. It is estimated that they will run from twenty to fifteen ounces to the ton. There are sixty thousand tons assembled on the dump, and, with the stamps available for the Savage, it will take three years to run the dump alone. The addition to the McKinley mill makes it the second largest in camp.

The Temiskaming and Hudson's Bay Mining Company has just declared another 300 per cent. dividend, payable May 21st. This makes their third disbursement this year. Already this year the company has paid or will have paid on May 21, 900 per cent. on the issued capital of the company, or $69,989.

The only point from which ore was shipped on the T. & N. O. Railway, exclusive of Cobalt, last month, was from Gow Ganda. Both the Mann mine and the Miller Lake-O'Brien shipped high grade to the Deloro Mining & Reduction Company at Marmora. The shipments were as follows:

| | |
|---|---|
| April 3—Mann .................... | 40,000 |
| April 8—Miller Lake-O'Brien....... | 50,380 |

All this ore was teamed from Gow Ganda to Elk Lake and there put on the cars instead of being teamed to Charlton. But since the Gow Ganda-Elk Lake road is still in wretched condition, it is costing $30 a ton to bring out to the steel.

It is understood that there is a deal on for the sale of the Miller Lake-O'Brien, and the Millerett for a large sum of money. An English company is negotiating for the property.

The hydraulicking plant on Nipissing Hill sluicing off the overburden for prospecting will this year be worked night and day, not merely one shift as last year. The ground to be cleared is all first-class prospecting territory. Last year some of the best prospective ground was left in order to fully strip the ground, to be later occupied by the tailings from the low grade mill, and the work has been taken up from this point. The overburden will be removed from a point below the low grade mill to the Chambers-Ferland line, and also between the low grade and the high grade plants. This is 75 per cent. of conglomerate and should yield good results. It has been trenched previously.

During the season 1912, 33.2 acres of ground were cleared, the average depth of the soil was 4.75 feet. In the vicinity of vein 92 one of the discoveries made produced 27,000 ounces by open cutting. The other veins found will be opened up later.

The production from the Casey-Cobalt mine for the week ending May 3rd, was 20,160 ounces. For the week ending May 10, it was 20,300 ounces. This is considerably higher than any of the April weekly records, which ran about 16,000 ounces. The agreement with the Northern Canada Power Company to build a line out to the mine will enable the company to materially reduce their costs. They are at the present time burning wood as the price for hauling coal from New Liskeard is prohibitive. The thousands of cords of wood stored in the yard at the Casey-Cobalt will easily carry the company over this year, and they will thereafter be able to run with electricity.

# BRITISH COLUMBIA

Revised statistics of mineral production in British Columbia in 1912 will, when published, show that the preliminary estimate of the Provincial Mineralogist, given out about the middle of January, was within $200,000 or $300,000 of the actual recorded value of the production. Exact figures are not yet available for publication, but it is known that the total is in excess of $32,000,000. The approximate proportions are:—Metalliferous minerals, $18,000,000; non-metalliferous minerals, $14,000,000. In round figures the value of the respective minerals included may be stated as about as follows: Gold (placer and lode), $5,800,000; silver, $1,800,000; lead, $1,800,000; copper, $8,300,000; zinc, $300,000; coal and coke, $10,500,000; building materials, etc., $3,500,000. As already stated, these are not exact, but they are near enough to be accepted as indicating about what the official records may be expected to show when they shall be available for reference.

Placer gold reached the highest total in the four years since 1908. Lode gold was within $11,000 of the highest total on record in the province, namely, that for 1910. Not so favourable is the comparison of total gold—placer and lode together—for in four previous years was the total of 1912 exceeded, as follows: As against a total of less than $5,900,000 in 1912, totals of higher years were—1910, $6,073,380; 1908, $5,929,880; 1905, $5,902,402; and 1902, $6,061,409. Silver is higher in value than for any other year since 1906, and in quantity since 1905. Lead has the highest figures, both quantity and value, in five years, 1908-1912. Copper figures are the highest on record in all years, as to both quantity and value. In zinc, the comparison is not favourable to last year. Coal shows a value of nearly $600,000 less than in 1910, but it is $1,500,000 higher than the 1911 total, and more than $2,000,000 higher than that of 1909, with earlier years showing a still greater disproportion. The coke total is the highest on record as to value, but not as to quantity, for in 1905 the production was 7,450 tons greater. Taking coal and coke together, there was only one year—1910—when a higher total value was reached, that year having been credited with $321,500 more than was 1912. A considerable reduction was made in the value placed on miscellaneous products, as compared with that shown in the preliminary estimate, thus bringing the total for these below that recorded for 1911. There is much difficulty in arriving at the value of these products, for comparatively few of those directly engaged in their production will make returns. Yet it is believed the value given by the Provincial Mineralogist each year is as near as can be arrived at under the conditions.

Looking at the production returns as a whole, there is certainly good reason for satisfaction with the generally good results achieved in 1912. Lower average prices may affect the 1913 total value to an extent that will result unfavourably in making a comparison between the current year and 1912, when the time shall come for this to be done; again, there will be the effect of fresh labour difficulties on Vancouver Island to adversely affect the result of the 1913 operations, but since the year is still comparatively young, the possible troubles of the future may well be left to take care of themselves when the necessity shall arise for their doing so. Meanwhile, the fact may reasonably be made the most of that the mineral production of British Columbia in 1912 reached a total value in excess of $6,000,000 higher than any other year in the history of mining in the province, with the mining industry continuing to make good progress.

## SIMILKAMEEN.

While occasional brief news items that are given publicity tend to show that the usual good progress is being made at the Hedley Gold Mining Co.'s mine and stamp mill ,little detailed information has been received of late. However, it is expected that it will be practicable to shortly ascertain what is being done in connection with that flourishing gold-mining enterprise, and to thereafter have for publication interesting details of operations.

The position is similar in regard to the development work the British Columbia Copper Co. has latterly been doing on Copper mountain and in its vicinity, but here again the expectation is that reliable news will be obtained soon, in which case it is thought best to defer further reference to this subject, especially as various newspapers have printed items that are not similar in their statements of the position in regard to the Voigt group and other groups of claims that have been receiving the attention of the company's development parties.

It has been announced that the British Columbia Cement Co.'s works near Princeton are nearly completed; in fact it has been stated in print that the manufacture of Portland cement would be commenced there early in May. Those chiefly interested in this enterprise are sanguine as to its success, and they expect to show that their confidence is well grounded.

There is little that is new to chronicle concerning coal mining in the Similkameen district. At Princeton the Princeton Coal and Land Co. is continuing its efforts to enlarge the market for its coal and is making the product of its mine as good a fuel as modern screen and other coal-cleaning appliances admit of its doing. Little is heard now-a-days of the operations of the Columbia Coal and Coke Co., but it is known that, with fewer men in its employ than when the long cross-cut tunnel was being driven from the Tulameen river slope of the mountain, development is in progress from the direction of Collins gulch. Although the results from the larger work done in 1911 and the early part of 1912 were disappointing, it is believed the company has some good coal, and it is stated that it is now going the right way about its development. When more coal shall have been made accessible for mining the problem of the best means of getting it down to the V. V. and E. Railway, already constructed in the Tulameen valley below, will be dealt with, and preparations be made for shipping the coal.

### Coast District.

The labour troubles, concerning which information was supplied for the last number of the Journal, have become much more serious than was at first thought they would do. The mines of the Western Fuel Co., Pacific Coast Coal Mines, Ltd., and Vancouver-Nanaimo Coal Co. have all been closed. The published statements of prominent U. M. W. of A. men that all the mines on Vancouver Island are closed are untrue, for the Canadian Collieries (Dunsmuir), Limited, cantinues to add to the number of miners it has at work and to increase the output of its mines. The following monthly totals of coal produced tell their own tale: In January, 29,541 long tons; February, 30,036 tons; March, 37,241 tons; April, 39,061 tons. April production gave a daily average of 1,502 tons for the 26 working days of that month. In one week in April three steamers together took from the company's shipping bunkers at Union Bay, Vancouver Island, 10,427 tons, in the following quantities: one took 6,796 tons, another 2,279 tons, and the third 1,352 tons. The largest single day's output was 1,763 tons, on April 30. On May 3 the Fernie "District Ledger," which is the official organ of District 18, United Mine Workers of America, published this misstatement, which was printed right across the page in large black letters: "All Vancouver Island Miners now out on Strike." On May 9 it was ascertained from the company's head office that there had not been any change at the Cumberland mines of the Canadian Collieries (Dunsmuir) Limited, during the expired portion of May, except that the average daily output of coal had been increased to nearly 1,600 tons. It may be stated that in addition to making the above-mentioned production of coal the company has been doing much development work at its Bevan and No. 8 mines, the latter being a new mine now being opened. Further, that the work on the hydro-electric power system is nearing completion, so that it is expected this new system will be in operation before the end of June. The total outlay on plant equipment, railways, and other improvements, provided for in appropriations authorized by the directors, is more than $3,000,000, and of this sum nearly $2,250,000 has already been expended by the company since it acquired the Dunsmuir interests.

# STATISTICS AND RETURNS

## DOMINION STEEL OUTPUT.

The April output at the several departments of the Dominion Iron and Steel Company shows up very satisfactorily.

Records were made in the pig iron steel ingots and all wire departments, including the wire drawing, wire and galvanized nails, wire mills, all of which showed records.

The total shipments were also very large for the month, being only a shade below the highest record in steel shipments.

The following are the figures in tons of the output in the various departments of the steel plant for April:

| | |
|---|---|
| Coke | 54,010 |
| Pig Iron | 32,680 |
| Steel ingots | 31,400 |
| Steel blooms | 26,550 |
| Steel rails | 12,770 |
| Steel billets | 7,765 |
| Rods | 3,550 |
| Total shipments | 32,330 |

## B. C. ORE SHIPMENTS.

Ore production in the Kootenay and Boundary districts last week totalled 53.462 tons, surpassing the high figure of two weeks ago. For the year to date the total is 933.231 tons. Smelter receipts for the week ending May 10. 1913, were 47,393 tons and for the year to date 822.727 tons. Ore production in detail:

**Nelson.**

| | Week. | Year. |
|---|---|---|
| Yankee Girl | 38 | 1.558 |

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assaye Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

# BUYERS AND SELLERS OF METALS

# PROVINCE OF QUEBEC

**Department of Colonization, Mines, and Fisheries**

*The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, Etc.*

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

**MINERS' CERTIFICATES.** First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is $10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

**WORKING CONDITIONS.** During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

**SIX MONTHS AFTER STAKING.** At the expiration of six months from the date of the staking, the prospector, to retain his rights, must take out a mining license.

**MINING LICENSE.** The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of $10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

**MINING CONCESSION.** Notwithstanding the above, a mining concession may be acquired at any time at the rate of $10 an acre for SUPERIOR METALS when more than 20 miles distant from a railway and $20 an acre when less than 20 miles.

For INFERIOR METALS the prices are $2.00 and $4.00 an acre respectively.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

**PROVINCIAL LABORATORY.** Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

**THE HONORABLE THE MINISTER OF COLONIZATION, MINES, AND FISHERIES, QUEBEC.**

# The Minerals of Nova Scotia

The extensive area of mineral lands in Nova Scotia offers strong inducement for investment.

The principal minerals are:—Coal, iron, copper, gold, lead, silver, manganese, gypsum, barytes, tungsten, antimony, graphite, arsenic, mineral pigments, diatomaceous earth.

Enormous beds of gypsum of a very pure quality and frequently 100 feet in thickness are situated at the water's edge.

The Province contains numerous districts in which occur various varieties of iron ore practically at tide water and in touch with vast bodies of fluxes.

The Gold Fields of the Province cover an area of approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Deposits of particularly high grade manganese ore occur at a number of different localities.

Tungsten-bearing ores of good quality have lately been discovered at several places and one mine has recently been opened up.

High-grade cement-making materials have been discovered in favorable situations for shipping.

Fuel is abundant, owing to the presence of 960 square miles of bituminous coal and 7,000,000 acres of woodland.

The available streams of Nova Scotia can supply at least 500,000 H. P., for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

**Copies of the Mining Law, Mines Reports, Maps and Other Literature may be had free upon application to**

**HON. E. H. ARMSTRONG,**
**Commissioner of Public Works and Mines,**
**HALIFAX, N. S.**

## FOR SALE

# Second Hand Machinery

We have recently changed over from Steam to Electric Drive and offer the following:

One Cross Compound Corliss Steam Driven, Corliss Inlet, two stage BB3 Canadian Rand Co. Air Compressor. Capacity at 95 R. P. M. is 1941 cu. ft. free air per minute.

One 10 x 10 in. Robb-Armstrong Horizontal Side Crank Engine Automatic.

One 11 x 14 centre crank Throttling Engine of the Frost Mfg. Co. make, Galesburg, Ill., with two pulleys.

Two Horizontal Tubular Boilers, Jencks Machine Co., each 72 in. x 18 ft. for working pressure of 125 lbs. per sq. in., complete with regular catalogue fittings, fixtures and smoke stacks.

One Header for boilers made up of pipes and valves.

One Austin Vertical Steam Separator.

One 16 x 42 right hand Corliss Heavy Duty Engine. Jenckes Machine Co., Wheel 12 ft. x 24 in. face.

Three No. 2 McCully Gyratory Crushers, manufactured by Power Mining & Machinery Co. One No. 3 Gates Gyratory Crusher.

Two General Electric Magnetic Belt Separators.

One No. 7 Cameron Vertical Plunger Sinking Pump.

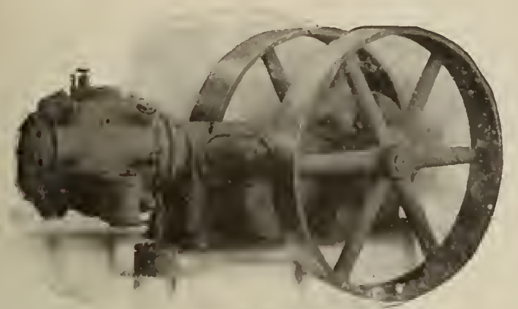
# YOUR COMPRESSED AIR SUPPLY—

*is just as important from every standpoint as your power supply.*

*Efficient application of compressed air is only procured through the use of efficient means of compression—a high grade compressor.*

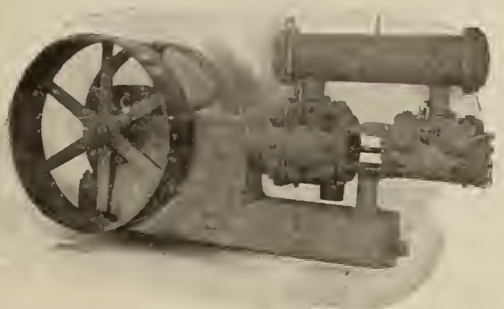


Class "NE-1" Single Stage, Belt Driven Compressor described in Catalogue K-92.

*The machines illustrated on this page are types of our Class "N" compressors.*

*While these compressors are compact in their construction they have a greater capacity per foot of floor space than any corresponding type on the market.*

*Every detail about these machines is the result of a predetermined standard of quality—that is, high capacity in a restricted space.*



Class "NE-2" Two Stage, Belt Driven Compressor. Details in Catalogue K-99.

*The sub-base extending under the entire machine, is well ribbed, and has flanges with wide bearings on the foundation.*

*The frame is strongly and adequately reinforced.*

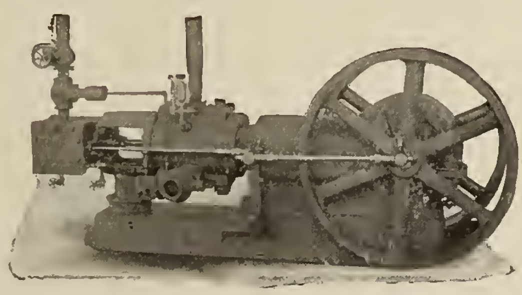
*Bearings are extremely well proportioned consistent with the speed accorded these machines.*

*Valve ports and passages are designed to convey the full rated capacity without undue rise in temperature.*

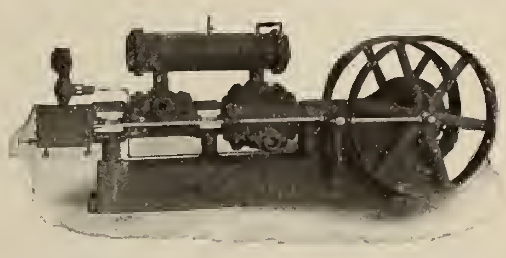
*The cooling surfaces are large and air cylinders are completely water-jacketed.*

*The automatic flood lubrication is a distinct feature of these compressors, keeping all bearings and wearing surfaces constantly bathed in oil.*

*Both single and two stage machines, for either steam or belt drive, with capacities ranging from 57 to 426 cubic feet of free air per minute at pressures from 15 to 100 pounds are included in this class.*



Class "NF-1" Single Stage, Steam Driven Compressor. For Description see Catalogue K-96.



Class "NF-2" Two Stage, Steam Driven Compressor. Covered by Catalogue K-98.

## BOILERKRAFT

ONLY the highest limits, not the lowest which may satisfy the inspector set the standard for construction in the boiler shops of the International Engineering Works, Ltd.

The material must be as good as, or better than the rules call for, even if it costs considerably more.

The shop processes, punching, reaming, rolling, riveting, will produce the safest, the most durable boiler only when executed with care and skill; and this is insisted upon even if more time is required.

These boilers represent the highest grade of workmanship known to the boilermakers' art.

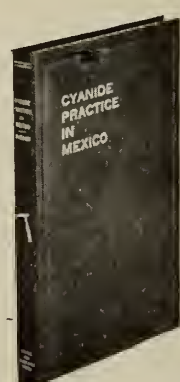
# CYANIDE PRACTICE IN MEXICO



BY

**Ferdinand McCann**

Author of 'Beneficio de Metales de Plata y Oro por Cianuracion' and 'Guia Minera.'

*199 Pages. 39 Illustrations.*
*2 Folding Plates. Cloth, 6x9 in.*

**$2.00**

An accurate detailed description of the equipment and practice at all of the important cyanide plants in the Republic of Mexico is given in this book. It is in part a translation of the author's book in Spanish—'Beneficio de Metales de Plata y Oro por Cianuracion.' There has been a revision as well as a translation of the material appearing in that book, so that the practice described is the latest. It contains more information on the cyanidation of silver ores than any other book. The illustrations have been carefully selected and include the flow sheets of many representative mills.

## PRESENT CONDITION OF COBALT MINES

Cobalt has made a remarkable record since its discovery, and promises to be an important producer of silver for many years to come. In the years 1904 to 1912, inclusive, the district produced 155,832,615, ounces of silver valued at over $80,000,000, and made a profit to the mine owners of over one-half of the value of the silver. The output is not only large, but the cost per ounce has been remarkably low, and the industry consequently an unusually profitable one.

The great profit has been made possible by the richness of the ore. To treat low grade ore several mills were built and are proving of great value. The profit being made is still largely from high grade ore; but the concentrators have each year contributed a larger percentage of the output. During the last two years a further advance has been made in treating the high grade ore at Cobalt, instead of shipping it to smelters. This process, worked out and now in operation at the Nipissing mine, gives a high recovery and yields a product of refined silver ready for the mint. A similar process is now in use at the Buffalo mine.

In mining the low grade ore to supply the mills it has been found that the number of high grade veins is more numerous than was expected. It is a common occurrence to break into narrow veins of rich ore a few feet from the openings which were made in following another vein. It has been found that in places where the high grade veins split up into stringers or apparently pinched out, the silver is distributed over a much greater width. Usually a large tonnage of milling ore occurs in such places.

The present condition of the mines indicates clearly that there is still a large quantity of high grade ore to be mined from veins already opened up, and that the mining of low grade ore must be expected to uncover many more small but rich veins. There is, as yet, no satisfactory evidence that the mines will prove profitable at great depth; but there is no doubt whatever that the tonnage of low grade ore to be mined within a few hundred feet of the surface is enormously large. As high grade ore fails, the profits will necessarily fall off. A comparatively small, but still handsome profit per ounce, will be made from the much larger tonnage of low grade ore, if the cost per ton can be kept at a reasonable figure. At present, owing to the nature, of the deposits, the costs are high and there is some ground to fear that the cost next year will be higher instead of lower.

Nearly all the mines which have ever been worked profitably are still making money, and there are a few which have only just this last year begun to earn dividends. Some of the mines have doubtless seen their best days, for the bonanza veins have been pretty well worked out; but even these will be important producers and have unexplored territory in which there is a reasonable chance that more ore will be found. In the mines which still have considerable quantities of high grade ore in sight, a large percentage of the definitely known ore has been taken out, and it is not likely that an equal quantity of such bonanza ore will be found. Some ore of equal richness and a large quantity of lower grade ore is, however, almost certain to be discovered as development proceeds.

Among mines which are certain to produce a large tonnage of high grade ore, Nipissing, Coniagas, and Crown Reserve are in remarkably good condition. Three mines, Townsite, Cobalt Lake and Casey Cobalt have only recently become important producers, and may be expected to figure more largely in future shipments. The Drummond mine has been re-opened with satisfactory results, and the Seneca-Superior has made several shipments of rich ore from a vein discovered only last summer.

With improved methods of mining, careful sorting and jigging of the ore as it is brought from the mine, treatment of high grade ore by the amalgamation-cyanide process, and of low grade ore by straight concentration and of slime tails by cyanidation, a very satisfactory recovery of silver is made at a low cost. Without allowing for further improvements made as experience is gained, it is evident that 12-ounce ore, enclosing occasional small veins of high grade ore, can be profitably mined. With this assurance and a knowledge of present conditions, one may well hesitate to predict the life of Cobalt as a silver producer. In any case, a large production for several years is assured. The profit that will be made during this period will depend largely on the amount of high grade ore that is discovered during development. How long the process of exhaustion will take is beyond human ken. But, considering the past production and the present conditions, it is safe to assume that Cobalt will be producing silver for many years to come.

## SUDBURY, COBALT AND PORCUPINE GEOLOGY

In the June 7 issue of the Engineering and Mining Journal, New York, Dr. W. G. Miller and C. W. Knight discuss the geology of Ontario's three most important mining districts. As the authors state in their opening paragraphs, the pre-Cambrian areas south of Lake Superior have for several years been closely studied by a large number of geologists and engineers on account of their great deposits of iron and copper. Similar formations in Ontario are much less well known; but the discovery of nickel, silver and gold ores and the large production that has resulted from the development of such deposits, has shown the desirability of much closer study of the geology of Northern Ontario. At Sudbury, Cobalt, and Porcupine, much has been learned in the past few years. Some relationships between these districts are brought out by the authors.

Sudbury is the oldest and most important district, having produced about 167,000 tons of nickel and 107,000 tons of copper. Cobalt, though much younger than Sudbury, is, perhaps, more widely known. Since the first discovery, in 1903, the district has produced about 170,000,000 ounces silver, valued at about $90,000,000, and netting the mine owners about $50,000,000. During the past year, Cobalt produced about one-eighth the total yield of the world, making Canada as a source of silver second only to Mexico and United States. Porcupine is still younger, gold having been first found in important quantity there in 1909. Already, in spite of many serious handicaps, this district has assumed considerable importance, two large deposits and a few smaller ones having been developed to such an extent that a production of several million dollars is assured.

The nickel, silver and gold deposits of these three districts are very dissimilar. They belong to three distinct types. There are, however, some features in common and it is these features which the authors deal with.

"The ore deposits of all three of these areas are in rocks that are classified as of pre-Cambrian age. While the deposits differ greatly, both as regards form and mineral content, it is believed that all of them owe their origin to igneous intrusions. At Sudbury, the intrusive rock is quartz-norite, at Cobalt quartz-diabase, and at Porcupine, granite."

As the paper is a short one, the authors do not elaborate arguments to account for their belief as to the origin of the ores, but state briefly that:

"In the opinion of most observers who have studied them, the Sudbury ores, essentially a mixture of pyrrhotite and copper pyrites, are direct segregation deposits from the norite magma, but there may also have been some later deposition of ore minerals.

"The Cobalt ores, essentially arsenides of cobalt and nickel with native silver, are, like those of Sudbury, believed to be directly connected with intrusions of igneous rocks. Not only at Cobalt, but in the surrounding region, about 5,000 square miles in extent, the ores are associated with quartz-diabase in such a way as to lead to the belief that they were deposited from heated, impure waters that followed the diabase intrusion. Thus both the Sudbury and Cobalt ores may be considered as coming from molten magmas, the former by direct segregation with the intervention of little water, while those of Cobalt may be looked on as the end product of the diabase intrusion, deposition taking place from aqueous solution.

"While granite is not exposed at most of the Porcupine mines, it surrounds the gold area. The rocks in which the veins occur form what may be called a large island-like area upon the granite, which probably underlies most of the area. The presence of feldspar, tourmaline and scheelite in the quartz of the gold veins suggests a close connection between the veins and the granite intrusions.

"It is of interest to note that, at least, most of the silver at Cobalt and most of the gold at Porcupine was deposited in the veins after the latter had been fractured and disturbed. At Cobalt, the vein filling before the disturbance took place, consisted essentially of cobalt-nickel minerals and dolomite, and at Porcupine of quartz."

The greater part of the paper is devoted to a discussion of the several series of rocks occurring in the three districts. The Sudbury norite and the Cobalt diabase masses are compared, and age relationships of the several rock groups are stated.

"Although the triangle-shaped region that includes the three areas is 8,000 square miles in extent, there is a close resemblance of the rocks of one area to those of the others. Broadly speaking, there are five or six great groups of pre-Cambrian rocks in the region. Insofar as it is possible to correlate them, each of these groups, with the possible exception of the Animikie, of Sudbury, is present in each of the mining areas, although some are more prominent in one area than in the others, and vice versa."

In order of age the groups referred to are Keewatin, Laurentian granite and gneiss, Timiskaming series, Lorrain granite, Cobalt series, Nipissing diabase, dikes of aplite, diabase, etc. It is suggested by the authors that part of the rocks classed as Keewatin may be of the same age as the Grenville series of Eastern Ontario.

The authors suggest that the dual system of classification of the pre-Cambrian be discarded, because of the thickness of the Grenville series in Eastern Ontario.

The classification of the pre-Cambrian rocks of the Lake Superior states into Huronian and Archean was at one time understood to imply for each district a separation of sedimentary from igneous formations. By several members of the United States Geological Survey it was thought that this was the case; but it has now long been known by these same men that this view was erroneous. The Huronian in some of the iron mining districts is largely sedimentary; but in others it is largely igneous. It is none the less true, however, that there is a remarkable difference between the older or Archean group, including Keewatin and Laurentian, and the younger group known as the Huronian. The Huronian group has suffered much less deformation than the Archean. The Lake Superior geologists have not discarded the classification of the pre-Cambrian which has been long in use; but they no longer consider that the Archean is wholly igneous or the Huronian sedimentary. In some districts the Keewatin is largely sedimentary and in a few the Huronian is largely igneous. The three Ontario districts discussed by Dr. Miller and Mr. Knight are not unlike some in Michigan.

## ROYAL ONTARIO MUSEUM OF MINERALOGY

The Province of Ontario and the University of Toronto have had until recently no adequate quarters for the display of minerals. A splendid new building has been constructed and the collections are now being arranged. The systematic collection of minerals is one of the most complete, so far as the number of species is concerned, on the continent. The Director of the Museum, Dr. T. L. Walker, is endeavouring to make the collection of Ontario minerals a very extensive one. Circulars have been sent out announcing the occupancy of new quarters and asking for donations of specimens. Large pieces of ore can be used to advantage. The specimens when exhibited will in all instances be credited to the donor. The fact that the Geological Congress meets in Toronto this summer makes it specially desirable that the material be received at an early date.

It is to be hoped that the request will meet with a liberal response so that it will be possible to make a display that will be a credit to the Province.

---

## VALUATION OF IRON MINES

The paper by Mr. J. R. Finlay on this subject presented at the New York meeting, February, 1912, of the A.I.M.E. has provoked considerable discussion and brought out interesting statements from some of the members of the Institute. Mr. Finlay's method is to determine mine valuation upon an apparent profit per ton based upon the difference between the selling price of ore and the expense of mining and marketing it for a term of years or for the expected life of the mine. Mr. E. E. White, however, considers that the factors assumed in applying this method are not justified. Of the five factors necessary to apply the method to any mine (1) the average cost per ton, (2) the ore reserves, (3) the production per year, (4) the average selling price, (5) the present value of a $1 per year dividend, Mr. White considers that (1) and (2) may be determined with fair accuracy, although in many cases the ore reserves are only estimates based on drilling, and although the average cost may only be determined by past experience, and may be different in the future, due to varying costs of labour, increasing cost and poorer quality of timber, and the possibility of even greater taxation. The production per year is a known factor. The last two factors Mr. White considers to be purely matters of personal opinion. He believes Mr. Finlay's method may be successfully used, but that the five factors for operating iron mines in Michigan should be determined as follows: (1) The average cost of production at lower lake ports for five years, plus or minus the difference in cost per ton of taxes due to such revaluation; (2) the estimated ore reserves: ore based on diamond drilling to be estimated very conservatively; (3) the average production per year for the last five years, if the mine has been equipped to produce actively for that length of time, otherwise for the number of years during which it has been so equipped; (4) the average selling price at lower lake ports for 18 years; (5) the present value of a $1 per year dividend based upon a 10 per cent. return on the investment, and capital returned in ten years of operation by investment of an annual sum at 3 per cent.

Mr. Finlay, in reply, states that Mr. White's method gives a valuation for the Michigan mines, on an 18-year life, of $42,000,000, and states that in his opinion the properties cannot be bought for three times this valuation.

It is not likely that the mine owners and the State will ever agree entirely on the question; but open discussion will lead to a fuller knowledge of the facts. It is to be expected that Mr. Finlay will endeavour to make it clear that his method is correct, and it is also to be expected that those interested in the mines taxed on his valuation will endeavour to show that his figures are too high. From the discussion we may learn how to put a fair price on a Lake Superior iron mine. In a recent judicial decision Mr. Finlay's method has been upheld by the courts.

## SECONDARY ENRICHMENT OF SULPHIDES

Those engineers and geologists who for economic or purely scientific purposes had occasion to study carefully the sulphide deposits of many of the Western and Southern mining districts of North America, found that the deposits showed three more or less well defined zones. A shallow zone of lean or barren vein material, an intermediate zone of rich ore and a deeper zone of leaner ore. Often the intermediate zone proved to be the only portion which could be profitably mined, and its relation to the others became a question of first importance. Independently three geologists, from the facts observed by many men who were familiar with the deposits, and from their own observations, formulated the theory of secondary enrichment. This satisfactorily explained the phenomena and assisted materially in obtaining an intelligent idea of the character of many orebodies.

The deep ore is considered as primary, having been but little altered since the deposit was first formed. The shallow zone is supposed to have lost considerable of its metallic content by solution and downward migration of metallic sulphides. The intermediate rich zone has supposedly been formed by the redeposition of sulphides from the downward migrating solutions.

Like most theories, this one of secondary enrichment seems to fail in many cases to explain the facts. It has so often been demonstrated as the true explanation, however, that it has proven a very useful guide in the valuing and developing of many deposits.

Unfortunately, it is frequently applied to deposits which differ fundamentally from those in which were observed the phenomena which led to the formulation of the theory. In such districts as Northern Ontario, where glaciation has removed the weathered zone, the theory without modification has no legitimate application. There the present surface must be regarded in most cases as having no necessarily close relation to the richest portion of an orebody. It is rather a chance surface due to the varying degrees of erosion after the deposits had reached practically their present condition.

It is, therefore, of interest to read in Mr. W. H. Emmons' recently published U. S. G. S. bulletin on the Enrichment of Sulphide Ores, that he does not consider many of the ore deposits of Canada to be correctly referred to as examples of secondary enrichment. Some paragraphs from his discussion on glaciated deposits will be found elsewhere in this issue.

## SEE THE MINES OF CANADA

The excursions to be held in connection with the International Geological Congress this summer will include trips to nearly all of the leading mining districts of Canada. Those who join the Congress will have unusual opportunity of visiting the producing mines. Coal, asbestos, silver, copper, nickel, lead, gold, and natural oil and gas properties will be inspected. Complete guide books and maps will be available. There will be special private trains, and the railroads have made remarkable reductions in rates for the period, June 15 to October 31.

## CORRESPONDENCE

### THAT "SUGGESTION FROM THE WEST"

Editor Canadian Mining Journal:

Sir,—May I add to the later part of your editorial comment of June 1, on the suggestion of the British Columbia Mining Association, that Mr. R. F. Green, M.P. for Kootenay, British Columbia, be appointed Minister of Mines for Canada, that the report of the meeting of the Association published in the Daily News, of Nelson, B.C., includes a misstatement, which is contained in the following excerpt from that report: "Mr. Retallack moved the resolution, urging the Government to create a separate portfolio of Minister of Mines, and to appoint the member for Kootenay, and quoted a resolution passed by the Canadian Mining Institute which suggested Mr. Green for the position." The point I wish to make quite clear is that at no time has the Canadian Mining Institute even considered a resolution suggesting Mr. Green for the position of Minister of Mines, not to say passed one. I may add that the seconder of the resolution moved by Mr. Retallack at the meeting of the Association above referred to has informed me that Mr. Retallack did not make the quotation as stated.

E. JACOBS.

Victoria, B.C., June 7, 1913.

# SURFACE PROSPECTING AT COBALT

The first discoveries at Cobalt were made by examining the rock outcrops. The ore, disintegrated for a few feet by weathering, was usually partly decomposed, the silver being tarnished and the arsenides oxidized. The oxidation of the cobalt minerals to pink erythrite, or cobalt bloom, furnished a remarkably good indicator. Thin films of bloom were commonly found when the rock near a vein was broken. The erythrite, however, does not retain its colour long when directly exposed to the weather, and is, therefore, of comparatively little value as an indicator until the rock is broken.

**Cleaning Rock Surface, Nipissing Mine**

The early prospecting consisted of examining all small crevices in the exposed rocks. The presence of ore was usually detected by the crevice yielding a soft black mud—cobalt oxide—containing nuggets of native silver, or by the brightly coloured arsenates of cobalt and nickel found a few inches below the surface.

After the well-exposed rocks had been closely examined, the practice of digging trenches to bed rock was begun. Where not actually exposed, the rock is usually covered with only a few feet of glacial debris—sand, gravel and boulders. This practice proved successful and many veins were thus discovered. The first trenches were run irregularly and in the most easily prospected places. Later, in areas which proved productive, trenches and cross-trenches were run at short intervals—50 to 100 feet. The digging of the trench is followed by thorough cleaning of the bed rock. This is then carefully examined. Any crevices found are stripped for some distance and the rock is broken frequently along them. It is a common occurrence for such diligent following up of mere cracks to be rewarded by the discovery of narrow veins of rich ore.

Recognizing the advantage of having the overburden removed, the Nipissing Mining Company in 1906 pumped up water and washed the soil completely from a small area of the property near the shore of Peterson Lake. Later a pump of much larger capacity was installed, and in 1912 hydraulic prospecting began in earnest at the Nipissing.

At the shore of Cobalt Lake an electric-driven turbine is pumping water up Nipissing Hill to clean the rock surface. From the $3\frac{1}{2}$-inch nozzle, 4,800 gallons of water per minute is directed against the glacial deb-

**Giant Nozzle, Nipissing Mine**

**Pumping Plant and Pipe Line**

ris. The sand and gravel are quickly washed away. To break rock and scatter beds of heavy boulders dynamite is used. The practice is not to wash the soil down into the lake, and very little finds its way thither. After an area has been thoroughly cleaned of debris it is carefully examined and surveyed. Subsequently in clearing an adjoining area the first is allowed to become covered again.

Already the work done at the Nipissing has been rewarded by the uncovering of several narrow veins of good ore, and it seems likely that this unusual method of surface prospecting will prove very profitable. Cheap power is available at Cobalt, and the cost of hydraulic prospecting is consequently much lower than in localities where steam-developed power is used.

The accompanying photos show the pump house, pipe line, and nozzle. A pressure gauge at the nozzle registers, under present working conditions, about 130 pounds.

**Stream Washing Sand and Gravel from Rock Surface**

# MINING AND THE CANADIAN NORTHERN RAILWAY

(Continued from June 1st Issue).

"The St. Lawrence lowlands, floored with nearly horizontal Palaeozoic strata, and bounded on the north by the southern edge of the Laurentian plateau, represent in Canada the north-eastern extension of the great plain-like area of the interior of the continent. Commencing near the city of Quebec, the lowlands stretch southwesterly on both sides of the St. Lawrence with slightly diverging boundaries, until, at Montreal, the level country is approximately 120 miles wide. Beyond Montreal, the northern boundary pursues a westerly course up the Ottawa valley to a point about fifty miles beyond Ottawa city, where a ridge of broken country—a low spur of the Laurentian highlands—projects southerly, crossing the St. Lawrence between Brockville and Kingston to join the elevated Adirondack region of northern New York. Near Kingston, at the foot of Lake Ontario, the lowlands again commence and occupy the portion of the Ontario peninsula lying between Lakes Huron, Erie and Ontario, and bounded on the north by a nearly straight east and west line from Kingston to the foot of Georgian Bay, Lake Huron.

"The widespread clays of glacial and post-glacial age that often completely hide the underlying rocks over considerable areas of the St. Lawrence lowlands have furnished the material for numerous brick and tile industries both in Ontario and Quebec. Advantage has also been taken, for the same purpose, of the shales in various of the lower Palaeozoic formations. The raw materials for the manufacture of Portland cement are abundantly displayed in the region, and support a number of large industries. Some of these utilize marls—deposits of calcium carbonate in lakes scattered over the uneven surface of the post-glacial deposits, and the clay beds of these deposits, while others use Palaeozoic limestone. These limestones of several of the formations, and more especially of the Trenton group, are also extensively quarried both for building stones and for the production of lime. At several points the limestones are also used in the making of calcium carbide, while the dolomites are used in the manufacture of pulp.

"The Laurentian Plateau region, surrounding Hudson Bay with a U-shaped form, has an area of over 2,000,000 square miles. Limited in the east by the North Atlantic and by the gulf and estuary of the St. Lawrence as far as the City of Quebec, its southern boundary there passes inland and up the Ottawa river to beyond the City of Ottawa, then turns abruptly to the south and crosses the International boundary at Brockville. Farther west, at the foot of Lake Ontario, it crosses back into Canada and follows a nearly due east and west line to the foot of Georgian Bay, from which point the two upper Great Lakes form the bounding line. West of Lake Superior the Laurentian plateau region extends south into the United States. In southeastern Manitoba the boundary again enters Canada, and from there passes along a general northwesterly course through Lake Winnipeg, Great Slave Lake, and Great Bear Lake, to the shores of the Arctic Ocean.

"Noted for its timber resources, the Laurentian plateau, where best known, is no less important from the standpoint of mineral wealth. Along the southern margin occur the noted copper and nickel ores of Sudbury, and to the north of these lie the Cobalt silver deposits. In eastern Ontario, and the adjoining portion of Quebec, are numerous and important deposits of graphite and mica. All through the region occur iron deposits, some now being mined, and many in the near future destined to become commercially important. Besides these, many other ores, both metallic and non-metallic, are known, although the country connot in any sense be said to have been closely prospected. Nor do these mineralized belts seem to be confined to the southern part of the country, but everywhere through the Laurentian Plateau region the general conditions appear to be similar, and it is certain that many deposits of economic value yet remain to be discovered.

**Gold.**—"In Eastern Ontario the auriferous deposits appear to be confined to a belt of varying width and about seventy miles long, extending through Peterborough, Hastings, Addington, Frontenac, and into Lanark County. This region is occupied by crystalline limestones, various types of schists, and bodies of dark basic rocks, all commonly grouped as the Hastings-Grenville series, and cut by bodies of granite. The gold deposits occur in the older rocks, generally near granite intrusions and along lines of fissures containing quartz veins or lenses, and, commonly, with abundantly associated mispickel, sometimes mined for arsenic.

**Copper.**—"Most of the copper won in the Laurentian plateau comes from the nickel-copper mines of Sudbury.

"In the Parry Sound district a number of discoveries of copper ore have been made. At a point about two miles east of Parry Sound a schistose diorite is more or less charged with bornite, chalcocite, and chalcopyrite, over a zone about 1,000 feet long and 250 feet to 400 feet wide. In places the ore is associated with stringers of quartz, but in general it occurs in bunches or pockets through the impregnated rock. At another locality in the same district, about eight miles south of Parry Sound, a garnetiferous gneiss is impregnated with copper and iron sulphides, over a band about 1,000 feet long and 30 to 75 feet wide.

**Zinc.**—"Zinc blende, usually accompanied by galena, occurs in workable deposits at a number of points in Quebec and Ontario. The Olden or Richardson mine, in Frontenac County, has been worked in recent years. The ore consists of a mixture of zinc blende and argentiferous galena. The deposit is irregular, and occurs in a band of crystalline limestone of the Hastings-Grenville group. Some work has been done on zinc deposits at Calumet.

**Iron.**—"Throughout Eastern Ontario and adjoining portions of Quebec, in the districts in which the Hastings-Grenville series occurs, are numerous deposits of magnetite. Many of these have been worked for years, and some are being mined at the present time. The deposits, though usually irregular in shape and distribution, are often of considerable size. In one instance, at the Mayo mine, Hastings County, the ore has been worked from an open pit 1,100 feet long by 220 feet broad, while a drill hole was sunk 140 feet without passing out of ore.

"In many cases the ore bodies lie along the contact of crystalline limestone and granitic or other igneous bodies. At times considerable pyrite is present, necessitating the cobbing of the ore. The general conclusion is that the ores are of contact metamorphic origin. Other iron ore deposits of the Hastings-Grenville districts lie within bodies of basic igneous rocks, are characteristically irregular in their occurrence, and doubtless are of direct igneous origin. Somewhat related in type are the masses of highly titaniferous magnetites so often associated with the various anorthosite bodies occurring throughout the eastern part of the Laurentian plateau. In size these titaniferous ore bodies vary widely, sometimes reaching large dimensions."

Recently some of the magnetite deposits of Eastern Ontario, referred to by Dr. Young, have been more energetically worked and a concentrator is now in operation at Trenton, treating the ore produced by the Canada Iron Mines, Ltd. A description of the mines and plant follows.

## THE CANADA IRON MINES, LIMITED.*

The Canada Iron Mines, Limited, was organized for the purpose of operating the important magnetite deposits along the line of the Central Ontario Railway. It owns the Bessemer and Childs group of mines near L'Amable Station, the Coe Hill mines at Coe Hill, and the Blairton mines near Marmora.

The Canada Iron Mines, Limited, ships the ores to its concentrating plant at Trenton, where it undergoes magnetic concentration, making a marketable product. In this manner, by a centralization of treatment and of administration it is able to achieve low costs, and by mining the various ores in their proper proportion according to their different characters, it is able to produce a product admirably suited to the blast furnace.

It has been necessary so far to open only the Bessemer and Childs group, and we will consider these mines first.

The Bessemer and Childs group comprise 3,100 acres of mineral lands situated in the Townships of Mayo and Dungannon in the County of Hastings. These mines are not directly on the Central Ontario Railway, but are five to seven miles east from L'Amable Station on that railway. The Bessemer and Barry's Bay Railway connects the mines with the Central Ontario near L'Amable. It is owned and operated by the Canada Iron Mines, Limited.

Bessemer Post Office is situated five miles from the junction of the Central Ontario Railway and Bessemer & Barry's Bay Railway, and here is located the mine office, store, club and settlement, etc., for both Bessemer and Childs mines.

**Bessemer No. 4 mine** is the most important mine at Bessemer and is the only one being operated at the present. At this mine two large ore bodies are being developed—the north lens and the south lens. The latter lies to some extent under Little Mullet Lake, and although opened up considerably under this lake, the workings are unusually dry. Of course a thick pillar is left between the workings and the lake bottom. The ore bodies are both of large size and permit mining methods to be used which give low costs for underground mining. The ore is extracted by overhand stoping on the shrinkage system, no timber being used.

Hammer drills are used for stoping. Three and one-quarter piston drills are used for all drifting. Hammer sinkers were tried for shaft sinking, but have not yet been a success owing to a great breakage of steel. This will be overcome by using 1⅛-inch hollow hexagon, instead of 1-inch as now used.

The ore is hoisted in a one-ton skip and is dumped directly into a No. 6 "K" Gates gyratory crusher. The crusher discharges onto a 22-inch troughed belt conveyor equipped with ball-bearing idlers. The conveyor is 44 feet long and is installed on a slope of 18½ degrees to gain headroom. The conveyor discharges either into the car loading bins, or into the tramcar for stockpiling.

The management intends to install a magnetic cobber at the head of this conveyor to reject clean rock. At the present time this is handpicked to some extent.

Very little pumping is required at this mine, as the ground is free from fissures. There is just enough dampness to keep the mine from being dusty.

Power is produced entirely by steam. The boiler plant consists of two 150 horsepower horizontal return tubular boilers. The compressor is a Nordberg cross-compound, two-stage machine of a capacity of 1,400 cubic feet of free air per minute. It has an independent jet condenser. The hoist is a duplex 12 x 22 engine with a single drum 6 x 5 feet.

In the blacksmith shop is installed a Leyner Drill Sharpener, which sharpens the drill steel for both the Bessemer and Childs mines.

The ore deposit at Bessemer is very large, there being 200,000 tons of ore developed by the present work-

*Written by W. D. B. Motter, Jr., Manager, Canada Iron Mines, Ltd., and published by courtesy of R. H. Flaherty, Chief of Mines Dept., Mackenzie, Mann & Co., Ltd.

ings, and the mine has really been only superficially opened. One of the accompanying photographs shows a general view of Bessemer mine, and the stockpile in the foreground.

**The Childs mine** is situated two miles northeast of Bessemer, and is the present terminus of the Bessemer & Barry's Bay Railway. This is a very large deposit which is now being developed. It has been explored by diamond drilling to a depth of about 300 feet, proving the existence of an ore body containing one and a half million tons above that depth. The ore body is wide even at that elevation, showing no signs of its being near the bottom of the deposit. The management is confident that the total ore reserves will be much in excess of the above estimate.

Crushing Plant, Childs Mine.

Bessemer Mine, Hastings Co., Ont.

The above ore body is known as Childs No. 1, and there is also a second deposit about 300 feet north of No. 1, which has a very large tonnage, but is not of such a good grade as the No. 1 deposit, and is therefore not being opened at the present.

The Childs No. 1 deposit is being developed as an open pit mine. The ore body is about 100 feet wide, but is divided into several lenses by narrow igneous dikes, consisting mostly of syenite. These dikes complicate the mining method to a certain extent, as it is necessary to do some dead work in opening up the working faces. The deposit is being attacked at several places, one of the accompanying photographs showing the opening near the eastern end. This is the latest opening. The hanging wall of the deposit is shown at the left of the photograph. The footwall is in the swamp at the extreme right.

Eastern End, Childs Mine

The ore is broken down by one steam drill at each working face. It is hand loaded into low bodied wooden end-dump tramcars of the coal mine type. These cars have a capacity of two and one-half tons, and are 36-inch gauge. The loaded cars are gathered and hauled by a 12½-ton dinkey locomotive to the foot of the hoisting incline.

The ore tramcars are hoisted up the inclined trestle as shown in photograph. They dump automatically into the No. 5 "K" Gates gyratory crusher, which rests on the crib foundation. The crusher discharges into the loading bins, thence into the railway cars.

It is intended to install here also a magnetic cobbing plant to reject clean rock and thus raise the grade of shipping ore.

There is enough ore in the Childs mine, above the 300-foot depth to ship 500 tons per day for ten years. Owing to the low cost of open pit mining, a large proportion of the above ore can be mined very cheaply, and even as an underground mine, the costs should be low owing to the large size of the deposit, and the mining methods that can be used.

**The Coe Hill mines** are situated in the Village of Coe Hill, for many years the terminus of the Central Ontario Railway. In fact, this railway was originally built from Trenton to Coe Hill, principally to handle the ore from the Coe Hill mines.

The Canada Iron Mines, Limited, has not done any work at Coe Hill, as it is necessary to do some additional experimenting, owing to the complexity of the ore.

The mine is full of water, but was formerly opened to a depth of 130 feet, and it is stated that the width of clean ore at that depth is about fifty feet. The workings extend to the surface where they form an open cut. The ore here varies from 10 feet to 60 feet in width. It is stated that some 100,000 tons have been mined during the time the mine was operated, which was from 1882 to 1886.

There is now on the stockpile about 30,000 tons of ore ready to be shipped, and according to the diamond drilling, a very large tonnage of ore underground.

**The Blairton mines** are located on the shore of Crow Lake, Township of Belmont, County of Peterboro, about four miles from the Town of Marmora on the Central Ontario Railway.

These mines have been worked to a greater or less extent until 1873, having produced, it is claimed, 300,000 tons.

These mines are being held in reserve. The deposit has been drilled and a large tonnage of ore proven. It will be necessary to construct a railroad from the Town of Marmora, and to fully equip the mine.

Development work will have a very good start owing to the former workings.

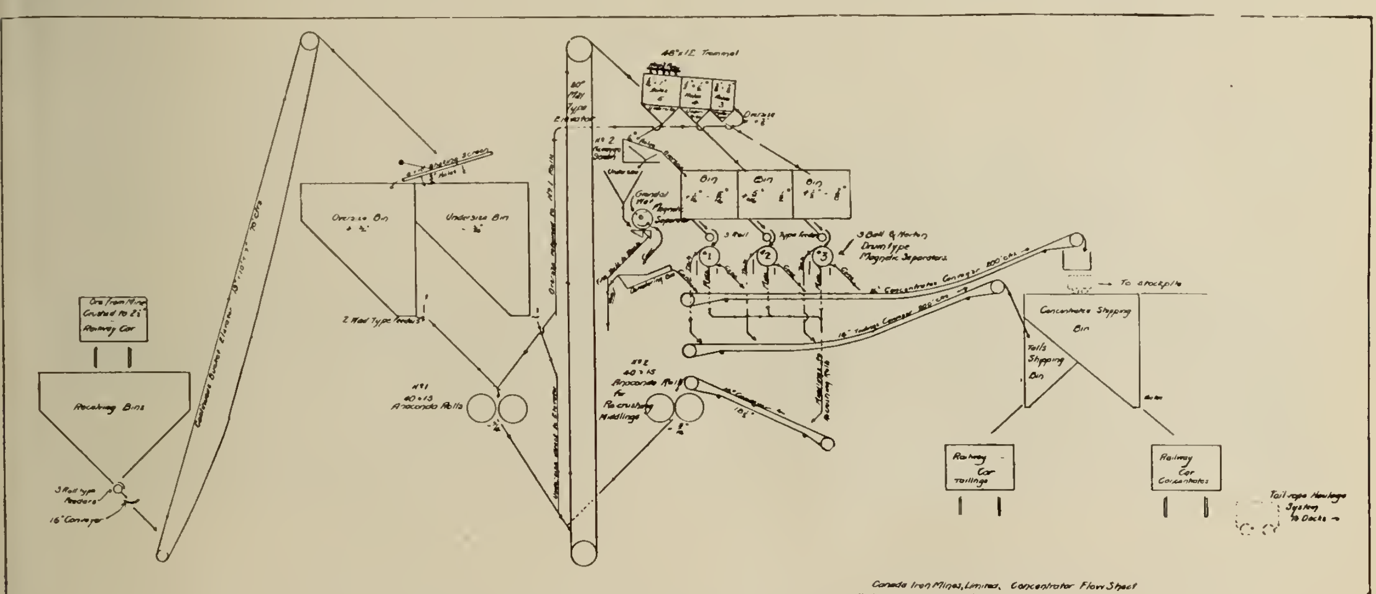
**The concentrator** is located in the Town of Trenton. Trenton has splendid shipping facilities, being a divisional point of the Central Ontario, the Canadian Northern and Canadian Pacific Railways, and also on the Grand Trunk. The Canadian Pacific is at present under construction. Besides the above railway facilities, Trenton is at the southern terminus of the Trent Valley Canal, now building, and is on the Bay of Quinte.

Very favourable rail freight rates are going into effect this month for shipments to Pennsylvania. Shipments to Lake Erie points will be made by water. It is probable that all shipments to Canadian furnaces will be by rail.

The concentrating plant was laid out on the basis of treating 1,000 tons of crude ore per day of 20 hours. This plant was divided into three units of a capacity of 330 tons each. It was considered best to build only one unit completely and to construct the other two in skeleton. It will be necessary only to install the machinery and some interior work in the building, etc., to complete the plant to its full capacity, as the steel building, trestle, etc., are all constructed for the entire plant.

The two stacks shown in photograph of concentrator are remnants of a saw mill which previously occupied this site, only one stack is now used, and is for the heating boiler in cold weather. The low brick buildings are also old, and are used for a warehouse and a shop.

The main building is of steel structure covered with a specially pressed sheet steel, which will later be cemented over to form reinforced concrete curtain walls. The interior finishing of the building, and the trestle,



**Concentrator flow sheet, Canada Iron Mines Limited**

and also the inclined conveyor housing and bins, are of slow burning mill construction.

Power conditions are very favourable at Trenton, owing to the great development of hydro-electric power along the Trent Canal system, in the immediate vicinity. This will furnish plenty of cheap power for any allied industries, which are expected to be developed later.

The Canada Iron Mines, Limited, own as a concentrator site 40 acres of land on the east side of the Trent River at the point of its confluence with the Bay of Quinte. This site consists also of an additional 40 acres of water lot on the Trent River and Bay of Quinte. Ore docks are under construction for water shipments. The Bay of Quinte, which now has a maximum draft of 10½ feet at low water is being dredged to a depth of 14 feet. The Murray Canal, which forms the western outlet of the Bay of Quinte into Lake Ontario, is also being deepened. When this work is completed vessels can be loaded to the full draft of the Welland Canal. At the present they can be loaded to a draft of 10½ feet only, at low stages of the water.

In order to make the plan of the treatment which the ore receives in the process of concentration perfectly plain, a diagrammatic mill flow sheet is shown here. Starting at the left hand side of this diagram, the ore is received from the mine in standard gauge ore cars. These are delivered on the trestle over the receiving bins into which the ore is dumped. It is drawn off from these bins by three roll type feeders, which deliver it onto a short 16-inch belt conveyor. This conveyor discharges through a chute into the buckets of the inclined continuous elevator, which elevates the ore into the mill proper, and delivers onto the shaking screen. This screen has ¾-inch square holes. The oversize goes into its bin over the rolls, and passes through an oscillating feeder to the No. 1 rolls. These are 40 x 15 inch Anaconda rolls set at ¾ inch. The crushed material then is delivered into the boot of the 20-inch vertical mill type elevator.

The undersize from the shaking screen, which is material ¾ inch in diameter and smaller, falls into its bin. This is a duplicate of the above-mentioned oversize bin. These are steel bins, lined with oak. The undersize is delivered from its bin by another oscillating feeder directly to the above vertical elevator. The entire crushed and fine product is discharged into the trommel.

The trommel or revolving screen is 48 inches in diameter by 12 feet long. It serves to grade the crushed ore in accordance with its sizes, in order that the magnetic separators will have the advantage of a sized product to treat. The first section of the trommel is punched plate five feet long with holes 5-16 inch by 1 inch. The second section is woven wire screen four feet long with ½-inch square holes. The third section is woven wire screen three feet long with ⅞-inch square holes. Wash water is added to the chute between the elevator and the trommel and also over the first section of the trommel.

mixes with the fresh ore entering the rolls. The treatment of the three different sizes in the separator bins is identical, the only difference being in the adjustments of the separators. The material is drawn from the bins by roll type feeders, which distribute it across the face of the drums of the separators. These are single drum Ball-Norton magnetic separators. Owing to the method of wiring used on these machines it is possible to make a three-part separation. The three products consist of clean tailings, clean concentrates and middlings, or particles containing both magnetite and gangue or rock. The tailings fall to the coarse tailings conveyor and are carried out to a car loading bin. The concentrates fall onto the concentrates conveyor. The middlings fall onto a short inclined middlings conveyor, which carries them to the No. 2 or recrushing rolls. These are duplicates to the No. 1 rolls, being 40 x 15 Anaconda rolls, but they revolve at much higher speed. They are set to crush to 3-16 inch. The recrushed middlings enter the system again in the boot of the vertical elevator, to be rescreened and retreated.

**Concentrating Plant, Canada Iron Mines Limited, Trenton, Ont.**

The material passing through the first section is delivered to a No. 2 "Newaygo" wet screen. This has a screening surface of woven wire with 1-16-inch or 1.6 mm. holes. This screen makes two products, an undersize and an oversize. The former is carried in a wet launder through a wooden feed box to "B" magnetic separator. This is a Grondal wet separator, and makes concentrates and tails. The latter are discarded as fine tailings, being used to make land.

The concentrates from the Grondal separator pass through a dewatering machine, which drains off most of the free moisture, and delivers them to the concentrates conveyor.

The oversize from the "Newaygo" screen is discharged into the bin over No. 1 separator. The undersize through the second and third sections of the trommel is discharged into bins over separators Nos. 2 and 3 respectively. The oversize from the trommel is material that will not pass through a ⅞-inch square hole, and is returned to No. 1 rolls to be crushed again. It

The concentrates conveyor collects the concentrates from all the magnetic separators and conveys and elevates them to a small pocket over the concentrates bin. It is then drawn off either into the concentrates shipping bin or a small tramcar to the stockpile. Railway cars are loaded from the concentrates shipping bins for rail shipments. A tail rope haulage system will convey the concentrates to the docks for water shipments.

The coarse tailings are also a marketable product, and the entire supply has been contracted for for several years. The revenue derived from their sale will amount to a considerable figure when the plant is running at its full capacity.

Although the plant was designed for a capacity of 330 tons per unit, in operation it can treat over 300 tons per ten-hour shift, and its capacity is from 500 to 600 tons per unit per day of twenty hours. The present ratio of concentration is about one and one-third tons of crude ore to one ton of concentrates. Therefore the daily production of concentrates from one unit will amount to from 375 to 450 tons per day when running two shifts. The operations are being pushed to this point as rapidly as possible.

It will be necessary to install the second and possibly the third units of the concentrates before opening up Coe Hill and Blairton mines.

The ore reserves guarantee a future ore supply for the concentrator at full capacity for many years.

(To be Continued.)

---

# EFFICIENCY IN UNDERGROUND PRACTICE*

By Andre Formis.

In consequence of the increased cost of labour and supplies in the process of mining it has become advisable to investigate the various steps in the production of tonnage with a view to reducing waste factors to a minimum. The paper submitted this evening hopes to bring out a discussion on the subject of rock-drilling, the most important of the underground operations.

Considering that the labour factor in mining is about 75 per cent. of the total cost, it is evident that the savings effected in this item are proportionately of greater importance than in the matter of the other 25 per cent. of the cost. However, owing to the nature of this larger factor it is also much more difficult to accomplish any results with it, partly on account of the evident distrust of the so-called old-time mining captains of anything suggested by a technical graduate, partly on account of the inertia of labour itself, and partly on account of the natural hesitancy of some mine managements to permit anything that may seem a radical departure from ancient and honorable customs. Yet it can be shown by actual tests, supplemented by correct cost figures—by these I mean costs based on observed and recorded facts and not pro-rated costs—that material savings are easily made without departures in any manner radical in underground practice.

In order to arrive at a correct analysis of any set of conditions it is, of course, important that the observations of these conditions be as accurate as possible. It is also obvious that a long continued set of observations is more nearly correct than a short one.

In the practice of rock-drilling many different methods are employed, many sizes and shapes of drills are used. Some of these drills are better than others; sometimes, perhaps, one only is the best for a certain class of work. Careful study and patient investigation are required to come to any definite conclusion. The selection of the drill depends on a large number of factors, the most apparent of which are:

1. Hardness of the rock to be drilled.
2. Irregularities of the rock, causing the steel to bind in the holes.
3. Diameter of drill cylinder.
4. Piston stroke if any.
5. Weight of moving parts.
6. Effective blow.
7. Total weight of drill.
8. Depth of holes to be drilled and diameter of holes.
9. Style of chuck.
10. Shape of bits.
11. Use of water in holes.
12. Hollow steel with water or air jet.
13. Wages of miners, based on company account, tonnage contract, or footage drilled.
14. Cost of power.
15. Various other factors, depending on locality, etc.

Each of the foregoing factors determines in a manner the proper drill to be used. What appears to be the proper drill having been selected, first an investigation of the amount of air it consumes should be made, second, a time study of its operation.

For the first of these studies may be used the graphic air-flow meter which has been perfected by the General Electric Company (see Bulletins No. 4004, No. 4827, and No. 4941), which measures in cubic feet the air consumed by any device connected to it. The record is made on a moving roll of paper. The interpretation of the record is simple.

The principle of operation of the meter is based on the velocity head. Consider a small pipe inserted in the airline in such a manner that the leading opening faces against the direction of flow and the trailing openings face in the direction of flow. These two pipes are connected to a vertical U-tube containing mercury. Thus the air flowing in the pipe impinges against the leading opening and sets up a pressure in the leading pipe which equals the static pressure plus a pressure due to the velocity head. The drag of the air on the trailing openings lowers the pressure in the trailing pipe. Due to the differential pressure, the mercury in the U-tube is deflected until the unbalanced column exactly balances the differential pressure. Since the leading set of openings extends approximately across the diameter of the pipe, the velocity pressure transmitted to the meter is the mean velocity pressure due to the flow of air, rather than the velocity at a single point in the pipe.

One of these meters was installed at the property with which I am connected. The meter was first used on the 1900-foot level to measure the amount consumed by a R 3 drill and a Butterfly drill No. C100. Only one drill was working on the line at a time. A recording air-gauge was also connected to the line, to ascertain the air-pressure near the drill for comparison at any instant with the graphic flow-meter records.

For a fairly accurate time study of the operations of the drill, nothing more is needed than a watch and a note book. Mr. R. T. Dana and Mr. W. L. Saunders in their work on rock-drilling have published a formula which permits of a set of short observations being used for an estimate of drilling performance. The formula is:

Time to drill one hole $=(c-fd)\ D/f-(l-g-k)$ in which the quantities signify as in the table following. The table includes also the figures obtained at our mine.

| | | | |
|---|---|---|---|
| e=average time to change steel | our figure, | 4.00 | min. |
| d=average time to drill one foot | our figure, | 4.87 | min. |
| l=average time to move drill | our figure, | 16.00 | min. |
| g=average time to set up drill | our figure, | 12.00 | min. |
| k=average time to blow, blast holes, etc. | our figure, | 24.00 | min. |
| D=depth of holes in feet | our figure, | 8.1 | ft. |
| f=length of feed | our figure, | 2 | ft. |
| fd=time to drill length of feed | our figure, | 9.6 | min. |
| Number of bits per hole | our figure, | 4.0 | |

Then if 540 is the number of working minutes per day shift, the number of holes per day shift=

$$\frac{540}{(e-fd)\ D/f-(l-g-k)}$$

---

*A paper presented at Michigan College of Mines Club, Houghton, and published in the M. C. M. Alumnus April, 1913.

It may be seen that a slight difference from average values will materially affect the result.

The time record taken from the chart of a single shift —day shift, January 31, 1913—is as follows:

| | | |
|---|---|---|
| Drill reciprocating | 36.5% | |
| Changing steel | 14.4 | |
| Moving drill on post | 17.5 | |
| | | 69.4% |
| Mucking out out for post | 10.7% | |
| Time lost going to face | 4.1 | |
| Getting drill steel and water | 2.2 | |
| Cleaning and charging holes | 2.8 | |
| Blasting | 2.9 | |
| Blowing smoke | 7.8 | |
| | | 30.5% |

Number of holes per shift, 6.
Feet drilled per shift, 40.5 (medium hard amygdaloid).
Cutting speed, 4.205 ft. per min.

The air pressure was about 96 lb. absolute, the consumption of air around 110 cu. ft.,—for the C110 drill 85 cu. ft.

From this time study it appears that the first three factors, amounting to 69.4 per cent., are inherent in the operation of the particular drill and cannot well be reduced. The other factors, amounting to 30.5 per cent., may be reduced for the benefit of the former,—that is, for more actual drilling time. This may be accomplished by a change in the method of drilling holes or by employing additional labor to perform part of the 30.5 per cent. time-loss, always with the condition that the cost of the additional labour is repaid by the increased footage obtained. In our case it is not.

# GLACIATION OF ORE DEPOSITS*

By W. H. Emmons.

In comparatively late geologic time a considerable portion of North America was capped by a continental ice sheet, which removed by erosion the loose debris and the surface rock over great areas. Glaciation was most extensive in northern latitudes, but the continental glacier extended southward as far as Ohio and Missouri rivers, and smaller glaciers accumulated in the more lofty mountain ranges of the American Cordillera. Many of the ore deposits that lay in the paths of the glaciers were planed off, and the ores in their upper zones were scattered in the rocky material which was left when the ice had melted. Erratic fragments of such deposits have been carried far from their sources and have been the cause of much fruitless prospecting.

The outcrop of an ore body may be removed gradually by erosion by water, but weathering generally precedes erosion. The solutions may leach the valuable minerals from the outcrop and may precipitate them at a lower level, where they will be preserved. But weathering does not attend erosion by ice, and chemical action of low temperatures is slight; consequently the metals present in the portions of the deposits that are removed are likely to be scattered. The extent to which the ore deposits in a glaciated region were weathered or otherwise altered by surface agencies before the glacial period began can not be estimated. The amount of rock removed by the continental ice sheet is known to be considerable, however, for the drift which it deposited is in many places more than 200 feet thick. It is probable that glacial erosion was in places equally great or greater. Whatever the amount of ice erosion, it appears to have been sufficient to remove the highly altered zones in most parts of northern North America.

As stated already, the processes of solution and enrichment are retarded in regions of low temperature. The areas in which ice erosion has been most vigorous are those in which the lower temperatures prevail today, and there is reason to suppose that the deposits in these areas were not so deeply altered before the glacial epoch as were similar deposits at lower latitudes. In Canada and in Alaska there are few large deposits of sulphide ores which are clearly of secondary origin. If the deposit at the Bonanza mine in the Chitina copper region, Alaska, is primary no large rich secondary sulphide deposits in Alaska are known to me. The sulphide ores now exploited in Canada, except possibly the deposits at Cobalt, in the silver-bearing region of Ontario (which some have considered of secondary origin), and certain well-authenticated examples in British Columbia, are generally believed to be primary. I know of no important secondary deposits in New England. Small deposits of chalcocite ores were exploited in the Ely district, Vermont. In a copper deposit at Milan, N.H., where the sulphides outcrop at the very surface, no considerable amount of oxidation has taken place below 30 feet, and in general oxidation is trivial at even shallower depths. Only a little chalcocite enrichment has taken place. the secondary ore consisting of primary yellow sulphides coated with thin films of chalcocite, adding to its value probably not more than 1 per cent.*

In Norway and Sweden, according to Vogt, the surface has been polished clean by the Quaternary ice sheet, and secondary alteration is insignificant.

Glaciers do not erode their beds equally at all places. In their higher portions, where the ice is accumulating, pressures are greater, the ice is more rigid, and erosion is more vigorous. Near the margins, where the ice is melting, deposition exceeds erosion and the deposit of drift protects the surface from wear. These differences are very conspicuous in some mountainous sections of the West where the glaciers covered only portions of the country and the processes are more clearly shown. In some of the ranges of Montana, Colorado, and Utah, where ore deposits are numerous and varied, the evidences of mountain glaciation are conspicuously preserved. At some places the mountain glaciers seem to have removed very little of the altered ore, for the secondary sulphide zones and even the oxidized ores are intact, and some of these appear to be too extensive to have formed since the Quaternary glacial epoch. The Amethyst lode at Creede, Colo., has an extensive secondary zone, and one end of this lode was over-ridden by the ice in late geologic time. In general, erosion by mountain glaciers has been localized, the maximum wear taking place near the heads of the glaciers.

Erosion by the continental glaciers is also somewhat erratic, for great differences in the effect of the action of ice may be seen in a comparatively small area. In the Mesabi range of Minnesota the hard, fresh country rock is polished clean in places, whereas a few rods away and at but slightly lower elevations thick bodies of cellular, almost powdery iron-oxide ore remain intact. These facts suggest that other important secondary zones may be encountered when the area over-ridden by the continental ice sheet is more thoroughly developed.

# RAISING SHAFT AT ROLLING MILL MINE, NEGAUNEE, MICH.*

By Edwin N. Cory.

The new shaft of the Rolling Mill Mine of the Jones & Laughlin Steel Co., was raised from the 621-foot level to the surface by the following method:

The work was started from this level and carried through to surface with one continuous raise. A force of nine miners divided into three shifts of three men on each shift working eight hours per day was employed. These men also trammed the material from the raise to No. 1 shaft, a distance of 750 feet, and put in the timber. The difficulties of raising so great a distance were successfully overcome and no accidents or delays occurred during the progress of the work.

The raise was 8x8 feet in size and was divided into three compartments. One compartment, 4x4 feet, including the timber, was used as a bucket way for hoisting tools and timber and a station was cut at the bottom of this compartment on the main level, in which was placed a small hoist. Another compartment, 4x4 feet, was used for ladders and an 8-inch pipe from air fan, also one 1¼-inch pipe for speaking tube and one 1½-inch air pipe for the power drills. The other half of the raise, 4x8 feet, was used for the rock broken in the raise, and was not timbered but kept filled with rock up to the height of the timber in the other compartments. A chute was constructed in the bottom of this compartment through which the rock was run when loading into tram cars. (See Fig. 1). A fan was placed at No. 1 shaft which forced the air through the 8-inch pipe up to the top of the raise, the current being down through one of the compartments, thus securing perfect ventilation.

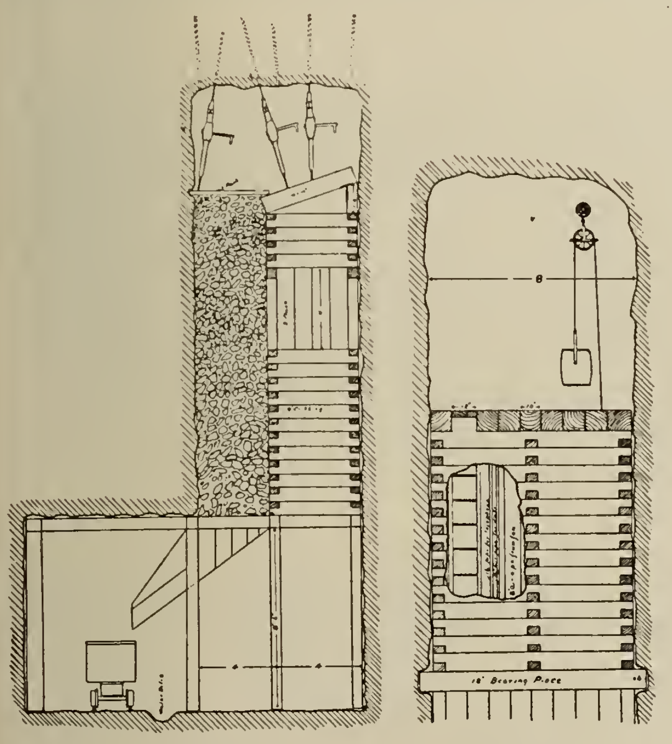

**Fig. 1. Fig. 2.**

**Method of raising shaft through rock.**

The type drill used was an Ingersoll-Rand, 2-inch cylinder B. C. 21, butterfly valve hammer drill. Three drills were operated at one time to drill the raise over, which consisted of 18 holes in three rows, six holes in each row. The cutting-in holes were drilled, so as to cut a space when blasted through the entire length of the raise directly over the rock compartment (Fig. 1) so that the other holes would throw the rock toward this opening and fall into the rock compartment. Before blasting, the ladder and bucket compartments were covered with 10-inch round timber, flattened on two sides to prevent rolling, and placed at an angle to deflect the falling rock into the rock compartment, necessitating only a minimum amount of shovelling. The space directly over the ladder compartment, was covered with 3-inch plank to permit the men to get away quickly when blasting, also to give them perfect protection in going up and down the raise (Fig. 2). The blasting was all done with fuse cut in various lengths to give the desired results. After blasting, and while the smoke was clearing out of the raise, the miners would tram enough rock out of the chute so that timbering could be commenced at the top of the raise. A gin-pole was erected about 8 feet from the last set of timber on which was hung a 10-inch sheave wheel for the rope used in hoisting the timber from the level below (Fig. 2). After the timber had been put in it was also used for hoisting the sharp drills and machines to start drilling. The drilling machines were thoroughly overhauled after each round of holes while the miners were blasting and timbering, and no delay was occasioned during the work.

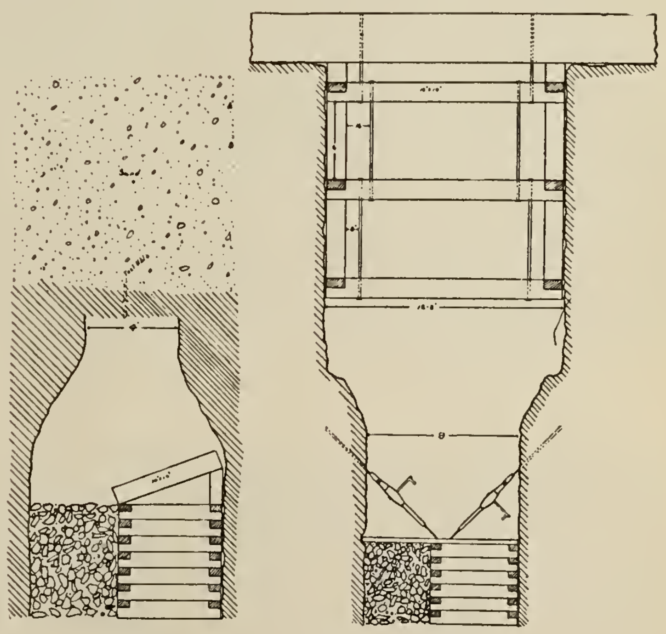

**Fig 3. Fig 4.**

**Method of raising to surface and enlarging shaft**

When the raise had been carried to a height of about 200 feet, hitches were cut in the rock and a set of bearing pieces put in about four feet above the last set of timber, and planked up with 3-inch plank. This

*Prepared for Houghton Meeting of the Lake Superior Mining Institute, and published in Vol. XVII of the Transactions, pp. 112-116.

was done to take the weight of the timber for the next 200 feet instead of letting it rest upon the timbers below. (See Figs. 1 and 2). A station 15 feet long was cut in the side of the raise about every 200 feet, to shelter the men when blasting instead of going down the ladders the whole distance to the level below.

In this manner the raise was carried to the height of 570 feet, which was 51 feet from the surface, when a smaller raise was carried up as is shown in Fig. 3, a test hole being drilled in advance of the top of the raise to ascertain the depth of the sand. When within 18 feet from the surface, sand was reached by the test hole, and the raise continued by carefully working through the sand to within 10 feet of the surface. A hole was then drilled from the surface, blasting the sand through to the opening below.

The work of enlarging the shaft was then begun. The surface at the opening made by the blast was levelled off and two stringers, 2 feet 6 inches in diameter and 25 feet long, were placed in position for timbering through the same. The dimensions of the shaft are 10 feet 2 inches by 12 feet 2 inches within timbers; 12x12 inch fir timber was used and the plan of timbering is shown in Fig. 4. The principal feature of this work was the method used in enlarging the opening made by the raise to the dimensions required by the permanent shaft. The type of hammer drills used in raising was also used for this work. The rock was drawn off through the chute at the 621-foot level as in raising until it was lowered about 15 feet. The timber from the raise was then pulled out for a distance of 15 feet and the two smaller compartments covered over as before. The holes were drilled upwards as in raising, but at an angle of 45 degrees, and were started 10 feet below the permanent shaft timber and so located as to strip 5 feet of the shaft at one blast, thus making room for one set of the shaft timber.

Ordinarily this work is done by drilling holes downward, but, as the above method proved very successful, it was continued for the entire shaft, and I think the use of the hammer drill a great improvement over the reciprocating type with shaft bars or tripods.

The progress made in the work was as follows:

Raising—621 feet; No. days, 125; average per day, 5 feet.

Cutting down—621 feet; No. days, 114; average per day, 5.44 feet.

Work started September 5th, 1911; completed July 15th, 1912.

# CONCENTRATION OF COBALT SILVER ORES

By Reginald E. Hore.

Remarkable success has been obtained in treating Cobalt silver ores by straight concentration. Experience led most of the millmen to screen the ore first, hand pick the large and jig the small sizes, crush the tails with stamps, and concentrate the pulp on tables. At some mills the sorting belt tailings go direct to stamp bins, at others the ore is first recrushed and then sent to the jigs. The tails from the tables are usually run over canvas.

In some cases rolls are used instead of stamps, and at the Buffalo they are said to work very satisfactorily. At the Coniagas, Krupp ball mills were used at first; but these were discarded in favour of stamps. The equipment of most of the newer mills with stamps indicates that experience has shown this to be the most efficient method of crushing to the desired fineness.

The results obtained by concentration at Cobalt during 1912 are given in the accompanying tables, taken from Mr. A. A. Cole's report to the T. & N. O. Commission:

**Concentration in Cobalt During 1912.**

| Total tons milled by cyanide mills | 65,043.5 |
| Total tons milled. 1912 | 455,516.5 |

In the plants using concentration processes only there is considerable variety. The Coniagas mill has a comparatively simple flow sheet. The flow sheets of the Hudson Bay and Cobalt Lake concentrating plants are of special interest, because these mills are of recent construction.

### The Coniagas Concentrator.

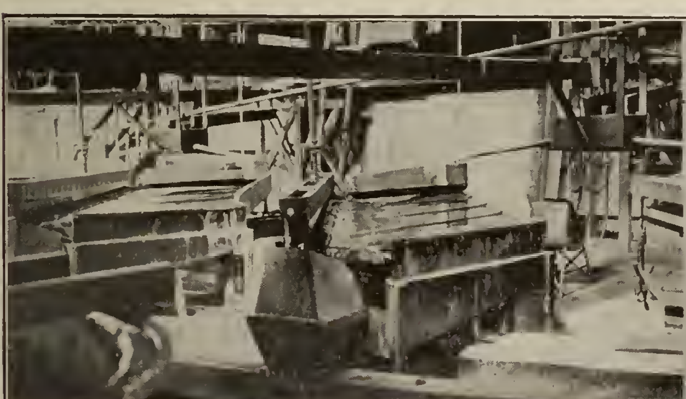
At the Coniagas property during the past year about 44 per cent. of the silver produced was from ore treated in the mill. Fifty-six per cent. was in high grade ore recovered without concentration. The mill output for the year 1911-12 was 803.3 tons high-grade concentrates and 484.2 tons low-grade slimes.

The ore from the mine is emptied from a self-dumping skip into a chute down which it runs to the mill bin. A grizzly, with 1¼-inch spaces, screens out the fine ore. The oversize is crushed to about 4 inches in a Blake crusher, elevated to bins and thence fed automatically to a gyratory crusher, the product of which is under 2 inches. The fines from the shaft-house grizzly join this crushed ore, which is then elevated and sized in No. 1 trommel, having 5-16 inch and 1¼-inch holes.

The oversize of 1¼-inch goes to a sorting belt, where ore averaging 1,500 to 2,000 ounces per ton is picked out by hand. The tails from the sorting belt are conveyed by portable belt conveyor to the stamp bins.

The undersize of 1¼-inch and over 5-16 inch goes to coarse jigs.

**Two views showing stamps, setting cones, distributors and Deister Tables, Coniagas mill**



**Deister Tables, Coniagas mill.**

**Canvas tables, Coniagas mill.**

The undersize of 5/16 inch is sized in No. 2 trommel, which has 3.5 mm. openings. The oversize goes to fine jigs. The undersize is classified in a drag classifier from which sands go to a Wilfley table and slimes to settling tanks. These mine slimes, which average 150 to 200 ounces silver per ton, are collected and shipped to smelter without further treatment.

The tails from all jigs and the Wilfley table unite and are elevated to a drag classifier, dewatered, and conveyed to the stamp bins. The water from the classifier with some slimes runs to a Callow settling tank.

No. 2 Deister Tailings.
Tailings from Drag Classifier.
Concentrates are skimmed from Jigs and sacked—From Tables go to Settling Tanks.
Hutch Product from Jigs Returned to No. 2 Elevator—Retreated on Fine Jigs and Wilfley.

The overflow from this tank returns to the jigs. The slimes go through the system again, and uniting with the mine slimes are eventually caught in the settling tank. The accompanying flow sheet was prepared by Mr. F. D. Reid, mill superintendent, November 4th, 1911.

The treatment of the ore before stamping results in the recovery of about one-half of the silver contained in it. From heads averaging 36 ounces per ton, 18 ounces is recovered by the picking, jigging, and table concentration. Of this 18 ounces, about 49 per cent. is recovered by the jigs, 11 per cent. on the Wilfley table and 40 per cent. on the picking belt.

The sixty Fraser-Chalmers 1250-lb. stamps each crush 2.8 to 3 tons per 24 hours to pass 16 mesh. From the screen the pulp runs to 3-foot cone classifiers, of which there is one for every ten stamps. Sands from the classifier are concentrated on No. 2 Deister tables. The overflow runs to 8-foot Callow tanks, the underflow from which is treated on Reid's improved Deister slime tables. The overflow from the tank, along with slimes from all slime tables, runs over canvas tables. Tailings from the sand tables are dewatered in a classifier and the sands elevated and stacked on the property. A sample is taken of the sands as they are elevated, and this is treated in the mill on a Deister table. There is thus a constant running test being made on both sand and slime tails.

Overflow from the Drag classifier unites with middlings from the tables and is pumped back to a series of two classifiers. The coarse sands from this are treated on a No. 2 Deister, and the fine sands on a second Deister, while the overflow slimes are pumped back to four Callow tanks, re-treated on four slimers and then on canvas tables. Tailings from the canvas tables are pumped to storage pond; but a sample of this product is being retreated in the mill on one of the Reid-Deister slime tables.

The ore fed to the stamps averages about 17 ounces silver per ton. About 30 to 35 per cent. of this is slimed in crushing and the slimes are usually richer than the sands, the relative content being about 5 to 4. The slime tails average 6 to 8 ounces and are being saved for possible future treatment. The sand tails average 3.5 to 4.5 ounces and are being stacked beside the mill at a cost of about $250 per year, during which time the product is about 35,000 tons of sand tails.

The shipping of mine slimes without treatment in the mill brings down the concentration ratio very considerably; but experience has shown that it is not advisable to mix these slimes with the lower grade slimes from the stamps. At present from 30 to 40 tons of the mine slimes per month is being shipped.

An especially interesting feature of the Coniagas mill is the great increase in efficiency of the Deister tables resulting in modifications introduced by Mr. Fraser Reid. The table deck has been changed from the standard type to one that not only does the work better, but is also much simpler in construction. Run in competition with other tables the superiority of Mr. Reid's modified deck has been conclusively proved. The concentrate produced by the new style table is said to average about 1,000 ounces, while that from the old style was 300 to 500 ounces.

The mining company's report for the year 1910-1911 shows that during that period the mill crushed 52,320 tons of ore, an average of 169 tons per day and shipped

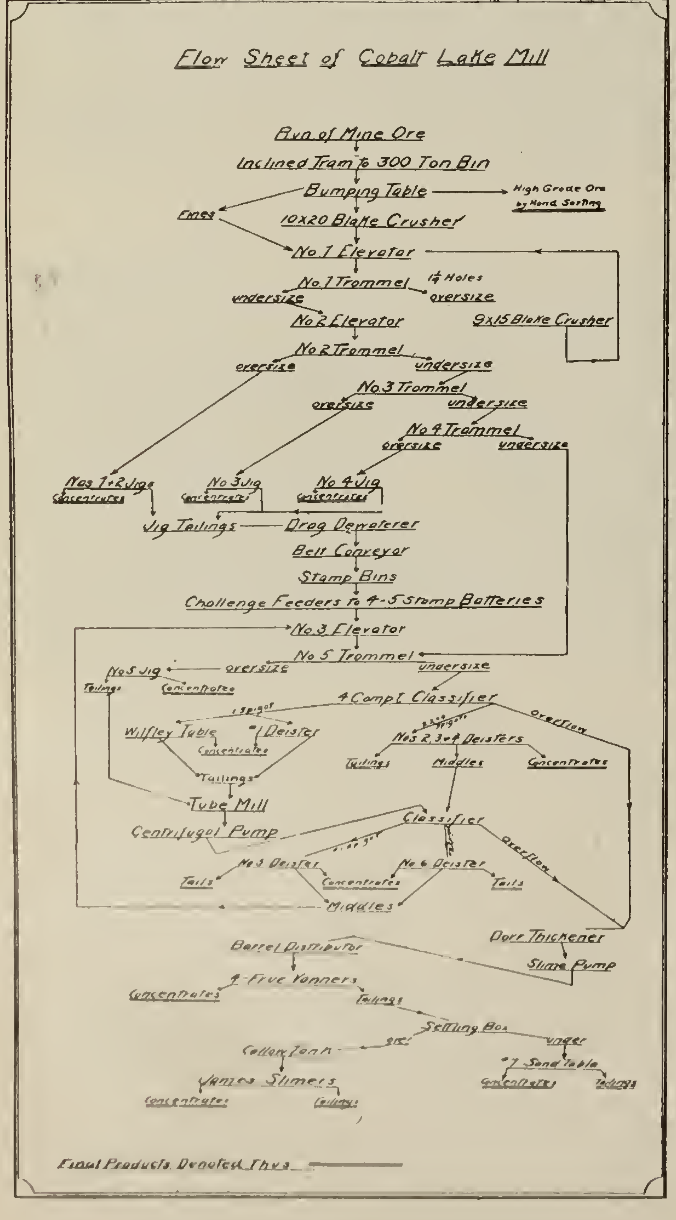
FLOW SHEET, HUDSON BAY CONCENTRATOR.



1,418.4 tons of concentrates containing 1,643,616 ounces of silver. The recovery was about 87 per cent. Sand tailings, containing 4 to 8 per cent. slime, averaged 3.8 ounces silver per ton. Slime tails, 85 pér cent. of which was 200 mesh or finer, averaged 6.6 ounces silver per ton.

### Hudson Bay and Cobalt Lake Concentrators.

The method of treating ore at the Hudson Bay and Cobalt Lake Mills is indicated by the accompanying flow sheets, the first taken from Mr. A. A. Cole's report and the second from the Mining Company's annual report. These two plants are among those most recently constructed.

---

## Armstrong Whitworth Company to Have Canadian Branch Plant.

It is announced that a site has been secured on the south shore of the St. Lawrence River, within Montreal harbour, by the well-known English company, Sir W. G. Armstrong Whitworth & Co., Ltd. A plant to cost about $1,000,000 will be erected for the manufacture of machinery, tool steel, etc. It is not intended that the Canadian branch will do any military or naval work.

The credit of bringing this new industry to Canada is said to be largely due to M. J. Butler, formerly general manager of the Dominion Steel Corporation and to Sir Percy Girouard, who is a director of the English company.

The announcement, coming while the United States Steel Corporation is establishing a branch plant at Ojibway, Ontario, indicates clearly that English steel makers, as well as those of the United States, believe that Canada offers a profitable field for investment. Armstrong Whitworth & Co. on May 31 announced an issue at par of £1,000,000 five per cent. shares. This is supposedly made to finance the Canadian undertaking; but the company's circular does not state the purpose of the issue.

# GEOLOGICAL SURVEY FIELD WORK IN 1913

Owing to the meeting of the International Geological Congress in Canada this year, the field work of the Geological Survey will be somewhat curtailed, as many of the officers are required for the work of the Congress, but as will be seen from the following programme of field operations, its work will still be comprehensive and extensive. Most of the parties have left for their respective fields.

### Canadian Arctic Expedition.

On the Canadian Arctic Expedition of V. Stefansson, George Malloch will be geologist and geographer for the Northern party, which will explore the unknown seas and lands north of the mouth of the MacKenzie and west of Banks and Prince Patrick's Land.

For the Southern party the following officers have been detailed: R. M. Anderson, zoologist; K. G. Chipman, geographer; J. R. Cox, assistant geographer; J. J. O'Neill, geologist; H. Beuchat, ethnologist; D. Jenness, ethnologist.

The Southern party will investigate the region about Coronation Gulf, including the Coppermine River basin and Victoria Land. The occurrence of copper-bearing rocks in this region makes the geological examination and mapping of great importance. The copper companies are interested in the possibilities of the region, as there are no physical difficulties that would prevent mining. Geological and geographical data are required for the guidance of prospecting for copper in this territory. Should copper be discovered in commercial quantities it would mean the opening up, by transportation, of the whole MacKenzie River valley and the Arctic Coast.

## GEOLOGICAL SURVEY FIELD PARTIES IN OTHER PORTIONS OF THE DOMINION.

### Geological Division.

### Maritime Provinces.

Bell, W. A.—Areal mapping of the Windsor and Horton series in an area comprising about 200 square miles, in the vicinity of Windsor, designated the Windsor map.

Faribault, E. R.—Revision and completion of the geological mapping of the western portions of Sheets 94 and 95, Lunenburg County. Completion if possible of Geological Sheets 91 and 92, Shelburne and Queen's Counties.

Goldthwait, J. W.—Investigation of the glacial features and physiographic history of Nova Scotia. General examination of sand, clay and gravel deposits not hitherto reported on.

Hayes, A. O.—Areal mapping (geological) of the St. John Sheet.

Hyde, J. E.—Continuation of investigation of the Carboniferous areas of Nova Scotia.

Wright, W. J.—Areal mapping (geological) of the Moncton Sheet. Preliminary examination of geological sections at Dorchester and Joggins.

### Quebec.

Harvie, R.—Completion of the mapping of the geological sections between Knowlton Landing and Cowansville. Completion if possible of Orford map.

Mailhiot, A.—Detailed petrographical and mineralogical investigation of the granitic areas of the Eastern Townships, which may contain gold, scheelite and tinstone(?).

Keele, J.—Continuation of the investigation of the clay deposits of Quebec.

Stansfield, J.—Completion of field work between Quebec and Mattawa, including the survey of the raised beaches on the Island of Montreal.

Wilson, M. E.—Areal mapping (geological) of the Buckingham Sheet (apatite, mica, graphite area).

### Ontario.

Barlow, A. E.—Detailed investigation of the corundum deposits at and near Craigmont.

Collins, W. H.—Completion of areal mapping (geological) of the Onaping Sheet (139). Commence revision of Sudbury Sheet.

Johnston, W. A.—Areal mapping of the calcareous drift which forms the valuable agricultural lands northwards from the International Boundary.

Taylor, F. B.—Continuation of investigation of glacial drift forms in Southwestern Ontario.

Uglow, W. L.—Completion of work between Port Arthur and Fort Frances, Can. Nor. Ry.

Williams, M. Y.—Continuation of investigation on the Silurian of Southwestern Ontario.

### Manitoba.

MacLean, A., and Wallace, R. A.—Investigation of the gypsum, anhydrite and associated beds of the Gypsumville districts and the beds furnishing the saline springs along the west shore of Lake Winnipegosis and of the phosphatic shales west of the Winnipeg Lakes.

### Saskatchewan.

Rose, B.—Completion of field work between Banff and Golden. Preparation of guide book of the Rocky Mountain Park at Banff.

Cairnes, D. D.—Areal mapping (geological) of the White River copper district. Examination and immediate report on the copper deposits of Valdez Island. Reconnaissance of the placer area southeast of Teslin Lake.

Camsell, C.—Reconnaissance in the Similkameen district.

Clapp, C. H.—Completion of areal mapping (geological) of the Duncan Sheet and the Sooke Special Sheet, Vancouver Island. Examination of alunite deposits on Kyuquot Sound, V.I.

Drysdale, C. W.—Completion of investigations of the gold-copper deposits of Rossland, including the South Belt.

Leach, W. W.—Examination of area being investigated for oil, Sheep Creek, Alta. Completion of areal mapping (geological) of Flathead Special. Commence areal mapping of Crow's Nest Sheet.

McConnell, R. G.—Examination of copper deposits at Granby Bay and Britannia. Reconnaissance of copper-bearing area of Rainy Hollow.

MacKenzie, J. D.—Areal mapping of the coal measures of Graham Island.

Ries, H.—Continuation of the investigation on the clay deposits of Western Canada.

Schofield, S. J.—Completion of areal mapping (geological) of East Kootenay sections, extending them to Kootenay Lake. Completion of geological section at Elko.

Whittaker, E. J.—Examination of geological sections of Mesozoic formations along Old Man River and Race Horse Creek, Race Horse map area. Preliminary examination of Cretaceous sections in escarpment west of Dawson Bay, Lake Winnipegosis.

### General Work.

Burling, L. D.—Collection of fossils, with the assistance of W. D. Matthews, from Matthews type localities in the Cambrian near St. John, N.B. Study sections which may be expected to afford data for the proper correlation of the constituent parts of the lower portions of the Quebec group. Stratigraphical palaeontology of section north of Yukon River, along 141st meridian.

Daly, R. A.—Field work between Golden and Vancouver.

Dowling, D. B.—Review coal development in Western Canada.

Kindle, E. M.—Examination of sections of the Devonian and Silurian in Quebec, New Brunswick and Nova Scotia. Supervision of certain stratigraphical palaeontological field parties.

LeRoy, O. E.—General supervision of field parties. General Congress work. Act as guide on C-2 Excursion (I.G.C.).

Young, G. A.—Supervision of certain eastern field parties.

Lambe, L.—Examinations of beds containing vertebrate remains in Western Canada.

Ingall, E. D.—Examination of bore holes, Ottawa and vicinity.

### Topographical Division.

W. E. Lawson, White River District, Yukon; S. C. McLean, Similkameen District, B.C.; A. C. T. Sheppard, Crow's Nest Map-area, B.C.; A. G. Haultain, Windermere Map-area, B.C.; E. E. Freeland, Lillooet Map-area, B.C.; F. S. Falconer, Flathead and Sooke Map-areas, B.C.; D. A. Nichols, Thetford Map-area, Que.; B. R. MacKay, Pictou Map-area, N.S.

The Anthropological and Biological Divisions of the Geological Survey will also have parties in the field.

---

# THE HARRIS MINES, NEAR HAZELTON, B.C.

By E. Jacobs.

Now that the Grand Trunk Pacific Railway has been constructed through the Hazelton district of Omineca mining division, more mining development work is being done in that part of the Skeena River country than was practicable at reasonable cost when the district was entirely without railway transportation facilities. In a recent number of the Omineca Herald, published at New Hazelton, there was printed some information designed to show what progress had been made in the development of the American Boy group, now known as the Harris Mines.

The Hazelton district was visited in the summer of 1911 by Mr. Wm. Fleet Robertson, Provincial Mineralogist for British Columbia, who, as he stated in his published report, "proceeded to examine the various mineral claims in the district within possible reach of the approaching railway transportation." The report on the numerous claims examined is contained in the "Annual Report of the Minister of Mines, 1911," which may be obtained on application to the Department of Mines, Victoria, B.C. (until out of print). The two sketch maps prepared to illustrate the report on parts of the Omineca and Skeena country are useful, for they give an excellent outline of the districts concerned. So that the impressions of the Government official of what he saw may be placed at disposal of readers, extracts have been made below from his report, and these are followed by the first above-mentioned particulars from the Omineca Herald. It should be kept in mind that the information quoted from the Provincial Mineralogist's report relates to what he saw two years ago, while the newspaper account gives particulars of the conditions after much development work has been done.

### Two-Mile Camp.

Under this heading the Provincial Mineralogist reported, in part: "The American Boy group, consisting of eight claims, owned by Harris Bros. and Mullen, of Hazelton, is situated on the eastern slope of Two-mile creek at an elevation of about 3,200 ft., and distant from Hazelton, by the trail, some seven miles.

"The camp and the various workings are on an easily sloping bench on the eastern side of, and several hundred feet higher than, the valley of Two-mile creek, in a dense growth of large hemlock, spruce, and balsam timber. The camp consists of a very good log-cabin with tents.

"The development of the property has been done by the owners, with little outside assistance, and is made up chiefly of stripping trenches in surface soil, uncovering the veins, and two small shafts.

"There are at least three parallel veins shown by the work done, and these are all of about the same general character, having a general north-and-south strike and a steep dip.

"No. 3 vein is probably the most promising and has received the most development; it occurs on a very easily-sloping hillside at an elevation of 3,200 ft., having been developed by an inclined shaft sunk 25 ft. in an argillite country-rock, and shows a very well-defined quartz vein, averaging about 24 in. wide, containing a heavy percentage of galena, with some zinc-blende, iron-pyrites, and arseno-pyrite. The vein has a strike approximately north and south and dips about 75 degrees; it is very regular and continues, as has been proved, for some distance.

"An open-cut about 20 ft. to the north of the shaft exposes the vein for a length of 10 ft., in which the vein shows clearly about 27 in. of white quartz with, disseminated through it, bunches and stringers of galena, etc.

"In the shaft, a few feet underground, there appears on the hanging-wall a light-coloured dike which did not show in the surface workings. The vein, as exposed in shaft, continues quite as strong to the bottom, varying somewhat in its width, but maintaining an average of 24 in. The mineralization in the vein also remains strong to the depth shown.

"As indicating the proportion of ore in the vein, it was noted that there was a pile of ore on the dump, amounting to about 30 tons, taken from the shaft in sinking the 25 ft. A sample taken by the writer, as roughly representing this ore-pile, assayed: Lead, 11.5 per cent.; silver, 138 oz., and gold, 0.2 oz. to the ton. A second sample taken of the ore in another vein on the property assayed: Lead, 48 per cent.; silver, 125 oz., and gold, 0.02 oz. to the ton.

"No. 2 vein is a couple of hundred yards down the hill from No. 3, and has been exposed by stripping and open-cuts for several hundred feet, which show it to be unusually regular and persistent, having a strike of N. 40 deg. W. and a dip of about 80 degrees to northeast, with a width of from 2 to 3 ft. The vein-filling is white quartz containing galena and a little zinc-blende, pretty generally disseminated through the vein, but in variable amounts at different places. The ore does not occur in a sufficiently concentrated form to be shipped direct, but would make a good concentrating ore.

"No. 1 vein lies still farther to the south, having about the same strike and dip as has No. 2 vein; it is some 3 ft. wide and has been traced by stripping for from 300 to 400 ft.; the vein-matter and mineralization being similar to No. 2 vein.

"A shaft has been sunk on this vein for a depth of 35 ft., and it is reported that a drift 20 ft. long has been made at the bottom, but as the shaft was partly filled with water, this could not be seen.

"The property is one of much promise as a concentrating proposition, and is ideally situated for cheap mining. When the development in the present location at the outcrops shall justify it, an adit can be driven from the valley of Two-mile creek, where the plant would be situated and all the ore brought out."

**A Present-Day Account.**

The following account of the development, etc., of the property, as at May 24, has been published in the Omineca Herald, admittedly by a firm having for its object the sale of shares in the Harris Company, to provide money for continuing development and making an output of ore:

"No. 1 vein opened by shaft 100 ft. deep in ore. Drift north 40 ft., on ore from the 100-ft. level. Ore along this drift is not of shipping grade, but vein and size of orebody all along very strong. At 80 ft. farther to the north on surface this vein is 3 ft. wide, with 16 in. of solid clean shipping ore averaging $90 per ton in silver and lead. The drift will be driven on the 100-ft. level to this point where it is reasonable to suppose a fine shoot of ore will be encountered.

"No. 2 vein opened by a crosscut tunnel 360 ft. long and taps the vein at 120 ft. depth. Drifting 45 ft. determines that the vein is badly broken at this point, but very high-grade ore in spots. Engineers advise active prosecution of work on this vein.

"No. 3 Vein.—Incline shaft to 19-ft. level. Vein and ore strong and continuous all the way down; ore averaging $100 per ton, varying in width from 6 in. to 3 ft. Drift off the 190-ft. level north is now in 170-ft. Shoot of extremely high-grade ore encountered at this point in the past week. The shoot is now 2 ft. 6 in. wide in the face, with 14 in. of solid clean galena streaked with grey copper averaging $300 per ton, while the remainder of the vein averages $155 per ton. From a point 75 ft. north in this shaft a fine shoot of ore was encountered which is continuous to date. The first carload of ore was shipped to the smeltery at Trail from this shoot in the past month and the net returns were $73 per ton, or $2,190 for the 30 tons. Another carload is about ready and will be shipped from New Hazelton in a short time. A drift run south on this same level shows the vein and ore of the same high-grade character as in the north drift. A drift was also run north from the 100-ft. level a distance of 90 ft. and shipping ore was continuous. A particularly fine shoot was encountered at a distance of 70 ft.

"No. 4 vein has been opened by surface cuts along the length of the vein and shows ore of equally good shipping grade as No. 3 vein.

"No. 5 Vein.—Open-cuts and surface stripping show much the same as Nos. 3 and 4. In spots the ore is of the highest value yet discovered. This will be opened by incline shaft this summer.

"The company owns eight adjoining claims (400 acres) and much of the surface has not been thoroughly prospected.

"All work to date has given good results. The high grade of the ore, continuity of the veins, and uniformity of the orebodies have satisfied practical mining men of the district that this property will be a good producer and a profit-maker. The depth at present obtained—about 200 ft.—has proved that the orebodies are larger and richer than at the surface, and such marked improvement at depth as a general rule insures the life of the ore.

"The total expenditure to date has been $19,000; some 1,500 ft. of development has been done. In addition, much surface prospecting has been done, and cabins, bunkhouses, etc., have been built. The four Harris Bros. have given the best part of two-and-a-half years to the property, besides having employed miners at wages. . . .

"To develop the mine further, by sinking another 100-ft. on the proved orebodies, it will be necessary to use machinery. To purchase this machinery and to defray the cost of sinking 100 ft. deeper, 100,000 shares of treasury stock are to be offered to the public. With the proposed work accomplished and a similar grade of ore at depth, the mine will be in a fair way toward becoming a dividend-payer. The profits from the ore from the drifts and stopes will, from now on, be used to further develop Nos. 1, 2 and 5 veins. The net proceeds from each car should average $2,000, taking the net profit from the first 30 tons as a basis. In view of the recent strike of high-grade ore the average may run much higher. . . ."

---

**The McGillivray Creek Coal and Coke Company,** operating a colliery at Carbondale, near Coleman, Southwest Alberta, held the annual meeting in Spokane, Washington, on June 5th. Officers and directors were re-elected, as follows: Lorne A Campbell, Rossland, B.C., president and general manager; James A. Nowell, Spokane, vice-president; W. E. Cullen, Spokane, secretary-treasurer. These, with P. M. Paine, Glencoe, Minnesota, and Fitzhugh Burns, St. Paul, Minnesota, constitute the directorate. Official reports presented at the meeting indicated satisfactory conditions at the mine, from which coal is being shipped regularly. Plans for increasing the output are under consideration.

---

**The Standard Silver-Lead Mining Company,** operating the Standard mine and concentrating mill near Silverton, Slocan Lake, B.C., for the calendar year 1912 reports as follows: Receipts: From 9,703 tons of silver-lead ore and concentrate shipped, $680,000; from silver-zinc concentrate, $41,340; from Government of Canada, bounty on lead produced, $20,240; from boarding house receipts, $16,500; total, $758,080. Disbursements: For supplies, $85,820; for labour, $113,954; balance, being net profit for year, $558,306. Dividends paid to shareholders totalled $425,000, leaving balance on hand, $133,306. The directors and officers of the company for the current year are: W. J. C. Wakefield, president; John A. Finch, vice-president; Chas. Hussey, secretary-treasurer; Geo. H. Aylard, manager, and P. Clark.

# A MACHINE-DRILL COMPETITION

A unique contest, in which teams from most of the copper mines in Michigan took part, was held at Calumet on August 23, 1912. The competitors used only drills made by one firm—and the contest was chiefly in speed of rigging up the machines. After rigging up the miners turned on full air for 2 minutes, and then turned it off and changed steel. No account was taken of the depth of the hole bored, and the prizes went to the team that took the shortest time for the complete operation.

Owing to the large number of contestants two blocks of granite were used, and the drills rigged up on opposite faces. In this way four faces could be used at once. The rules of the day were as follows:

1. Only one entry will be accepted for each contest, from each mine.
2. Complete outfit to be placed 10 ft. from place of rigging.
3. Nuts on clamp and arm to be even with the bolt, at the start.
4. One standard wrench to be used.
5. A 50-ft. length of hose coiled, one end connected with the air supply.
6. Both chuck bolts to be tightened.
7. Jack screws to be flush with bottom of jack, at the start, and collar to be stationary on the post.
8. Each contestant to rig up, turn on full air, and run his drill 2 minutes and change steel at the finish and tighten both chuck bolts.
9. Numbers will be marked on rock and cap and contestants will draw for position and place in contest.
10. Machines, drill steel and hose and complete equipment will be furnished.
11. The drilling will be on flat, dry holes.

Provision was made for 1-man and 2-man contests. Two men rigged up a Rand 3 B and one man a C 113 Butterfly machine. The Ingersoll-Rand Company donated three prizes of $100, $50 and $25 for each class. The Calumet and Hecla Mining Company furnished compressed air delivered at the drills at about 85-lb. pressure. The accompanying photographs show how the frameworks for the granite blocks were constructed.

**Drilling Contest, Calumet, Mich,**

Thirty-eight teams were entered.

The 1-man contest was won in 4 min. 33 sec., and the 2-man in 3 min. 42 sec.

After the rigging-up contests a match between a machine drill and two hammers and drill, resulted in a victory for the machine. The hand-drillers made 49 ins. in 15 minutes. The machine-drill made over 50 ins. in 14 minutes.

The rules for this match provided that each competitor should drill for 15 minutes, in a block of granite, but the machine operator pierced the block before the expiration of the time allowed.

The hand drillers started with a 1¼-inch bit and finished with a ¾-inch. The machine operator started with a 2-inch and finished with a 1⅛-inch bit.

# PERSONAL AND GENERAL

### MR. E. T. CORKILL, INSPECTOR OF MINES, RESIGNS TO TAKE POSITION WITH CANADIAN COPPER COMPANY.

The Canadian Mining Journal has recently learned of the resignation of Mr. E. T. Corkill, Chief Inspector of Mines for the Province of Ontario, during the past nine years. The resignation comes as a result of the inauguration by the Canadian Copper Company of a new policy in connection with their mines and metallurgical plants, whereby the company creates the position of safety engineer, which is to be filled by Mr. Corkill.

There is without doubt no man who has such an intimate knowledge of the mines of Ontario, and at the same time, of the great nickel deposits of the Sudbury area. The Canadian Copper Company would go far afield before securing a more capable, efficient and energetic official than the former inspector of mines. Aside from the pecuniary benefits which will certainly accrue to this great company, the humane and laudable efforts to decrease the number of accidents, and to inculcate methods of safety among the employees will meet with the hearty approbation of the responsible mining fraternity and the general public.

Mr. Corkill, who has won the respect of the mining men of Ontario, has made a host of friends in the north country, and filled the difficult positon of inspector of mines with firmness and dignity. To criticize, without arousing antagonism, the mining method of men who were often much older and more experienced than himself, required the possession of rare tact and good judgment. With these qualities Mr. Corkill is endowed.

Born in Frontenac County, Ontario, in the year 1880, it was perhaps natural that Mr. Corkill should take kindly to the mining profession, since that country is unsurpassed for the quality of its mica and feldspar, and is the seat of the well-known School of Mining at Kingston. He received his early education at the Sydenham High School, from which he matriculated in 1897, entering the School of Mining, Kingston, three years later. Fitted by temperament and physique for the onerous work of mining engineer, he early entered with enthusiasm into the spirit of his profession. Part of his college course was under the guidance of Willet G. Miller, who was then professor of geology at Queen's University. In 1904 Mr. Corkill received the degree of B.Sc., and the following year the degree of mining engineer. During his undergraduate course he gained considerable experience while working in the summer months for the Canadian Copper Company and the mines department of the General Electric Company. After graduating in 1904 he was appointed superintendent for the General Electric Company's mica mines in New Hampshire, which position he held until appointed in 1905, by the Ontario Government, to the important post of inspector of mines for the Province and later chief inspector. The latter appointment he has held continuously up to the present time.

The Ontario Government loses a valuable official, and it is certain that Dr. Miller, the Provincial geologist, and Mr. Gibson, the Deputy Minister of Mines, will keenly regret his departure, while, at the same time, wishing him success in the larger field he has entered.

It is regrettable that the salaries of Government officials cannot be raised to correspond with increased usefulness of the men. A large fund of information gathered during several years of careful observation, and invaluable on many occasions is lost to the country because of the policy of making the compensation for faithful service so small that the men are attracted by numerous better offers from outside, and eventually leave the service.

---

D'Arcy Weatherbe announces that he has withdrawn as partner from the firm of Bainbridge, Seymour & Co., and has taken offices and will continue practice at 62 London Wall, London, E.C.

Mr. C. W. Meek, superintendent of the Dome Mines, has left for a trip through the States and to California which will take about three months. His place is being looked after by Mr. De Pencier, of Copper Cliff. Mr. Hansen, who resigned as mill superintendent, has also gone to the States. His position was taken by Mr. J. Longworth.

Mr. John S. MacLean has been appointed to take charge of the publicity and advertising work of the Canadian General Electric Company, Limited, and of the Canadian Allis-Chalmers, Limited, with headquarters in Toronto. The latter company, in addition to manufacturing an extensive line of machinery and appliance, will also act as sales agents for all the products of the Canada Foundry Company, Limited. Mr. MacLean held a similar position with Allis-Chalmers-Bullock, Limited, for a number of years.

Mr. C. Ivan Murray, B.Sc., McGill, has accepted a position as metallurgical engineer with the Pittsburg Electric Furnace Co., Pittsburg.

The Sullivan Machinery Co. have just published three new bulletins, No. 38-M, No. 66-M, and No. 112, describing different types of air compressors and hammer drills.

Mr. Frank Loring has returned from a trip to Western Ontario.

It is reported that the Mond Nickel Company has taken over the old Worthington nickel mine in the Sudbury district.

Mr. D. W. Brunton, of Denver, Colorado, has been on a visit to his son, Mr. Frederic K. Brunton, who is assistant superintendent at the British Columbia Copper Co.'s smelting works at Greenwood, B.C.

Mr. Chas. A. Banks, manager for the Jewel & Denero Mines, Ltd., operating a gold mine and stamp-mill in Long Lake Camp, Boundary District of British Columbia, has returned from a visit to England.

Mr. T. Walter Beam recently returned to Denver, Colorado, from the Similkameen district, B.C. He is prospecting with the diamond drill a group of mineral claims in Hedley camp, Similkameen.

Mr. J. J. Campbell, of Nelson district, British Columbia, who some years ago was commercial manager for the Hall Mining and Smelting Co., with his fellow-members of the British Columbia Agricultural Commission, travelling about that Province obtaining information relative to its agricultural industry.

Mr. Chas. H. Clapp, of the Geological Survey of Canada, is reported to have accepted a position on the Faculty of the School of Mines of the University of Arizona at Tucson, Arizona, U.S.A.

Mr. A. W. Davis is now in charge of mining operations at the Consolidated Mining and Smelting Co.'s No. 7 mine, in Boundary district, B.C.

Mr. James Finlay, for several years actively connected with the management of the Sullivan mine and smelting works in East Kootenay, B.C., is now manager of the Maple Leaf coal mine, near Frank, Southwest Alberta.

Mr. Albert I. Goodell, formerly manager of the copper smelting works at Boundary Falls, B.C., and afterwards of the Le Roi Mining Co.'s smeltery at Northport, Washington, is now manager for the Idaho-Continental Mining Co. He represents the Ryan interests, which have advanced the company $325,000 for expenditure on development of its mine and equipment of its concentrator, situated about 26 miles from Porthill, Idaho. Latterly, Mr. Goodell had been district representative of the International Smelting and Refining Co., and had made Spokane his headquarters.

Mr. A. L. Gatsinger, of New York, is spending some time on the property of the Dividend-Lakeview Consolidated Gold Mining Co., Ltd., on Dividend Mountain, Osoyoos mining division, British Columbia, in which developing property he is interested.

M. Beatty & Sons, Ltd., will be represented in Toronto by H. W. Petrie, Ltd.

Dorothy China Clay Pit, St. Stephens, Cornwall, England

## THE CORNISH CHINA CLAY INDUSTRY.

Kaolin, as it was called, was first used by those ingenious people of China in the manufacture of their own domestic vessels, but those who were better skilled in this crude art, made finer specimens which they exported. The secret of this ancient industry was well kept for many generations, until it was unravelled by some missionaries, who were travelling in the Celestial Empire. The ware took its name from the country of its origin and when the raw material was eventually discovered by William Cookworthy in the St. Austell or Mid-Cornwall district in the year 1755, the original name was still retained. Kaolin or China clay is the result of the partial decomposition of granite rock and one of the most remarkable and interesting features is that whereas there are many plastic clays derived from other strata, yet none of these can be employed for the purposes for which pure clay or kaolin is most essential. Such clays are, however, used in large quantities for the manufacture of earthenware pipes, floor-tiles and coarser kinds of pottery.

Kaolin is derived from feldspar, one of the principal constituents of granite. The granite disintegrates and the feldspar becomes decomposed, and thus the substance called kaolin is originated.

When it is considered that only two generations ago, less than 1,000 tons of China clay were produced in Cornwall and the output last year amounted to considerably over 900,000 tons, one has some conception of the advance made in recent years of this great Cornish industry. Of this vast production about two-thirds is used in the great paper manufactories of the world.—Pulp and Paper Magazine.

# SPECIAL CORRESPONDENCE

## COBALT, SOUTH LORRAIN AND GOWGANDA.

**The May production of McKinley-Darragh-Savage Mine** reached a total of 206,781 ounces, which showed an increase of more than 40,000 ounces over April, and is the highest for the present year. The increase in production was partly due to a better grade of ore being treated and partly to the starting of the new mill extension. Of the total ounces produced only 42,662 ounces came from the Savage mine. 75 tons daily is being transported from the Savage by the aerial tramway to the McKinley concentrator. This ore is being taken from the Savage dumps. A total battery of fifty stamps is now in operation.

**The production of the Cobalt Townsite** for the two weeks ending June 7th was 81,900 ounces. The production of the Casey Cobalt for the same period was 40,400 ounces.

**The Cobalt Lake Mining Company** this month went on a regular production basis of 35,000 ounces. All forty stamps are now dropping in the mill and about 150 tons are being treated daily. The plant has a capacity of about 175 tons daily, which will probably be reached shortly. Underground some high grade ore has been discovered in what has been called No. 1 vein. It is most probably a continuation of one of the best producers of the Cobalt Townsite, and has been opened up within a few hundred feet of the Townsite extension line. There is a continuous shoot of high grade ore for ninety feet on this vein, and it promises to be one of the most important on the Lake property. A considerable tonnage of ore is being run through the mill from the dump at No. 6 shaft.

**The King Edward**, another old mine, once abandoned, is showing up well. It is leased and operated by the York Ontario. The general manager, Mr. Jackman, reports to shareholders that since February the developments at the mine have been satisfactory. Silver ore has been found on numerous veins. This ore varies from small veins of high grade ore to several feet of milling ore. At the end of April it was reported that there was on hand about 7 tons of high grade silver ore assaying about a thousand ounces to the ton and about 3 tons of second grade assaying 200 ounces to the ton. Three drills are working in the mine and the small plant is treating ore at a customs rate of $3.00 per ton.

**The Meteor Mining Company** is now working again. Some years ago this company bought the Powell claim on Diabase Mountain and ran a tunnel for some distance into the side of the hill. From this tunnel a shaft was sunk 100 ft. Work is being resumed at this point.

## PORCUPINE, SWASTIKA AND KIRKLAND LAKE.

**The strike at Porcupine is virtually over.** Twice it was brought forward at the union meeting that the strike should be declared off, but on both occasions it was decided that it should be continued. At the last meeting, however, it was felt by the leaders that they could no longer hold their men, and while they did not declare the strike off they gave the union men permission to seek work. This they did with alacrity. The married men went the rounds first; and after they had had a chance to secure berths, the single men followed. Any company in Porcupine that desires to work can now get a full complement of men.

Upwards of a thousand men went on strike last September, but not a third of these were in camp when the strike virtually ended. For the past two months they have been drifting out of camp to other Northern Ontario fields, to Cobalt, and to Kirkland Lake and Swastika. Some dozen of them accepted government work on the Kirkland Lake road at two dollars a day and board.

The strike began last September with the determination of the McEnaney, Jupiter, Plenaurum, McIntyre and Vipond to cut wages, owing to better conditions prevailing in the camp. A conciliation board was formed and heard evidence. The strike followed when the award was made, the men refusing to accept it. It has been attended with more violence than is usual in a Canadian strike, although no one has been seriously injured. For instance, the last Hollinger report chronicles the fact that one of the houses of the shift bosses had been burned down and when investigation was made it was found to have been sprinkled with petroleum.

Now that the strike is virtually off, the camp has already begun to show signs of mending. The mines that fought the strike have, as a matter of fact, been steadily improving; but many in the prospective stage decided that it would be more advantageous to shut down till the strike was over rather than to incur the expense of fighting it. These will now start up again almost at once. The industrial conditions in the Porcupine camp have been subjected to a unique succession of disasters. There was first the big fire which swept out of existence the work of a busy six months. the boom that followed it was almost as disastrous since it was inevitably followed by a depression, then just as business was picking up again in the various settlements the strike arrested progress again. Now it would seem there is again a clear sky and the camp should be in a good position in every respect in the fall.

**Hollinger May Report.**—Owing to the fact that the mill only ran 49 per cent. of the time possible for the four weeks ending May 20th the net profits for the Hollinger Gold Mines were only $48,611.34. Mr. P. A. Robbins gives the cause as due to a total shut down of power for twelve days, owing to mishaps at the power plants in the camp. However, conditions are again normal, and the mine and the mill producing satisfactorily.

The profits from the first of the year to May 20th are $598,505.70.

Mr. P. A. Robbins' report says, in part: During the shut down the mine was operated at reduced capacity by means of steam-driven compressors and the development ore was not hoisted from the mine until the resumption of milling operations. In order to get the mine clear it was necessary to mill this development rock when milling operations were resumed and the month's operations, therefore, show a falling off in grade as well as a great reduction (one-half) in tonnage treated. Having milled only 50 per cent. of the usual output, and having been put to a heavy policing cost, it will be understood that the total costs per ton are of necessity abnormally high, but the present period will show a reduction in costs to a figure considerably below those previously published. The approximate average value of all ore hoisted was $17.53 per ton. Mining costs:

| | |
|---|---|
| Production .................... | 3.506 per ton milled. |
| Exploration .................... | $0.227 per ton milled. |
| Development .................. | 0.745 per ton milled. |
| Total ........................ | $4.478 per ton milled. |

The mill treated a total of 6,560 tons, average value of ore treated $17.53 per ton., approximate extraction 95 per cent., milling costs $2.280 per ton milled.

**Goldfields, Limited.**—Forty stamps are dropping in the mill of the Goldfields, Limited, at Larder Lake, some eighty tons per day going through to the tables. Tube mills have been ordered and a cyanide plant will be installed with the intention of increasing the capacity very largely and also the extraction, which by the simple amalgamation now in vogue is not high. All the ore is coming from a "glory hole," the mining being very expensive. The ore body is large, but the grade is very low. The shaft is now being put down another hundred feet, and the open cut will be carried through.

**At the Mine d'Or Huronia**, a Montreal property, situated halfway between Larder Lake and the Kirkland Lake section a compressor plant and boilers are being set up. The company has a ten-stamp mill; but it has not been set up yet nor are the foundations in. While there is a good surface showing there is practically no underground development work done.

**At the Hughes Porcupine** the small mill is now running after a stoppage of two months and a half. The first bar was melted on the property last week. A vein has been struck between the 200 and 300-foot levels, and is said to be good ore.

**At the Teck Hughes, Kirkland Lake,** the compressor plant is now running. The shaft will be put down to the 100-foot level before any cross-cutting is attempted.

**The Government Road.**—Good progress is being made with the work on the Government road between Swastika and Kirkland Lake. 150 men are employed and the right of way has already been cut as far as Gull Lake. It is the intention of the Government to put in an excellent road and an appropriation of over $3,000 a mile has been made.

Prospectors have this year been more active than for several springs past, but are being driven out of the woods by the flies, which are this season unusually severe.

## NOVA SCOTIA.

**Dominion Coal Outputs.**—The output of the Glace Bay mines for June will be about 395,000 tons. This will be slightly in excess of June last year. Outputs are a little restricted by a shortage of labour, the supply not being quite equal to the rapid expansion of the mines. A large number of men returned to Europe at the outbreak of the Balkan War, and none of these have returned. If the long-promised demobilization of troops takes place no doubt men will commence to come back, but in any case immigration from Southeastern Europe will be small for a long time to come.

No. 11 Colliery, which was unwatered only in April, is now producing an output of almost 200 tons daily. The unwatering of No. 17 Colliery is proceeding satisfactorily, but it is not likely that this mine will be a producer until next year.

The No. 2 Bankhead of the Nova Scotia Steel Co. was destroyed by fire in the middle of the month. The restriction of output caused by this mishap will be very small, as the hoisting arrangements were only slightly damaged. The bankhead was a wooden one of old design, and fully covered by insurance.

The Cape Breton Coal Iron & Railway Co. are now producing a small output from the Broughton mine. It is understood that orders have been passed for coal cars and locomotives, and some small shipments will probably be made by the autumn.

**Nova Scotia and Immigration.**—Nova Scotia, and the Island of Cape Breton, in particular, has never received a "square deal" in the matter of immigration and labour supply. The overwhelming bulk of the advertising literature that issues from the Dominion and floods the countries of Europe paints the lure of the "last, best West," but who in Europe, outside a few specialists, hears of Nova Scotia? There are people even in Toronto who regard Cape Breton as a close approximation to the wilds of the Yukon, and who have a vague idea that the country and the climate resemble northern Labrador. It is only a short while ago that a letter was received in Glace Bay addressed to the "Old Dominion Coal Company, Little Glace Bay, South Cape Breton." The letter came from one of the Government Departments at Ottawa, and the address had evidently been extracted from a directory at least twenty-five years old. Why the word "old" was prefixed to the address is a mystery, unless the idea was to give the address a thoroughly antiquarian flavour. A metropolitan newspaper recently referred to Glace Bay as "a little cove on the Bay of Fundy." These incidents are trivial, but illustrate the prevailing ignorance of Nova Scotia. Most people think of Glace Bay as a place where Marconigrams are received for the New York dailies, and if they remain in ignorance of the existence of the greatest coal industry in Canada, it cannot be said that the advertising agencies of the Dominion make much ado to enlighten them.

The immigrant fare on the railway from Halifax to Montreal and Toronto is very much less than the fare from Halifax to Sydney, i.e., an immigrant is carried from Halifax to a city over a thousand miles distant for a less charge than for conveyance from Halifax to Sydney, a distance of less than three hundred miles.

The regulation which demands that every intending immigrant into Canada must show $25.00 of his own money in addition to transportation to destination, was temporarily held in abeyance, but becomes effective again at the 1st of July, because of alleged signs of financial depression. It may be that frantic speculation and foolish inflation of values in the West are being reduced to saner dimensions by the existing tightness of the world's money markets, but no financial depression exists in Nova Scotia, nor any threatened surplus of workers. Since 1906 there has been a chronic labour shortage in Nova Scotia. The Province needs immigrants, particularly miners and mine labourers. Farm labourers and railway labourers are admitted into Canada without restriction. Why should not mine labourers be considered equally necessary? Canada is not wholly dependent on farmers and railways, though to judge from some of the regulations of the Immigration Department some people apparently think so.

It is an absurdity to expect a European miner to emigrate who can raise $25.00 in addition to steamer fares and rail fares, and an outfit. This means an expenditure of from $100.00 to $150.00 for the miner who wishes to emigrate from Germany or England. The miner in Europe who can boast of such a sum has no need to emigrate, but there are hundreds of miners who cannot pay their way across who would gladly come were they able. It is not fair to judge conditions as to labour in Cape Breton by the congested areas of Western boom cities, or the winter soup kitchens of Toronto and Montreal.

Nova Scotia should demand a separate Immigration Department of her own, unhampered by Federal control. The immigration needs of the Province are pressing and peculiar, and no industry in Nova Scotia should be in the least degree hampered by regulations framed to meet conditions prevailing in the other Provinces of the Dominion, but not present in Nova Scotia. Halifax is the great gateway for immigration—to the West. The newspapers report 5,000 immigrants in one day, of which number not fifty stay east of Montreal. It is even said that immigrants brought especially to Nova Scotia through the efforts of the paid immigration officers of the Province have been detained and threatened with deportation under Federal laws administered by Federal officials. Surely it is time Nova Scotia said what immigrants should or should not come through her principal port, and insisted on equal terms with the West.

## BRITISH COLUMBIA.

### War Eagle Mine Headworks Burned.

The Rossland "Miner" has printed the following account of the destruction by fire, on June 1, of the big shafthouse and other buildings comprising the head works of the War Eagle mine at Rossland, British Columbia, which mine is one of the well-known Centre Star group of mines, owned by the Consolidated Mining and Smelting Company, of Canada, Ltd.

"One of Rossland's chief landmarks was destroyed by fire on Sunday evening, when the War eagle shafthouse, standing as it did on one of the slopes of Red Mountain, so that it could be seen from every portion of the city, went up in smoke and flames. The shafthouse contained, beside the plant, a lot of very dry mining timber, ready for use in the mine, and this also burned very rapidly.

"The fire was successfully fought from the shaft of the War Eagle. One bulkhead was put in on the 100-ft. level of the mine, and another on the 200-ft. level. The flames were prevented from entering the mine by means of well-directed streams of water from the collar of the shaft and from the 100-ft. level. Only about 25 ft. of the timbers below the collar was burned.

"After the fire had burned for nearly an hour, the structural steel frame of the building and the steel gallows-frame, collapsed as easily as though they had been of cardboard.

"The flames continued their work of destruction until about 11 o'clock at night, but in the meanwhile the streams of water were kept constantly at work until finally the fire was extinguished. The loss is estimated at about $50,000; it is partially covered by insurance.

"On Monday morning work was continued as usual in the mine, and a number of men were employed on the surface in clearing away the debris. The War Eagle hoist has been used to lower and bring up men and to handle waste and timber. The ore has been sent up through the Centre Star shaft, so the destruction of the War Eagle shafthouse will not seriously affect the production of ore nor reduce in numbers the underground working force. The Centre Star hoist can do, and is doing, the work that had been done by the War Eagle hoist, so that the disaster is not nearly so serious as would have been the case had the Centre Star headworks been destroyed instead of that of the War Eagle.

"The War Eagle shafthouse was erected in 1898-9, soon after the Gooderham-Blackstock syndicate acquired the mine."

### Placer-Mining on Granite Creek, B.C.

The Similkameen Star says: "R. A. Lambert has again replaced the dam on Granite creek, near the north fork, which was washed away by high water last year. He has made the present dam as secure as possible, having anchored it in the solid rock on either side. Its dimensions are: 80 ft. long, 10 ft. deep, 12 ft. 6 in. wide, and an apron of 30 ft. Much interest is taken in Mr. Lambert's work, which, if proven successful, will give an immense impetus to placer-mining throughout the district. Gold and platinum are known to be in the creeks and rivers and it is hoped Mr. Lambert may demonstrate the successful mining of these placers. His flume is 950 ft. long, 5 ft. 6 in. by 3 ft. inside, and will carry the creek at low water."

The following excerpt from a paper by Mr. Chas. Camsell, of the Geological Survey of Canada, taken from Vol. XIII, 1910, of the "Journal of the Canadian Mining Institute," is of interest in connection with the foregoing news:

"A short distance above the mouth of the north fork, on the main Granite creek, Messrs. R. A. Lambert and Stewart are doing the only serious placer-mining in the whole district. The preliminary development has been carried on by five men for the past three seasons, but the actual sluicing of the gravel may only commence in the coming season. Lambert and Stewart have a lease of one-and-a-half miles of the creek bed above the north fork, a very small part of which had been worked in former times. The gold recovered from these portions was very coarse, though the bedrock was reached in only one spot. In this particular portion, which was but 200 ft. in length, the yield is said to have been $1,200 to the length of a sluice box, where the gravel in the stream bed had a width of 40 to 50 ft. This yield included nuggets, the gold value of which was from $100 to $150; the platinum, however, was fine. The remainder of the creek bed covered by the lease is deep ground and could not be bottomed. Lambert and Stewart are now engaged in cutting down the bed of the stream in the lower part of their lease, in order to reach bedrock and recover the gold and platinum lying on it. Commencing at the lower end of their ground, a dam has been constructed across the stream bed, while 600 ft. of a board flume carries the water over the portion of the channel which it is proposed to first work. The large boulders and rock in the lower part were blasted away, thus enabling the removal by ground-sluicing of a depth of about 25 ft. of gravel, which before formed the bed of the stream. The depth of gravel overlying the bedrock is now about 5 ft. and the point has been reached when the gravel can be shovelled into the sluice boxes. This, however, can only be done after the season of high water has been passed. The returns should show a proportion of about four parts of gold to one of platinum, and should amply repay the cost of the preparatory work."

**Conditions in Metal Mining Camps.**—With the return of summer there is general activity in the chief metal mining camps of the Province. Although there is still an unsettled feeling in parts of Slocan district owing to the persistence of the agitating element of the Miners' Union, there has not been any stoppage of mining operations from labour troubles. Whether or not there will yet be seems uncertain, but it is understood that a considerable number of the miners are opposed to a strike. There does not appear to be a similar feeling in either Rossland or Boundary camps, or at least nothing was heard during a recent visit suggestive of any serious interference with mining operations. On the Coast, the situation at the Britannia Co.'s camp is stated to be similar to what it has been ever since the company made up its full number of miners and helpers from non-union sources.

**In the coal mining districts** matters are as usual, with the exception that the mines at and about Nanaimo, Vancouver Island, are still non-productive. Whether the operators will be able to resume production without first coming to an agreement with the United Mine Workers of America, which organization called the strike, is not yet clear; certainly they are endeavouring to make arrangements with a sufficient number of their employees to get things running again independently of the sanction of the union. At the time of writing no information is available as to the prospects for success or failure in this direction.

**Kaslo.**—On July 13 the "Spokesman-Review," of Spokane, Washington, published the following concerning the Rambler-Cariboo, one of the best-known mining properties in Slocan district: "According to a report received yesterday by Walter J. Nicholls & Co., the Rambler-Cariboo mine, in Slocan district, B.C., up to May 1, had shipped 250 tons more ore to the smeltery at Trail than the total output of the mine in 1912. The shipments for the period covered by the report aggregated 1,403 tons, as against 1,153 tons for the whole of 1912. Last week the quantity shipped amounted to 189 tons, and the company is preparing to increase operations. The new concentrator is turning out 300 tons of concentrates weekly and the output is to be augmented, according to the report, as a higher-grade mill-feed is being extracted for treatment. All kinds of rumors are being circulated locally in explanation of the sudden drop in the price of Rambler-Cariboo shares, the most persistent being that the concentrator, completed but recently, will have to be rebuilt, the system having proved inefficient, but officials of the company vigorously deny this and assert there is nothing in the financial condition of the company to warrant the break, and that there is nothing wrong with the property physically. There are between 350 and 375 shareholders in the Rambler-Cariboo Company, most of them residents in the Inland Empire, and the recent rapid decline in the price of the shares, coupled with the resignation of Mr. W. E. Zwicky, the former general manager, has caused some uneasiness among them."

**New Denver.**—Now that the snow is off the wagon-road to the Idaho-Alamo mines, the repairing gang has been putting the road in good condition for hauling. Two cars of silver-lead ore will be at once hauled to the railway at Alamo, for shipment to Trail.

**Capella Mine.**—The trail to the Capella is being cleared and supplies will shortly be taken up, so that W. R. Will may resume work in this mine. Some very rich silver ore has been taken from the Capella in past years, one carload having returned more than $10,000.

**Silverton.**—With the melting of the snow the wagon-road and trail to the L. H. group, in the mountains a few miles south of Silverton, is once more fit for travel, so the British Columbia Copper Co. is arranging to resume development work on the Slocan property, on which it has an option of purchase. There is here a body of ore of considerable size and averaging $7 or $8 in gold.

**The Consolidated Mining and Smelting Co.** has taken under option a group of claims in Four-mile camp, near where the old Wakefield concentrating mill stood before it was burned. Thos. J. Lloyd has been prospecting this group and having developed a good showing has bonded it to the Consolidated Co., which is arranging to do further development work.

**Silverton Mines, Ltd.**—The concentrating mill recently put in by the Silverton Mines, Ltd., is reported to be working satisfactorily on ore from that company's Hewitt-Lorna Doone group of mines at which development work has been kept up for a number of years. One unit of the Minerals Separation flotation process plant has been included in the equipment of the new concentrator.

**Greenwood.**—The work of hauling to the Jewel gold mill at Long Lake, some 40 or 50 tons of new machinery, which lately reached Eholt from England, was in progress late in May and early in June. C. A. Banks, manager for the Jewel-Denero Mines, Ltd., immediately set about installing this additional plant. Lumber for use in the erection of another building for the accommodation of men employed at the Jewel has also been taken up from Eholt. It is stated that operation of mine and mill will shortly be undertaken to full capacity and that there will consequently be more activity in Long Lake camp than for a number of years.

More than 3,000 tons of ore has been shipped from the Consolidated Mining and Smelting Co.'s No. 7 mine since work was resumed in it several weeks ago. The ore is quartz, containing value in gold and silver; it is conveyed by aerial tramway down to the Canadian Pacific Railway at Boundary Falls and hauled thence to the smeltery at Trail.

**Hedley.**—From the Gazette it is learned that T. Walter Beam left Hedley late in May for Denver, Colorado, intending to return in June to spend part of the summer in the camp. Before leaving he saw that arrangements for prospecting the properties he and his associates lately bonded were well forward, and diamond-drilling had been commenced. The country over which power and water lines had to be taken is rough and it was somewhat difficult to do the requisite preliminary work in the rocky canyons in which much of the drilling is to be done. It is stated that three drills will be kept in continuous operation, and some 25 men will be employed. Gomer P. Jones, general superintendent for the Hedley Gold Mining Co., will have the oversight of this work as well as continuing his ordinary duties.

**New Hazelton.**—At the Erie, on Four-mile mountain, the tunnel was in 170 ft. by the end of May. Another car of ore is to be shipped, this time to the Consolidated Co.'s smeltery at Trail. Some time since the district gold commissioner reported that a shaft had been sunk 75 ft., while open-cuts had been made in the outcrop of the vein along a distance of 300 ft. The vein had been found to have an average width of 14 ft. and to contain an ore-shoot ranging from 18 in. up to 4 ft. 6 in.

There are now about 30 men employed at the Silver Standard, on Glen mountain, and three power drills are being worked. The cross-cut adit is being advanced about 6 ft. a day and it is expected that the vein will be reached before the end of June. After the provincial mineralogist visited this property two years ago, he reported that much prospecting work had been done on a system of several veins varying in width up to 6 ft. of vein-matter, chiefly quartz. The work done had shown the veins to be continuous and permanent and to contain in places shoots of ore, principally galena. A sample taken by that official gave returns on assay: Lead, 58 per cent.; silver, 303 oz.; and gold, 0.24 oz. to the ton. Since then underground development has proved the occurrence of much ore of excellent grade, and the property has been sold to a railway contractors' syndicate—Stewart, McLeod and McHugh.

# COMPANY NOTES

## VIPOND PORCUPINE GOLD MINES COMPANY

Manager C. H. Poirier, under date of May 23rd, 1913, says in part: "The total amount of development to date is as follows: Shafts, 385 feet; drifts, 2.517 feet; crosscuts, 1,832 feet, raises, 220 feet; 1.070 feet of drifts on the various veins has been timbered, chutes placed at intervals, and stopes started.

"The installation consists of the following: One Sullivan two-stage belt-driven compressor of 873 cubic feet capacity per minute, driven by a 150 h.p. G. E. motor, one 9x12 Jenckes hoist, one 100 h.p. Robb-Munford boiler, three transformers of 225 kw. capacity, mill installation of the Hardinge type of 120 tons daily capacity, fully equipped with motors, etc., and 600 square feet of amalgamating plate. Blacksmith shop with all necessary furnishings, change house, fitted with shower baths, for the convenience of the men. Powder magazine, powder thaw house, three cottages, store house and stable. Suitable buildings housing all machinery, headframe and plant. Necessary lighting and heating equipment.

"The main shaft has been sunk to a depth of 325 feet, crosscuts have been run at 100-foot intervals, intersecting both the Godfrey and the Davidson veins, the limits of the main oreshoots on these veins have been reached on both the 100 and 200-foot levels, and both shoots have been partially explored on the 300-foot level. Surface prospecting has shown the existence of at least one additional oreshoot on the Davidson vein which has not yet been explored underground. A very small amount of drifting would prospect this oreshoot at a depth of 300 feet.

"A conservative estimate of ore blocked out above the 200-foot level shows 40,000 tons of an average assay value of $10.00 per ton. Development on the 300-foot level shows the continuance of the known oreshoots above on both the Godfrey and Davidson veins to that depth, and as far as the work has gone there is apparently no change in values or widths. The ore occurrence being erratic, the above estimate includes only ore blocks that have been exposed on at least three sides. An additional probable tonnage of at least 15,000 tons between the 200-foot and the 300-foot levels can reasonably be figured on.

"Based on the mining and milling of over 5.000 tons of ore, it is estimated that the total cost of extracting 95 per cent. of the values in the above ore reserves will average approximately $4.45 per ton. Tailings impounded from ore already treated should yield a net recovery of over $15,000.

"The gross bullion output to date has been $20,928.00, this represents a recovery of 48 per cent. of the values in the ore milled. The low extraction is accounted for by the high percentage of sulphides, found in the ore from the Davidson vein, and the difficulty in securing the necessary supply of water for amalgamation. Numerous tests have shown that the addition of a suitable cyanide plant to our present installation, will insure a recovery of at least 95 per cent.

"A cyanide plant should be erected as an annex to the present mill installation, the tailings resulting from past operations cyanided, work underground started, in time to insure a full supply of ore for the mill, when the tailings have been disposed of and development of the known ore bodies carried on at a rate commensurate with the output of the mine."

Henry H. Ward, president of the company, in a letter to shareholders states that he and his associates, in addition to paying in $125,000 for stock at 50 cents a share, have advanced since January 1st, 1912, upwards of $60.000. Other shareholders were asked to subscribe $50,000. On May 23rd, 1913, shareholders of the Porcupine Gold Mines Company were offered for subscription at par, $125.000 bonds of the Vipond Porcupine Mines Company, Limited.

President Ward, in a letter accompanying the offer of bonds, says in part:

"Pursuant to an agreement made in October, 1911, a syndicate composed for the most part of the Directors of the Company, bought and paid for 250,000 shares of the Treasury Stock of the Company at 50 cents per share, a price at that time somewhat higher than the market value. This realized the sum of $125,000 for the Company. Under the agreement entered into at the time this amount was to be paid in before January 1st, 1913. Full payment of the amount, however, was completed on June 14th, 1912. After that date further amounts, aggregating in excess of $62,000, were advanced to the Company by certain shareholders. Other indebtedness of the Company amounts to somewhat more than $18.000.00.

"At the time that the agreement was entered into by which the Company was provided with the $125,000.00 it was expected that the machinery which was to be purchased with the funds so provided would be installed and in operation certainly not later than April 1st, 1912. There was various unforeseen and unavoidable delay in connection with the installation of this machinery, and as it was not considered wise to halt development work pending its installation, the funds thus provided had to be used not only for the purchase of machinery, but to carry on development work for a considerably longer period than had been anticipated. It resulted, therefore, that when the mill was finally ready to operate, about July 1st, 1912, the $125,000.00 had been spent, and it was necessary for further money to be advanced before the mill could be put on a paying basis.

"Even then it was hoped that the operation of the mill, treating the ore by the amalgamation process alone, would pay for operating expenses, provide for a reasonable amount of development, and soon put us in a position where, if additional plant was required, it could be purchased without its being necessary to undertake any new financing of the company. However, although the mill was found to be satisfactory in every way, so far as its design and installation were concerned, it was found that the ore under conditions existing could not be treated by the amalgamation process with an extraction sufficient to carry out this program as expected. It was found, too, when the actual stoping of the mine was undertaken, that in many parts of the workings, the walls were of such a character that considerably more waste was broken with the ore than had been calculated upon. This reduced the head assays considerably, and, while the amount of ore, or ore and waste, treated was thereby somewhat increased, the expense of extracting a given amount of value increased also.

"Another difficulty encountered in the operation of the mill was the lack of sufficient water to satisfactorily treat the ore by the amalgamation process alone.

"Before determining on further steps to be taken, an examination of the property was made by competent engineers, and, as a result of their report, it was decided that it would be necessary and desirable to install a cyanide plant. The cost of this installation should not exceed $30,000.00.

"From the statements of our engineers and from examination of other similar cyanide plants in operation, it is confidently expected that with the erection of the cyanide plant our extraction will be not less than 95 per cent. Moreover, the difficulty as to the water supply will be eliminated as the available supply of water is at all times sufficient to run the mill to its full capacity using the cyanide process.

"In November, 1912, the mine operatives of the Porcupine District went on a strike, shutting down practically all of the plants in that district including our own, and in view of the conditions existing we have considered it wiser not to resume operations until the cyanide plant is provided and ready for operation. In the meantime our staff has been reduced to the lowest possible limit, and our monthly expenses cut down correspondingly.

"As will be seen from the foregoing, certain shareholders of the Company in addition to providing on terms most liberal to the company the amount of $125,000, have further advanced the considerable sum of $62,000, for the further operations and development of the property. The indebtedness of the Company to these shareholders and other creditors now amounts to $80,000+. The Directors have used their best efforts not only to carry the work on economically, but to provide or obtain the necessary funds, without calling on the general body of shareholders. Under present circumstances, and in view of the large amounts already advanced, and in view of the other debts of the Company, it becomes necessary in the interests of all shareholders to provide for an early liquidation of these debts and provide at the same time sufficient additional funds to erect further plant and put the property on a paying basis. In the event that a sufficiently large amount of subscriptions are not received it will obviously be necessary for the present creditors to take such steps as may be necessary for the protection of their own interests. Should this course be forced upon them the interests of the shareholders at large may suffer. It is, therefore, in the best interests of all concerned that shareholders respond generally and liberally to this call."

## SIR W. G. ARMSTRONG WHITWORTH AND CO., LIMITED.

The certified profits for the past three years, after providing for Depreciation, Interest on the Debenture Stock and the Dividend on the four per cent. Preference Shares, have been as follows:

For the year ended—

| | |
|---|---|
| December 31st, 1910 | £487,864 18 0 |
| December 31st, 1911 | 467,826 3 7 |
| December 31st, 1912 | 635,526 11 6 |

Dividends have been paid on the ordinary shares for the past five years as follows: 1908 to 1910, 10 per cent.; 1911 and 1912, 12½ per cent. In the year 1912, after providing for the interest on the Debenture Stock the dividend on the four per cent. Preference Shares and the above-mentioned dividend for 1912 of 12½ per cent., there was carried forward to the credit of Profit and Loss Account the sum of £335,849 10s.

The company's works at Newcastle, Manchester and elsewhere are fully occupied, and orders are in hand which the directors consider sufficient to justify them in estimating that the rate of profit above indicated will be maintained.

The Directors of the Company are: Sir Andrew Noble, Bart., K.C.B., F.R.S., Chairman; The Right Hon. Lord Rendel, Vice-Chairman; Herbert Hanbury Smith Carington, Esq.; John Meade Falkner, Esq.; Colonel Sir Edouard Percy Cranwill Girouard, K.C.M.G.; Henry Neville Gladstone, Esq.; The Right Hon. Sir George Herbert Murray, G.C.B.; John Henry Brunel Noble, Esq.; Saxton William Armstrong Noble, Esq.; Rear-Admiral Sir Charles Langdale Ottley, K.C.M.G.; Henry Whitehead, Esq., M.V.O.

**Rambler-Cariboo Mines.**—Early in June directors and shareholders in the Rambler-Cariboo Mines, Ltd., from several cities in the State of Washington proceeded to Kaslo, B.C., to there attend the annual meeting of the company, convened for Tuesday, June 10th. Before the meeting was held a visit was paid to the Rambler-Cariboo mine, in McGuigan Basin, Slocan, and the concentrating mill on the middle fork of Carpenter Creek, about three miles above Three Forks. The party included Dr. John Armstrong, Tacoma; Mr. Frank Bowman, Seattle; Dr. B. W. McPhee, Col. John Hunter and Mr. Alfred Coolidge, of Spokane. At the meeting, Messrs. Coolidge and A. M. McLaine, and Dr. McPhee, all of Spokane; Dr. Armstrong and Rev. Father S. P. Hylebos, of Tacoma; and Dr. John Benson, of Colfax, were re-elected directors of the company. Mr. W. E. Zwicky, of Kaslo, for many years manager of the company, tendered his resignation. Mr. John Rinta, also with the company a long while, as mine superintendent, is named as likely to succeed Mr. Zwicky as manager.

# STATISTICS AND RETURNS

## BRITISH COLUMBIA ORE SHIPMENTS.

For week ending June 14, and for this year to date, ore production and smelter receipts, in tons, are:

**Boundary.**

| | Week. | Year. |
|---|---|---|
| Nickel Plate, milled | 1,500 | 36,000 |
| Granby | 21,991 | 563,379 |
| Motherlode | 4,830 | 151,462 |
| Rawhide | 5,298 | 119,653 |
| Napoleon | 245 | 16,203 |
| Unnamed | 198 | 3,268 |
| Knob Hill | 79 | 1,251 |

## COBALT ORE SHIPMENTS.

June 21, 1913.

The ore shipments for the week are:

| Mine. | High. | Low. | Pounds. |
|---|---|---|---|
| Cobalt Townsite | 1 | | 50,180 |
| Crown Reserve | 1 | | 40,000 |
| McKinley-Darragh | 2 | | 126,072 |
| Nipissing | | 2 | 129,824 |
| La Rose | | 1 | 100,000 |
| Cobalt Lake | 1 | | 63,100 |
| Hudson Bay | 1 | | 64,582 |
| Temiskaming | 1 | | 62,421 |
| | 7 | 3 | 636,129 |

The shipments from the Cobalt mines to date are:

| Mine. | High. | Low. | Tons. |
|---|---|---|---|
| Coniagas | 25 | | 832.41 |
| Trethewey | 6 | 6 | 332.43 |
| Nipissing | 2 | 33 | 1,094.94 |
| Dominion Red. | 10 | | 318.66 |
| Hudson Bay | 9 | | 336.46 |
| Cobalt Townsite | 30 | | 1,073.56 |
| McKinley-Darragh | 35 | | 1,213.21 |
| Kerr Lake | 9 | 1 | 355.89 |
| Beaver | 7 | | 194.41 |
| La Rose | 31 | 2 | 1,349.27 |
| Peterson Lake (Seneca-Sup.) | 4 | 3 | 250,76 |
| Temiskaming | 10 | 1 | 340.38 |
| Crown Reserve | 7 | | 289.95 |
| Chambers-Ferland | 1 | 4 | 159.20 |
| Colonial | 1 | | 21.56 |
| Cobalt Lake | 13 | | 453.99 |
| Penn-Canadian | 3 | | 87.22 |
| Drummond | 3 | | 87.22 |
| General Mines | | 1 | 8.89 |
| O'Brien | 6 | | 221.26 |
| Silver Queen | | 1 | 60.34 |
| Bailey | 4 | 1 | 102.44 |
| Casey Cobalt | 3 | | 109.72 |
| Right of Way | 1 | 1 | 62.19 |
| City of Cobalt | 4 | | 147.20 |
| Silver Bar | | 1 | 20.00 |
| York-Ontario | 1 | | 20.00 |
| Buffalo | 2 | | 66.13 |
| Silver Cliff | 1 | | 20.00 |
| | 236 | 55 | 9,852.38 |

The bullion shipments for the week ending June 21 are:

| Mine. | Bars. | Ounces. | Value. |
|---|---|---|---|
| Nipissing | 109 | 123,279 | $72,734.61 |
| Kerr Lake | 3 | 3,393 | 2,001.87 |
| Dominion Red. | 43 | 48,633 | 28,693.47 |
| | 155 | 175,305 | $103,429.95 |

Bullion shipments to date, June 21, are:

# BRIQUETTING

## A Profitable Industry that has come to stay

Briquets as they are turned out at the 40-Ton-Per-Hour Plant of the Berwind Fuel Co. at Superior.

Briquetting has had a checkered career. The conversion of inferior—often worthless—slack into a high grade fuel, has been a too-attractive proposition.

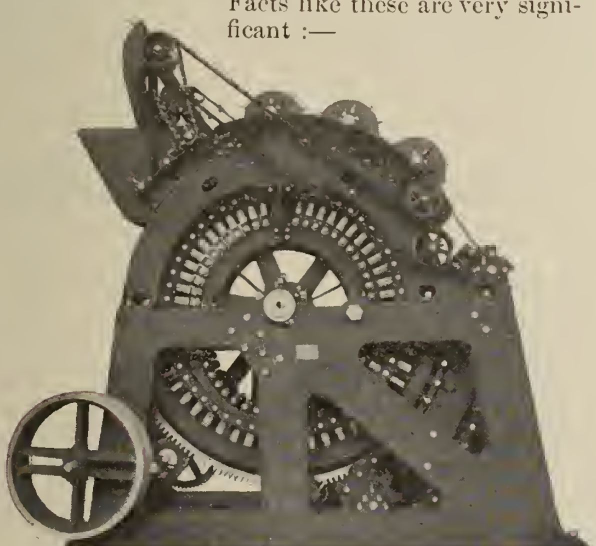
Briquetting has too often been made the football of a cheap sort of "high finance." But that day has passed—briquetting as a profitable industry has come to stay. It has passed from the realm of "high finance" into a permanent and substantial industry.

Facts like these are very significant :—

In 1907, 66,524 tons of briquets were produced in the United States, with a total value of $258,426 ; in 1911, 218,443 tons were produced with a value of $808,721.

In general the cost of making briquets, exclusive of cost of raw fuel and binder, but including interest on investment, depreciation and repairs, insurance, miscellaneous supplies, power, etc., amounts to only 50c to 60c per ton.

Briquets, made from slack that is otherwise worthless, sell for about the same price as the best screened lump coal.



THE LADLEY BRIQUETTING PRESS. The Press that minimizes the percentage of binder required.

There *may* be a briquetting opportunity open to you—there are still undeveloped opportunties in nearly every section of the country.

It is well worth looking into. And you can get no more reliable advice than from our Briquetting Department. We will gladly go into detail. Write.

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assaye Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

---

**BUFF Mining Transits and Levels**

FOR cold or moist climates the Buff Transit is a particularly serviceable instrument. It will withstand greater degrees of heat and moisture without impairment of its accuracy. This is because of the superior metals employed in its making, precise method of assembling and final hard lacquer finish.

The Buff Transit is a particularly serviceable instrument in all climates. It will last at *least* 25 years and probably as long as 50 years

Send for Catalogue 63 **BUFF & BUFF MFG. CO.** Jamaica Plain Station MASS.

# DEPARTMENT OF MINES GEOLOGICAL SURVEY.

## PUBLICATIONS

**The Geological Survey has published maps and reports dealing with a large part of Canada, with many local areas and special subjects.**

A catalogue of publications will be sent free to any applicant. A single copy of a map or report that is specially desired will be sent to a Canadian applicant free of cost and to others at a nominal price. The applicant should state definitely the precise area concerning which information is desired, and it is often of assistance in filling an order for a map or report if he states the use for which it is required.

Most of the older reports are out of print, but they may usually be found in public libraries, libraries of the Canadian Mining Institute, etc.

### REPORTS RECENTLY ISSUED:

CANADA

## Warm in Winter--Cool in Summer

### Comfortable all the Year Round

The Ready-Cut home is the ideal home for the miner. He can buy all material at rock-bottom price—all cut to exact size wanted and shipped in one lot. No skilled labor required to erect.

### "READY-CUT" HOME

(Warm and Substantial—Not Portable)

Every piece of lumber is cut to exact size in our mills and shipped to you together with all hardware, ready to erect. If you can drive a nail, you can build your own home.

## FOR SALE

## Second Hand Machinery

We have recently changed over from Steam to Electric Drive and offer the following:

One Cross Compound Corliss Steam Driven, Corliss Inlet, two stage BB3 Canadian Rand Co. Air Compressor. Capacity at 95 R. P. M. is 1941 cu. ft. free air per minute.

One 10 x 10 in. Robb-Armstrong Horizontal Side Crank Engine Automatic.

One 11 x 14 centre crank Throttling Engine of the Frost Mfg. Co. make, Galesburg, Ill., with two pulleys.

Two Horizontal Tubular Boilers, Jencks Machine Co., each 72 in. x 18 ft. for working pressure of 125 lbs. per sq. in., complete with regular catalogue fittings, fixtures and smoke stacks.

One Header for boilers made up of pipes and valves.

One Austin Vertical Steam Separator.

One 16 x 42 right hand Corliss Heavy Duty Engine. Jenckes Machine Co., Wheel 12 ft. x 24 in. face.

Three No. 2 McCully Gyratory Crushers, manufactured by Power Mining & Machinery Co. One No. 3 Gates Gyratory Crusher.

Two General Electric Magnetic Belt Separators.

One No. 7 Cameron Vertical Plunger Sinking Pump.

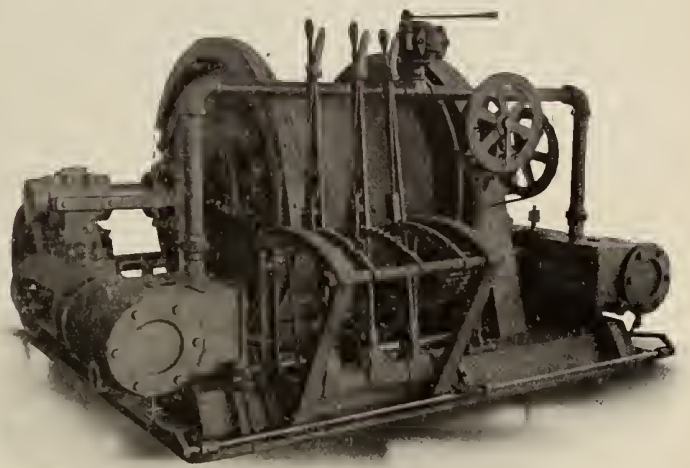
# HOISTING ENGINES

## A GOOD MINE IS WORTH A GOOD HOIST

**And a good Hoist is an insurance policy against delays and accidents.**



**Standard Double Cylinder,
Single Friction Drum,
Reversible Engine,
with
Dial Indicator.**

Good workmanship, good design and good materials are some of the essentials of a good hoist. Add to these the reliability of old responsible manufacturers and you have the choice of a discriminating buyer.

The mining hoists offered by Canadian Ingersoll-Rand Co., Limited, are qualified by these characteristics.

In these hoists you get powerful, rugged construction, with bearings large and friction losses small; good provision for ample lubrication; well proportioned brakes, capable of handling the full capacity of the hoists; and powerful, reliable band friction clutches.

Special attention is given to the cylinders of hoists intended for operation by compressed air. Discharge ports are short, direct and of large cross section, absolutely preventing the collection of frost and consequent back pressure at the exhaust.

# Make the Roof as Everlasting as the Foundation!

You construct the foundation of your building of stone because you know that nothing can affect stone—know that it will *last forever.*

Now suppose your roof was made of the same everlasting stone as your foundation. What an everlasting fire-proof roofing you'd have!

Then why not put on a *stone* roofing? J-M Asbestos Roofing is a light-weight, flexible roofing that is *solid stone* to all intents and purposes.

# J-M ASBESTOS ROOFING

is made of several sheets of Asbestos—*stone*—securely cemented together with Trinidad Lake Asphalt—a *mineral.* It is *all* mineral *all the way through.*

Think what it would mean to you if your buildings were covered with J-M Asbestos Roofing. It would mean not only permanence and absolute security from leaks, no matter what the climate or weather; but freedom from the cost and trouble of coating or re-graveling, and positive protection from sparks and burning embers. It would mean that your roofing would *cost you less per year of use* than any other roofing on the market.

Your dealer has this roofing, or we'll sell you direct from our nearest branch.

Asbestos is a peculiar substance, and very interesting. Perhaps you'd like a sample so you can see what it's like, also our illustrated catalog No. 303.

Mail your request *today* to our nearest branch.

# Genuine Satisfaction

If you have anything to do with Rock Drills, you have, probably, been disgusted with them many times and wished you were running by hand. You are striving for fewer delays, lower mining costs, increased tonnage, and increased profits, and cannot afford to leave anything untried which would aid in the attainment of the above.

Can you afford therefore to pass by

THE

## "CLEVELAND" STOPE DRILL

and not give it a trial when we can guarantee that it will relieve you of this part of your troubles.

There are so many reasons "why" that we haven't space enough here to enumerate them, but will you please

Write for Bulletin No. 30.

# CYANIDE PRACTICE IN MEXICO

BY

**Ferdinand McCann**

Author of 'Beneficio de Metales de Plata y Oro por Cianuracion' and 'Guia Minera.'

***199 Pages. 39 Illustrations. 2 Folding Plates. Cloth, 6 x 9 in.***

**$2.00**

An accurate detailed description of the equipment and practice at all of the important cyanide plants in the Republic of Mexico is given in this book. It is in part a translation of the author's book in Spanish—'Beneficio de Metales de Plata y Oro por Cianuracion.' There has been a revision as well as a translation of the material appearing in that book, so that the practice described is the latest. It contains more information on the cyanidation of silver ores than any other book. The illustrations have been carefully selected and include the flow sheets of many representative mills.

## GOVERNMENT ROADS IN ONTARIO MINING DISTRICTS

Those who have opened up mining properties in Northern Ontario have as a rule little cause to be pleased with the roads built by the government. Very poor roads have been built and these generally after much delay. It is therefore of much interest to note that the government is now building good roads and building them quickly. In the Porcupine and Gowganda districts the prospectors are by no means satisfied with the treatment they have received. In the Kirkland Lake district, however, there is more cause to commend than to criticize the government's road builders. Under the direction of Mr. J. F. Whitson, a roadway was cut from Swastika to Kirkland Lake a distance of six and a half miles, in three weeks, and grading is now being rapidly and well done. If the present rate of progress is kept up there will soon be a good road on which it will be possible to transport heavy machinery. It is planned to dress and roll the road next summer and thus make a permanent highway that will be useful at all seasons of the year.

It is to be hoped that the work now being done on the Kirkland Lake road can be taken as an indication that better treatment is to be accorded the men who are opening up New Ontario.

## GEOLOGICAL MAP OF GOWGANDA MINING DIVISION

The Geological Survey has just published what promises to be a very useful map covering twenty-eight townships in the vicinity of Gowganda, Nipissing district. Mr. W. H. Collins worked in this area during 1908-1910, and the information gathered by him has thus been made accessible. The maps made by Mr. A. G. Burrows for the Ontario Bureau of Mines, have also been an important source of information. The map is colored to show subdivisions of the Keewatin as well as of the Huronian. The succession is given as Keewatin, Huronian, Keweenawan and Pleistocene. Masses of granitic and gneissic rocks are called Laurentian Rhyolite and rhyolite tuff is colored separately and placed in the legend, below the Huronian.

The map includes the district from Shining-tree Lake on the west, to Elk Lake on the east. Gowganda, Hangingstone, Everett, Duncan, Bloom and Stony lakes and the connecting canoe routes travelled by many prospectors in the Gowganda rush, are in the area mapped.

## GEOLOGICAL GUIDE BOOKS

For use of those attending the Geological Congress in Canada this year, the Geological Survey has prepared a very remarkable set of guide books. All the producing mining districts and areas presenting interesting structural features are described and mapped. The country along the whole length of the transcontinental railroads is described briefly, and illustrated by maps that illustrate the noteworthy features, without being encumbered with a maze of unimportant detail. The guide books contain 140 such maps, and will for years be a valuable source of information. The maps of the whole country have been brought up to date and published in attractive and convenient form.

The undertaking was a gigantic one; but it has been very successfully accomplished. Director R. W. Brock and the whole staff of the Geological Survey have made a splendid success of the work, and the Government printer has shown that Canada has facilities for turning out such work in a remarkably short time. To publish such a large number of maps and accompanying text without taking several years for the work was only a few years ago considered quite impossible. It is therefore very creditable to find that Canada has prepared for our European visitors the best set of guide books yet issued by any country.

The Congress will supply guide books to all those who take part in the excursions. Complete sets will be furnished at a very nominal price.

To non-members the price for the set will be about $7.50.

## COAL RESOURCES OF THE WORLD

The volumes on Coal Resources being printed by Morang and Co. for the Geological Congress, like the guide books, are very creditable to Canada. The maps are unusually good, and the general make-up of the volume is a source of pride to both editor and publisher. The Journal will publish a review of the work after the Toronto meeting.

## THE LOGAN MEMORIAL

Mining men and geologists in Canada owe much to the work of Sir Wm. Logan, first Provincial Geologist of Canada. On a very small grant Mr. Logan in 1843 began the work of the Canadian Geological Survey. His early investigations of the Pre-Cambrian in Ontario and Quebec resulted in the first systematic subdivision of these ancient formations, in which nearly all the metallic wealth of the provinces occurs.

An arrangement is now being made to erect suitable memorials to Canada's pioneer geologist. A subscription list has been started, and you are cordially invited to subscribe. Subscriptions should be made payable to the Secretary, 12th International Geological Congress, Ottawa.

## KEELEY MINE HAS GOOD ORE

As a result of development work undertaken by Messrs. Ehrlich and associates, two good veins of ore have been discovered at the Keeley mine, which of late has received much notoriety. The credit for the discovery is due to Dr. J. McIntosh Bell, the company's agent, and former director of the Geological Survey of New Zealand. After a careful study of the mine, on which an option was taken only a few months ago, Dr. Bell planned the operations which have resulted so satisfactorily. It is stated that there is already enough ore blocked out to assure the company a very quick return of the money invested.

## SEVENTH ANNUAL REPORT OF THE BUFFALO MINES LIMITED

The annual report for the year ending April 30th, 1913, shows that the company was very successful. The recovery of silver was 710,591 ounces greater, and the net receipts were $440,038.80 larger. The recovery by the cyanide plant was much greater. The new amalgamation and refining plant was successfully operated, and enabled the company to market the silver more quickly. The ore reserves developed during the year were slightly less than the ore extracted.

The income from operations totalled $1,252,432. The expenses of operation amounted to $310,279.80, and expenses of administration $57,391.55. The net income was $891,192.99. There was paid in dividends $650,000, and surplus for the year was $233,450.49, making the total surplus April 30, 1913, $623,028.16.

The report by Superintendent Tom R. Jones says, under the heading of "Ore Reserves":

"There is no decrease in the stock piles on surface and a slight decrease in the amount of milling ore broken in the mine of 3,224 tons, making a total of 25,767 tons of ore broken in the stopes ready for milling, the mining charges of which have already been paid and no credit is taken for this work in the costs submitted.

"There is still on surface an accumulation of untreated slime tails from the previous year, for further treatment, approximately 12,000 ounces.

"The ore reserves developed were approximately 57,330 tons of about 30-ounce ore, or 1,719,900 ounces. This is about equal to the tonnage removed during the year, but slightly less in ounces. The development has been mainly along branch veins on third level No. 5, with the additional ore developed in the Nancy-Helen workings, also on the first level No. 7. This is new development, as no work has been done previously on this vein. There are several branches of this series of veins and during the coming year they should develop into considerable tonnage of milling ore."

# INTERNATIONAL GEOLOGICAL CONGRESS

During the three years since the last meeting of the Congress, the officers have been preparing for this meeting in Canada. The Dominion and Provincial Governments have contributed liberally, and the railroads have made very low rates for members attending. During the past year a very large number of Government geologists have been working on maps and descriptions of the centres to be visited. The mining companies have given much assistance and will offer the members unusual opportunities of seeing the properties.

Among those who will visit us this summer will be many of the most prominent geologists in the world. It means much that these men by their visit will obtain some idea of the wonderful possibilities of Canada as a mineral producing country.

The first excursion, A1 in charge of Dr. G. A. Young, leaves Montreal July 13. A visit will be made to Quebec and vicinity on July 14, and the following day will be spent on the south shore of the St. Lawrence. Then two days will be spent studying the formation at the eastern extremity of Gaspe Peninsula. On July 19, iron deposits of Bathurst, New Brunswick, will be examined. On July 20 the party will be in Halifax. Visits will be made to the gold and coal mines and the industrial plants at Sydney, Antigonish, Joggins, Moncton, and St. John will be starting points for several local excursions to study geological structures. The party will return to Ottawa Friday, August 1st.

On July 24 Dr. F. D. Adams and Dr. A. E. Barlow lead a party to points of interest in the Haliburton-Bancroft area, Eastern Ontario. The area lies to the north of Lake Ontario, on the margin of the Laurentian Protaxis of the continent. In this district is exposed the most notable section of the Grenville Series in Canada. The strata show to a remarkable degree the results of progressive metamorphism, as a consequence of the intrusion of extensive batholiths of granite, producing various types of amphibolite, etc. This district is also interesting by reason of the very extensive development of nepheline and other alkaline syenites, some of which are of the rarer types. In certain localities these rocks contain an abundance of corundum, while elsewhere sodalite, of a fine depth of colour, is conspicuous. The excursion will also include an inspection of the corundum mines and mills at Craigmont. This party will visit Craigmont on July 30 and arrive in Ottawa July 31.

The guides for the first excursion of members of the Congress to Sudbury, Porcupine and Cobalt will be: Dr. W. G. Miller, C. W. Knight and A. G. Burrows, of the Ontario Bureau of Mines; Professors A. P. Coleman and T. L. Walker, of the University of Toronto; Mr. J. B. Tyrrell, consulting mining engineer, Toronto; and Mr. Arthur A. Cole, mining engineer of the T. and N. O. Ry. Commission, Cobalt.

Dr. W. G. Miller, Provincial Geologist, who is leader on this trip, has arranged to open quarters at his office in the Parliament Buildings for the convenience of the excursionists. The start will be made from Toronto Wednesday evening, July 23, and from Montreal Wednesday morning.

Among those who will make the trip are: J. Stansfield, McGill University; A. W. G. Wilson and G. C. Mackenzie, Mines Branch, Dept. Mines, Ottawa; Alfred C. Lane, Tufts College, Mass.; J. Barrell, Yale University, New Haven; F. L. Ransome, U. S. Geological Survey, Washington, D.C.; H. Eckfeldt, South Bethlehem, Penn.; Miss C. A. Raisin, Bedford College, London, Eng.; A. E. Kitson, London, Eng., delegate of University of Glasgow; S. W. Beyer, Iowa State College, Iowa; H. F. Bain, Editor Mining and Scientific Press, San Francisco, Cal.; G. A. J. Cole, Director Geological Survey of Ireland, Royal College of Science, Dublin, Ireland; Bedford McNeill, president Inst. of Mining and Metallurgy, London, Eng.; Mrs. Bedford McNeill; Dr. Jules Szadeszky de Szadecsne, Kolozsvar, Hungary; Guiseppe Mercial, Pisa, Italy; Fred Searls, Jr., Goldfield, Nevada; Eugenisz Romer, Lemberg, Austria; William H. Emmons, professor of Geology, University of Minnesota, Minneapolis, Minn.; Serafino Cerruli-Irelli, Rome, Italy; Ettore Matirolo, Ingeniur en Chef des Mines, Torino, Italy; George W. Graham, Government Geologist, Khartoum, Anglo-Egyptian Soudan; Annie Eubank, Toronto; Arthur G. Charleton, London, Eng.; Reginald E. Hore, Canadian Mining Journal; H. Sjogren, Sweden; Charles McDermid, Secretary Institute of Mining and Metallurgy, London, Eng.; Prof. E. Wherry, Lehigh University, South Bethlehem, Pa.; E. Ordonez, mining geologist, Mexico City, and Mrs. Ordonez.

## LOGAN MEMORIAL.

At the meeting of the Organization Committee of the Twelfth International Geological Congress, held at the Chateau Laurier, Ottawa, on Tuesday, March 4th, 1913, it was moved by Mr. W. Fleet Robertson and seconded by Mr. W. F. Ferrier and carried:

"That the Logan Memorial Committee, consisting of Messrs. Barlow, Brock, Coleman and Miller, be instructed to proceed with the arrangements for the erection of suitable memorials to the late Sir William Logan, the locations and characters of the memorials to be left to the named committee and that the Organization Committee guarantee the expenses up to the sun of Five Hundred Dollars."

In agreement with this motion the Logan Memorial Committee have asked Mr. Henri Hebert to design and execute a bronze tablet measuring 25 by 30 inches, with a suitable inscription and a bust of Sir William Logan in relief. The original of this tablet will be placed in a suitable and conspicuous place near the entrance of the Victoria Memorial Museum at Ottawa. A duplicate will be securely fastened in position on the southern face of a conspicuous exposure of limestone breccia near the village of Perce, (Gaspe Peninsula), Quebec.

Subscriptions may be handed to any of the members of the Logan Memorial Committee or sent direct to the Secretary of the Twelfth International Geological Congress, Victoria Memorial Museum, Ottawa.

You are cordially invited to subscribe.

The following is a list of the subscribers to the Logan Memorial to date: J. A. Bancroft, \$10; A. E. Barlow, \$25; R. W. Brock, \$5; C. Camsell, \$5; C. H. Clapp, 5; J. M. Clarke, \$50; D. B. Dowling, \$5; J. A. Dresser, \$20; C. Drysdale, \$5; D. A. Dunlap, \$20; W. F. Ferrier, \$20; Abbe R. Guimont, \$5; E. Haanel, \$5; R. Harvie, \$5; R. E. Hore, \$5; M. L. Hersey, \$10; E. Jenkins, \$5; W. A. Johnson, \$10; E. D. Kindle, \$2; O. E. LeRoy, \$5; G. G. S. Lindsay, \$5; A. P. Low, \$10; Jas. McArthur, \$10; W. McInnes, \$10; D. S. McIntosh, \$5; J. McLeish, \$5; G. F. Matthew, \$5; W. H. Merrill, \$5; Mussens Ltd., \$10; M. Nordegg, \$10; W. A. Parks, \$5; M. E. Purcell, \$1; T. W. Racey, \$5; J. C. Sutherland, \$2; J. B. Tyrrell, \$10; T. G. Wait, \$2; J. White, \$5; A. B. Willmott, \$5; A. G. Wilson, \$5; M. E. Wilson, \$10.

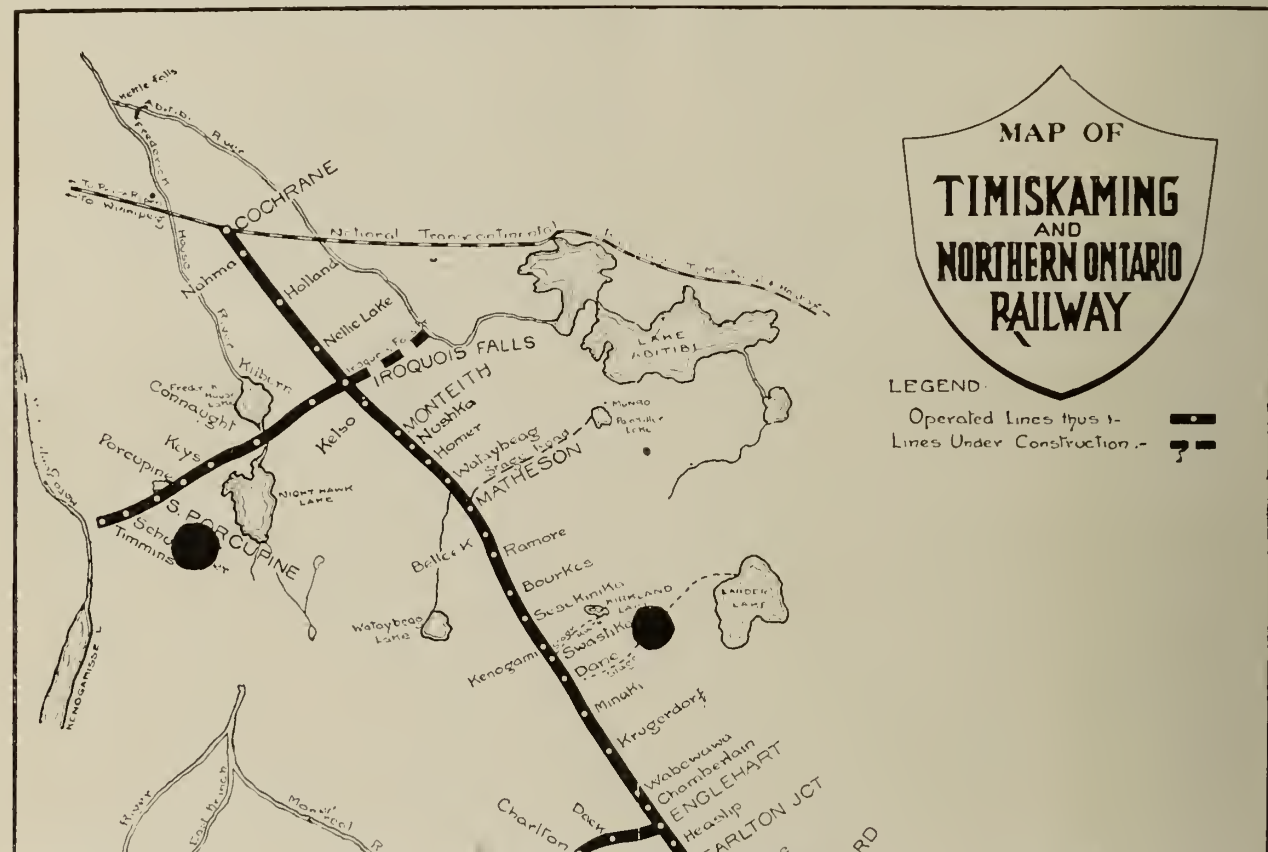
# KIRKLAND LAKE GOLD DEPOSITS

By Reginald E. Hore.

During the past year the development of prospects in the vicinity of Kirkland Lake, Ontario, has resulted in the discovery of important gold deposits. One property, although only equipped for exploratory work, is producing enough gold to pay all running expenses, while a shaft is being sunk on the vein.

**Location of the Goldfield.**—Kirkland Lake is situated in Teck township, close to the main line of the Temiskaming and Northern Ontario Railway. The nearest station is Swastika, which is 164 miles from North Bay and 61 miles north of Cobalt. At Swastika there are two small producing mines, Lucky Cross and Swastika. North and east of Swastika a trail leads to Kirkland Lake and Gull Lake, passing on the way across several properties, including the Wettlaufer, Oakes, Teck-Hughes, Robbins, and Foster, on which work is being done.

From the Foster mine to Swastika the owners have cut temporary roads and now the Ontario Government is building a permanent highway.



Map showing location of Sudbury, Cobalt, Porcupine and Kirkland Lake

**Discovery of Gold.**—The claims in this district were first staked in the Larder Lake rush of 1906 and 1907. For a few years very little was discovered, however, and it was not until 1912 that much of promise was found. During last summer gold was discovered on several claims; but the veins in which it occurred were small and not very continuous. Repeated testing, however, showed that gold occurs in considerable quantity in the rock enclosing thin quartz veins and numerous samples show good values to extend over a width of several feet.

The most extensive development work in the district has been done on claims now owned by Messrs. Foster, Tough and Oakes. The Foster property consists of six claims, four in Lebel and two in Teck township. The total area is about 210 acres. At present the exploration is all being done on one claim.

**The Foster-Tough-Oakes Claims.**—The chief gold deposits at the Foster property are designated as veins No. 1, No. 2 and No. 3. The No. 1, or discovery vein, is a narrow brecciated quartz vein enclosed in a reddish-gray feldspar-porphyry. From it some fair assays have been obtained, but in the opinion of the management it is not as promising as the No. 2 and No. 3.

**The No. 2 vein** is also a very narrow quartz vein; but the ore is rich and there are good values in the wall rocks for a width of several feet. The vein is in a gray conglomerate a few feet north of the contact between the sedimentary series and gray feldspar-porphyry. The contact and the strike of the vein run nearly parallel east and west. So far as can be judged from the arrangement of the pebbles in the conglomerate, this rock dips steeply to the south and, therefore, under the porphyry. According to Mr. Foster, the data so far obtained indicate that the conglomerate dips nearly at the same angle as the vein. So far as the workings have gone the dip is about 60 degrees to the south. The vein has been stripped as far as the rock surface could be easily cleaned—a few hundred feet—and a shaft on the vein is on July 28th, 175 feet deep, on the dip. From an open cut about 30 feet deep, shown in the accompanying photographs, two carloads of high grade ore were shipped. The shaft was then started in the bottom of the open cut. The surface exposure and the shaft excavation show the vein always thin and irregular in thickness and often branching into very thin seams of quartz. The main vein in several places is split down the middle and presents a graphite covered smoothed surface, as may be seen in the accompanying underground photograph, taken by Manager Chas. O'Connell and A. M. Hotchkins.

So far as the development has progressed, and it is being pushed as rapidly as the temporary equipment will allow, the vein shows very high values and the wall rocks contain pay values for the thickness mined. There is no waste rock being broken.

The shaft is sunk in the footwall and if the hanging wall proves as rich as the footwall there will be an ore-body of 15 to 20 ft. in thickness.

**Foster No. 3 Vein.**—Running about parallel to No. 2 vein and a few hundred feet north of it is another important deposit. This one is chiefly enclosed by porphyry; but towards the east traverses a fine grained gray ferrodolomite, and is further east enclosed by conglomerate. Some of the richest ore as determined by sampling is said to be that in the portion enclosed by the gray ferrodolomite. An analysis of this rusty weathering carbonate rock shows that it is highly siliceous. The following analysis is of a dense hard portion, silica 58.80, lime 4.50, magnesia 2.02, iron 3.62, carbon dioxide 6.03. The composition is much like that of an alkali porphyry which has been weathered. Compare this analysis with the one below.

This vein has not been tested to any extent since it was stripped and sampled, and nothing is yet known as to its continuity with depth.

**Tough-Oakes Mine, tramway and mill, Kirkland Lake, Ont.**

**Tough-Oakes Mine and Mill.**—The shaft on No. 2 vein is a two compartment inclined one measuring 6 x 10 ft. inside timbers. It has been broken considerably larger than necessary as the opening is all in ore and no endeavour is made to keep it very small.

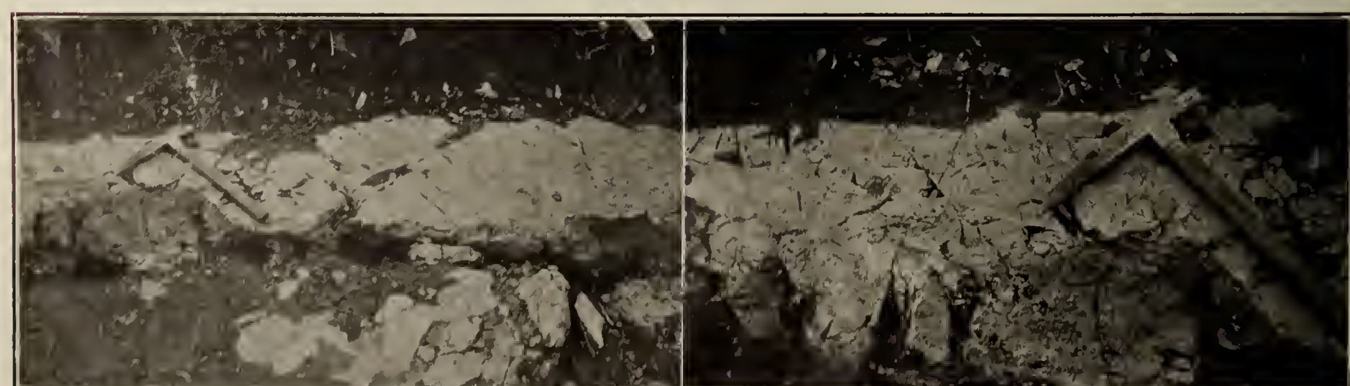
In sinking, two one-man hammer drills and hollow steel are used. The drillers have one helper between them. In the first month of sinking the miners made 100 ft.

The conglomerate rock is rather easily drilled and in one shift enough is broken to keep two shifts busy

Ed. Note.—Just as we go to press we are advised that the name Tough-Oakes Mines, Ltd., has been chosen as the official name of the property referred to in this article as the Foster or Foster-Tough-Oakes.

**No. 1. vein, Tough-Oakes Mine. Gold quartz in brecciated porphyry**

**Conglomerate in which gold quartz veins occur, Tough-Oakes Mine, Kirkland Lake, Ont.**



**Two views of No. 2 vein, a gold quartz vein in conglomerate, Tough-Oakes Mine.**

Two views of Wettlaufer property, Kirkland Lake, Ont.

Two views of gold bearing porphyry. Wright-Hargraves property

Gold quartz vein in porphyry. Wright-Hargraves property

No. 3 vein, Tough-Oakes property

Tough-Oakes Mine, looking west.

Tough-Oakes Mine, looking towards hanging side mucking. The men work 8 hours, and there are three shifts.

The rock broken is hoisted by bucket to surface and there loaded in a tramcar and elevated to the mill or piled on the stockpile. There is excavated in sinking about 25 tons per day and the 5-stamp mill can only treat 11 or 12 tons of this. In blasting, 40 per cent. dynamite is used. The holes for the cut are drilled about 7 ft. and for the bench about 6 ft.

**The Mill.**—The mill is an Allis-Chalmers 50 B battery, 5 stamps of 1,050 lbs. It is driven by a 30 h.p. slide valve engine. The crusher is a 7 x 10 Blake. The mortar block is of wood set in solid rock. The screen is a Toncap 40 mesh. The mill cost $6,000, and was erected in 28 days. It treats about 11 tons per day, making a recovery of about 75 per cent. of the values. About 65 per cent. is recovered inside the mortar, and about 10 per cent. on the outside plates. The mill tails contain about $11 per ton, and are being ponded for future treatment.

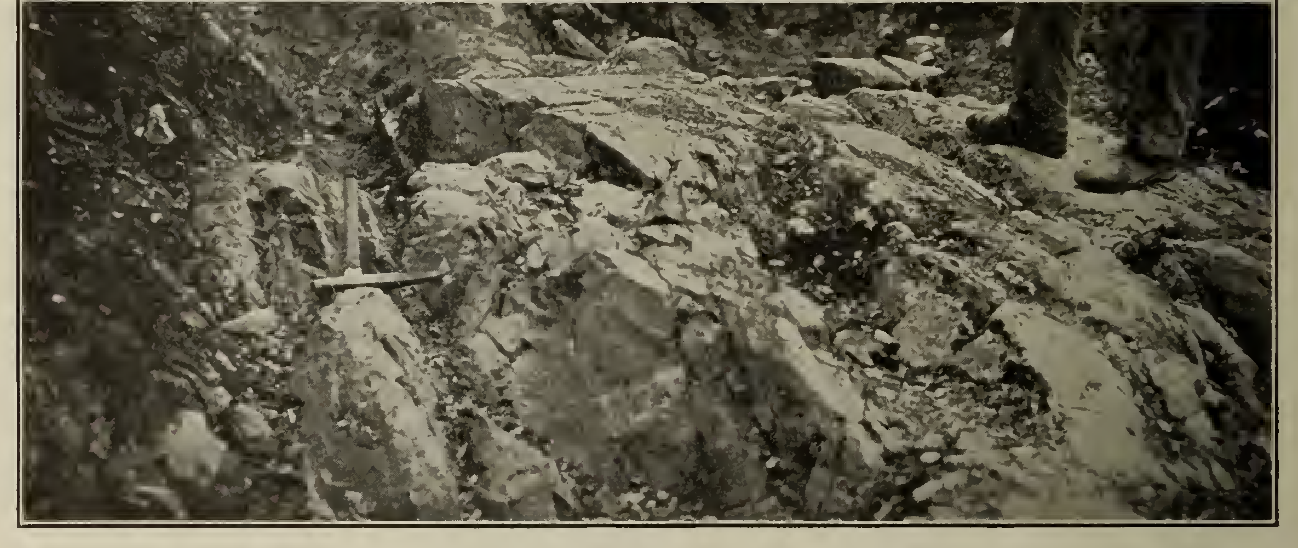
The mill was started May 14, 1913, and has been in continuous operation since. Two bars have been melted one weighing 231 ozs. and the second 122.5 ozs. The first bar was 821.7 fine, and the second 868, so the total

with graphite. In several cases there are slickensided black walls spotted with small flakes of gold. The main longitudinal fracture in No. 2 vein at the Foster mine has afforded numerous specimens of such ore. Quite as common, though not so peculiarly characteristic of these deposits, is the occurrence of abundant pyrite with the gold. Much of the pyrite is in very small grains, and the microscopic examination of wall rocks shows that there are a very remarkable number of small pyrite crystals. Most of these are not in contact with one another; but scattered throughout the rock as single grains.

Some specimens show a little copper pyrites and others arsenopyrite. With these sulphides there is usually much secondary quartz, calcite and sericite, and in some cases chlorite.

Some specimens show gold grains wholly enclosed in calcite, and most specimens containing gold show some calcite.

All the observations are of a nature to make one conclude that the gold is much younger than the wall rocks. These have been remarkably fractured, and their minute particles crushed and broken before the deposition of the gold.



**No. 3 vein, Tough-Oakes property, Kirkland Lake, Ont,**

value was about $6,000. These two bars were shipped on June 27.

**Mode of Occurrence of the Gold.**—The gold occurs as native metal and as telluride. Particles of coarse gold are very common in the fracture planes in the quartz veins. The telluride has not been isolated and analyzed, but is supposed to be calaverite. It occurs with the native gold in rather poorly crystallized grains of a greenish bronze colour. The native gold and telluride while most abundant in the quartz veins occurs also in the wall rock. Native gold in coarse grains is, however, generally found in the veins rather than in the rock.

A very remarkable feature of the deposit is the abundance of black graphitic mineral in the gold bearing portions. Nearly all the rich ore contains much graphite, and, according to Mr. Chas. O'Connell, it has been found that graphite is a very good indication of values. In some of the veins nearly all the samples of quartz showing graphite contained gold.

A common mode of occurrence of coarse gold is on fracture faces or walls of quartz veins which are black

It has been noticed that where gold occurs in porphyry wall rock the latter is much decomposed. Fresh unaltered porphyry is regarded by the experienced prospectors as less promising than the altered zones.

A peculiar feature of some of the deposits is the considerable content of gold, despite the meagre size of the quartz veins. It seems that the rocks have been very much fractured along zones rather than broken by extensive fissures. Seldom are the quartz veins more than a few inches in width, but narrow veinlets are remarkably numerous.

It is very difficult to determine the nature of the deposits without doing considerable work. Stripping must be followed by much breaking of the rock and panning of all showings of quartz however small. As the quartz is not readily distinguished from the light colored porphyry, the small veins are easily overlooked.

**The Porphyry Wall Rock.**—The igneous rock in which many of the veins occur is a light coloured, very feldspathic porphyry. Some thin sections show the chief constituents to be feldspar phenocrysts, in a fine grained siliceous ground mass. Other specimens examined microscopically show numerous greenish colored micaceous and chloritic patches, which have probably resulted from the alteration of ferromagnesia silicates, such as biotite and hornblende.

In some sections, notably one taken from near No. 1 vein on the Foster property, the phenocrysts are chiefly orthoclase. Other specimens, including some from the same property, show the chief feldspar to be one of the plagioclases, of rather basic composition. There are evidently varieties of porphyry to be distinguished by different names; but they can all be conveniently referred to as feldspar-porphyry, as some member of the feldspar series is generally the most conspicuous mineral in the rock.

The porphyry is very hard and dulls the drills quickly. Slow progress is made, therefore, in excavating it, and this is one of the reasons why at the Foster mine the No. 2 vein in the conglomerate was chosen for development before No. 3, which at the outcrop is also very promising.

An analysis of a specimen of porphyry from the Foster property showed, silica 59.10, alumina 23.59, iron 2.25, lime 4.13, magnesia 1.56, $K_2O$ 3.31, $N_2O$ 4.23. This analysis shows the rock to be very high in alkalies.

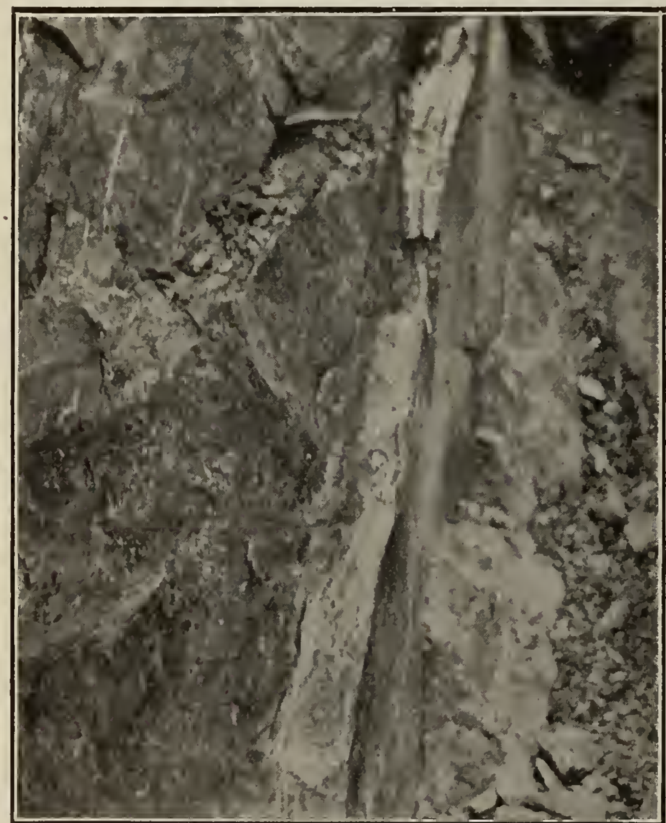
**The Conglomerate Wall Rock.**—The rock in which the No. 2 vein occurs, as may be seen by the accompanying photographs, is a conglomerate. It is in some respects similar to that at the Dome mine, being a gray schistose conglomerate, with numerous pebbles of

**Gold quartz vein in conglomerate, 100 foot level, Tough-Oakes mine, Kirkland Lake, Ont.**

porphyry, greenstone and chert. It differs somewhat, however, in other respects, notably in containing a large number of red jasper pebbles and being more extensively fractured. The rock contains remarkably numerous fractures, large and small, many of which have been filled by quartz or calcite.

Microscopic examination of thin sections of this rock —sections and microscope were placed at the writer's disposal while at the property by Chas. Spearman, superintendent of operations for the adjoining property owned by the Burnside syndicate—show that the fracturing is not confined to large cracks, but that many of the individual grains of the rock, especially the quartz grains, have numerous minute fractures.

By the naked eye it is readily noted that individual pebbles of the conglomerate have been broken into many pieces. The hard jasper pebbles show numerous cracks. Secondary minerals are common on the fracture faces, and several jasper pebbles examined show



**Gold quartz, vein in porphyry, Robbins claim, Kirkland Lake**

pyrite. One of the miners reports having found a jasper pebble which showed free gold on the fractured surface.

Microscopic examination of the ground mass of the conglomerate reveals a poorly sorted aggregate, largely composed of quartz, sericite and carbonates. In addition to the fractured and evidently older quartz grains, there are patches and veins of younger quartz and of calcite.

A small jasper pebble in one section shows numerous fractures, which have been filled with secondary silica. The jasper has somewhat of an oolitic structure, the red coloring matter being in circular bands.

The rock at a depth of 170 feet is quite like that at the surface. The bottom of the last cut, when examined by the writer, showed coarse conglomerate, numerous grey and greenish pebbles and occasional red jasper pebbles.

According to Mr. Foster's observations, the conglomerate shows quite distinct banding of coarse and fine portions. In some places there is just a single line of pebbles; but more commonly the conglomeratic portion is thick. Mr. Foster states that in sinking the shaft it was noticed that the vein follows the coarse pebbly portion. It left this for a short distance, and was enclosed in fine grained sediment; but after a few feet it was found to run into the conglomerate again. The pebbly layers are less strong than the fine-grained and have been more fissured.

Charles Spearman states that on the adjoining property of the Burnside Syndicate, the conglomerate is standing nearly vertical.

**Character of the Ore.**—It will be noticed from the record of shipments that the proportion of silver to gold has increased somewhat with depth. It has also been observed that the proportion of tellurides is greater at depth than at surface. Tellurides were first noticed at a depth of about 18 feet, but may have occurred nearer surface also.

The ore is rather easily broken in the mine and in the mill. About 75 per cent. of the gold is recovered by amalgamation, and the tails are being ponded for future treatment.

The graphite presents no serious difficulty in the mill, as it floats off very readily when the ore is crushed.

**Vein from mill looking over shaft, Tough-Oakes mine**

**Gold Production of Foster Mine to Date.**—It was in July 15, 1912, that Mr. Foster took over the controlling interest in the Tough-Oakes properties. At first considerable attention was devoted to No. 1 vein; but soon it was found that No. 2 and No. 3 were much more promising. After the preliminary exploration by stripping, it was decided that the further development work should be first done on No. 2 vein. A small shipment, A, about two tons of ore, broken from the outcrops of several veins, was made in September, 1912.

Work at No. 2 vein was carried on at first by an open excavation about 30 feet deep. From the ore broken the high grade portion, or vein material, was picked out and bagged for shipment. Two cars, known as lots B and C, were obtained in this way. The weight and value of the high grade ore is indicated in the accompanying table of shipments.

The open cut work was discontinued at a depth of 30 feet, and equipment was installed for sinking. A shaft was put down on the vein. The ore broken in sinking the shaft was sorted, and when a depth of 100 feet had been reached, another car load, lot D, of high grade ore had been produced. Since that time no shipments have been made, though a few tons of high grade has been bagged. D shipment is expected to yield fully as high returns as B and C, but settlement for the shipment has not yet been made and the actual figures are therefore not published here.

In picking the ore for shipment, the high grade was not all saved. The high grade fines were hoisted with the lower grade ore, and will be treated in the mill.

According to Mr. Foster the high grade shipments made correspond in volume to a thickness of about 4 inches of vein material. The records indicate the average thickness of vein material to be about double this width, so it is evident that a considerable portion of the high grade is mixed with the wall rock now on the stock pile.

The production of gold from milled rock is given above—about $6,000 being obtained in the first two melts.

**Gold Ore Shipments From Foster-Tough-Oakes Claims.**

| | | | Weight | Yield per Ton Ounces | | Total Yield Ounces | |
|---|---|---|---|---|---|---|---|
| Shipment. | Source. | Date. | Tons. | Gold. | Silver. | Gold. | Silver. |
| A | From outcrops of 5 veins other than No. 2........ | Sept. 1912 | 2. | 18. 2 | 24. 8 | | |
| B | Open cut, No. 2 vein....... | Feb. 15 | 19.985 | 22. 5 | 23. 4 | 448.04 | 465.77 |
| C | Open cut, No. 2 vein....... | Mar. 19 | 21.527 | 19.688 | 33.665 | 403.67 | 690.93 |
| D | Shaft above 100 ft......... | June 4 | | | | | |

**Value of Shipment.**

| | Gold. | Silver.. | Gold and Silver. |
|---|---|---|---|
| A | | | |
| B | $8,960.80 | $274.80 | $9,235.60 |
| C | 8,073.40 | 493.96 | 8,567.36 |
| D | | | |

On the ore shipments the charges for freight, sampling and treatment amounted to $26.50 per ton. When ore was being stoped, the total cost per ton was about $68.00.

The stock pile of milling ore on June 28 is estimated by Mr. O'Connell, manager of the property, to contain about 2,500 tons. This is being added to from development work at the rate of about 12 tons per day.

**Plans for Increasing Production.**—If the development work continues to give such results as have been obtained to date, a large mill will be erected. A considerable production is already assured and mining and milling equipment will be hauled in as soon as the road is made ready for heavy traffic.

It is hoped that hydro-electric power may be obtained. Otherwise a Deisel engine unit may be installed at Swastika. A metallurgical expert will be employed to work out a process of treatment of the ore.

While the lack of roads prevents the installation of machinery, preparations are being made for production on a large scale.

Mr. Chas. O'Connell, formerly manager of the Trethewey mine, is now manager of the Tough-Oakes. Mr. A. M. Hotchkin is assistant manager, J. A. Murphy, mine superintendent, and Fred Jost, mill superintendent.

**Government Geological Maps.**—The Ontario Bureau of Mines has a party in the district making a geological map. Mr. A. G. Burrows is in charge of this work, and Messrs. P. E. Hopkins and M. E. Smith are assisting him. Six townships are being surveyed, and it is hoped that the map will be ready in August Last year the Bureau of Mines published a geological map prepared by E. L. Bruce which shows the distribution of the rocks in the neighbourhood of Swastika. Mr. Burrows' map will show the contiguous area.

# SUDBURY, COBALT AND PORCUPINE

The mineral production of Canada is increasing rapidly and the future of the mining industry in this country is generally conceded to be more promising than in any other country in the world. The developments of the last decade have proven that our mineral resources are greater than anyone could have hoped, that there are rich deposits of precious metals a few hundred miles from our chief centres of population and that we have vast areas of promising territory awaiting exploration.

**Mineral Production During the Year 1912**—As shown by the report of Mr. John McLeish, chief of the Division of Mineral Resources and Statistics, Department of Mines, the total value of the mineral production in Canada in 1912 was $133,127,489, an increase over the preceding year of 29 per cent. or $29,906,495. The per capita production in 1912 was over $18.00.

Of the total production, $61,177,989 or about 46 per cent. is credited to the metals, and $71,949,500 or about 54 per cent. to non-metallic products.

Of the several provinces Ontario was the largest contributor to the total, being credited with $51,023,134; British Columbia second, with $29,555,323; Nova Scotia third, with $18,843,324; Alberta fourth, with $12,110,960 and Quebec fifth, with $11,675,682.

The production of the more important metals and minerals is shown in the following tabulated statements:

**The Mineral Production of Canada in 1912.**
(Subject to Revision)

**Non-Metallic.**

| Product. | Quantity. | Value. |
|---|---|---|
| Actinolite, tons | 92 | 1,000 |

The subdivision of the mineral production in 1911 and 1912 by provinces was approximately as follows:

| | 1911 | | 1912 | |
|---|---|---|---|---|
| Province. | Value of production. | Per cent. of total. | Value of production. | Per cent. of total. |
| Nova Scotia | $15,409,397 | 14.93 | $18,843,324 | 14.15 |
| New Brunswick | 612,830 | 0.59 | 806,584 | 0.61 |
| Quebec | 9,304,717 | 9.01 | 11,675,682 | 8.77 |
| Ontario | 42,796,162 | 41.46 | 51,023,134 | 38.33 |
| Saskatchewan | 636,706 | 0.62 | 909,934 | 0.68 |
| Manitoba | 1,791,772 | 1.74 | 2,314,922 | 1.74 |
| Alberta | 6,662,673 | 6.46 | 12,110,960 | 9.10 |
| British Columbia | 21,299,305 | 20.63 | 29,555,323 | 22.20 |
| N.-W. Territories | 4,707,432 | 4.56 | 5,887,626 | 4.42 |
| Dominion | $103,220,994 | 100.00 | $133,127,489 | 100.00 |

In Ontario the mineral production is largely metallic. Silver, gold, nickel, copper, iron and cobalt are the metals produced. Of non-metals, brick, cement and natural gas are the leaders. There are about 11,000 men employed in the metal mining industry in Ontario and they receive in wages an average of about $800 per year.

The chief source of silver is the Cobalt district, of nickel and copper the Sudbury district, and of gold the Porcupine district.

profit from nickel in the Sudbury ores soon became greater than that from the copper, and in late years the operating companies have been very successful.

The known ore reserves are very large and there are numerous promising properties yet undeveloped. Increased yield in future years is therefore to be expected.

In the recently issued report of the International Nickel Co., which derives most of its profits from mining and treating Sudbury ores, President Ambrose Monell says:

"During the fiscal year just closed the business of the company has shown a substantial and satisfactory growth. The improved conditions in the steel industry resulted in a greatly increased demand for nickel from the steel makers, and in all other industries in which the company's products are used the demand has been the best in the history of the company. All indications point to a very satisfactory business for the coming year.

"We are continuing our policy of keeping our plant up to date in every respect, of increasing its efficiency wherever possible, and of enlarging its capacity."

The following table from the report of Thos. W. Gibson, Deputy Minister of Mines, Ontario, summarizes the operations during the years 1907 to 1911. The final figures for 1912 have not yet been published; but it is known that they will show a large increase over previous years.

The nickel producing companies in the past year were the Canadian Copper Co., (controlled by the International Nickel Co.), and the Mond Nickel Co. The formation of a third company to develop has quite recently been announced. This is the Canadian Nickel Corporation, Limited, capitalized at $30,000,000. Among those interested in the new venture are Dr. F. S. Pearson, President of the Brazilian Traction, Light, and Power Co., and of many other South American corporations; Mr. J. Frater Taylor, Vice-President and Managing Director of the Lake Superior Corporation; Mr. J. E. McAlister; Mr. B. B. Lawrence, Consulting Engineer, New York; Mr. E. R. Wood; Mr. Walter Gow and Mr. Miller Lash.

**The Cobalt Silver Mining Industry.**—The development of the Cobalt district has been so spectacular that

### Nickel-Copper Mining in Ontario, 1907 to 1911.

| Schedule. | 1907. | 1908. | 1909. | 1910. | 1911. |

**The Sudbury Nickel-Copper Industry.**—The Sudbury district is the world's chief source of nickel. The deposits were originally worked for copper by the Canadian Copper Co. in 1887. Cars of picked ore were shipped to eastern refiners and the difficulty experienced in treating the ore for its copper contents led to the discovery of the presence of nickel with the copper. There was at that time no available method of separating nickel from the copper, and a period of experimentation followed. A process was finally found and it then became necessary to find a market for the large quantity of nickel available, for the amount then used was very small.

Fortunately about this time, 1890, the valuable properties of nickel-steel became known and the nickel industry was then established on a substantial basis. The the general public has heard much of this wonderful storehouse of silver. The recent progress has been very satisfactory.

### The First Discovery of Silver at Cobalt.

During the summer of 1903 men were working west of Lake Temiskaming on the construction of the Temiskaming and Northern Railway. This road was built by the Government to open agricultural land beyond the district now known as the Porcupine gold field in Northern Ontario. In the vicinity of a narrow unnamed lake, later known as Cobalt Lake, some of these railroad men noticed peculiar minerals in the rocks. Fred La Rose, blacksmith of the gang, spent considerable of his spare time in examining the mineral-stained rocks at the edge of a little swamp, where he found some loose ore and subsequently a deposit in place. He mistook niccolite for a copper mineral, and continued his prospecting without realizing that he had found a rich vein of silver-bearing ore.

At the south end of Cobalt Lake, James McKinley and Ernest J. Darragh found the first specimens of native silver which were recognized as such. These men were lumbermen engaged in getting out ties for the railroad, and they made a practice of prospecting whenever opportunity afforded. While making their way around the south end of one of the numerous lakes skirted by the railroad, their attention was attracted by the colour and weight of some loose pieces of rock in the shore gravel. These they found on washing to be rich ore, and on August 14 they applied for a mining location. Their affidavit of discovery, sent in on October 6, states that on August 7, 1903, they found rock containing "a goodly percentage of free or native silver," and assays of samples sent to Montreal showed several thousand ounces per ton. Their claim of 32 acres is now the chief holding of the McKinley-Darragh-Savage Mines Co.

In the meantime LaRose had been digging away at his pink-stained ore, and on September 15 he found a vein of solid "copper," which he showed to his employer, Duncan McMartin. Together they staked out two claims, and on September 19, 1903, applied for a location at the 103 mile post, a quarter mile north of Cobalt Lake. The claim of 40 acres containing the original discovery is the chief producer of the LaRose Con. Mines Co., while the second claim has been known as the LaRose Extension. LaRose apparently did not recognize the native silver, which was abundantly disseminated through the niccolite, until it was pointed out to him by Dr. W. G. Miller, who visited the camp in November.

On October 8, 1903, Neil A. King, a fire ranger on the T. and N. O. Railway, filed a claim for 160 acres, including the LaRose property. In the suit which followed LaRose was given a clear title to his claim, while King's supporters, J. B. O'Brian and M. J. O'Brien, received the adjoining property on agreeing to pay to the province a royalty of 25 per cent. of the gross value of ore raised to the surface.

Considerable prospecting was done in the vicinity of Cobalt Lake by those who recognized the richness of the deposits. Messrs. A. Ferland, Thos. Hebert and R. R. Galbraith made two important finds in October. One of these—the Cobalt Hill vein—was a vein of solid cobalt ore on the east shore of the lake. The second was a narrow vein in the cliff south-east of the lake. It was very rich in native silver, and became known as the "Little Silver" vein. These properties were located on October 22, and subsequently called the Chambers-Ferland claims. They are now part of the holdings of the Nipissing Mines Co. All four of these discoveries were narrow veins, filling vertical fissures in Huronian conglomerate, quartzite and shaley greywacke. Three of them showed native silver with smaltite and niccolite, while the fourth was largely smaltite.

Specimens of the niccolite from LaRose's discovery were shown by A. Ferland to Thos. W. Gibson, director of the Ontario Bureau of Mines, and as a result the discoveries were examined by Dr. W. G. Miller in November. After this examination, official announcements of the nature of the deposits were made in the daily press and in technical journals in December, 1903. These announcements aroused considerable interest, but, nothing being known of the extent of any of the deposits, few mining men investigated further. One of the few was E. P. Earle, of New York, whose attention was attracted by the descriptions of cobalt ore given by Prof. Miller. Mr. Earle later visited the camp and secured the property now known as the Nipissing.

During the winter and spring a number of claims, including properties which subsequently became important producers, were staked; but no important veins were discovered for seven months. W. G. Trethewey, an experienced prospector, had his interest aroused by Dr. Milton Hersey, who had received specimens of silver ore from McKinley and Darragh for assay. Trethewey saw more of the ore at the Bureau of Mines office in Toronto, and gathered information regarding the country and its mining laws. Leaving Toronto on May 15, 1904, he reached Haileybury two days later and Cobalt Lake on the day following. After examining the early discoveries he began to prospect himself, and on May 23 he found two veins on the hill north-west of the lake. Two claims of 40 acres each were applied for. These are the properties now known as the Coniagas and Trethewey.

Following the success of Trethewey, a number of claims, including the Buffalo, were staked on less valuable finds; but not until July was another notable discovery of silver made. Up to this date all the known deposits were veins in Huronian conglomerate. Now silver was found in the diabase at Cross Lake. Then in quick succession followed discoveries at Kerr and Giroux Lakes, including one in the Keewatin greenstones. By the end of the season of 1904 all the exposed rocks in the producing area at Cobalt had been more or less carefully examined.

In October, 1904, steel on the T. and N. O. Railway reached Cobalt Lake, and several rich shipments were made during the winter. Some of the car lots of hand-sorted ore netted about $2,000 per ton, and much outside interest was at once aroused. In the spring of 1905 a large number of prospectors began work in the district, and in addition to the work being done at Cobalt, rocks in more remote parts were subject to close scrutiny. Fortunately the surrounding country had been described and geologically mapped 10 years earlier by Dr. A. E. Barlow, of the Canadian Geological Survey. The prospectors were thus early aware that rocks similar to those in which they saw silver ores at Cobalt had been found over a large area to the westward.

In the spring of 1904, Dr. Miller, for the Ontario Bureau of Mines, and Dr. Parks, for the Canadian Survey, went to Cobalt to make official reports on the camp. Dr. Miller made a map of the immediate vicinity. Dr. Parks spent a few weeks examining the discoveries, and then went northwards to the height of land and across to the Montreal River to determine the areal extent of the silver-bearing rocks. With these and Barlow's reports, the crowd of prospectors had during the following years much useful information regarding the country they were working in.

### Discoveries in 1905.

The prospectors now in the district had two chances before them. Some believing that the field would prove an extensive one made hurried examinations of the outcrops over a large territory. Others stayed close to the proven area and began a system of prospecting which proved to be very profitable, namely, digging of narrow trenches to bed rock through the glacial debris. In this way many very important finds have been made.

Most of the valuable discoveries were, like the first ones, in Huronian sediments. Some rich veins were found, however, in the diabase and in the Keewatin series. All of them were deposits of very similar form and composition—narrow, vertical veins carrying silver and arsenides of cobalt and nickel.

Those who went far from Cobalt found cobaltiferous deposits in widely separated areas in rocks similar to those of Coleman township.

The prospectors at first gave their attention almost entirely to outcrops of conglomerate such as they had seen at Cobalt Lake. For some time little was found outside of Coleman and Bucke townships.

**Silver Found in Casey Township.**

The first important location of a similar nature at a distance from Cobalt was made in Casey township, 15 miles north of the camp, by David Bucknell. Mr. Bucknell had been attracted to Cobalt from his father's home on the Blanche River, and was for some time engaged in clerical work. He observed that the deposits were in rocks which resembled those at home. On returning home one day, he immediately set out to examine an outcrop on a neighbour's farm. After a short search he found a vein and located the property now known as Casey Cobalt. Later other small veins were found on adjoining properties, but the only ore shipped has been mined on the claims first staked.

It was three years after Bucknell's discovery of this field, before important discoveries were made in Huronian sediments in another part of Nipissing, on the Blackburn property at Miller Lake—now Millerette mine.

While the first discoveries were all found in Huronian sediments, the prospectors in Coleman township soon found that similar, though generally less productive veins, occurred in the other rocks.

In the western part of Coleman cobalt ore was found in diabase in the vicinity of Portage Bay on the Montreal River, and during the same summer, 1905, small veins carrying smaltite in a quartzose gangue were discovered in Ingram township, 30 miles north of Cobalt.

The prospectors now began to regard the diabase with more favour, and their preference became more marked as the field seasons went by without any notable find being made in the sedimentary rocks.

Several occurrences of cobalt bloom in diabase were found during this year in the vicinity of Wendigo Lake; but the prospectors here did not find any silver, and their attention was soon diverted by the discovery of gold at Larder Lake, some 20 miles further north.

**Native Silver Found in Temagami Forest Reserve.**

A number of prospectors worked westward from Portage Bay and examined the country to and beyond Lady Evelyn Lake. During the fall of 1906, Messrs. White and Darby found several veins of cobalt and silver ore in a diabase ridge between Anvil Lake and Maple Mountain. Many prospectors had at this time gone up the Montreal River and were working for a few miles westward. Silver was found in James township and vicinity during the fall of 1906.

During the following winter hundreds of claims were staked in the vicinity of Maple Mountain and Elk Lake. The number of prospectors now in Nipissing was much greater than in any previous winter; but many of them were busily staking out gold claims at Larder Lake. The spring of 1907 saw a great rush into the Maple Mountain and Elk Lake territory. The diabase outcrops were subjected to close scrutiny by an army of fortune hunters, with the result that a large number of discoveries were made. Westward from Elk Lake, cobalt minerals were found in many places, notably near Bloom Lake, but no rich deposits were uncovered for some time.

**Silver Found in South Lorrain.**

While most of the prospectors were working in the Forest Reserve, a few were examining less well-exposed areas south-west of Cobalt. Late in the year 1907 discoveries of silver were made in South Lorrain, 16 miles from Cobalt station. During the winter 1907-1908 several claims were staked and other discoveries made. Most of these were in the Keewatin greenstones, some in the Keweenawan diabase, and all near the contact.

**Silver Found at Miller and Gowganda Lakes.**

The prospectors working westward from Bloom Lake in 1907 made several discoveries of cobalt minerals in diabase, and during the following winter and spring silver was discovered in the vicinity of Leroy and Miller Lakes. Then in August several silver-bearing veins were found west of Gowganda Lake.

No new silver field of importance has been discovered during the past few seasons, and most of the prospectors have been seeking gold.

Ten years ago there were in Nipissing only a few individuals who were at all interested in minerals, and very few of these were trained prospectors. There are to-day in the district hundreds of men experienced in mining and prospecting and well versed in woodcraft. It will probably be long before a twelve-month shall have passed, in which none of these energetic pioneers has made an important discovery.

While the prospectors were hunting new fields, the working mines at Cobalt were steadily developed. Some veins rich near the surface were found disappointingly low grade at depth, and others pinched out. Some workings in low grade ran into rich ore and several new veins were found. These are the every day occurrences in the camp, new finds being made which counterbalance the working out of others.

Cobalt silver mines had another very profitable year in 1912, netting the owners over $10,000,000 on a production of about 30,000,000 ounces, having a gross value of about $17,000,000. During the year $8,179,468 was distributed in dividends. The output was somewhat lower than in 1911, but the average selling price was considerably higher and costs remained about the same. The output for previous years is shown by the accompanying table from the report of the Deputy Minister of Mines, Thomas W. Gibson. The mines have now produced a total of about 170,000,000 oz. silver, valued at more than $90,000,000. After the year's operations most of the mines have as much ore in sight as in 1911 and should be large producers in 1913. Two or three of the producers, however, have very little in reserve and will probably show serious falling off unless new discoveries of high-grade ore are made.

Two properties, Cobalt Townsite and Cobalt Lake, have shown great improvement during the last two years. They paid dividends of $220,000 and $310,000 in 1912, and are expected to increase production in 1913. Nipissing, the largest producer, had a highly successful year and was able to build a costly low-grade mill out of profits without decreasing the dividends; $1,800,000 was distributed to stockholders during the year. Coniagas met with like success in mining and developing, and paid to stockholders $1,440,000 without decreasing the known reserves. Crown Reserve held its own and was able to pay $1,080,000 to shareholders. McKinley-Darragh-Savage found some unusually rich ore and distributed $898,000 from profits. La Rose did not develop as much new ore as was hoped, and the market value of shares fell to new low levels, but the company was able to pay 12 per cent. on its capitalization of $7,500,000 without decreasing the large surplus.

### Total Production, Cobalt Mines, 1904 to 1911.

| Year. | Shipments of Ore and Concentrates, Tons. | —Cobalt— Tons. | —Cobalt— Value | —Arsenic— Tons. | —Arsenic— Value. | —Silver— Ounces. | —Silver— Value. | Total Value. |
|---|---|---|---|---|---|---|---|---|
| 1904 | 158 | 16 | $19,960 | 72 | $903 | 206.875 | $111.887 | $136,217 |
| 1905 | 2,144 | 118 | 100,000 | 549 | 2,693 | 2,451,356 | 1,360.503 | 1,473,196 |

| Temiskaming | 2,500,000 | 2,500,000 | 1 | 225,000 | 300,000 | 1,309,156 |
| Trethewey | 1,000,000 | 1,000,000 | 1 | 200,000 | 200,000 | 971,999 |

*Includes profits shared privately before incorporation.

Buffalo paid $320,000 and built a new amalgamation-cyanidation plant. Kerr Lake paid $600,000 and still has much rich ore in reserve. Temiskaming had a profitable year, paying $300,000 to stockholders, but as compared with some former years, has little high-grade in reserve. The same is true of the O'Brien mine. Beaver has been prosperous recently and is meeting with some success at greater depth than other Cobalt mines. The Temiskaming and Hudson Bay mine increased production and profits and paid dividends amounting to $209,000. Trethewey paid 10 per cent., but has little high-grade in reserve. Casey-Cobalt increased production, profits and reserves and should be a larger producer in 1913.

The most noteworthy discovery during 1912, aside from ore discovered on property of the large producers, was made by the Seneca-Superior. This company, operating on a lease from Peterson Lake Mining Co., opened a vein of high-grade ore under Cart Lake. A few shipments have been made and the property promises to be profitable.

While paying out handsome dividends during the last few years, the mines at Cobalt have also paid for construction of a large number of well equipped mills and cyanide plants. There are at Cobalt 17 mills with a total capacity of about 1,800 tons per day. Remarkable progress in treating the unique ore has been made. Straight concentration methods have been so adopted that a good recovery is now being made from low-grade ore. Cyanide methods have also proven suitable and the Nipissing company has just put in operation a plant of 200 tons daily capacity for the treatment of low-grade ore by cyanide. The Nipissing has in operation a remarkable process for treating the high-grade ore. The crushed ore is ground with mercury and cyanide solution in a tube mill and most of the silver amalgamates with the mercury. The silver is recovered and refined on the property and the bullion shipped is of high purity. A plant to treat ore in a similar way has been constructed during the year by the Buffalo Mines, Limited.

**Porcupine Gold Mining Industry.**—Gold was first found in the Porcupine district in important quantity in 1909. Rapid progress was made in developing the deposits; but disastrous forest fires in July, 1911, gave the industry a serious setback. Nothing daunted, the mine owners immediately began reconstruction of mining plants and mills, and in 1912 Ontario became for the first time in history an important gold producer. The Porcupine mines yielded gold valued at about $1,800,000 and there are assurances that a very much larger production will be made in 1913.

The leading mines are the Hollinger and Dome. The Hollinger ore is comparatively rich and the profit per ton is large. The Dome has a large deposit of much lower grade ore. Other properties in the vicinity of the Hollinger, including the McEnaney, Miller-Middleton and Dixon, McIntyre, Pearl Lake, and Jupiter have also made a good showing, although overshadowed by the Hollinger and Dome.

At the Hollinger, Manager P. A. Robbins reported the estimated ore reserves at the beginning of the year to be 644,540 tons, valued at $11,271,400. The profit made during the last half of the year was $600,664.42.

At the Dome the new mill built to replace that lost in the fire of 1911, treated in the period from March 23, 1912, to March 31, 1913, 101,812 tons ore, which yielded $1,043,995. The tonnage developed above the 45-foot level is estimated at 315,528 tons with a sampling value of $7.53 per ton.

From these brief statements it will be evident that Ontario has now two very important gold mines. The smaller mines in the district will also contribute much to the country's wealth. During the past year also, promising gold discoveries have been made at Kirkland Lake, about 50 miles north of Cobalt, and there can be little doubt that the country traversed by the Temiskaming and Northern Ontario Railway will long be a very important mining district.

# THE MINING ENGINEER AND THE PUBLIC*

By Bedford McNeill.

In these days of specialized professions the tendency is more and more for the mining engineer and metallurgist to limit himself within the narrow boundaries of the mining, or the treatment of the ore of that particular metal, with which his life's work may be associated. There are manifest advantages, however, in extending our enquiries and knowledge with regard to the metals with which we are associated, and, as it were, taking a more extended view of their influences and uses in our complex civilization.

It is no use ignoring or pretending to ignore, the fundamental fact that mining is and must always continue to be essentially speculative, and so far as its initial operations are concerned it will, in my opinion, become more speculative in the not very distant future. Attention has already been drawn in our Transactions to the extent to which deposits at or near the surface are being more and more worked out, although as we all know, there are still large areas of the world's surface yet to be properly prospected. We may ultimately be driven to working that class of mineral occurrence which presents no visible evidence whatever at surface, and the location and working of which will inevitably demand higher technical skill and involve greater risk of loss of capital than those deposits with which we have at present mainly to deal.

Each successive advance of the science of mining ought to tend to equalize its increasing hazards. We are limited by our present knowledge, and although the difficulties met with stimulate our exertions to overcome them, we have still to work with insufficient enlightenment in regard to certain natural laws. At practically all points (commencing at a minimum when prospecting) the mining engineer is in close contact with finance. It is in connection with the finding and the losing of capital that so many difficulties and perils occur to the members of our profession.

If we consider the life-history of a mine, we are faced at once with a very practical point—the provision of the necessary working capital—and we must consider the relations between the mining engineer and capitalist. I know there are some mining engineers (belonging rather to the opulent section of our community) who argue, that if a mining enterprise cannot have the capital they estimate to be necessary therefor, the property should not be worked, until the whole of the money is available. But this is not always possible, and I hold that one is justified in taking some risk in this direction. Again, it is necessary to consider the capitalist. The mining engineer cannot always obtain the working capital, save on terms that largely diminish the value of the property to the public, and from the dividend-paying standpoint.

The true prospector is a man who "dreams dreams" (he would not be any good if he did not), and who endures untold privations and hardships, anticipating that one day he will realize wealth beyond his wildest hopes. The prospector may be excused taking a too sanguine view when he has discovered something; but if a man styling himself "a mining engineer" wilfully misleads himself and others into believing that a mere "prospect" is a mine, it should not be possible for that man to retain the title which he has so improperly assumed.

Being of too sanguine a nature or too inexperienced in the chances of mining, may lead to large and useless expenditure and loss. The difficulty of spending money, so that the data developed by that expenditure, are going to prove that the money itself has been judiciously spent, and has led to the justification of raising further capital or otherwise, demands from the advising mining engineer, the exercise of his greatest skill. On the one hand, he has to get the information for the least expenditure; and, on the other, to so arrange that, in the event of the property proving all he hopes or more, his previous expenditure can still be further utilized. At one time he may have to restrain or at another time encourage, those with whom he is associated, and who may not be equipped with his technical knowledge and experience.

To curb one's own hopes, to proceed with deliberate caution, and not to lose valuable time, often requires that the mind shall have been educated, by experiencing the bitterness of disappointment. From the prospecting up to the final stage, that of actually working the property so as to get the largest amount of profit in the shortest possible time, we have the dependence of mining upon capital, and it is considerations such as these that demand the gravest thought from those who propose to legislate for members of our profession.

We all know instances where a man with little professional training, and with the merest superficial experience, has posed as a mining engineer; I ask, can we wonder that our profession is, in many instances, regarded by a large section of the public as being of little or no repute? That this view is no new thing, is evidenced by the fact that the mining engineer was long ago called upon to verify his report by affidavit.

We want to consider the qualifications of the mining engineer and metallurgist, and how best the status of the members of our profession can be advanced. We want when it is said of a man "he is a mining engineer," that all may know, he is a man, who, in connection with mining enterprises, can be trusted with the expenditure of other people's money, or who may equally be trusted to save it, and who for undergoing the necessary training and acquiring that special knowledge and experience which enables him to overcome the difficulties which beset mining enterprises, is entitled to be equitably remunerated. It must always be remembered that metal mines are, generally speaking, short-lived. Either the deposit itself be-

*Excerpts from the Presidential address, Institution of Mining and Metallurgy, March 13, 1913.

comes worked out, or the economic conditions which at one time permitted profits no longer continue. The market price of all metals (if we except gold) is liable to such fluctuations that the substantial profits at one period become certain losses at another, and we have also our own particular risks, some preventable, and others non-preventable. I mean disasters due to underground fires, floods at surface or underground, falls of ground, air blasts, etc.

It is our present misfortune, and it will be our fault, if such conditions with regard to the lack of control which we as an institution have over those who call themselves "mining engineers" be allowed to continue. I hold no one should be permitted to style himself a mining engineer, or to practise as such, unless he is qualified to do so; and of his qualifications for mining, other than coal, this institution ought to be the tribunal.

From this point of view our position as an institution is not satisfactory. According to the law—important though we know ourselves to be, and as a fact are—we are not recognized as existing. No other institution fills, or has attempted to fill, the place that we occupy. We cannot, in the quaint wording of the Physicians' Charter, "Plead or be impleaded." We have no authority, jurisdiction or corporate being whatsoever. Anyone can call himself "a mining engineer," can re-date and use a report years after it was originally made, can write a report on a property that he never visits, or if he does so, it may be when the underground workings are inaccessible, can knavishly mislead the public with impunity; and all we can do, if he uses our initials, is to ask him to cease doing so.

In this connection, I very much like the phrase employed by the Royal Institute of British Architects, with regard to members of that profession, and I trust the mining engineer (when the use of that title is legally restricted) will always be regarded not only as the agent of a client, but also that such implicit confidence will exist, as to enable him to become a "friend and adviser." What we wish to do is, to protect the public on the one hand, and, on the other, secure an honourable career for ourselves.

**BEDFORD McNEILL**

# MAGMATIC ORIGIN OF SUDBURY NICKEL-COPPER DEPOSITS

Numerous descriptions of the Sudbury nickel-copper deposits have been published and many geologists have discussed the origin of the ore bodies. Most of those who are familiar with the district believe that the ores originated in the same magma as the norite with which they are associated. Some believe that the metallic sulphides were concentrated from the molten magma by differentiation during or preceding crystallization. Others believe the sulphides to be essentially secondary deposits made by aqueous solutions which may or may not have been derived from the magma.

The writer's purpose here is not to sum up the evidence in favour of each of these views, but rather to call attention to some of the processes involved in the solidification of the nickel-bearing eruptive; to state certain peculiar relationships which Mr. David H. Browne has found to exist between the ore deposits and the furnace products; to give Mr. Browne's interpretation of these relationships and to show how these facts and the interpretation of them are in accord with the theory or origin.

That the formation of the ore bodies was primarily by differentiation is here assumed. It is not denied that there is abundant evidence of secondary deposition, for in some of the deposits there are relationships which can only be thus interpreted. After examining a few of the deposits and studying the literature, especially the work of Prof. Coleman, it seems clear to the writer that the localization of the ore bodies has resulted from a directly igneous process of concentra-

(1) Dr. A. E. Barlow and Dr. A. P. Coleman have reported on the district for the Geological Survey and the Ontario Bureau of Mines, respectively. They both believe that the ore bodies were formed by a process of magmatic segregation. Dr. C. W. Dickson has presented the evidence in favor of secondary origin in Transactions of A. I. M. E. Vol. XXXIV. 1904, pp. 3-67. Prof. T. L. Walker discussed differentiation in the nickel-bearing eruptive in Quart. Jour. Geol. Soc. Vol. LIII., No. 209, 1897, pp. 40-65. References to writings of several others are to be found in these reports and papers. An extensive bibliography accompanies Dr. Dickson's paper.

A paper presented by R. E. Hore at Annual Meeting Canadian Mining Institute, Ottawa, March, 1913.

tion, and that this is therefore the theory of origin most useful in directing exploration. Individual ore deposits often show sulphides in the form of fillings in the norite and sometimes secondary silicates occur with the sulphides. Such ore may very well have been derived without great migration of the constituents, from primary ore bodies. It would be remarkable if secondary changes had not taken place in these old deposits, especially in places where crushing and faulting (2) has occurred. Without further reference to such changes, however, let us consider the primary separation of the sulphides from the molten magma.

From Prof. Coleman's descriptions of the fused character of the conglomerate immediately overlying the eruptive sheet, with which the ores are associated, it is evident that when the magma had pushed its way out along the unconformable contact, it was still at a temperature much above that of its freezing point. It doubtless absorbed a very large amount of the conglomerate, and it is likely that the light coloured siliceous upper part of the eruptive is due largely to such absorption. The extension of the norite far out from the main mass into comparatively narrow crevices in the surrounding rocks points also to very considerable superheating. It seems likely that enormous quantities of heat were given off before any appreciable portion of the magma had cooled to a temperature at which solidification began. There was then this very thick molten bed with its thin solid crust surrounded by rocks that were already highly heated. Further loss of heat must have been at a very slow rate, and the time for differentiation in situ was undoubtedly enormously long.

So far as known molten silicates are miscible in all proportions. Molten sulphides, however, will not mix in all proportions with molten silicates. One cannot state off hand, therefore, whether the cooling magma would behave as one or as two or more solutions. From a consideration of the end products—the norite and ore bodies—it seems to the writer (3) that before solidification took place the magma with decrease in temperature had separated very imperfectly into two solutions. One of these was composed chiefly of the constituents of silicates and the other chiefly of the constituents of sulphides. Each solution contained a comparatively small portion of the constituents of the other. The sulphide solution being heavier sank to the bottom. The process would be much like the separation of matte from slag, with the very essential difference that none of the furnace man's precautions to effect a clean separation were taken. The proportions of the constituents not being the most favourable and no fluxes being added, the resulting solid does not show two distinctly separated portions. Not only was the boundary irregularly defined, but one solution in solidifying may have enclosed numerous detached portions of the other.

In each solution, moreover, there would be further differentiation as the necessary result of the fact that some minerals crystallize before the others. The first minerals formed would be found at the margins. On these more crystals of the same composition would form, and the composition of the remaining solution be thereby changed. Moreover, crystals forming early in any part of the solution, if of high specific gravity, would sink slowly. Since, however, at the temperature at which such crystals separate out the melt would be very viscous, the sinking of crystals would be extremely slow. Some differentiation from these causes alone would, however, without doubt take place.

If the proportions of sulphides and silicates were such that their molten constituents were perfectly miscible under the conditions and no separation in the liquid state took place, there would certainly be some accumulation of sulphides in the lower part as the result of the crystallization phenomena just mentioned. One may well doubt, however, whether the ore deposits were thus produced. It is true that all gradations from solid ore to norite containing only a few scattered grains of sulphides occur; but compared with the thickness of the sheet the transition takes places in a remarkably short distance. Incomplete miscibility of the constituents of the magma and consequent formation of two solutions would be much more likely to result in the formation of such deposits. Imperfect separation of the two solutions with resulting entanglement of large and small bodies of the other during the solidification would explain the absence of a sharp line of division comparable with that obtained in furnace practice. Moreover, each solution contained some of the constituents of the other. Thus the silicate solution was saturated with sulphides, and on cooling below the temperature beginning the freezing interval, it is probable that the sulphides would be among the first formed minerals. If in the silicate solution there were any included bodies of the sulphide solution, there would be doubtless a change in the composition of the solutions in contact. After the main mass of the silicate solution became solid there would on further cooling be a second deposition of sulphides from the included solution. We would expect as a result of such processes to find, and we do find, large masses of norite specked with grains of early formed sulphides and with occasional patches of later formed massive sulphides, and from the sulphide solution massive ore with early formed silicates enclosed in it.

### David H. Browne's Comparison of the Ore Bodies With Furnace Products Obtained in Treating the Ores.

In the light of the theory that the ore bodies have been formed by a process of magmatic segregation as above outlined, it is interesting to compare the ore bodies with the furnace products. That the comparison is an apt one has been shown by Mr. David H. Browne in a paper entitled, "Segregation in ores and mattes," published in School of Mines Quarterly, July, 1895. Mr. Browne shows in his paper that the distribution of copper and nickel in the matte is closely analagous to the distribution of the two metals in the ore bodies, and he has kindly supplied the writer with data which clearly substantiate his argument. In his paper, Mr. Browne gives the results obtained by careful analysis of copper-nickel matte made in water-jacketed blast furnaces from roasted copper-nickel ore. This matte, having an average composition Cu. 24, Ni 20, Fe 28 and S 28%, was tapped into hemispherical or conical cast-iron pots, allowed to set and turned out on the dump to cool. The moulds or matte pots used were about 24 in. in diameter by 14 in. deep. The matte was tested to determine variations in composition at different parts.

"Numerous analyses showed that in one and the same matte casting a sample broken from the top will be, as a rule, higher in copper and lower in nickel than a sample from the bottom. Eleven pots thus examined gave an average as follows:

(2) The existence of a great fault at the Crean Hill Mine is pointed out by Dr. Coleman in his recent report to the Department of Mines. Summary report 1911, pp. 87-89.

(3) For previous views and further references on this subject see "On the Igneous Origin of Certain Ore Deposits" by F. D. Adams, Journ. Gen. Min. Ass. of P. Q., Vol. II., p. 35. 1894.

| | Cu. | Ni |
|---|---|---|
| 11 top samples ........ | 23.26 | 20.15 |
| 11 bottom samples...... | 21.14 | 20.32 |
| | 2.12 | 0.17 |

"Further analyses showed that nickel was higher at the centre than at the bottom of the casting. Copper tends towards the top and outside of the casting, while nickel and iron tend to concentrate toward the centre."

Mr. Browne gives the following figures obtained from analyses of samples taken along central horizontal plane of a pot.

| | Outside. | —— | —— | Centre. |
|---|---|---|---|---|
| Cu ....... | 25.12 | 24.30 | 21.06 | 19.02 |
| Ni ....... | 22.82 | 23.80 | 25.04 | 29.24 |
| Fe ....... | 26.5 | 26.6 | 26.8 | 27.00 |

and the following figures for section along vertical central lines of a pot of furnace matte:

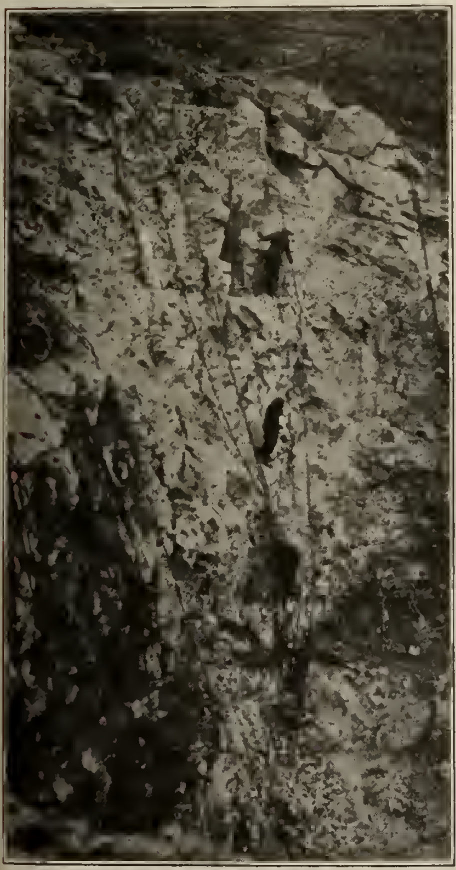
The analyses showed that the segregation of the nickel to the centre and the dispersion of copper to the outside is very pronounced. From other observations and experiments the same conclusion was drawn.

Mr. Browne also calls attention to the fact that sodium sulphide forms with the matte an exceedingly fluid magma from which on cooling nickel sulphide separates as a bottom. He concludes that "if copper-nickel-iron sulphides can be held in a molten condition the copper and nickel will separate as individual minerals, the sharpness of the separation being dependent on the fluidity of the mass and the time occupied in cooling."

Considering then the ore deposits, Mr. Browne states, "The tendency of copper pyrites to separate from the nickeliferous pyrrhotite is very noticeable. However closely the two minerals may be intermingled, each is entirely free from traces of the other. The chalcopyrite is free from nickel, while the pyrrhotite beside it is free from copper. Beside this chemical separation there is an equally noticeable physical separation. It may be stated, as a rule, that copper tends toward the rock, whether forming the wall or forming included masses. The miners often remark the way in which copper follows the rock, and look on the presence of massive copper ore as indicating an approach to the rock. In driving a drift from the shaft in clean norite to and through the ore, the first symptoms of the presence of the ore are small shots or pockets of copper pyrites impregnating the rock. Coming nearer to the ore-body the amount of copper increases, large masses being met with before any nickel is found. On reaching the ore proper, the copper pyrites is found mixed with pyrrhotite and rock, while



West end, open pit

East end, open pit, Creighton nickel-copper mine

"In order to get a correct sample and to map out, if possible, the variations of copper and nickel, a quarter pot was placed under a drill and sampled by drilling with an inch drill holes one-half inch deep at the points marked. These samples were analyzed and the entire quarter pot was now crushed, quartered, sampled and analyzed. It contained Cu 24.64, Ni 22.86, Fe 26.70 and S 25.82."

in the heart of a deposit a large quantity of nearly pure pyrrhotite (and pentlandite) almost free from copper is found. The cross-section of the ore-body then shows as follows: rock, copper-ore and rock, copper-nickel ore, nickel ore, copper-nickel ore, copper ore and rock, and finally rock again."

"The ore as mined does not show these variations for there is much ore intermixed with the rock walls and many included fragments of rock in the ore-body itself, and each mass of rock tends to attract copper ore."

"A general tendency of copper to disperse to the rock and to the walls and of nickel to concentrate towards the centre of the deposit, is thus shown to exist in the ore-body."

Mr. Browne further showed by analyses of ores from different depths at the Copper Cliff mine that the nickel sulphide is more perfectly separated as depth increases. This is true also of mattes.

In mining the ore there is necessarily broken a considerable percentage of rock. In the rock houses the ore is crushed and then hand-picked on travelling belts. Both ore and rock are regularly sampled and analyzed. There is kept, therefore, a complete record of the contents of all ore and rock that is mined. A consideration of the following figures, calculated by Mr. Browne from the average analysis for each year's output, will show clearly that the ratio of copper to nickel is much higher in the rock than in the ore. With Mr. Browne's figures I will quote the interpretation of them as he has presented it to me.

**Ratio of Copper to Nickel in Ore and in Rock.**

| Creighton Mine. | Parts Nickel | Parts Copper in ore. | Parts Copper in rock. |
|---|---|---|---|
| 1909 | 100 | 35 | 87 |
| 1910 | 100 | 36 | 75 |
| 1911 | 100 | 38 | 88 |
| Average | 100 | 36.3 | 83.3 |
| No. 2 Mine | | | |
| 1910 | 100 | 61 | 141 |
| 1911 | 100 | 54 | 147 |
| Average | 100 | 57.5 | 144 |

"Averaging these results we find that for each 100 pounds nickel in ore there was at Creighton 36.3 and at No. 2 mine 57.5 pounds copper, and that for each 100 pounds nickel in the rock there was at Creighton 83.3 and at No. 2 mine 144 pounds copper.

"The ratio of relation of the nickel and copper in ore to the nickel and copper in rock is as follows:

"This means that the copper relation in Creighton rock is 2.3 times the copper relation in the Creighton ore.

"This ratio represents the average of a very large tonnage—in the case of Creighton mine several hundred thousand tons. Ore and rock from other mines show similar ratio of copper to nickel, and we can now make more emphatically the statement that the ratio of copper to nickel in the rock is very considerably greater than the ratio of copper to nickel in the ore. In matte similar relations were seen in comparing the margins with the centre.

"An analogy between ore body and matte along a horizontal line being thus established, we have now to consider the variations along a vertical line. If there is an analogy here we would expect to find the ratio of nickel to copper increase with depth until a point well down towards the bottom is reached. As the various workings in the mines are not separately sampled, we have no assay plan showing the required figures. We have, however, the analyses of regularly taken samples of ore mined and as, in general, each year sees ore taken from lower levels than the previous year, we have figures showing changes in ratios with increase in depth. In some mines, such as at Creighton, where ore is being still taken from various depths from surface to the fourth level, the yearly averages do not give much clue to changes with depth. At other and smaller ore bodies, where sinking was fairly regular, we find a very significant series of figures. These show clearly that with increase in depth in the ore there was an increase in the ratio of nickel to copper.

---

**Increase in Ratio of Nickel to Copper With Increase in Depth as Shown by Average Analyses of each Year's Production.**

| Year. | Parts copper to 100 parts nickel. | Remarks. |
|---|---|---|
| No. 2 Mine. | | |
| 1898 | 74 | Gophering on surface. |
| 1899 | 121 | |
| 1900 | 77 | |
| 1901 | 79 | |
| 1902 | 90 | Going down |
| 1903 | 62 | |
| 1904 | 49 | fairly |
| 1905 | 53 | |
| 1906 | 44 | uniformly. |
| 1907 | 49 | |
| 1908 | | Not worked. |
| 1909 | | Not worked. |
| 1910 | 61 | Taking out floors and pillars. |
| 1911 | 54 | |
| Evans Mine. | | |
| 1890 | 85 | |
| 1891 | 57 | |
| 1892 | 56 | Widening on pit. |
| 1893 | 92 | |
| 1894 | 117 | |
| 1895-96 | 94 | |
| 1897-98 | 98 | Going down. |
| 1899 | 87 | |
| Stobie Mine. | | |
| 1890 | 113 | |
| 1891 | 93 | Widening on pit. |
| 1892 | 94 | |
| 1894 | 73 | |
| 1895 | 104 | |
| 1896 | 89 | |
| 1897 | 87 | |
| 1898 | 86 | Going down. |
| 1899 | 64 | |
| 1900 | 44 | |
| Copper Cliff Mine. | | |
| 1888 | 200 | |
| 1889 | 147 | |
| 1890 | 156 | |
| 1891 | 87 | |
| 1892 | 125 | |
| 1893 | 118 | |
| 1894 | 108 | |
| 1895 | 80 | |
| 1896 | 135 | |
| 1897 | 157 | A second ore shoot. |
| 1898 | 93 | |
| 1899 | 137 | Robbing pillars. |
| 1900 | 150 | |

"These figures, while showing many irregularities, prove the statement that the ratio of nickel to copper increases with depth. Many of the apparent irregularities are in reality not evidence of exceptions to this statement. The first few years output in several cases does not represent increase in depth alone, being offset by horizontal extensions of the pits. The last two years at No. 2 mine and Copper Cliff show reversal to higher copper ratio corresponding to robbing of pillars. Regular decrease in copper ratio is very noticeable in the figures for No. 2 mine for years 1899 to 1907, and the production for these years was from fairly regular increase in depth on a clean uniform chimney of ore. The figures for the Copper Cliff mine show a fairly regular decrease in copper ratio down to 1895, and then a much higher copper ratio in the succeeding years, were found on inquiry to correspond with the working out of one ore shoot and the development of a second deeper shoot."

"Another analogy between ore deposits and the furnace products is found in comparing the ratio of nickel to copper in slags with the ratio between these metals in the mattes. Small drops of sulphide are carried off by the slag, and analyses show the ratio of copper to nickel in slag to be always greater than the ratio of copper to nickel in the corresponding matte.

"Ratios of copper to nickel in matte and in slag:

| Year. | Parts copper to 100 parts nickel. In matte. | In slag. |
|---|---|---|
| 1910 | 44.3 | 47.5 |
| 1911 | 43.9 | 53.0 |

"An objection to comparison of these furnace products with the ore deposits lies in the fact that the iron has been oxidized and all put into this slag, while in the ore body it remains with the other sulphides. A better comparison would be obtained from products obtained on melting together rock and ore without oxidation. This is not a common practice, but has been done, and the resulting slag showed a copper ratio of 41.5 compared with a ratio of 32.8 in the matte.

"Interesting also are comparisons between the ratio of nickel to copper in marginal and in offset deposits. If the analogy between furnace products and ore bodies still holds we would expect to find in the offset deposits, where the molten magma penetrated far out into the surrounding rocks, that the ratio of copper and nickel is less than the marginal deposits. This is in fact the case. For the marginal deposits the only available figures showing the average for the whole output of the mine are for the Creighton. The figures given for the other properties are less truly representative. For the off shoot deposits the figures given are in each case the average for total output.

Ratios of copper to nickel in marginal and offset deposits:

| Marginal. | Parts copper for every 100 parts nickel. |
|---|---|
| Victoria mine | 87 |
| Gertrude mine | 50 |
| Creighton mine | 33 |
| Murray mine | 50 |
| Blezard mine | 50 |

Average for 5 marginal deposits, 54 parts copper to 100 nickel:

| Offsets. | |
|---|---|
| Evans | 88 |
| Cliff | 147 |
| No. 1 | 96 |
| No. 2 | 71 |
| Stobie | 74 |

Average for 5 offset deposits, 95 parts copper to 100 nickel.

## Summary.

1. It has been shown by Drs. A. P. Coleman, T. L. Walker, A. E. Barlow and others, that (a) the nickel-copper deposits of the Sudbury district all occur in the same type of rock—a quartz-hypershene-gabbro or norite.

(b) The norite forms the lower part of a great spoon shaped laccolitic sheet and the ore bodies occur along the lower outer margin of the sheet and in narrow masses of norite, which occur far out in the surrounding rocks.

(c) The ore bodies, sulphides of nickel, copper and iron have been formed by a process of magmatic segregation.

2. The author calls attention to the processes involved in the solidification of the magma and suggests that it is probable (a) that limited miscibility of the molten constituents of sulphides in the molten constituents of silicates resulted in the formation of two solutions—a silicate solution and a sulphide solution—each containing some of the constituents of the other.

(b) The sulphide solution sank to the bottom, but the separation was not a clean one, and on solidification a zone of intermediate composition was formed owing to inclusion of large and small bodies of one solution in the other. (In the furnace a cleaner separation is obtained by adding fluxes.)

(c) In each solution also differentiation took place by early formed minerals accumulating at the margins and especially at the bottom. Such differentiation was very incomplete owing to high viscosity at the freezing temperature.

3. Mr. D. H. Browne gives a statement of relationships between ore deposits and furnace products. He states that (a) "Analyses of a pot of matte show marked tendency of the nickel to accumulate in the central part, well towards the bottom. In the ore deposits a horizontal section shows increase in the ratio of nickel to copper towards the middle of the ore body. The output of mines shows an increase in the ratio with depth. The 'marginal' deposits show a greater ratio of nickel than do the 'offset' deposits."

(b) "Analyses of slag and matte show the ratio of nickel to copper to be greater in the matte than in the slag, and the same relation holds true for ore and the rock that is mined with the ore." One reason, doubtless, lies in the fact that molten nickel sulphide is more mobile than the copper sulphide, and that therefore a greater proportion of the former would settle out from the mixture. The relative solubility of the molten sulphides in the molten silicate solution is an unknown, but probably less important factor."

4. The analogies which Mr. Browne has shown to exist between the ore deposits and the furnace products strengthen the view that the deposits were formed directly from a molten magma.

5. Since the first solidification all the deposits have been altered—some slightly and others almost completely. The localization of the ore-bodies, however, was determined by the primary deposition, and this is, therefore, the factor of chief importance. The extent of secondary alteration has been peculiarly dependent on very local conditions, and the discussion of the nature of the secondary changes calls for more detailed description of individual ore bodies than is at present available.

# STOPING DRILLS AT SUDBURY, ONTARIO*

By Albert E. Hall.

In late years the stoping drill of the hammer type has been steadily improved, until now no mine manager can afford to overlook the possibility of using it as a means of reducing his working costs.

A stoper is cheaper to operate, since it can be handled by one man instead of two, as required on a large machine. In some cases a helper is assigned to two or three stopers, but, as a rule, this is not advisable. In addition, the use of stopers permits a larger proportion of the total time to be spent in actual drilling. With a big drill much time is consumed in setting up after a blast or after moving to a new working place; with a stoper, on the other hand, the preparations for drilling are simple. As a rule, a stoper can be rigged up and set to work 30 to 40 minutes earlier than a big drill. One disadvantage of the stoper, when used for shrinkage stoping, is its tendency to create a large amount of shattered and partly loosened rock on the roof and walls of the working place. The men must first scale of this loose ground, which takes from 30 minutes to an hour. With a sufficient number of working places, however, this scaling can be done by a special gang of scalers, while the machine men are drilling in a previously scaled place.

As a result of the extra time applicable to drilling, and also of the more rapid drilling, stopers make an average of 30 to 40 linear feet of hole per shift, while a large drill will make 20 to 30 feet. As a rule stopers work on a bench in the back. When necessary a bench is created by taking out a diamond cut, and is then followed across the stope. The holes are made about 6 feet deep. The amount of powder used (40 per cent. dynamite) as computed from several groups of holes average 0.63 lbs. per cubic yard of ore. The amount of air consumed by a stoper is estimated to be about two-thirds of that used by the largest drills.

Some workmen object to the stopers on the ground that stoppages for small repairs are too frequent. It is true that the dust, which is a disadvantage in itself, from the runner's standpoint, sometimes clogs the valve and prevents the extension leg or standard from working properly, but only a few minutes are needed to clean out the valve, and if a screen or a bit of waste be put into the hose, this trouble is almost eliminated. Water sprays can also be used. On the basis of total repair bills, the stopers do not compare unfavourably with the larger machines.

In many places it is impracticable to use a stoper, and a big drill becomes necessary; for example, in hard rock, where the light drill makes little or no headway; but in shrinkage stoping the smaller machine does excellent work. The stoper has one advantage, which is probably realized fully only by the men working underground; this relates to the matter of block-holing. Where the muck is being drawn off through chutes, the size must be fairly small, so as not to block the chute and so hinder tramming and hoisting. With small stoping drills, the ground is generally broken small enough to pass readily through chutes, and very little block-holing is required. With large machines, on the other hand, considerable block-holing is necessary.

*A paper presented at Houghton meeting Lake Superior Mining Institute, August, 1912.

# SOME APPLICATIONS OF CONCRETE UNDERGROUND*

By H. T. Mercer, Painesdale, Mich.

The rapid growth in favor of concrete for certain classes of construction has been one of the most noteworthy engineering developments of late years; and in this the applications made to the mining field have played an important part. This is owing to the decreasing supply of suitable timber and to the limited life of even the best timber when exposed to underground conditions.

Concrete has been used for many years in building underground dams, bulkheads, etc., some notable examples of which can be seen at the Chapin Iron mine at Iron Mountain, Mich. The principal uses of concrete in mines, however, is in connection with shaft support, and it is the purpose of this paper to describe some of the work that has been done along these lines in the Michigan Copper Country. Good examples of concrete shaft collars can be seen at many of the mines, and although the details vary somewhat, a description of one or two will perhaps suffice to illustrate this form of construction.

At the Trimountain mine it was decided to replace the old timber collars with concrete, and work was begun at No. 2 shaft, where the overburden was 80 feet deep, consisting for the most part of sand, with more or less clay and some boulders. To guard against any possible "running" of the sand, and to make the operation of the shaft during construction easier, as well as to reinforce the concrete, it was decided to replace the timber with steel I beam sets, and then concrete between and around the steel sets. The sets would provide a support in case it became necessary to put in lagging to hold back the sand before the concrete was placed. A foundation was first prepared at the ledge by placing heavy steeel beam box girders across the shaft from foot to hanging under the dividers and under the south e—nd plate (Fig. 1A). At the north end there was a natural rock ledge or shelf. Starting from the foundation thus formed the steel sets were built up, two or three at a time, and concreted in. The work proceeded as follows:

First, the old timber on the ends and footwall was taken out for as great a height as was deemed safe; then two or three of the steel sets were placed and bolted up, after which the forms were erected, and the concrete poured. Then another space would be opened up and the operation repeated, and so on until the surface was reached. Fortunately the old hanging wall plates did not have to be removed, as there was sufficient clearance to permit the new concrete lining being carried inside of them. Care was taken to leave no timber or blocking under the foot wall side of the concrete lining which might by rotting permit settling.

*From School of Mines Quarterly, July, 1913.

The sand was carefully tamped along the foot wall as the concrete was finished. One skip road and the ladder way were built first, hoisting going on meanwhile in the other compartment. The skip was then changed over to the completed road, and the other road was built up. The steel sets were 2 feet 4 inches apart in the lower half of the collar, and 3 feet 0 inches apart in the upper half, centre to centre. The concrete between the sets was reinforced with ¾ inch rods, as shown by Fig 1, which also shows the construction of the steel sets and the position of the concrete.

The materials used for the concrete were: Portland cement, coarse amygdaloid stamp sand and crushed trap rock. They were mixed by hand in the proportion 1:3:5, in the shaft house just back of the shaft and lowered by means of a bucket and trolley, the trolley rope being concreted in on the hanging side as the work progressed. As no difficulty was experienced at No. 2 shaft with the sand running in, or otherwise, it was decided to build the Nos. 3 and 4 collars of reinforced concrete only, leaving out the steel sets. Fig. 3 shows the construction of the No. 3 collar, which was started in June, 1910, and finished in August, 1910. The materials for the concrete were the same and the work was carried on in the same manner as at No. 2, except that there were no steel sets. The collar at No. 4 shaft was similar to the one at No. 3, except that the dividers were made 12x48 inches instead of 12x12 inches. The overburden at No. 4 shaft was 128 feet deep on the pitch of the shaft, (71 deg.), that at Nos. 3 and 2 being 60 and 80 feet, respectively; but in order to secure a suitable foundation, the No. 3 and No. 4 collars were started some distance below the ledge in the solid rock. The length of No. 3 collar was 93 feet, and No. 4 was 158 feet.

**Comparative Statement of Cost of Concrete Shaft Collars**

| | No. 2 Shaft. | No. 3 Shaft. | No. 4 Shaft. |

**Details for steel-concrete collar, No. 2 shaft, Trimountain mine**

No. 2 Shaft Collar commenced February, 1907, completed August 1907.

No. 3 Shaft Collar commenced June, 1910, completed August, 1910.

No. 4 Shaft Collar commenced March, 1911, completed August, 1911.

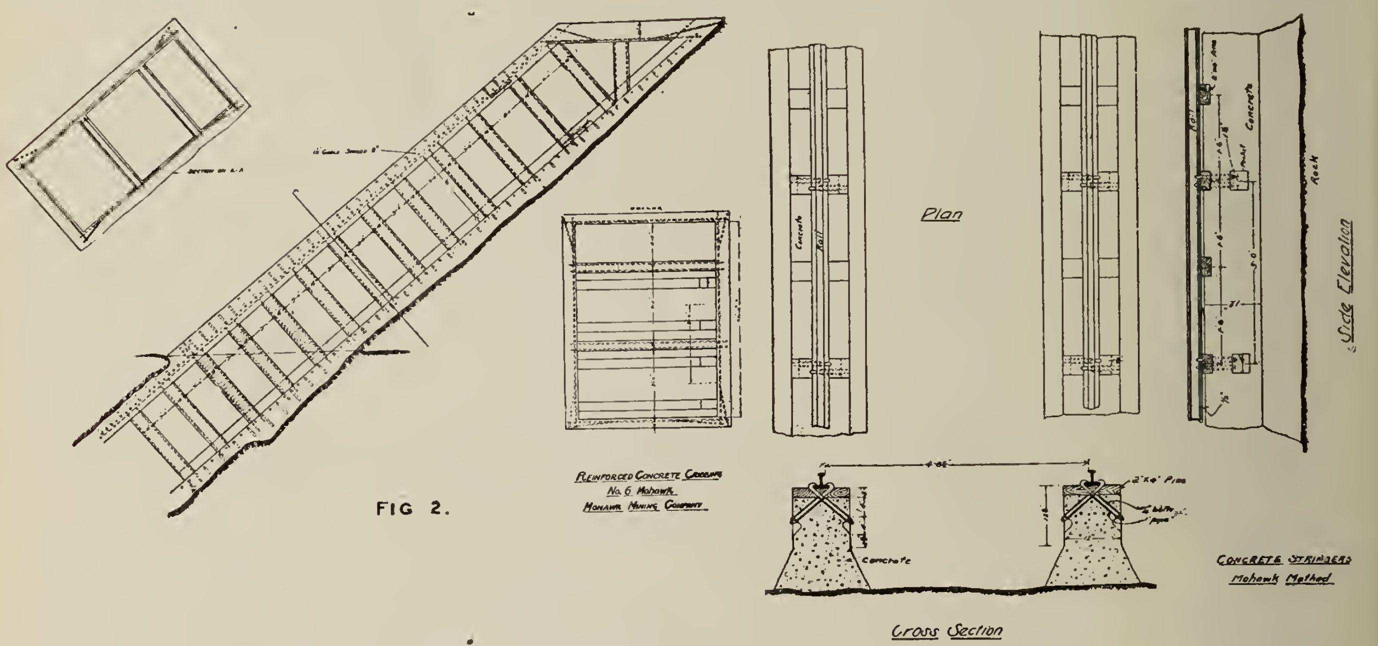
| Cost per Foot— | Labor. | Supplies | Total. |
|---|---|---|---|
| No. 2 shaft ......... | $47.47 | $43.70 | $91.17 |
| No. 3 shaft ......... | 16.77 | 16.66 | 33.43 |
| No. 4 shaft ......... | 15.04 | 7.25 | 22.29 |

Fig. 2 illustrates a reinforced concrete collar designed by Mr. W. F. Hartman for No. 6 shaft, Mohawk mine, where the dip is very flat (about 38 deg.). The reinforcement was rods and wire rope. The collar was built in 17 days and the total cost was $3,931.00. The length of the collar was 100 feet. The pit was first excavated at the shaft site. Then the forms were started at the bottom and built up as the work progressed. The concrete was mixed on surface and run down to the working platform in an iron trough. The use of concrete for plat floors, levelers, stringers and dividers is becoming quite common.

put in, reinforced with old rails and wire rope. The concrete extended across the hanging and down on both ends, and sometimes across the foot, and there were also heavy concrete dividers 4 feet high by 10 in. thick, placed 10 or 12 feet apart. At several levels the whole plat was arched over with reinforced concrete. This lining has been in place about two years and has proven satisfactory.

Drift sets built of concrete have been tried to some extent at the Wolverine and Mohawk mines in some of their cross-cuts, where loose ground was encountered. These sets consisted of legs 6x6 inches in section, and a cap 6x8 inches, reinforced with ½ inch rods and wire rope. Concrete planks, reinforced with Kahn expanded metal, or woven wire, were used for lagging. Above the caps they were 4x14 inches in section and behind the legs 2½x14 inches.

The use of reinforced concrete in the form of shaft sets and lagging is well described in a paper read before the Michigan College of Mines Club, at Houghton, Mich., by Mr. E. R. Jones, who has kindly given his permission for the use of the following excerpt:



**Concrete Stringers and reinforced concrete cribbing, Mohawk mine**

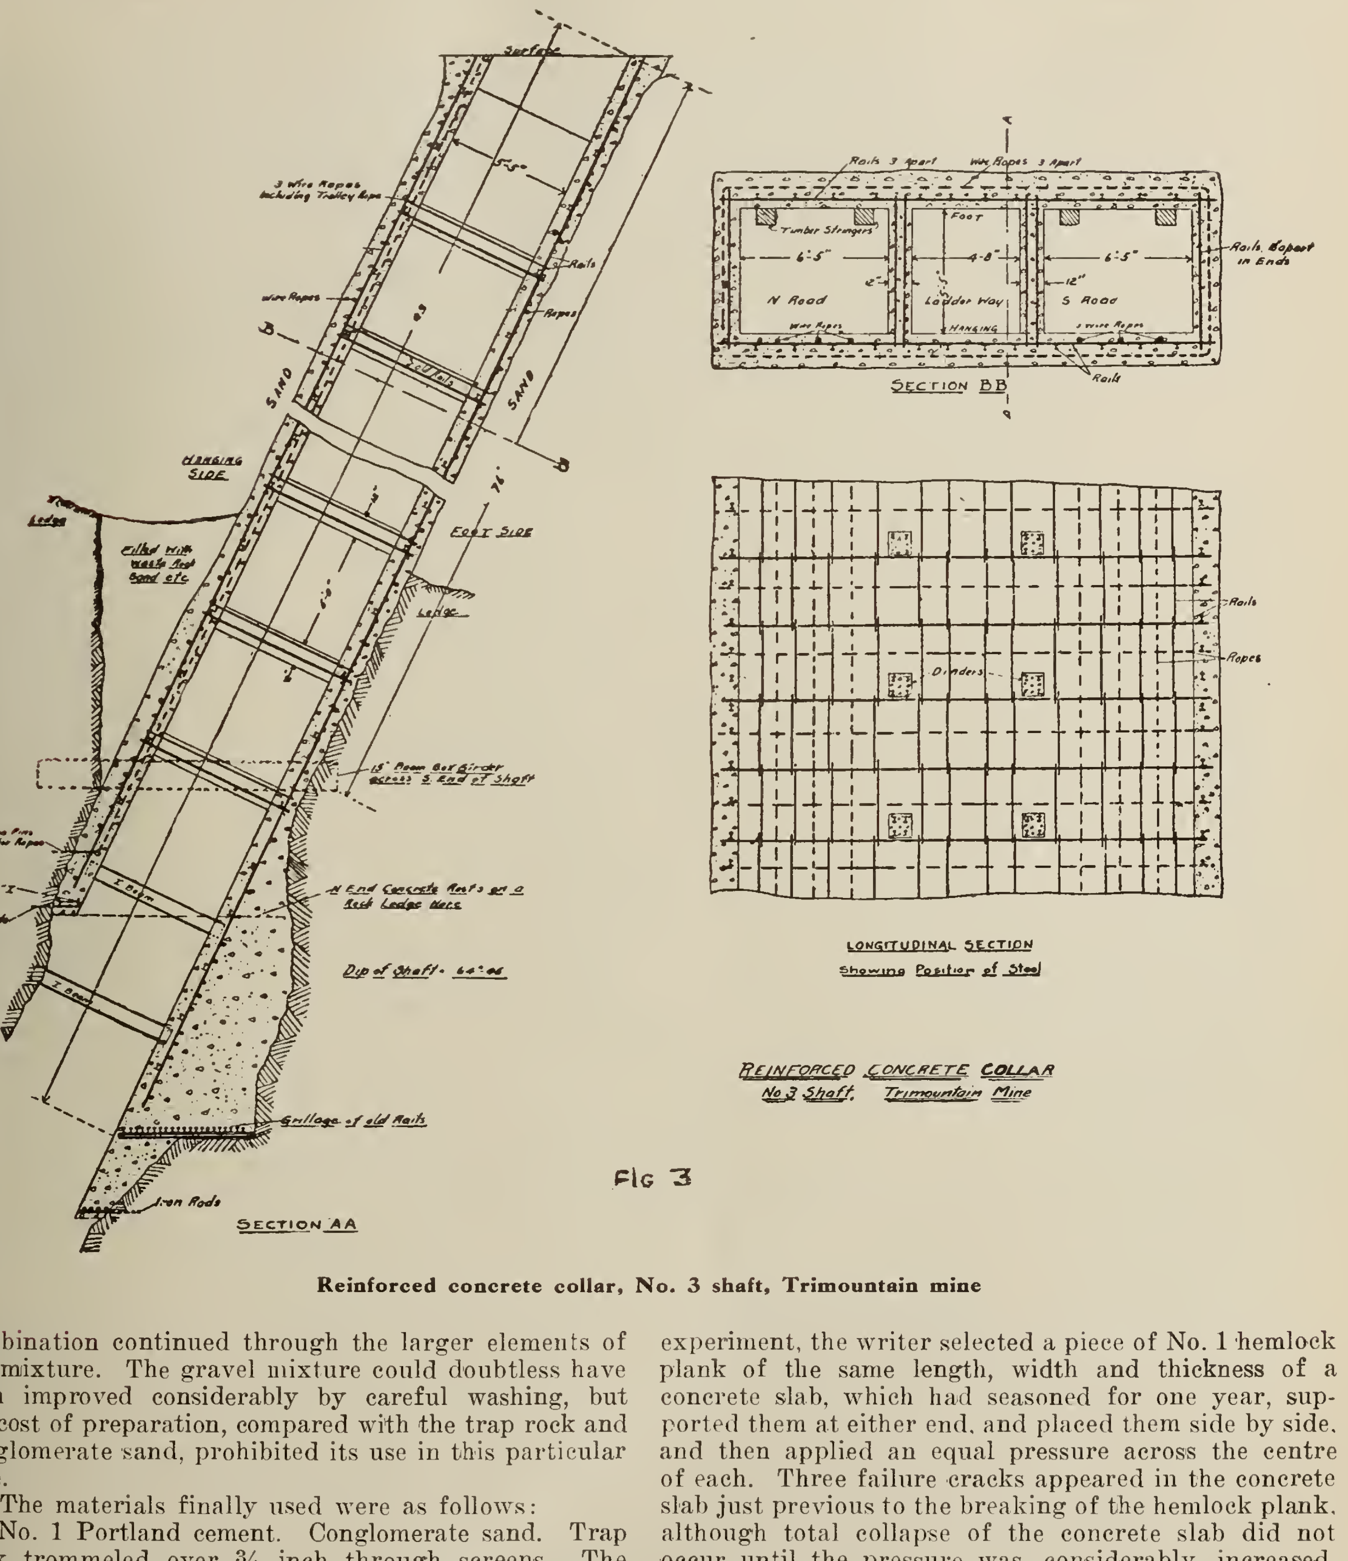
Fig. 4 shows a station or plat in one of the Champion Copper Company's shafts, and indicates the manner in which the levelers are reinforced. This illustration also shows the method used for concrete stringers. At first an all concrete stringer was built after the manner in use at Ahmeek mine, as designed by Mr. W. J. Uren, to which the rail was bolted by means of bolts and clips, but because of the hard rigid roadbed thus formed the wear and tear on skip and rails was very great, and the bolts and clips were continually working loose. The scheme was therefore abandoned in favor of a combination wood and concrete stringer.

Fig. 4 shows the method in use at the Copper Range Consolidated Company's mines, and the Mohawk and Wolverine scheme is illustrated in Fig. 6. Both methods made a very satisfactory roadbed.

At some of the mines where the foot is subject to "heaving" concrete stringers cannot be used advantageously.

In sinking through some loose ground at one of the Champion shafts it became necessary to close-timber, or line the shaft. Concrete 12 to 18 inches thick was

"For a number of years solid concrete and reinforced concrete shaft collars and shafts have been in vogue where the conditions warranted a shaft of any degree of permanence, but not until 1909 was reinforced concrete tried as a substitute to take the form and similar methods of installation as the long-used timber sets for shaft purposes; namely, at the Nos. 3 and 4 shafts of the Ahmeek Mining Company. At first, two distinct kinds of material were used; a good grade of gravel and natural sand from a local pit; and the trap rock, through which the shafts were sinking, together with clean conglomerate sand from the Calumet and Hecla mill. Sets were moulded from these two classes of material and installed with equal partiality and subsequent service has proven both to be equal to the demands made upon them. Pieces set aside for the purpose were allowed to season sufficiently that they might be given a fair competitive test, and it was found on comparing the fractures in the two combinations of material, that the sand and cement filling the spaces between the rounded pebbles broke away from them, while the fracture in the trap-conglomerate same



**Reinforced concrete collar, No. 3 shaft, Trimountain mine**

combination continued through the larger elements of the mixture. The gravel mixture could doubtless have been improved considerably by careful washing, but the cost of preparation, compared with the trap rock and conglomerate sand, prohibited its use in this particular case.

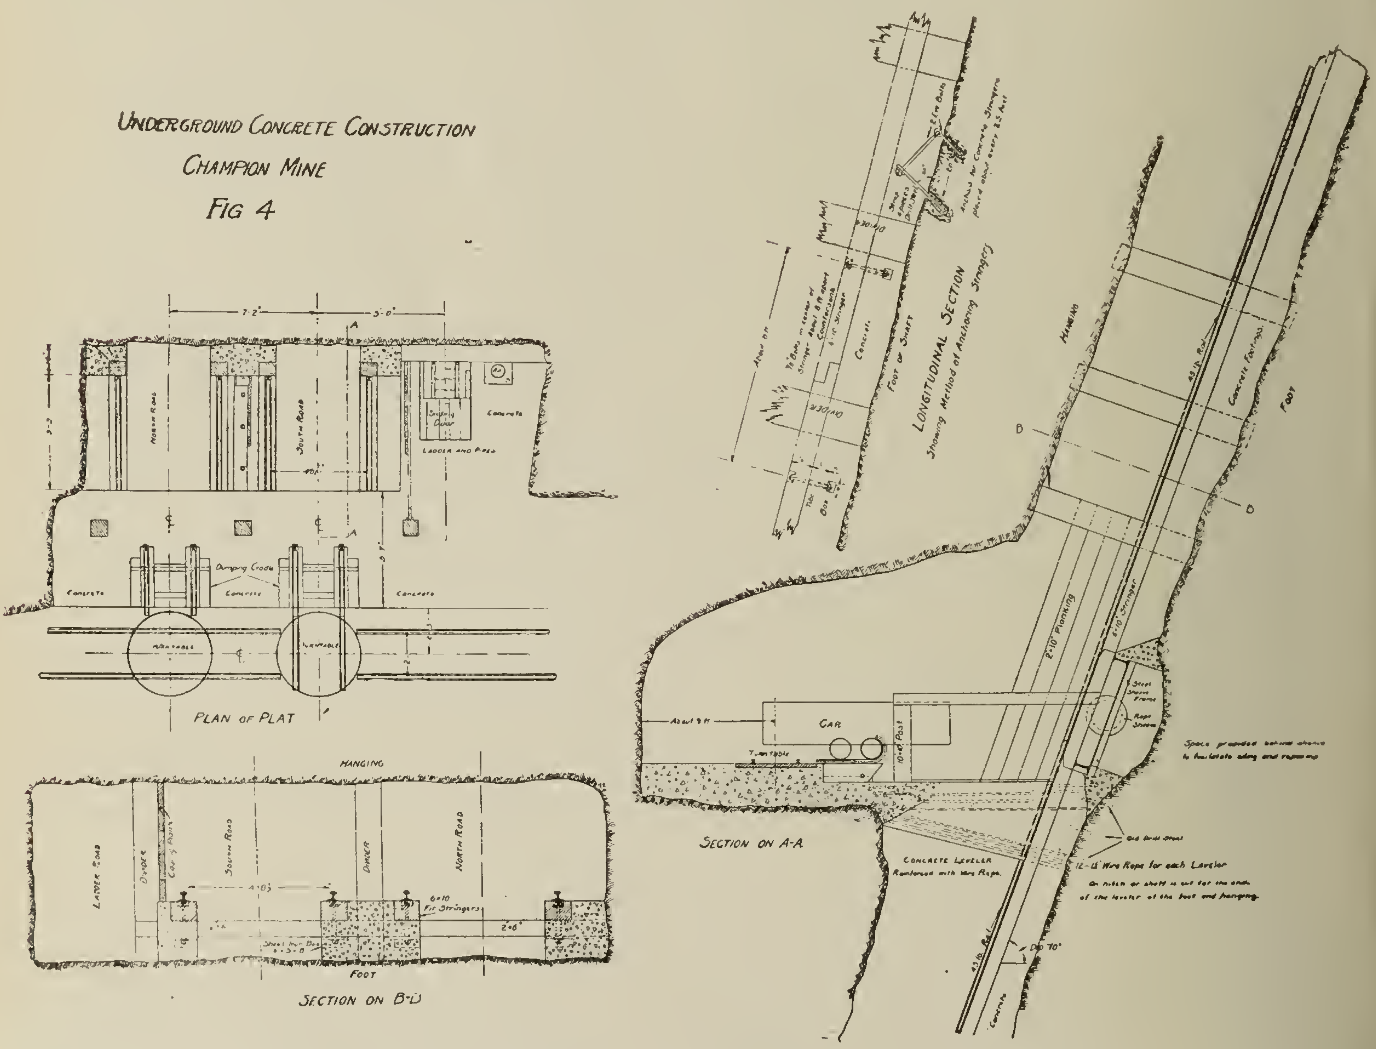
"The materials finally used were as follows:

"No. 1 Portland cement. Conglomerate sand. Trap rock trommeled over ¾ inch through screens. The proportions used were 1:3:5 in wall plates, end plates, and dividings, and 1:2:4 in studdles. The reinforcement in wall and end plates consisted of three ¾ inch monolith steel bars with ¼ inch webs, crimped onto them, together with two straight ¾ inch monolith bars. The dividings were reinforced by four ½ inch monolith steel bars wound spirally with ¼ inch steel wire, the whole presenting a column with square cross-section. Studdles were reinforced with two pieces of old wire rope 1¼ inch in diameter. Reinforced concrete slabs were moulded for the shaft lining, the material used being fines of trap rock under ¾ inch, conglomerate sand and Kahn expanded metal as reinforcement. The mixture used for slabs was 1:2:4. By way of experiment, the writer selected a piece of No. 1 hemlock plank of the same length, width and thickness of a concrete slab, which had seasoned for one year, supported them at either end, and placed them side by side, and then applied an equal pressure across the centre of each. Three failure cracks appeared in the concrete slab just previous to the breaking of the hemlock plank, although total collapse of the concrete slab did not occur until the pressure was considerably increased. While the method of the test employed was crude, it proved to the satisfaction of the writer that the concrete slab was much superior in strength. Considering the rapid decay of timber used as shaft lining no further comparison of the two is necessary.

"In the moulding of the concrete sets, 2 inch No. 1 white pine was used in the construction of the forms. These were soaked in Delaney's wood preservative, and repainted with preservative on the interior each time before setting up, thus insuring them against warping and prolonging their lives indefinitely, as well as securing a smooth and easy parting from the concrete when removed. A Smith barrel type mixer was employed in preparing the charge for the forms. The amount of water used in the mix was such that, when the batch was piled, it settled rapidly without agitation. A dryer mix was attempted by way of experiment, but due to the amount of reinforcement employed, it was found impossible to ram the dryer mix into place.

"The labor involved in making consisted of two carpenters, setting up forms and keeping them in repair; one man wheeling forms onto skidways ready for filling, returning used forms to shop and cleaning the same; one man feeding mixer from stock piles of rock, sand and cement; one man delivering mix to forms and shovelling material into place; and one mason ramming charge into final position. With this combination of men as many as four complete sets, consisting of 64 separate pieces, have been moulded in one day of nine hours. In ordinary weather, the sides of the forms were allowed to remain in position over night, and then removed, while the bottoms were left in place another 24 hours. The bottoms were removed by turning the pieces on their sides, where they were left to harden one day longer before removal to the stock pile. All through the process of removal the sets were handled with the greatest care in order to preserve the appearance of the set and prevent cracking, which might not develop to the eye until weathered. All skidways used in making and storing were brought to a level to prevent warping and bending while the sets were green, to insure a perfect fit underground, for, unlike timber, the concrete set cannot be brought to place unless perfectly true. Sets should not have been used under 60 days after removing forms, although we, through the reduction of the stock piles, have been forced to install pieces of 14 days set, but the greatest care was observed in handling and putting in place underground. Concrete sets one year old, which have been subjected to all manner of weather, can be abused somewhat and handled almost as carelessly as timber.

"As before stated, the above mentioned sets were made for the Nos. 3 and 4 shafts of the Ahmeek Mining Company. The shafts are of the three compartment variety—two skipways and one manway, dipping at an angle of 80 degrees. The outside dimensions of the compartments are:



**Sections and plan showing underground concrete construction, Champion mine**

"Skipways—7 feet 6 inches high, 6 feet 10 inches high.

"Manway—7 feet 6 inches high, 3 feet 0 inches wide, with the end plates and dividings, making the greatest span of 7 feet 6 inches. Offsets were moulded in all plates 5 inches from the inside face to accommodate lining slabs. Also, holes were cored for the use of hanging bolts and bracket bolts. The wall plates, end plates and studdles have a cross-section of 80 square inches, dividings 81 square inches. The percentages of reinforcement are approximately as follows:

| | |
|---|---|
| Wall and end plates | 5 per cent. |
| Dividings | 5 per cent. |
| Studdles | 3 per cent. |

"It was found advisable from the beginning, because of the great weight of the wall plates, to mould them in two sections, one section spanning the ladder way and one skipway, and the other section spanning the remaining skip compartment. These two sections were connected when in place by two bolts passing through holes, cored for the purpose, and two straps of iron spanning the splice. Studdles were made for 4 feet 0 inches, 5 feet 0 inches, and 6 feet 0 inches sets to accommodate the ground passed through.

"The weights of the different pieces comprising the set are as follows:

| | Pounds. |
|---|---|
| Long section of wall plate | 1,035 |
| Short section of wall plate | 700 |
| End plate | 600 |
| Divider | 645 |
| Three feet 3 inch studdles | 268 |
| Complete set of 16 pieces | 8,104 |

"Taking the weight of No. 1 Western fir, which has been exposed to the weather in stock piles, as 33 pounds per cubic feet, the above concrete set weighs almost three times that of a 12x12 inch timber set, which the concrete set is intended to replace. Because of this additional weight of the concrete set, it was found necessary to increase the usual five or six men on the timber gang to seven in number. In a vertical shaft, to which the concrete sets are especially adapted, the number of men per gang might again be reduced. The sets are hung or built as the ordinary timber sets, only requiring an additional rope and block to swing the pieces in place. After the sets are wedged to line, bottoms are put in between the plates and the surrounding shaft wall, and the set is then tied to the shaft wall by means of concrete, in the proportion of 1:3:5. The concrete slabs are then put in place, and loose rock thrown behind them, filling up what space still remains between the set and the wall of the shaft.

"After the set is in place, it is extremely important that it is well protected from the blast, for, unlike the timber set, concrete will not stand the blast. For the purpose, the writer used flat timber and steel plates chained to the under side of the plates and dividings, and even this precaution was at times inadequate. Where the ground was breaking easily, the sets have been as near as 12 feet to the miners, and again when the ground was especially refractory, sets 40 feet from the blast have been cut out. It is obvious that it is well to keep as far behind the mining as the ground will permit. In dangerous ground, which required timbering close up to the sinking, timber sets were used, but, had not time played an important part in the sinking, no ground was met in which concrete sets could not have been installed. With a gang of seven men, one complete set can be installed in a nine hour shift. This permits a sinking rate of better than one hundred feet per month, which was accomplished at the Nos. 3 and 4 shafts.

"The comparative cost of the concrete set and timber set, delivered at the shaft collar, is striking. The concrete set was delivered for $22.50, the timber set for $37.60. These figures are based on:

"Western fir at $28.00 per M., f.o.b. car.

"Crushed rock at 35c per yard, f.o.b. shaft

"Conglomerate sand at 60 per yard, f.o.b. shaft.

"No. 1 Portland cement at $1.15 per bbl., f.o.b. works.

"Reinforcement at $12.00 per set, f.o.b. factory.

"The Ahmeek Mining Company, I believe, was the first to adopt the concrete stringers, and the Mohawk Mining Company soon followed with their use. At the Ahmeek, these stringers have been in continuous use since the beginning of operations, and have required no repairs. Superintendent Smith of the Mohawk has informed me that soon after the stringers were installed, skip repairs increased about 100 per cent. The stringer being entirely rigid and the skip also of rigid construction, the axles of skips were found to be crystallized and the rivets working loose. This feature was overcome by moulding inch pine strips, after preserving them in Delaney's wood preservative to prevent decay, into the stringers at intervals of three feet, allowing them them to propect one-half inch above the face of the stringer, and resting the rail thereon. The pine strips have been in place four years, and none have been replaced to date, and skip repairs have been reduced to normal. Possibly because of a differently constructed skip, Ahmeek repairs were not abnormally high, but the same racking of the skip body occurred and the Ahmeek Company has adopted the Mohawk feature and expects to profit accordingly.

"Concrete plats, or stations, have been in use at both the Ahmeek and the Mohawk for some time. They differ from the timber plat in outward design only in the cross-section of the members, which are 9x12 inches, and are reinforced with old rail and wire rope, and replace the 12x12 inch and 12x14 inch timber formerly used. Holes are bored to accommodate gates for skip and dump doors, and tram rails are imbedded in the concrete, making the use of spikes unnecessary. When turn-tables are used on the back of the plat, the rigidness furnished by the concrete insures the trammers against derailed cars, resulting from a tilted table.

"At the present time our company is installing reinforced concrete dividings to replace the practice of putting in 10 inch flat timber. In cross-section they are 9x12 inches, and are reinforced by old rail. On the ladder road, they are placed six feet from centre to centre and between the skip compartments are put in as often as the hanging requires. Since the casing along the ladder road performs no other office than the protection of the men while on the ladder, or in case of a fall, plank is used for the purpose, and a 3-inch hemlock strip is moulded into the dividings to facilitate the fastening of this casing."

# SPECIAL CORRESPONDENCE

## PORCUPINE, SWASTIKA AND DANE

**The Bush Fires** which have caused so much uneasiness and loss of property, have subsided without much damage to the mining industry. The Cobalt camp is, of course, safe, and has been for several years past, owing to the very large area absolutely clear of all vegetation. In Porcupine there was some trepidation; but, thanks to the wholesale and very efficacious precautions taken after the lamentable fire of two years ago, there was no damage of any account done. At Kirkland Lake the bush is fairly green, and the wind shifted at a favourable moment. To sum up, the only loss was of several plants, isolated and long abandoned.

**A Copper Mine at Dane.**—There appears every possibility of the Temiskaming districts possessing a copper mine. In the first annual report just issued, Mr. G. O. McMurty, manager for the Dane Mining Company, estimates that in milling ore alone, they now have reserves which should yield a profit of over half a million dollars. The principal claims of the Dane Mining Company are about six miles from Dane, which is a station on the T. and N. O. Railway, fifty miles north of Cobalt. Before Cobalt was discovered, the Temiskaming and Hudson Bay Mining Company of New Liskeard sent prospectors north before they heard of the staking in Cobalt. These men stopped at Boston township, going up there by way of the Blanche River, before the steel was laid past New Liskeard. They staked what they described as iron deposits, but the claims were allowed to lapse when the tremendous excitement broke out at Cobalt. Some of these claims undoubtedly are the same as are now proving to be of value to the Dane Mining Company. After detailing the development to date, Mr. McMurty states: "We can therefore conservatively estimate by figuring on the vein or veins to a depth of 200 feet, and for the distance between the two shafts, together with a reasonable distance to the east of No. 4, altogether a distance of, say 1,000 feet, and by averaging the width to 7 feet it is 10 feet wide to the east of No. 1 on the surface, that we have 116,600 tons of ore. Figuring on three and a half per cent. copper content, we can reasonably conclude a net profit of $571,000."

Mr. McMurty points out: "This estimate, it must be remembered, does not include further high grade ore we are expecting in No. 4, nor the 4 per cent. blue quartz lead at the south of No. 4, nor the ore on the dumps, of which there is a considerable quantity, nor does it include the ore which we have in the bottom of the winze."

"The high grade ore is a direct smelting proposition. The lower grade material should probably be treated in a smelter on the ground reducing to a copper matte."

The company has made estimates, which show that it would be possible to set up and have running a 100 ton per 24 hours' smelting plant, for between $25,000 and $35,000.

**Jupiter Again Active.**—Resuming work after shut down caused by the strike, the Jupiter mine is now very busy in blocking out ore for the proposed new mill, plans for which have already been drafted. Ten to twelve drills are working underground, the company having rented the plant of the Plenaurum Mining Company. Recently a raise was put through from the 300 to 200 foot level, and here some of the best grade ore in the mine was found. At the 300 foot level there has now been developed an ore shoot 300 feet in length.

It is proposed that the Jupiter mill shall be financed out of the sale of the 157,214 shares as yet unissued.

**The Rea Mine** at Porcupine is being worked by the Mines Leasing Company on a 25 per cent. royalty basis. The little mill, which was purchased from the defunct Little Pet Mining Company, is now dropping stamps, and will treat between 17 and 18 tons per day. Before the old company abandoned the mine, there had been blocked out between the surface and the 200 foot level 10,000 tons of good milling ore, the shoot being from 180 to 200 feet long. No ore of milling grade was found at the 300 foot level, and the Mines Leasing Company will at once endeavour to pick up the vein.

**Petzite at Harricanaw.** In a specimen from the Maloney claim at Harricanaw, the Northern Quebec gold camp east of Cochrane, there has been discovered the telluride ore, petzite. It was taken from the lead which yielded some remarkable specimens of free gold. Very little work so far has been done on claims in this particular district, although there have been prospectors in there for a year and a half at least. The Harricanaw district is reached from Cochrane and the Transcontinental. The claims can be reached by water from the Transcontinental Railway at a point about 130 miles east of Cochrane.

**Hughes Porcupine.**—At the 300 foot level of the Hughes Porcupine mine good results are being obtained. The development at this level has so encouraged the directorate that they have had plans drawn for a much larger mill. The present little mill has a capacity of only about ten tons a day.

**Nickel Shipments from Alexo Mine.**—During the month of June the Alexo Mining Company shipped 12 cars of about 30 tons each from the nickel property near Iroquois Falls. All this ore is going to the Mond Nickel Company's smelter at Coniston. The ore is still being taken out from the open cut. This has now attained a depth of 40 feet. The ore is being mined for a width of about eight feet.

## COBALT, GOWGANDA AND SOUTH LORRAIN.

**Cobalt Townsite and Casey Cobalt.**—The production of the two principal English companies for the month of June by weeks was: Cobalt Townsite, June 7, 41,100 ounces; June 14, 41,500; June 21, 41,100; June 28, 40,100; total, 123,800 ounces. Casey Cobalt, June 7, 19,900 ounces; June 14, 20,000; June 21, 20,200; June 28, 20,000; total, 80,100 ounces.

**Beaver Consolidated.**—In the last quarterly report of the Beaver Consolidated Mining Company, the Beaver Auxiliary prospect at Elk Lake plays a prominent part. Mr. Frank L. Culver, in his report to shareholders, states that the Beaver Consolidated had already paid $40,000 for a three-quarters interest, leaving $30,000 still to pay. $34,800 has already been spent on development, and three-quarters of the amount, $26,100, had been paid by the Beaver Consolidated Mining Company. The shaft on the property is down to a depth of 194 feet, and the first cross-cutting will take place at the 280 foot level.

| | |
|---|---|
| The company's cash balance on May 31 was | $ 7,226.71 |
| Ore at smelters and in transit | 40,994.17 |
| Ore bagged ready for shipment | 50,932.27 |
| | $102,153.15 |
| Less accounts payable | 16,969.98 |
| Available balance | $ 85,183.17 |

**The Gowganda-Elk Lake Branch T. and N. O. Ry.**—There seems very little possibility that the T. and N. O. Railway will undertake the extension of the Elk Lake branch into Gowganda. In an interview, Mr. J. L. Englehart, the chairman of the T. and N. O. Commission, states that of the half dozen surveys taken in an effort to locate an extension to Gowganda, there had not been one route which would warrant the construction. However, survey parties are still in the field.

**Keeley Mine Has Good Ore.**—There appears every probability that Erhlich and Hamilton, the English syndicate which is working the old Keeley mine of South Lorrain, will exercise their option. Two excellent veins of high grade ore have been discovered at the 50 foot level, and one of these has also been found at the 100 foot level.

**Penn Canadian.**—Although the Penn Canadian developed an old mine to a good producer during the year, the first annual report shows a deficit. According to the president, Mr. Wm. J. Haines, the first 12 months' operations resulted in a loss of $24,211. He explains it as being "due to the exhaustion of ore, depreciation of plant and equipment, and annual proportion of deferred charges included among the assets."

**A New Vein at the Savage Mine.**—The most important discovery of the present year in the Cobalt camp was the cutting of an entirely new vein on the Savage property of the McKinley-Darragh-Savage Company. It is between two and a half to three inches wide of $5,000 ounce ore. In addition, the wall rock on both sides of the vein promises to make good milling grade.

The discovery was made in virgin territory. A crosscut, driven south from the No. 10 vein at the 140 foot level, cut the new ore body at a distance of 40 feet. The vein has a strike of east and west paralleling No. 10 vein.

## BRITISH COLUMBIA.

**Ore Receipts at the Consolidated Mining and Smelting Co.'s Smeltery at Trail** during the six months to July 1 have been about 170,000 tons. Exact figures are not yet available, but it is known that the aggregate for the half year will be approximately that quantity. A rough apportionment shows the sources from which ore was received to have been as follows: From mines in East Kootenay, 18,000 tons; Ainsworth, 5,000 tons; Slocan, 12,000 tons; Nelson, 5,000 tons; Rossland, 113,000 tons; Boundary, 4,000 tons; Lardeau and other small shipping districts, 1,000 tons; United States, 12,000 tons. These figures do not include ores milled, but only the concentrates from such ores. An estimate of the quantity of ore received at Boundary district smelting works during the same period places it at 950,000 tons, 620,000 tons at the Granby Co.'s smeltery at Grand Forks, and 330,000 tons at the British Columbia Copper Co.'s reduction works at Greenwood. Included in the latter amount is about 20,000 tons from United States mines; otherwise practically all the ore was from the several mines of the respective companies. Then, the production of the Britannia and other mines in the Coast district was probably about 100,000 tons for the half year. Allowing 100,000 tons for other ores, not sent to smelting works, but treated in stamp mills or concentrators, it s evident that the aggregate output of the lode mines f the province during the expired half of the year as been about 1,320,000 tons. As the aggregate for 912 was 2,688,000 tons, it would seem that this year's itput of ore has thus far been approximately similar the rate recorded for last year.

### A Brief Review.

Briefly reviewing the position, mention may be made the leading metal mines in the various districts, as der:

n East Kootenay, the Sullivan Group mines are the y important present producers of ore. Their output the half year has been nearly 18,000 tons.

West Kootenay, the several mining divisions thy of mention are: Ainsworth, Slocan, Nelson Trail Creek (Rossland). The Bluebell, near Koot- Lake, made a comparatively large output of lead- -somewhere about 30,000 tons. Other mines in worth division that sent out ore, though in com- ively small quantities, were the No. 1, Silver d, Florence Co.'s, and Utica. Development was ued on Retallack and Co.'s Whitewater group n several other properties.

Slocan district, the Lucky Jim and Noble Five shipped zinc ore, while the Rambler-Cariboo, ond-Eureka, Standard and Van-Roi sent out silver-lead products—ore and concentrate. The two last-mentioned also shipped zinc concentrate. Others that had more or less work done on them, and in some cases shipped ore, are the Payne, Ruth-Hope group, Slocan Star, Surprise, Silverite, Cinderella, Idaho-Alamo, Hewitt-Lorna Doone, L. H., Eastmont, Lily B. and a number on which operations were less important.

In Nelson division, the Queen Victoria (which shipped 13,000 tons of ore to the smeltery at Greenwood), Eureka, Granite-Poorman, Molly Gibson and Silver King group, in the northern part of the division; the Dundee, Yankee Girl and Wilcox, in Ymir camp; the Emerald and H. B.—both lead mines—near Salmo; the Queen and Motherlode, in Sheep Creek camp, and the Arlington and Second Relief, in Erie camp, constituted the chief working mines in this division.

Rossland mines, in Trail Creek division, made a production of about 123,000 tons, this including the ore concentrated at the mill of the Le Roi No. 2. Of this total about 102,000 tons was from the Consolidated Mining and Smelting Co.'s Centre Star and Le Roi groups, and practically all the remainder from the mines of Le Roi No. 2, Ltd. The destruction by fire a few weeks ago of the big head-frame, shaft-house, ore-bins, etc., of the War Eagle mine, while not seriously interfering with ore-production, occasioned the Consolidated Co. some inconvenience and loss. The Inland Empire gold mine and stamp mill, in this division, was operated when weather conditions permitted.

Turning to Boundary district, which produced between 900,000 and 1,000,000 tons of ore, it may be noted that both the Granby and British Columbia Copper companies continue to regularly maintain a comparatively large output of ore—the former from its big copper mines in Phoenix camp, and the latter from its Mother Lode mine and the New Dominion Copper Co.'s Rawhide mine. The Consolidated M. and S. Co.'s No. 7 mine shipped about 3,700 tons of ore to the company's smeltery at Trail. Additional plant and machinery was put in at the stamp mill of the Jewel-Denero Mines, Ltd., and preparations were made for mining and milling ore. Several other properties were worked in a small way, but they did not add much to the total of ore-production.

In Similkameen district, the only producer was the Hedley Gold Mining Co.'s Nickel Plate group, with an output of about 35,000 tons and a recovery of gold valued at approximately $450,000. The British Columbia Copper Co. continued doing exploratory work on a number of mineral claims on Copper Mountain, a few miles from Princeton, with results that are stated to promise favourably for the establishment there of a productive copper camp. Some work was done on placer-gold claims on Granite Creek, and the development of several mineral claims in Summit camp, at the head of the Tulameen River, was continued.

In the Coast district, the Britannia, near Howe Sound; the Marble Bay, on Texada Island; the Surf Inlet Gold mine, on Princess Royal Island; a considerable total of work in Omineca division of the Skeena country the important development work continued at the Granby Company's Hidden Creek mines, and the preparations for the establishment of a 2,000 ton smelting works; the operations of the Portland Canal Tunnels, Ltd., the Indian Mines, Ltd., and others in Portland Canal district, and the work done on Queen Charlotte Islands—all these contributed to a total of work and progress that augurs well for substantial improvement in the metal-mining industry of this district.

No detail can now be given relative to placer-gold mining in Cariboo and Atlin districts, nor of coal mining in various parts of the province. As to the former, it may be said that the gravel-washing season opened auspiciously, with much snow on the mountains and cool weather to ensure its melting only gradually. It is hoped that there will be plenty of water late into the summer, and that autumn rains will assist in prolonging the operating season. Concerning coal mining —it is thought that production is being well maintained in all the coal mining centres of the province, save only in Nanaimo district, where there are labour troubles.

### General Notes.

The low-level tunnel being driven by the Portland Canal Tunnels Co., about three and one-half miles from the town of Stewart, at the head of the Portland Canal, was in 1,400 ft. by about the middle of June. It is estimated that a further distance of 900 ft. will have to be driven to reach the fissure zone at that depth.

A drilling contest is to take place at Rossland on July 16, open to all union men in good standing. Fifteen minutes will be the time to be allowed for each team to drill. The first prize will be $100 and the second $50.

Development of the Milly Mae mine, near Burton Arrow Lake, will be continued this summer.

The 10-stamp mill of the Coronation Gold Mines, Ltd., operating on Cadwallader Creek, Lillooet mining division, has been started crushing ore from the company's mine nearby. It is stated that a mill will shortly be placed on the Pioneer claim, in the same locality.

Requiring siliceous ore for metallurgical purposes, the Consolidated Mining and Smelting Co. lately resumed work at its No. 7 mine, situated several miles from Boundary Falls, Boundary district. After having shipped nearly 4,000 tons of ore to Trail, operations were suspended.

A report published in Spokane, Washington, is to the effect that during four months, to May 1, ore shipments from the Rambler-Cariboo mine, Slocan, totaled 1,403 tons, as compared with 1,153 tons during the whole of 1912. The quantity of crude ore and concentrate received at Trail from that mine during six months, to July 1 inst., was approximately 1,600 tons.

Negotiations have been in progress for some time with the object of securing the use of the electrothermic smelting plant at Nelson for the purpose of completing the investigation, by the Mines Branch of the Canadian Department of Mines, of the application of electric melting to the zinc ores of British Columbia. It is probable that the plant will be in operation during the ensuing autumn.

## NOVA SCOTIA.

**Dominion Coal Outputs.**—During the first half of June the outputs were much reduced by absenteeism and general shortage of unskilled labour. Towards the end of the month, howeer, these conditions became much improved, and in the closing week of the month particularly, a high rate of production was obtained. During the week ending the 28th, the production of the Glace Bay mines was as under:

| | Tons. |
|---|---|
| June 23 | 15,506 |
| " 24 | 17,600 |
| " 25 | 17,307 |
| " 26 | 17,633 |
| " 27 | 18,130 |
| " 28 | 16,997 |
| Total | 103,203 |

This is the best sequence of outputs as yet obtained from the Coal Company's mines. The output for the month was 394,000 tons compared with 391,498 tons in June, 1912. The aggregate outputs to the end of the half year totalled 2,292,000 compared with 2,124,158 tons over the corresponding period of last year, a gain of 168,000 tons. The output of 18,130 tons for the 27th marks another record, which it is hoped will be again exceeded on several occasions during the coming summer. Following is the output of the individual collieries for this record day, and also for the month of June:

| | | |
|---|---|---|
| No. 1 | 2,082 | 44,000 |
| 2 | 3,147 | 68,000 |
| 3 | 526 | 9,200 |
| 4 | 1,437 | 33,000 |
| 5 | 762 | 18,800 |
| 6 | 1,198 | 22,200 |
| 7 | 813 | 17,900 |
| 8 | 297 | 6,400 |
| 9 | 1,285 | 30,500 |
| 10 | 694 | 16,000 |
| 11 | 222 | 3,900 |
| 12 | 1,257 | 29,600 |
| 14 | 1,671 | 36,000 |
| 15 | 844 | 18,100 |
| 16 | 1,079 | 22,400 |
| 21 | 600 | 12,600 |
| 22 | 216 | 4,600 |
| | 18,130 | 394,000 (Approximate) |

## QUEBEC.

**The Asbestos Industry** in the Thetford district has come to its own, and the prosperous times predicted for the past several years are now everywhere in evidence. Practically all the mines are working double shift and shipments are made as fast as the material can be produced. The fibre mines at Broughton are still idle, while of the three at Robertson but one is operating. The reason for the delay in these mines starting up is unquestionably the fact that the advance in prices has beer principally in crudes and long fibre and that the advanc in the price for short grades will be slow until the sui plus in these grades has been used up. Recent repor moreover, indicate that there is a steady cleaning up the various surplus stocks so that in a few months may expect the average price equal to those of 1908.

Wages have advanced from 17½ to 20 cents per hc for pit labourers, and several of the mines have c tracted for the mining and delivery of the ore. A g deal of labour has come into the camp and the pres supply is considerably in excess of what it was at time a year ago.

Mr. Theo Denis was a busy visitor to our city this week when he was making elaborate preparations fo visit of the Congress Geologique.

Mr. P. Hammerich, who has for the past two been mill superintendent for the Bell Asbestos Co accepted a similar position with the Jacobs Asbest

## PERSONAL AND GENERAL

J. B. Tyrrell is making a short visit to the i-canaw district in Northern Quebec to investigate recent gold discoveries.

Mr. T. F. Sutherland, assistant inspector ofs, has been appointed chief inspector of mines of io. to succeed Mr. E. T. Corkill.

The Lake Superior Mining Institute will hold its next annual meeting, August 26th to 30th, on the Mesabi Range, at places to be selected by the local committees as most convenient during the trip.

W. J. Woolsey, Thetford Mines, has returned from a nine months' business trip to Europe.

Chas. Spearman is superintending development work on the Burnside claims at Kirkland Lake.

A. E. Blair, Julio Madero and Raoul Madero, mining engineers, who took a prominent part in the Mexican revolution, are in New York City.

P. B. McDonald is at Gouverneur, N.Y.

Robt. Bryce is in charge of development work on properties south of Kirkland Lake.

H. K. Boysen has joined the staff of the Foster mine, Kirkland Lake.

Chas. H. Rogers, representing Ontario Porcupine Goldfields Company during the past year at Porcupine, leaves this month on a business trip to London, England.

Mr. Arthur S. Herbert has resigned his position as general manager of the Siemens Company of Canada, and has been appointed general manager of the branch offices of the Siemens Company in Australia.

W. Henderson Clark, managing director of the Anglo-French Exploration Company of London, England, and J. A. Denison, engineer in London for the same company, sailed from Quebec for Liverpool on June 26th on the Empress of Ireland, after having spent a month in the mining camps of Northern Ontario. They were accompanied on their trip by J. B. Tyrrell, who is their consulting engineer and representative in Canada.

The Roberts and Schaefer Company, engineers and contractors, Chicago, have just closed a contract with Mr. W. W. Keefer, president of the Pittsburg Term. Railway and Coal Company, and also the Millburn Coal and Coke Company, for the building of a large steel tipple at Keeferton, W. Va. The cost of this tipple will be about $30,000, and it will be equipped with the new Marcus combination screen and picking conveyor.

Mr. W. L. Anderson, formerly of Porcupine, has been appointed local manager for the Motherlode Sheep Creek Mining Co., with gold mine and stampmill in Sheep Creek Camp, Nelson mining division, British Columbia. Mr. Geo. E. Farish, of New York, resigned as general manager for the company several weeks ago. He left Nelson on a visit to New York, going via Montreal, at the end of June. Mr. John McMartin and associates are large shareholders in the Motherlode Co.

Mr. J. Berglund is in charge of diamond drilling operations for the British Columbia Copper Co., on a group of mineral claims that company is exploring under option of purchase, on Copper Mountain Similkameen, British Columbia. Four drills are being worked, and much development work is being done as well, under the superintendence of Mr. Ed. Berryman.

Mr. J. F. Fredin, formerly of Toronto, has for some time been engaged in doing mining engineering work for the British Columbia Copper Co. on Copper Mountain, near Princeton, B.C.

Mr. Jay P. Graves, vice-president and general manager of the Granby Consolidated Mining, Smelting and Power Co., accompanied by Mr. George W. Wooster, treasurer of the company, left Spokane late in June for Granby Bay, Observatory Inlet, B.C., on a visit of inspection of the company's Hidden Creek mine and the new smelting works being erected and equipped in its vicinity. On the coast the party was to be joined by Mr. A. C. Flumerfelt, of Victoria, who is also one of the directors, and Mr. F. M. Sylvester, assistant to Mr. Graves.

Mr. James J. Johns was given a valedictory smoker and made the recipient of a valuable present of silver plate and glass on the occasion of his leaving the Motherlode mine, near Greenwood, B.C., to proceed to Sudbury, Ontario, to begin his new duties of mine superintendent for the Dominion Nickel Co.

Mr. Frederick Keffer, geologist and mining engineer for the British Columbia Copper Co., recently examined a mine in Montana for that company. He was accompanied on his trip by Capt. Harry Johns, superintendent of the company's Kootenay mines.

Mr. I. L. Merrill, president of the Hedley Gold Mining Co., has returned to Camden, Maine, from a visit to Europe.

Mr. W. C. Thomas, of Vancouver, B.C., has been in Lillooet district, British Columbia. He was formerly manager of the smelting works at Boundary Falls, in the same province.

Mr. J. Trainor, who was at one time superintendent at the Sunset copper mine, in Boundary district, B.C., is now engaged in a similar capacity on the property of the Dividend-Lakeview Consolidated Gold Mining Co., on Kruger Mountain, Osoyoos mining division.

## STATISTICS AND RETURNS

### OUTPUT OF ONTARIO MINES FOR FIRST THREE MONTHS OF 1913

Returns made to the Bureau of Mines show that the output of the metalliferous mines and works of Ontario for the first three months of 1913 was as follows:

| Products. | Quantity. | Value. |
|---|---|---|
| Gold, oz. | 50,637 | 1,030,920 |
| Silver, oz. | 7,264,559 | 4,040,450 |
| Copper, tons | 3,075 | 436,328 |
| Nickel, tons | 6,311 | 1,309,870 |
| Iron ore, tons | 15,389 | 25,695 |
| Pig iron, tons | 181,042 | 2,506,175 |
| Cobalt, cobalt and nickel oxides, lbs. | 280,096 | 120,500 |

### COBALT ORE SHIPMENTS.

The ore shipments for the week ending July 5, 1913, were:

| Mine. | High. | Low. | Pounds. |
|---|---|---|---|
| Casey Cobalt | 1 | .. | 73,800 |
| Cobalt Townsite | 1 | .. | 56,500 |
| Cobalt Lake | 1 | .. | 60,900 |
| Dom. Reduction | 1 | .. | 86,900 |
| Coniagas | 2 | .. | 156,460 |
| Peterson Lake | 1 | .. | 59,650 |
| Cobalt Comet | 1 | .. | 63,700 |
| Trethewey | .. | 1 | 40,000 |
| | 8 | 1 | 597,900 |

The bullion shipments for the week were:

| Mine. | Bars. | Ounces. | Value. |
|---|---|---|---|
| Nipissing | 123 | 147,854.70 | $85,706.21 |
| O'Brien | 29 | 26,983.00 | 14,889.93 |
| Miller Lake O'Brien | 2 | 1,976.00 | 1,082.86 |
| | 154 | 176,813.70 | $101,679.00 |

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assaye Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

## PUBLICATIONS

**The Geological Survey has published maps and reports dealing with a large part of Canada, with many local areas and special subjects.**

A catalogue of publications will be sent free to any applicant. A single copy of a map or report that is specially desired will be sent to a Canadian applicant free of cost and to others at a nominal price. The applicant should state definitely the Precise area concerning which information is desired, and it is often of assistance in filling an order for a map or report if he states the use for which it is required.

Most of the older reports are out of print, but they may usually be found in public libraries, libraries of the Canadian Mining Institute, etc.

### REPORTS RECENTLY ISSUED:

**CANADA**

1085. Descriptive Sketch of the Geology and Economic Minerals of Canada. Accompanied by a geological and mineral map of Canada, by G. A. Young and R. W. Brock.

**NEW BRUNSWICK and NOVA SCOTIA**

1165. Memoir No. 18. Bathurst District, New Brunswick, by G. A. Young. Maps not yet published.

**QUEBEC**

1186. Memoir No. 35. Reconnaissance along the National Transcontinental Railway in Southern Quebec, by John A. Dresser.

**ONTARIO**

1160. Memoir No. 17. Larder Lake District, Ont., and Adjoining Portions of Pontiac County, Quebec, by Morley E. Wilson.

**NORTH WEST PROVINCES**

1204. Memoir No. 24. Preliminary Report on the Clay and Shale Deposits of the Western Provinces, by Heinrich Ries and Joseph Keele.

**BRITISH COLUMBIA**

1175. Memoir No. 21. The Geology and Ore Deposits of Phoenix, Boundary District, B.C., by O. E. LeRoy.

**YUKON AND NORTH WEST TERRITORIES**

1228. Memoir No. 31. Wheaton District, Yukon Territory, by D. D. Cairnes. Maps not yet published.

### MAPS RECENTLY ISSUED:

**CANADA**

1042. Mineral Map of Canada. Scale 100 miles to 1 inch.

**NOVA SCOTIA**

1133. Map 13A. Kingsport sheet, Nova Scotia, No. 84. Scale 1 mile to 1 inch.

**NEW BRUNSWICK**

1181. Map 35A. Reconnaissance Map of Parts of Albert and Westmoreland Counties, N.B. Geology and topography. Scale 1 mile 1 inch.

**QUEBEC**

1178. Map 32A. Larder Lake and Opasatika Lake, Nipissing, Abitibi and Pontiac, Ontario and Quebec. Geological. Scale 2 miles to 1 inch.

1202. Map 52A. Northeast part of the Serpentine Belt, Eastern Townships, Quebec. Geology. Scale 4 miles to 1 inch.

**ONTARIO**

750. Grenville Sheet. Parts of Counties of Ottawa, Argenteuil, Terrebonne, Two Mountains and Vaudreuil, Quebec and Carleton, Russell, Prescott and Glengarry, Ontario. Geology. Scale 4 miles to 1 inch. Reprint.

1177 Map 31A. Larder Lake, Nipissing District, Ontario. Geology. Scale 1 mile to 1 inch.

**ALBERTA**

1132. Map No. 7A. Bighorn Coal Area, Alberta, by G. Malloch. Scale 2 miles to 1 inch.

**BRITISH COLUMBIA**

1260-1276. Maps 74A-90A. Geology of the Forty-ninth Parallel. Geology and topography of the International Boundary between British Columbia and the United States. Scale 1 mile to 1 inch, contour interval 100 feet.

1237. Map 62A. Nelson and vicinity, British Columbia. Geology and topography. Scale 1 mile to 1 inch.

1247. Map 69A. Route map of part of Nass River, British Columbia. Scale 8 miles to 1 inch.

1168. Map 30A. Mother Lode and Sunset mines. Geology and Topography. Scale 400 feet to 1 inch; contour interval 20 feet

1200. Map 50A. Part of Portland Canal Mining Area. Topography. Scale 2 miles to 1 inch; contour interval 200 feet.

**YUKON and NORTH WEST TERRITORIES**

1089. Map 9A. Explored Routes on parts of the Albany, Severn and Winisk Rivers. Scale 8 miles to 1 inch.

NOTE.—Maps published within the last two years may be had, printed on linen, for field use. A charge of ten cents is made for maps on linen.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon. Letters and samples that are of a Departmental nature, addressed to the Director, may be mailed O.H.M.S. free of postage.

*Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.*

# CANADIAN ALLIS-CHALMERS,
LIMITED

# PROVINCE OF QUEBEC

## Department of Colonization, Mines, and Fisheries

*The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, Etc.*

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

**MINERS' CERTIFICATES.** First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is $10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

**WORKING CONDITIONS.** During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

**SIX MONTHS AFTER STAKING.** At the expiration of six months from the date of the staking, the prospector, to retain his rights, must take out a mining license.

**MINING LICENSE.** The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of $10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

**MINING CONCESSION.** Notwithstanding the above, a mining concession may be acquired at any time at the rate of $10 an acre for SUPERIOR METALS when more than 20 miles distant from a railway and $20 an acre when less than 20 miles.

For INFERIOR METALS the prices are $2.00 and $4.00 an acre respectively.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

**PROVINCIAL LABORATORY.** Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

**THE HONORABLE THE MINISTER OF COLONIZATION, MINES, AND FISHERIES, QUEBEC.**

# The Minerals of Nova Scotia

The extensive area of mineral lands in Nova Scotia offers strong inducement for investment.

The principal minerals are:—Coal, iron, copper, gold, lead, silver, manganese, gypsum, barytes, tungsten, antimony, graphite, arsenic, mineral pigments, diatomaceous earth.

Enormous beds of gypsum of a very pure quality and frequently 100 feet in thickness are situated at the water's edge.

The Province contains numerous districts in which occur various varieties of iron ore practically at tide water and in touch with vast bodies of fluxes.

The Gold Fields of the Province cover an area of approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Deposits of particularly high grade manganese ore occur at a number of different localities.

Tungsten-bearing ores of good quality have lately been discovered at several places and one mine has recently been opened up.

High-grade cement-making materials have been discovered in favorable situations for shipping.

Fuel is abundant, owing to the presence of 960 square miles of bituminous coal and 7,000,000 acres of woodland.

The available streams of Nova Scotia can supply at least 500,000 H. P., for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

**Copies of the Mining Law, Mines Reports, Maps and Other Literature may be had free upon application to**

**HON. E. H. ARMSTRONG,**
**Commissioner of Public Works and Mines,**
**HALIFAX, N. S.**

Westinghouse 200 H.P. Motor Driving Centrifugal Mine Pump, Capacity 600 G.P.M., Head 800 Feet.

***Reliable Pump Service,*** lower maintenance cost, greater compactness, greater flexibility as to location, elimination of steam pipes, greater ease of control, and the ability to operate with practically no attendance, are some of the more important advantages gained by driving your pumps with

## Westinghouse Motors

Westinghouse Motors for mine work are especially designed for this work. They are extremely simple in construction, and will operate satisfactorily under the severest conditions. The bearings have a larger area than the needs of the service require and will wear for years.

The lubrication is automatic and the bearing surfaces are always flooded with oil whenever the motor is in operation.

Full information on request to nearest office.

# There's A—

# TERRY TURBINE

## For Every Purpose

**60 Terry Turbines in operation or on order for the British Admiralty.**

For driving pumps, generators or blowers, it is standard practice to use a small steam turbine. For these purposes, Terry Turbines have been widely adopted, over 1500 now being in use. They are built in sizes—horizontal, 5 to 1000 H.P.; vertical, 5 to 600 H.P.

Every Terry unit is designed for the particular service for which it is furnished and is not an adaptation. No advantageous point in design is sacrificed for low cost in construction. This is one reason why Terry Turbines have made unequalled records for long continuous runs.

Terry Turbine-driven sets have many points of advantage over reciprocating sets. They are absolutely reliable in operation, are economical in steam consumption, take up a small amount of space, and the only attention required is occasional oiling. They are free from repairs and incur no packing expense.

Terry Turbine-driven pumping sets make ideal sets for mining purposes. Unlike motor-driven sets they are not affected by the cold and dampness of the mine, dust, dirt, etc. There is no danger from ignition of gases as in case of motor-driven sets. Terry Turbine pumping sets for mines can be made automatic in operation.

State what particular service you are interested in and we will send proper literature. Our latest publication, "Testing Small Steam Turbines," may interest you. Ask for it.

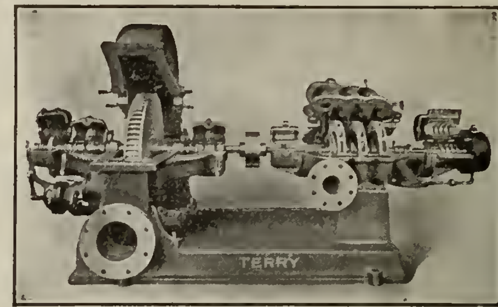
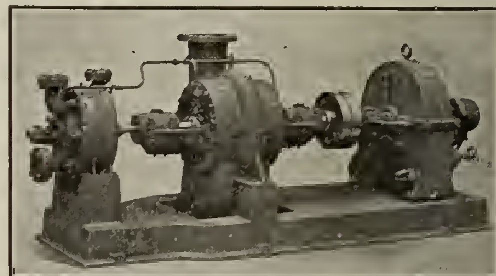
**4 Phillips Place - - Montreal, P.Q.**

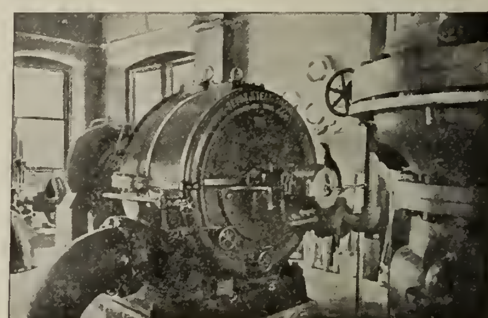
32-185



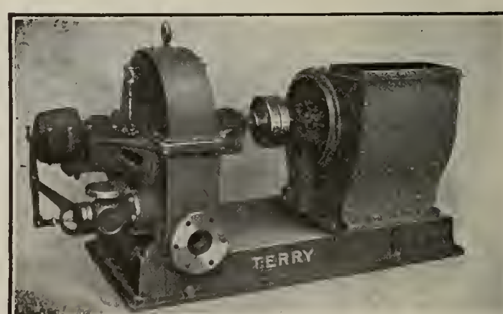
**TERRY MULTI-STAGE BOILER FEED PUMPS**
These sets, which furnish absolutely reliable service, are built in capacities from 100 to 1500 gals. per min. up to 300 lb. pressure. No water-hammering, vibration or packing expense.



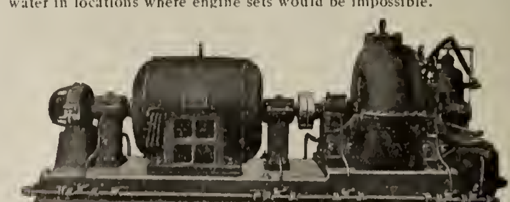
**TERRY COMBINED CIRCULATING & HOT WELL PUMP**
This set illustrates how one Terry Turbine may drive two pumps—all machines on same base. Such an arrangement effects economy in use of floor space.



**TERRY CONDENSING TURBO-PUMP SET**
One of the many Terry turbo-pump illustrations. Over 50 different pumping services are performed by Terrys.



**TERRY FORCED DRAFT SET.** Due to their reliability and simplicity, these sets have now become standard practice for this class of auxiliary service. They will stand up for years subjected to dirt and water in locations where engine sets would be impossible.



**TERRY TURBO-ALTERNATOR.** Terry Turbo-Generator Sets are built in capacities from 5 to 300 K.W. (a.c. and d.c.). They are light, compact, and free from vibration.

## GOLD MINING ON THE RAND

The past few weeks have been marked by serious riots at Johannesburg. According to press reports several men have been killed in the streets by the government police and soldiers in an endeavour to maintain order. Gen. Botha, the ex-Premier, and Gen. Smuts, Minister of Mines, met representatives of the unions and arranged terms of settlement of the strike; but many of the miners have refused to return to work.

The government reports that 1,000 special police proved unable to check the riots and Viscount Gladstone, Governor-General of the Union of South Africa, sent 3,650 soldiers to Johannesburg at the request of the officials there.

What this labour disturbance means to the gold mining industry may be understood when it is known that the average number of rock drills in use at the Transvaal mines is over 6,000, the number having been doubled since 1908.

The Rand has long been the world's chief source of gold. The output has increased greatly in the last five years and in 1913 was £37,182,795, or about 40 per cent. of the world's output.

The South African Mining Journal in a recent issue computed the payable, fully exposed and fully valued tonnage of ore in reserve on December 31, 1912, in the chief producing mines at 87,387,462 tons. Adding ore partially developed or partially valued and tonnages in some smaller mines, a total reserve of 110,000,000 tons is arrived at. The estimated recoverable gold in this ore is estimated at $750,000,000. There is also standing developed in the mines a vast tonnage of low grade ore which may some time be profitably worked.

The enormous amount of work to be done in order to recover the values contained in the ore developed makes it specially unfortunate that labour disputes should intervene, and it is to be hoped that an early settlement of the strike will be made.

According to Canadian Press Despatches bearing date of July 7, a dispute is on over the actual terms of settlement which Gen. Botha and Gen. Smuts made with the unions. The unionists assert they insisted that the government provide for the miners whose places were taken by strike-breakers until new places should be found for them; that Generals Botha and Smuts agreed to this, but thought it inadvisable to put it into writing, and also that the leaders claimed amnesty for the rioters. Gen. Botha replying that that was a matter for the Department of Justice, but giving the impression that he favored amnesty.

The mine-owners say that the strike leaders are attempting to show that they concluded a better bargain than they did in order to strengthen themselves with the men.

## PRECIPITATION OF SILVER FROM CYANIDE SOLUTION BY ALUMINUM

In 1906 S. F. Kirkpatrick, Professor of Metallurgy, School of Mining, Kingston, undertook some experiments, with the assistance of the Ontario Bureau of Mines, on the ores of the Cobalt district in order to develop a commercial process of treating them and saving the by products. It was found that the ores were fairly amenable to cyanidation even when they contained 2,000 to 4,000 oz. silver per ton; but the cyanide consumption was heavy, and zinc was not an ideal precipitant, tending to foul the solution and give a bullion below market requirements. Mr. Kirkpatrick found that aluminum could be used satisfactorily, the difficulties experienced by earlier experimenters being overcome by using the metal in the form of a dust. The process was introduced by the Deloro Mining & Reduction Co., in 1908, and has been in use ever since. It is also in use at the O'Brien cyanide plant.

In a recent issue, June 28, of the Engineering and Mining Journal, Mr. Kirkpatrick describes the process and gives the results obtained. In another article in the May 10 issue of the same journal, Mr. E. M. Hamilton discusses the use of aluminum as a precipitant of silver at the Nipissing plant at Cobalt. Mr. Hamilton states that the arsenic and zinc in solution interfered seriously with extraction and that this difficulty was overcome by substituting aluminum for zinc. Owing to the fact that aluminum does not form any compound with cyanogen, not only is the whole of the cyanide recovered which was combined with the precious metals, but also the additional loss of cyanide by direct combination with the zinc is avoided.

## MAGMATIC WATER

Dr. A. P. Day at a recent meeting of the Geological Society of America exhibited a sealed glass tube about two feet long and an inch or more in diameter in which was about a pint of actual magmatic water. This was obtained by Dr. Day and Dr. E. D. Shepherd, of the Carnegie Geophysical Laboratory, from a little blister-cone a short distance from the main lake of lava at Kilauea. Through a pipe they exhausted from the immediate surface of a mass of molten rock the gases which were being given off and which above the tube became ignited as flames. From these gases the two investigators, at a safe distance, were able to condense in tubes unmistakable samples of water.

In view of the fact that some investigators have shown that the exhalations from volcanoes in some instances contain very little water and doubt has been thrown on theories based on the assumption that magmas contain water, the work of Dr. Day and Dr. Shepherd is of special interest. By Prof. Kemp, of Columbia University, that pint of water must have been viewed with loving eyes.

## IRON ORE CONTINUES TO GREAT DEPTH ON THE MARQUETTE RANGE

It was feared in the early days of iron mining in Michigan that the ore would not persist to any great depth; but the development work in recent years has shown that the iron formations are in many places ore-bearing at considerable depth. R. C. Allen, Director of the Michigan Geological Survey, in a recent report states that there is more ore in sight now than ever before. The Marquette district has shipped nearly 100,000,000 tons of iron ore and the mines have in sight above the bottom levels about 50,000,000 tons. According to C. K. Leith recent deep drilling in bottom horizons of the Negaunee formation "suggests that the beds of this horizon at great depths may ultimately be found to carry a larger tonnage of ore than those of any of the other horizons." Mr. Allen states that in the Marquette as well as in the Gogebic district development at great depth has changed what was formerly a hope into a practical certainty. Deeply buried portions of the iron formation are ore-bearing and are likely to be fully as productive as the shallower parts.

## THE TERRITORY OF NEW QUEBEC

The Mines Branch of the Department of Colonization, Mines and Fisheries has just sent out a volume containing extracts from reports on the District of Ungava, recently added to the Province of Quebec. The report was compiled from various sources and edited by Theo. C. Denis, Superintendent of Mines. It is accompanied by a large map, coloured geologically in parts where the necessary information was available. The chief source of such information has been the reports of explorations by A. P. Low and Robert Bell for the Geological Survey of Canada.

The report includes much useful information on water powers, physical geography, climate, soil, plants and fisheries. Detailed descriptions are given of the country along the main water routes.

While no originality is claimed for the contents of the report the work is a very useful one, as it makes the information on Ungava readily available.

# THE TWELFTH INTERNATIONAL GEOLOGICAL CONGRESS

The Twelfth International Geological Congress, which is to be held in Canada this year, gives promise of being a marked success. The governments of twenty-five different countries have signified their intention of sending official delegates, and various scientific institutions in thirty-eight countries will be represented. The membership already is about 800, consisting of leading geologists and mining engineers of the whole civilized world.

The session of the Congress will be held in Toronto on August 7 to 14, inclusive, during which papers of great general geological interest will be read and discussed. The most attractive feature, however, is the opportunity that will be afforded to visit the leading mining districts and points of greatest geological interest in the country. To this end a great number of excursions have been arranged for.

**The Late Sir W. E. Logan**
First Director, Geological Survey of Canada.

### Arrangements for the Session in Canada.

The Congress visits Canada this year on the invitation of the Government of Canada, transmitted through the foreign office and through the British Ambassador in Sweden. It was supported at the Stockholm session by Dr. W. G. Miller, for the Province of Ontario, and Dr. Frank Adams, who represented on this occasion the Government of Canada.

On December 2, 1910, an inaugural meeting was held in Toronto. It was called at the instance of the general secretary, R. W. Brock, acting for the government as the Director of the Geological Survey. At it were present representatives of the Institutions who had invited the Congress to be present in Canada and a small executive committee was appointed with instructions to appoint such other committees as might be required as and when they were required.

Committees dealing with the following subjects were appointed: Organization, coal resources, editorials, excursions, finance, leaders of discussions, official invitations, patronage, publications, qualifications for membership, Toronto local, transportation, and a committee to appoint an assistant secretary. Some of these committees have completed their work and have been dissolved, but most of these are still active and consist of one or two members of the Executive committee with in some cases other gentlemen but in each case they report direct to the executive committee which makes itself responsible for the financial arrangements.

Preparations were made for publication of a monograph on the Coal Resources of the World to consist of 1200 pages published in three volumes accompanied by an atlas of 70 maps. The work has been accomplished under the editorship of Messrs. William Mc-Innes and D. B. Dowling, and is a credit to the country.

The excursions will, no doubt, be the leading feature of the Congress and every effort is being made to make them attractive both to geologists and mining engineers. The itineraries of the excursions are contained in circulars distributed by the secretary. The guide books consist of fifteen volumes comprising a total of more than 1,600 pages and 140 maps.

The preparation of guide books for use on excursions has proven to be one of the most useful features of the sessions. By this means a great deal of information concerning the structural geology and ore deposits of the countries visited has been made available. The set of guide books prepared for the Canadian meeting covers practically all through railway lines and steamboat routes from Sydney in Cape Breton to Dawson in Yukon. They consist in all of 1,600 pages, contain well arranged notes, are of convenient size, are accompanied by geologically coloured maps and sections and make a notable contribution to the literature treating of the geology of the country. Their attractive appearance, the fine quality of the material entering into their make up, and the excellent typography reflect great credit upon the Government Printing Bureau by whom the printing was done.

## OBJECT AND WORK

Geology is defined as the science treating of the earth's history, and it includes the study of its mineral deposits and the floras and faunas which have successively clothed and peopled the earth's surface. The direct value of geological work is now fully recognized, especially by those connected with mining, civil and hydraulic engineering, it being daily applied not only to mining problems, but to many others, such as water supplies, foundations for bridges and large buildings, dams, road construction, etc. In fact, in the recognition of the commercial importance of geology there is danger that some branches of the science may be overlooked or slighted. It is well, therefore, to point out that in many cases the application of geology to engineering and commercial work has been made possible only by the study of problems which appear to be solely of scientific interest. The International Geological Congress takes care that all aspects of geology receive adequate consideration in its sessions.

The object of the International Geological Congress is, briefly, the advancement of knowledge concerning the earth both in the field of pure geological science and in its application to the arts and industries, through the association and co-operation of leading geologists and engineers of all nations.

The more important methods by which it endeavours to accomplish its aim are as follows:—

Meetings, publications, international committees, excursions and prizes.

Meetings.—The meetings are held every three years in different countries, and each session lasts from seven to ten days. The meetings are attended by members from every civilized country. The leading countries, societies and universities are represented by specially appointed delegates. Papers bearing on questions of general interest are read and discussed. As main topics for discussion subjects of scientific or economic importance are selected in advance so that every member who can contribute knowledge on the subject may be prepared to do so. In this way, the exact state of present knowledge on these topics is put forth and made known.

Publications.—The transactions of the Congress are published as soon after the session as possible. They contain the more important papers and discussions, and a general report on the business and work of the Congress. The transactions of the eleventh Congress form two volumes totaling 1,413 pages. In addition, a quarto volume of papers on "Changes of Climate since the Maximum of the Last Period of Glaciation," and two quarto volumes and a large atlas on "The Iron Ore Resources of the World" stand to the credit of the eleventh Congress.

International Committees.—Committees are formed to deal with questions requiring international or concerted action.

Such subjects as the standardization of geological colours and signs employed on maps, the standardization of geological nomenclature, and the planning of general geological maps covering an entire continent have been dealt with by these committees.

Excursions.—Excursions have become an outstanding feature of the sessions, special facilities being provided in the country in which the meeting is held to enable the delegates coming from every portion of the world to make, at small expense and under expert guidance, a personal study of its geological structure and mineral resources.

The value of the excursions is not confined to what is seen and learned. They afford the best opportunity for the members to fraternize and to become acquainted with each other and with each others' work and ideas. The informal discussions of the geological problems presented in the field and the information that is thus brought out concerning the methods employed in the various parts of the world in attacking and solving similar problems: and the use that has been found for neglected or little-known substances; these and similar discussions are perhaps the most instructive and valuable features of the Congress.

Prizes.—The Congress affords the necessary machinery for awarding prizes for special achievement in the science or application of geology. The Spendiarow prize, founded by a Mr. Spendiarow of St. Petersburg, Russia, in memory of his son, is awarded at each session for the most important work accomplished by an individual since the preceding session. Special prizes have been awarded at various sessions.

### Value of the Congress.

From even such a brief recital of the object and work of the Congress, its importance is evident, but a few other points may be touched upon. It has secured the co-operation of the governments of various countries, as well as of men of science that has resulted in the magnificent geological map of Europe now approaching completion. A similar geological map of the whole world will be undertaken. As an example of valuable international studies may be mentioned the very careful investigation into the iron ore resources of the world, the results of which are embodied in a series of magnificent volumes, in which the extent, quality and mode of occurrence of the iron ore resources of every country of the world are set forth, and illustrated by means of maps and plans. A similar plan of study is now in progress to determine the coal resources of the world, a full report of which will be issued in 1913 before the meeting of the Congress in Canada. The Congress serves, in a sense, as an international clearing house for geology. These great gatherings of distinguished scholars of all nationalities have aroused greater interest in geology on the part of private individuals, corporations and

Governments, given it a higher standing as a science, and rendered possible its increased economic application.

The country entertaining the Congress is repaid in many ways. The excursions are participated in by the more eminent geologists and mining engineers of the world, giving them a knowledge of its resources and possibilities, which they spread abroad, for they are the advisers of capital; the writers of text books and authoritative articles; and the instructors in universities and schools. Their criticisms and suggestions based upon their experience with similar problems and conditions in other parts of the world are helpful and stimulating to the home geologists and mining engineers. After leaving any country they have learned where to obtain reliable information concerning it and they follow its developments and discoveries as announced in the press and technical papers.

**Character of Attendance.**

Geologists from every quarter of the globe attend the Congress. The word "International" in the title was well chosen and the character of the attendance at each Congress has been remarkable for the number of different nationalities represented. As to the personnel of the members, they may be broadly classed in three divisions.

1st. Professors and teachers from the leading colleges and universities as well as the technical mining schools.

2nd. Officers of Government geological surveys or equivalent organizations.

3rd. Geologists and mining engineers in private practice.

**History.**

The foundation of the Congress was inspired by the collections of geological maps and sections from various regions of North and South America, as well as from many countries of Europe which were shown at the International Exhibition in Philadelphia in 1876. The advantage of such comparative study so deeply impressed visiting geologists that at the annual meeting of the American Association for the Advancement of Science held in Buffalo, August, 1876, a committee was appointed to arrange for an international congress of geologists at the 1878 Paris Exhibition.

It is interesting to note that Dr. T. Sterry Hunt, who from 1847 to 1872 was chemist and mineralogist to the Geological Survey of Canada, was Secretary of this first committee—the Comite Fondateur of 1876, and at the first session of the Congress, held in Paris in 1878, Messrs. A. R. C. Selwyn, T. Sterry Hunt and Paul de Caze were the Canadian delegates, twenty-three countries being represented.

## ORGANIZATION OF THE CONGRESS

The following paragraphs are from a circular sent out to geologists in the year 1876 by D. T. Sterry Hunt and associates. It presents the aims of the men who organized the Congress.

"The activity which has prevailed in the study of geology within the past generation has given to it a great importance both from a scientific and an economic point of view, and has resulted in a large accumulation of facts and materials. Workers in different countries have, however, pursued their labours to a great extent independently of each other, and have given their results in such ways that it is often difficult to co-ordinate them. Those geologists from Europe and America who have been at the International Exhibition at Philadelphia in 1876, have found there important collections of geological maps and sections, with rocks and organic remains from various regions of North and South America, as well as from many countries of Europe, and they have become deeply impressed with the great advantages to be gained by their comparative study. It was, moreover, evident that the bringing together of a still larger number of such collections in accordance with a previously arranged plan, could not fail to lead to important results for geological science. The International exhibition to be held at Paris in 1878 will furnish such an occasion, and it is proposed to invite to that end governmental geological surveys, learned societies and private individuals throughout the world, to send to Paris such collections as will make the geological department of that exhibition as complete as possible.

"In order to take advantage of the collections which may thus be brought together it is moreover proposed to convoke an International Geological Congress, to be held at Paris at some time during the Exhibition of 1878, and to make that Congress an occasion for considering many disputed problems in geology.

**The Late Dr. T. Sterry Hunt**
**Secretary of the Committee of 1876**

"In accordance with this plan it is proposed that the geological department of the International Exhibition of 1878 shall embrace:

"I. Collections of crystalline rocks, both crystalline schists and massive or eruptive rocks, including the so-called contact formations and the results of the local alteration of uncrystalline sediments by eruptive masses. In this connection are to be desired all examples of organic remains found in crystalline rocks, including Eozoon and related forms. These collections should moreover comprehend all rare and unusual rocks of special lithological, mineralogical and chemical interest, examples of ore-deposits and of veinstones of all kinds, with their encasing rocks. As far as possible these collections should be limited to specimens of

# PATRONS

*Honorary President:*

**His Royal Highness, the Duke of Connaught Governor-General of the Dominion of Canada,**

*Honorary Vice-President:*

**Prime Minister of the Dominion of Canada and Secretary of State for External Affairs**

*Honorary Vice-President:*

**Hon. L. Coderre, Minister of Mines, Ottawa**

*Honorary Vice-President:*

**Hon. Frank Cochrane, Minister of Railways and Canals, Canada**

*Honorary Vice-President:*

**Hon. W. H. Hearst, Minister of Lands, Forests and Mines of Ontario**

a size convenient for examination, and be accompanied with sections prepared for microscopic study. In the arrangement of all these materials regard should be had to their natural associations rather than to theoretical notions or artificial classifications, so that they may be studied not only petrographically but geognostically.

"II. Collections illustrating the fauna and the flora of the paleozoic and more recent periods, particularly of such horizons as present a more critical interest to paleontologists from the first appearance or the disappearance of important groups of organic forms. It has appeared to the committee named below that the organic remains of the Cambrian, Taconic or so-called Primordial strata merit especial attention in this connection.

"These various collections should be explained as fully as possible by labels, catalogues, monographs and maps.

"III. Collections of geological maps, and also of sections and models, especially such as serve to illustrate the laws of mountain structure. In the geological maps regard should be had to various questions which deserve the special consideration of the Congress, such as the scales best adapted for different purposes, the colours and symbols to be used, and the proper mode of representing superficial deposits conjointly with the underlying formations. A discussion of these will prepare the way for improved general geological maps of the continents.

"In pursuance of the above plan the American Association for the Advancement of Science during its annual meeting at Buffalo, under the presidence of Prof. William B. Rogers, unanimously adopted the following resolution on the 25th of August, 1876:

"Resolved, That a Committee of the Association be appointed by the chair to consider the propriety of holding an International Congress of Geologists at Paris during the International Exhibition in 1878, for the purpose of getting together comparative collections, maps and sections, and for the settling of many obscure points relating to geological classification and nomenclature. And that to this committee be added our guests, Prof. T. H. Huxley, of England; Dr. Otto Torell, of Sweden, and Dr. E. H. von Baumhauer, of the Netherlands, who shall be requested to open negotiations in Europe looking to a full representation of European geologists at the proposed Congress. The said committee to consist of Prof. William B. Rogers, Messrs. James Hall, J. W. Dawson, J. S. Newberry, T. Sterry Hunt, C. H. Hitchcock and R. Pumpelly in behalf of the Association, with the addition of Prof. T. H. Huxley, Dr. Otto Torell and Dr. E. H. von Baumhauer.

"On the same day, at a meeting of the Committee, Prof. James Hall was elected chairman, and Dr. T. Sterry Hunt, secretary. It was then resolved to prepare the present circular, to be printed in English, French and German, and distributed to geologists throughout the world, asking their co-operation in this great work of an International Geological Exhibition and an International Geological Congress to be held at Paris in 1878; the precise date of the Congress to be subsequently fixed.

"All those interested in this project are invited to communicate with any one of the following members of the Committee: Prof. T. H. Huxley, London, Eng.; Dr. Otto Torell, Stockholm, Sweden; Dr. E. H. von Baumhauer, Harlem, Holland; Dr. T. Sterry Hunt, Boston, Mass., U. S. A."

Boston, Massachusetts, Sept., 1876.

*Honorary Vice-President:*

**Hon. E. H. Armstrong, Commissioner of Works and Mines of Nova Scotia**

## QUEBEC AND MARITIME PROVINCE EXCURSION

### The A1 Excursion.

The first excursion in connection with the Twelfth Congress left Montreal at 1 o'clock Monday morning, July 14, for points in Quebec, New Brunswick, Nova Scotia and Cape Breton.

**Str. Virginian with several geologists on board arriving at Montreal**

Dr. G. A. Young, leader; E. R. Faribault, associate leader; R. Harvie, secretary, and A. Mailhiot, assistant secretary for this excursion, looked after the members as they arrived. Dr. F. Adams, president of the Congress; W. S. Lecky, secretary, and P. D. Quensel, who was secretary of the last Congress in Sweden, were on hand to make the final arrangements and see the excursion well started. Dr. Adams and Mr. Lecky went as far as Quebec and Dr. Quensel stayed with the party for several days.

A special train on the Intercolonial Railway carries the party of about 50 members. There are plenty of sleepers and two diners on the train. In the baggage cars a box is provided for each member to store specimens, etc., collected on the trip.

The train reached Levis early Monday morning. Here Dr. Percy Raymond, guide for the day, joined the party, and directly after breakfast a visit was made to points of interest about the town.

Splendid exposures of the Levis and Sillery formations were seen in the cliff back of the town. Dr. Raymond pointed out many of the most noteworthy features of the geological structure.

The rocks on either side of the St. Lawrence at this point are quite different. Between Levis and Quebec there are two major faults, known as the St. Lawrence and Champlain. On the Levis or hanging side the rocks exposed are much crumpled and folded, while on the Quebec or foot side the rocks have been less disturbed.

It is thought that forces acting from the southeast have forced the Levis and Sillery formations up and over so that they now appear, on casual examination, to be stratigraphically higher than what are in reality younger rocks on the Quebec or northern shore.

During the morning the party visited several good exposures at Levis, where the folded and faulted structure of the rocks could be studied. On Davidson Street a well-exposed sharp anticline was seen. At other points conglomerate beds among the shales were followed and found to pinch out. In several places fossil hunters were rewarded by interesting discoveries. Many expressed a desire to visit the locality again. Owing to poor exposures in some interesting places the actual contact between the Sillery and Levis formations could not be carefully studied. Dr. Raymond stated that the evidence indicates a fault between the formations in a little ravine visited by the party. Some of the members, from their brief examination, were led to express very diverse views; but an armistice was arranged until more careful examination has been made by the exponents of opposing views.

About noon the party crossed by ferry to the Quebec side of the St. Lawrence and went by electric cars to Montmorency Falls. Here lunch was served at Kent House. An address of welcome on behalf of the City of Quebec was delivered by Sir Georges Garneau. Dr. Frank Adams replied on behalf of the Congress, and extended Canada's welcome to the members from abroad. He then called on Dr. P. M. Termier, Director of the Geological Survey of France, Dr. B. Weigand of Strassburg, and Dr. A. Strahan, of the Geological Survey of Great Britain, who responded on behalf of France, Germany and Great Britain respectively.

After luncheon the exposures in the vicinity of Montmorency Falls were visited, and the structural features were explained by the guides. It was pointed out that a major fault exists here, that the rocks above the falls are older than those below, that above the falls the Trenton beds lie almost in their original position on the eroded surface of Archean gneiss, and that at the foot of the falls, the Paleozoic rocks have been brought down against the Archean by a normal fault. At the brink of the falls there are remarkably good exposures, showing the fossiliferous Trenton limestone lying on the Archean gneiss. According to Dr. Raymond the sponges and corals are standing practically in the position in which they grew on the Archean floor.

After examining the exposures above the falls the party went down below and saw good evidence of the

*During a Shower at Levis*

faulted structure . The fossiliferous beds were here industriously attacked by the European and American visitors. The German geologists were especially busy with their little hammers, as may be seen in some of the accompanying photographs.

**Dr. B. Weigand, Germany**

Professor B. Weigand, delegate of the Oberrheinischer Geologischer Verein, Stuttgart, is the eldest of the German visitors. He is an indefatigable traveller and is noted for his custom of choosing the longest excursions. In Sweden he was one of the few who made the trip to Spitzbergen. This year he intends to be a member of the party which will go to the Yukon. Dr. Weigand always has been much interested in the study of earthquakes and was the first to systematically record the shocks.

**Chutario Kido**
**Director of the Geological Institute South Manchuria Railway Company, Tokyo, Japan**

**Aubrey Strahan, F.R.S.**
**Director Geological Survey of Great Britain**

**P. M. Termier**
**Director Geological Survey of France**

P. M. Termier, Director of the Geological Survey of France, has made a special study of the changes in rocks brought about by mountain building forces and has done much towards making clear Alpine geology. He is a delegate of the Service de la Carte Geologique de la France, the Societe Francaise de Mineralogie, the Ecole Polytechnique, Paris, and of the Association Amicale des Eleves de l'Ecole Nationale Superieur des Mines, Paris.

**Anticline in Levis formation, Levis, Quebec**

By electric cars the party returned to Quebec. Here carriages furnished by the city were waiting for the members. A long drive through the historic town up the hill and out past the Plains of Abraham and back along the shore road to the ferry completed an interesting afternoon.

In the evening the members attended a reception by the city, held at Laval University. The buildings and equipment were shown to the guests and proved to be much more pretentious than had been thought by many. The equipment of the scientific laboratories is remarkably good and elicited much praise.

After listening in the University gardens to a programme rendered by the Guards band, and partaking of refreshments, the party returned to the train, much pleased with the splendid reception accorded them by the City of Quebec. Early next morning a start was made for Riviere du Loup and other points in Quebec and the Maritime Provinces.

The officers of A1 excursion are:—

Leader—G. A. Young.

Associate Leaders—J. M. Clarke, E. R. Faribault.

Secretary—R. Harvie.

Assistant Secretary—A. Mailhiot.

The following members have registered or will join the party en route:—

Andree, K., Dr., Privatdozent fur Geologie an der Universitat Marburg, Germany.

Arlt, Hans. Dr., Kgl. Bergassessor, Herzogparkstrasse 2, Munchen, Germany.

Bailey, L. W., Professor, University of New Brunswick, Fredericton, New Brunswick.

Bancroft, J. A., Dr., Associate Professor of Geology, McGill University, Montreal.

Barrows, W. L., M.A., 28 Brownell Avenue, Hartford, Conn., U.S.A.

Bell, W. A., St. Thomas, Ontario.

Boden, K., Dr., Privatdozent fur Geologie der Universitat, Geologisches Institut, Alte Akademie, Munchen, Germany.

Professor Dr. R. Zuber, delegate of the K. K. Franzens Universitat, Lemberg, is an oil specialist. He has made a study of most of the important oilfields of the world and is a prominent authority.

## PROGRAMME FOR THE SESSION AT TORONTO

The following programme is provisional and subject to change. The Secretary will be glad to receive suggestions. If requested by the Presidents or Secretaries, special time will be alloted for meetings during the Session of any of the International Committees.

The following sections have been suggested:

Section 1—(a) Pre-Cambrian; (b) Economic; (c) Petrology, Mineralogy, etc.

Section 2—Paleontology and Stratigraphy.

Section 3—Glacial Geology and Physiography.

*President, Twelfth Session*

**Frank D. Adams, F. R.S., Dean of the Faculty of Applied Science and Logan Professor of Geology, McGill University**

Wednesday, August 6th.—8.00 p.m., Reunion and informal reception by the Toronto Local Committee. Costume de voyage. Convocation Hall, University of Toronto.

Thursday, August 7th.—10.00 a.m. Meeting of Council for organization and appointment of Bureau. 12.00 noon, Opening General Meeting, Convocation Hall. 3.00 p.m., General Meeting—Reports of International Committees of the Congress. 8.00 p.m., Popular lecture in Convocation Hall, University of Toronto.

Friday, August 8th.—9.00 a.m., Meeting of Council. 10.00 a.m., General Meeting: Topic No. 1. 2.30 p.m., Section 1: Topic No. 2; Section 2: Topic No. 6. 1.15 p.m., Ladies' Luncheon. All day, Excursion B-3, Hamilton.

Saturday, August 9th.—9 a.m. Meeting of Council. 10.00 a.m., General Meeting: Topic No. 7. 2.30-4 p.m., Section 1: Topic No. 3; Section 2: Topic No. 7 continued. 4.30 p.m., A Garden Party will be given to the members of the Congress by Mr. and Mrs. D. A. Dunlap. All day, Excursion B-5, Moraines north of Toronto. Evening, Excursions 8-6, Muskoka, and B-10, Madoc, leave.

Monday, August 11th.—9.00 a.m., Meeting of Council. 10.00 a.m., General Meeting: Proposals and continuations of Reports of International Committees. 2.30 p.m., Section 1: Topic No. 5; Section 2: Miscellaneous; Section 3: Miscellaneous. Evening, Reception by His Worship the Mayor and Aldermen of the City of Toronto at the City Hall.

Tuesday, August 12th.—Excursions only.—All day, Excursion B-1, Niagara; B-2, Don and Scarboro; B-4, Credit River.

On application being made by ten or more members, excursions will be arranged to any accessible point and leaders provided.

Wednesday, August 13th.—9.00 a.m., Meeting of Council. 10.00 a.m., General Meeting: Topic No. 3. 2.30 p.m., General Meeting: Topic No. 4. All day, Excursion B-7, Streetsville; Excursion B-9, Orillia Afternoon, Excursion B-8, Clay Deposits. Evening, Banquet.

Thursday, August 14th.—9.00 a.m., Meeting of Council. 10.00 a.m., General Meeting: Miscellaneous Business, and close of the Twelfth Session. 3.00 p.m., Special Convocation of the University of Toronto at which honorary degrees will be conferred. 4.15 p.m., Garden Party. Evening, Excursions C-1 and C-2, leave.

*General Secretary, Twelfth Session*

**R. W. Brock, F.R.S.C., Director of the Geological Survey of Canada**

### Topics for Discussion.

Topic No. 1.—Coal Resources of the World.—There are no separate papers, but the discussion on this subject will be based on the Monograph which has been in preparation for the last two and a half years under the direction of the Executive Committee of the Twelfth Session in Canada. Information has been supplied by Government Officials, Geological Surveys, Mining Bureaus and geological and mining engineers throughout the world. It has been edited by the members of the staff of the Geological Survey of Canada. The Monograph will be published in three volumes and one atlas, and the price for the set will be $25.00 net. The publishers are Messrs. Morang & Company, Limited, Toronto, Canada. The members of the Twelfth Session, have the privilege of buying one set at the price of $20.00 net, provided their order reaches the publishers or the Secretary of the Congress on or before August 15th of this year, 1913.

Topic No. 2.—Differentiation in Igneous Magmas.—Messrs. F. Becke, Austria; R. A. Daly, U.S.A.; A. Harker, England; W. H. Hobbs, U.S.A.; J. P. Iddings, U.S.A.; F. J. Loewinson-Lessing, Russia; D. Platania, Italy; H. S. Washington, U.S.A.; and others have promised to take part in the discussion or to present papers.

Topic No. 3.—The Influence of Depth on the Character of Metalliferous Deposits.—Messrs. W. H. Emmons, U.S.A.; L. L. Fermor, India; J. F. Kemp, U.S.A.; P. Krusch, Germany; Louis de Launay, France; W. Lindgren, U.S.A.; Malcolm Maclaren, England; and others have promised to take part in this discussion or to present papers.

Topic No. 4.—The Origin and Extent of the Pre-Cambrian Sedimentaries.—Messrs. H. Baeckstroem, Sweden; J. Horne, Scotland; C. K. Leith, U.S.A.; J. J. Sederholm, Finland; and others have promised to take part in the discussion or to present papers.

Topic No. 5.—The Sub-divisions, Correlation and Terminology of the Pre-Cambrian.—Sir T. H. Holland, England; Messrs. A. C. Lawson, U.S.A.; T. Ogawa,

**Three members in Sweden, 1910**

Lady R. McRobert (Miss Workman), P. D. Quensel and W. G. Miller

Japan; J. J. Sederholm, Finland; A. Strahan, England; and others have promised to take part in the discussion or to present papers.

Topic No. 6.—To what extent was the Ice Age broken by Interglacial Periods?—Messrs. T. W. E. David, Australia; H. L. Fairchild, U.S.A.; G. W. Lamplugh, England; W. Lozinski, Austria; A. Penck, Germany; F. B. Taylor, U.S.A.; Warren Upham, U.S.A.; W. Wolff, Germany; and others have promised to take part in the discussion or to present papers.

Topic No. 7.—The Physical and Faunal Characteristics of the Paleozoic Seas, with Reference to the Value of the Recurrence of Seas in Establishing Geological Systems.—Messrs. Chas. Barrois, France; T. C. Chamberlain, U.S.A.; Chas. Schuchert, U.S.A.; C. D. Walcott, U.S.A.; and others have promised to take part in the discussion or to present papers.

Miscellaneous.—In addition to papers on the topics mentioned, contributions on other subjects of interest have been received from: Messrs. L. E. Gentil, France; C. N. Gould, U.S.A.; C. R. Keyes, U.S.A.; J. Samojloff, Russia; Bailey Willis, U.S.A.; and others.

## Proposals.

The Phosphate Resources of the World.—A proposal has been received from Prof. J. Samojloff, of Moscow, Russia, suggesting the world's phosphate resources as a timely subject for the consideration of the Thirteenth International Geological Congress.

The Fractures of the Earth's Crust.—Regarding the proposal made at the Eleventh Session of the International Geological Congress by William H. Hobbs, and which was referred to the Executive Committee of the Twelfth Session, the Executive Committee will report to the Council of the Congress as follows:

"The Executive Committee regret that, owing to the demands made upon their time in connection with the preparation of the extended series of excursions arranged for the Twelfth International Geological Congress, as well as in the publication of the Monograph on the Coal Resources of the World, they have been unable to undertake the preparation of an additional Monograph dealing with the fractures of the Earth's Crust as suggested by the Eleventh Session of the International Geological Congress. The Committee would, therefore, respectfully request that this task be transmitted to the Executive Committee of the Thirteenth International Geological Congress."

## Reports of Committees.

Reports will be presented at the Twelfth Session of the International Geological Congress from the following Committees:

1.—International Glacier Committee.—Elected in 1894 to encourage and advance studies of the size and variations of glaciers.

2.—Committee of the International Geological Map of Europe.—This committee since the Congress at Stockholm, has decided to publish a map of the world on a convenient scale, and to add to the number of the Committee by inviting representatives from non-European countries.

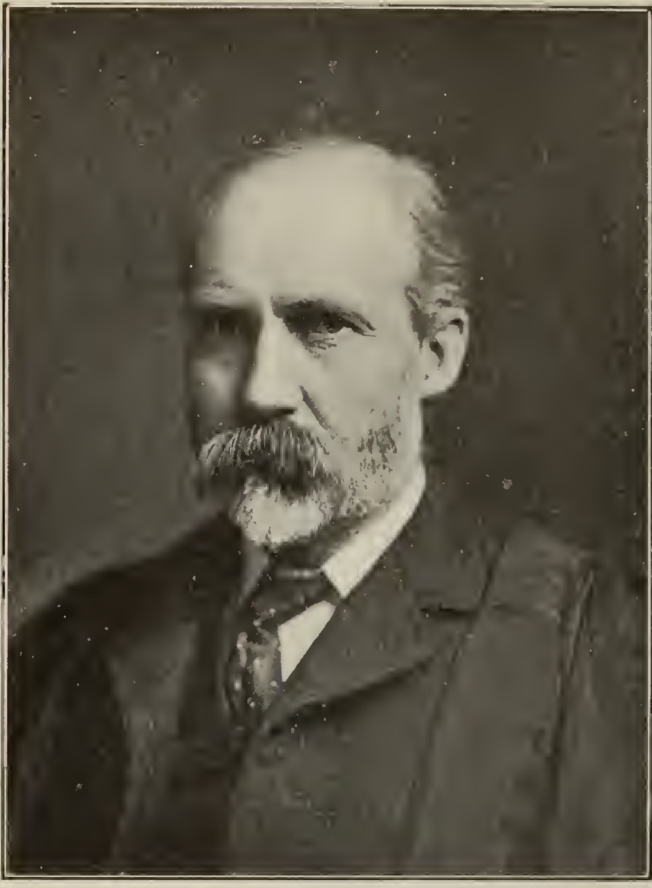
3.—Palaeontologia Universalis Committee.—An International Committee formed in 1900 to study the proposition of Mr. Oehlert regarding the reproduction by photographic processes of a series of type fossils.

4.—Spendiarow Prize Committee.—Charged with the award at each Session of the interest from a sum of 4,000 roubles donated in 1897 by Mr. Spendiarow, of Russia, for the most important geological work on a subject proposed by the Committee, that has been accomplished by an individual subsequent to the last Session.

5.—Stratigraphical Lexicon Committee.—Elected to carry out the proposal of Mr. Waagen regarding the publication of a stratigraphical lexicon.

*Chairman, Finance Committee*

**G. G. S. Lindsey, K.C.**



*Chairman Toronto Local Committee*

**Dr. A. P. Coleman**

**Professor of Geology, University of Toronto**

*Secretary Toronto Local Committee*

**Dr. W. A. Parks**

**Professor of Geology, University of Toronto**

**J. B. Tyrrell**

**Mining Engineer and Geologist, Toronto**

**Dr. T. L. Walker**

**Professor of Mineralogy and Petrography, University of Toronto**

**W. G. Miller,**

**Provincial Geologist of Ontario**

**Cyril W. Knight**

**Assistant Provincial Geologist, Ontario**

6.—Committee on Valuation of Iron Ore Resources. —To carry out and complete, according to a uniform method, the valuation of the world's iron ore resources, principally from an economic point of view.

7.—Committee on Institute for Study of Volcanoes. —Elected to consider the proposal of Mr. E. Friedlander, regarding the establishment of an Institute for the study of volcanoes.

8.—Fossil Man Committee.—Elected to examine the proposal of Mr. N. O. Holst regarding the election of a Committee for the study of fossil man and for presenting a programme at the next Congress.

**A. A. Cole,**

**Mining Engineer T. & N. O. Railway**

**A. G. Burrows**

# PRODUCTION OF GOLD AND SILVER*

By Bedford McNeill.

The outstanding feature of progress for the last 33 years is, in my opinion, to be found in the enormous extension of mining, and the consequent corresponding increase in the production of the metals. Especially has the rate been accelerated during the past 10 years. I have prepared a table (see below) showing the World's production of the metals during the years 1889, 1891, 1901 and 1911.

**Increase of World's Production of Metals.**

| | 1899. Tons. | 1891. Tons. | 1901. Tons. | 1911. Tons. | Pctge Inc. for ten years ending 1911. |
|---|---|---|---|---|---|
| Pig Iron .. | ... | ... | 41,000,000 | 65,000,000 | 58 |
| Copper .. | 261,205 | 279,391 | 526.000 | 884.000 | 68 |
| Zinc .. .. | 329,600 | 356,200 | 500,000 | 900.000 | 80 |
| Lead .. .. | 540,200 | 589,000 | 850,000 | 1,100,000 | 29 |
| Tin .... .. | 55,400 | 59,500 | 88.000 | 116.000 | 32 |
| Nickel ... | 1,800 | 4,700 | 9,000 | 24.000 | 144 |
| Aluminium. | 70 | 328 | 7,500 | 46,000 | 513 |
| Mercury . | 3,700 | 3,700 | 3,000 | 4.000 | 33 |
| Silver .... | 4,100 | 4,700 | 5.300 | 7,500 | 41 |
| Gold ..... | ... | ... | 380 | 680 | 79 |
| Antimony . | ... | ... | 10,000 | 23,000 | 130 |

It is particularly the comparison between 1901 and 1911, say only ten years, to which I would direct your attention.

In no instance for the latter year is the increased production less than 29 per cent., and that is lead; copper and zinc increase 68 per cent. and 80 per cent. respectively; antimony 130 per cent.; nickel 144 per cent.; and with aluminium the production is multiplied no less than five times.

### Some Points Concerning the Relationship Between Gold and Silver.

The production of silver in 1901 was 5,300 tons, in 1911 it was 7,500 tons, the increase being 41 per cent. In the case of gold, the production in 1901 was 380 tons; in 1911, 680 tons; an increase of 79 per cent. It may be mentioned incidentally, that at the Royal Mint, during the year 1911, the gold dealt with was no less a quantity than 442 1-10 tons (avoirdupois).

### Gold.

Taking gold first, for the 108 years from 1493 to 1600, the average annual production was a little under a quarter of a million ounces. Taking the next 100 years, from 1601 to 1700, this figure approximated to a little less than one-third of a million ounces; for the next 60 years, 1701 to 1760, the output approximated to two-thirds of a million ounces. From the earliest date (1493) until 1840, there is only a gradual rise in production, but from 1841 onwards, the increase markedly sets in.

The discovery of gold in California was in 1848, and in Australia in 1851, and the effect of these two discoveries is shown in the output for next 40 years.

From 1851 to 1860 the average annual output was 6.4 million ounces.

From 1861 to 1870 the average annual output was 6.1 million ounces.

From 1871 to 1880 the average annual output was 5.6 million ounces.

From 1871 to 1880 the average annual output was 5.1 million ounces.

This latter date brings us to the starting of the Transvaal output in 1889, which owes so much to the simultaneous successful application of the cyanide process. We now get an enormous acceleration in output, and in 1911 the total output reported for the world was 22½ million ounces.

In other words, the world's present average production in one year is now equal to more than the total production for the 60 years preceding the year 1700.

Another way of bringing the gold production vividly before you is the statement that it is estimated that 653 millions sterling was added to the world's stock of gold for the 358 years from 1493 to 1850, whereas for the 11 years alone of this present century, that figure of 653 millions sterling has already been exceeded by the output of 867 millions sterling. Or again, there has been added to the world's stock of gold during the last 15 years a quantity greater than the total amount previously known to exist in the civilized world.

Before I leave the figures of the production of gold, I should like to allude to a remarkable feature, namely, its absorption and disappearance in India. Sir James Wilson, K.C.S.I., has recently published some interesting figures bearing upon this. For the ten years 1891 to 1900, the average annual absorption was 2.8 millions sterling. For the ten years 1901 to 1910 this figure became 8.2 millions sterling. In the year 1911 this absorption is given as 18½ millions sterling, and so recently as January last, Sir Edward H. Holden, Bart., estimated that during this present year, 1913, the probability is that the gold sent to India will be nearer 30 millions sterling.

In Egypt, too, there is a similar, though smaller, absorption of gold taking place. For the year 1910 this figure was given as six millions sterling. Lord Cromer, as far back at 1907, gave some Egyptian instances of hoarding gold. He says:

"A little while ago I heard of an Egyptian gentleman who died leaving a fortune of £80,000, the whole of which was in gold coin in his cellars. Then, again, I heard of a substantial yeoman who bought a property for £25,000. Half an hour after the contract was signed he appeared with a train of donkeys bearing on their backs the money, which had been buried in his garden. I hear that on the occasion of a fire in a provincial town no less than £5,000 was found hidden in earthen pots. I could multiply instances of this sort. There can be no doubt that the practice of hoarding is carried on to an excessive degree."

It is most extraordinary that the gold which is produced under circumstances demanding the highest technical skill, and in the obtaining of which the greatest care is lavished, and for which so many risk so much, should be destined ultimately to be buried and hidden out of sight, and, as far as we can judge, ruled out of any economic calculations, at any rate for the time being.

I need not remind you that the use of gold in a civilized community is not merely as it were for itself, but as serving the foundation for an enormous superstructure of credit; and unless, therefore, this absorption of

*Extracts from Presidential address, Institution of Mining and Metallurgy, March 13, 1913.

gold can be controlled or directed into channels in accordance with modern conditions, the embarrassment of the more civilized communities, as we regard ourselves, is going, I fear, to become more and more accentuated.

It is only fair to mention there are some who argue that this disappearance of gold is the least of several evils, and if it did not so disappear much greater troubles would ensue.

The question is, "Will the absorption of gold displace the absorption of silver in India?" which latter has been calculated by Sir James Wilson as totaling 423 millions sterling for the 70 years ending 1910. Will India continue to absorb silver? One can hardly think that it can absorb both gold and silver, and if India does not absorb silver, what is to be the result? What will be the outcome if the enormous population of India—who have already proved that they are unable to withstand the fascination of "hoarding"—be still further tempted.

### Silver.

In connection with silver there are three aspects to consider:

Firstly—The weight of silver produced;

Secondly—The ratio of that weight to the weight of gold produced; and,

Thirdly—The value of the silver as compared with the value of the gold produced.

Now, firstly, as to the weight of silver produced.

Commencing with the ten years 1801 to 1810 we had an average annual production of 29 million ounces. This figure dropped to 15 million ounces 1821 to 1830. Then, the successive figures are:

| Period of Time. | Average Annual Production. |
|---|---|
| 1831 to 1840 | 19 million ounces. |
| 1841 to 1850 | 25 million ounces. |
| 1851 to 1860 | 29 million ounces. |
| 1861 to 1870 | 39 million ounces. |
| 1871 to 1880 | 71 million ounces. |
| 1881 to 1890 | 100 million ounces. |
| 1891 to 1900 | 162 million ounces. |
| 1901 to 1910 | 182 million ounces. |
| 1911 | 252 million ounces. |

It is very remarkable that for a period of ten years (1901-1910) the weight of silver produced should have been maintained at a ratio as regards gold of 10 to 1, and this notwithstanding the great differences of locality and of the conditions under which the two metals were produced.

Secondly, as regards the ratio of the weight of silver produced as compared with the weight of gold produced.

Commencing with the period:

| Period. | Times as much weight of silver produced as compared with weight of gold produced. |
|---|---|
| 1801 to 1810 | 50.9 |
| 1811 to 1820 | 46.0 |
| 1821 to 1830 | 32.6 |
| 1831 to 1840 | 29.2 |
| 1841 to 1850 | 14.0 |
| 1851 to 1860 | 4.5 |
| 1861 to 1870 | 6.4 |
| 1871 to 1880 | 12.7 |
| 1881 to 1890 | 19.8 |
| 1891 to 1900 | 15.9 |
| 1901 to 1910 | 10.0 |
| 1911 | 11.2 |

Example—From 1801 to 1810 the production of silver was 50.9 times that, by weight, of gold.

In the ten years. 1851 to 1860, the discoveries of gold in California and Australia, as I have already pointed out, added to the gold production without any corresponding increase in silver, which for 1851-1860 fell to 4½ times the weight of gold. As between 1861 and 1911 the silver production varied by weight from 6.4 to 19.8. The production of silver for the year 1911 being by weight 11.2 times as much as gold.

Thirdly, as to the value of the silver produced as compared with the value of the gold produced, and for the same periods.

I have endeavored to discover as to how and when the ratio of value between gold and silver commenced, and as to what was its origin. Since the year 1884, I have been closely in touch with silver, and have watched its fluctuations daily. Silver to-day is enormously depreciated in value when compared with gold, but it was not always so. At one time there is a great probability that silver was the more valuable of the two.

Starting A.D. 1250, when 10.9 ounces of silver were exchangeable for 1 ounce of gold, we come down to 1911, when 38 ounces were required, and silver was 2s. 0½d. per ounce; the ratio for 1912 has slightly diminished, 1 ounce of gold requiring 33.3 ounces of silver to purchase it, the price being, say 2s. 4d. per ounce.

To about the year 1840, the gold produced in the world would only have purchased one-half of the amount of silver produced. In 1841 an increase of gold production commenced three times that of the previous ten years, and for the first time silver is more than balanced by gold. For the next period, 1851 to 1860, the gold production makes another leap of three times the previous production, the ratio of gold to silver being 15 to 1. The production of silver rises, until for the period 1881 to 1890 the silver was practically equal to the amount represented by the gold production multiplied by the existing value ratio.

This will be clear to you if we take for example, the ten years, 1881-1890, during which period the production of gold was 5.1 million ounces. The production of silver was 100 million ounces, that is to say, 20 times the amount by weight. The ratio of value for the same period was 19.8 (nearly 20), so that the 5.1 million ounces of gold were just balanced by the 100 million ounces of silver. Once, however, we leave the period ending 1890, we never again get the same conditions. As you already know, the production of gold has been unprecedented, and similarly so has that of silver. For the ten years ending 1900, the gold produced was equivalent to 309 million ounces of silver; for the ten years ending 1910, it would have purchased 657 million ounces of silver. For 1911, at the ratio of 38 to 1, the gold produced would have purchased no less than 855 million ounces of silver.

### Stocks of Metal.

In considering the foregoing figures, we have to take care that we do not lose sight of the cumulative effect of the world's stocks of the two metals, and it is to this aspect of stocks of metal I want to direct your attention for a few minutes.

A fact that has always to be remembered when we are considering gold, is the excessive care taken on every hand to prevent loss. The result is that gold stands pre-eminent as regards its increasing stock, and, although a part is utilized in the Arts (estimated by Dr. Soetbeer at 4,000,000 ounces per annum), this remains generally in such a shape that it can be re-melted and quickly put into the form of bullion again.

**The Relative Production of Gold and Silver.**

| Period. | Number of Years. | Gold: Millions of oz. | Gold: Value in millions. £ | Silver: Millions of oz. | Silver: Value in millions. £ |
|---|---|---|---|---|---|
| 1493-1660 | 168 | 41 | 173 | 1,490 | 514 |
| 1661-1850 | 190 | 113 | 480 | 3,320 | 952 |
| 1851-1900 | 50 | 334 | 1,400 | 4,010 | 750 |
| 1901-1911 | 11 | 205½ | 867 | 2,062 | 226 |
| | 419 | 693½ | 2,920 | 10,882 | 2,442 |

The total figures are not very dissimilar, namely, gold 2,920 millions sterling and silver 2,442 millions sterling, but this is explained when we remember the measurement of value, by the fixed value of gold. The total world's production of silver from the discovery of America, say—400 years ago, is estimated roundly to have been nearly 11,000 million ounces, and there was, of course, a large quantity of silver in the world before then. Taking the present world's stock, therefore, as being 12,000 million ounces, we have a value at its present price of, say, 1,200 millions sterling, more than one-half of which has been added to the world's stock of silver during the last 60 years.

**The Future.**

We should all like to know whether the present output of gold and silver will be maintained.

As regards the present, the large producers of gold are: The Transvaal, United States of America, Australasia, Mexico, Russia.

The large producers of silver are: Mexico, United States of America, Canada, Australasia.

Taking the world's total production as 100, I have worked out the annual percentage production of each of the above countries for the ten years ending 1911 (see following table). No accurate figures are yet available, but it is estimated that so far as gold is concerned the total production exceeded 25 million ounces, which is an increase over 1911. With regard to silver, the only estimate that I have seen is that the production for 1912 could be considered as equal to 1911.

It will be seen that the Transvaal has maintained its gold production, and in a lesser degree Mexico, but the United States and Russia are barely holding their own, whilst Australasia shows a falling off which has been continuous for the last ten years.

The question is: Will the ratio of production ruling for 1911 be maintained? The answer is to be found in giving a positive value to the following factors.

Against—We have the rise of cost of materials and labor acting as an automatic check on any further increase of production.

For—We have (1) the possible discovery of new gold fields; (2) new processes giving increased extraction, but for which new processes there is less and less scope; (3) diminished cost owing to improved mechanical means of handling tonnage. South Africa has shown us what can be done by the employment of huge amounts of capital, combined with competent technical and thorough business management.

As regards silver, which is also based upon the foregoing table, interest centres mainly in Canada.

PERCENTAGE OUTPUT OF GOLD AND SILVER PRODUCED 1902-1911

# U. S. MINE RESCUE CAR IN LAKE SUPERIOR DISTRICT

By P. B. McDonald.

Two years ago a mine fire occurred in the Hartford mine of the Republic Iron and Steel Co, at Negaunee, Mich., and seven miners were suffocated. It was realized that had oxygen helmets and pulmotors been available the men might have been saved, and mining companies, both in the copper and iron regions became aroused over first aid and mine rescue work. Previously the Lake Superior mines had been considered reasonably safe, as comparisons had been made with the coal mines, where so many fatal accidents occur. The Cleveland-Cliffs Iron Co. led the way in rescue work, by purchasing oxygen helmets and pulmotors, and training first aid and rescue crews at each of its mines; the company later held contests and exhibitions at its headquarters in Ishpeming, where prizes were distributed to the teams showing greatest proficiency. Other companies have followed the lead of the Cleveland-Cliff Co., even to the creation of a safety inspector, whose sole duty is to visit his company's mines and report machinery and working places liable to be dangerous.

A petition was then circulated in the mining towns and the signatures of thousands of miners obtained, asking the Government that one of the Rescue cars of the Bureau of Mines be stationed in the Lake Superior district. This request was complied with, and U. S. Rescue Car No. 8, the only one assigned to a metal mining region, was sent to Ironwood, Mich., as a headquarters. The car is fully equipped with all necessary apparatus for use in mine fires, accidents, etc., including oxygen helmets and pulmotors, and is manned by three Government experts. The car is ready at any minute to be taken to the scene of a mine catastrophe, where the crew will co-operate with the company in saving life. In addition the car travels around the different iron and copper districts, and the crew gives instructions and lectures to the miners and mine officials, spending several weeks in each place.

The car was recently at Ishpeming, on the Marquette range. At this place the Oliver Iron Mining Co. gave the use of an old building for experimental purposes; a smudge was built in the stove, and the building filled with smoke, so that a man could see only a few feet ahead. Then men were sent in fitted with oxygen helmets, and remained for an hour, during which they climbed ladders, sawed timbers, and operated a rock drill on a piece of diorite taken in for the purpose.

The pulmotors are used to resuscitate persons overcome by smoke, gases, electricity, or water; pure air is forced into the lungs and breathing automatically stimulated. The results obtained with the pulmotor on persons apparently dead are remarkable. In first aid demonstrations, the miners are instructed how to tie up an artery to stop the flow of blood, place splints on a broken arm or leg, make a stretcher out of such materials as a pair of overalls and two long drill-steels, etc.

Following the visits of the Rescue Car in nearly every district, the mine officials of the different companies have co-operated to form a Miners' Safety Club, which meets at intervals to discuss safety and rescue work.

# METHODS OF MINING AT COBALT

By Reginald E. Hore.

The general method of mining high grade ore in the early days was by open cuts. Rock on one side of the vein was broken and removed, and then the vein matter was picked off the wall and bagged. From open cuts 50 or 100 feet deep, several million ounces of silver was taken in this way before more systematic mining was undertaken.

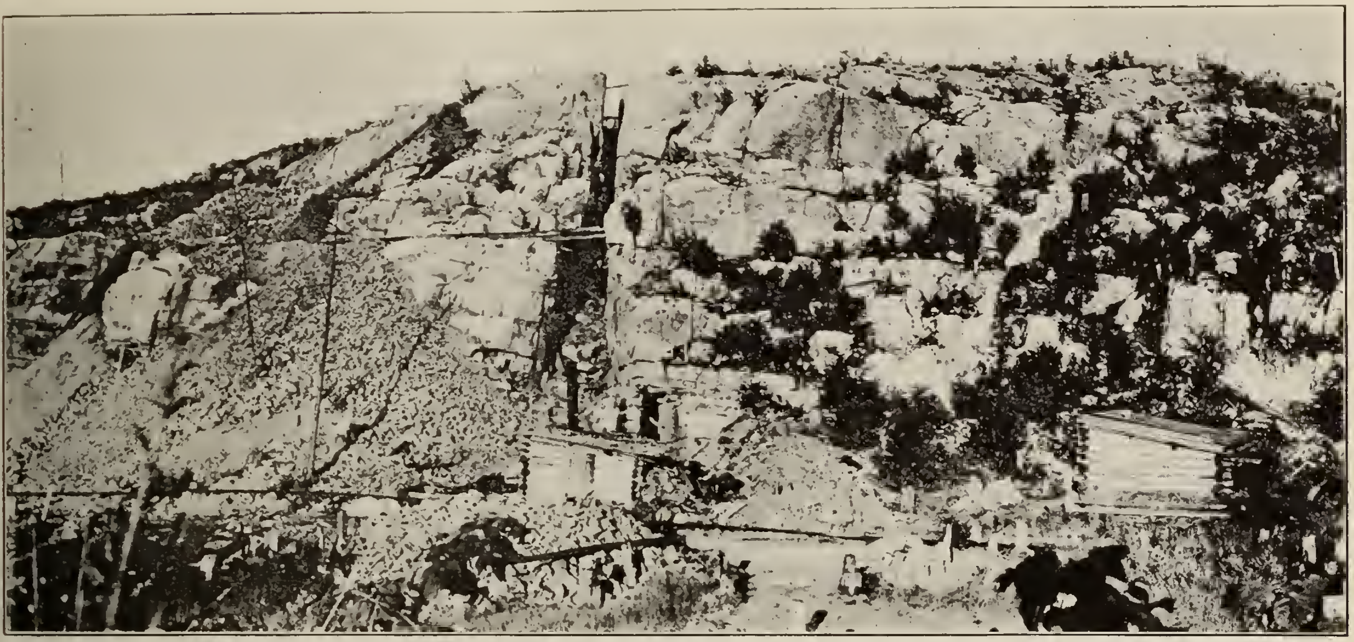
The deposits having proven to be of great value it might have been expected that ordinary development shafts and drifts would have been started, but at many mines this was not done for some time. When such work was finally done and overhand stoping commenced, it was still common practice to leave the vein on one wall and bag only the ore taken off after removing the broken rock. Much fine ore became mixed with the rock which was piled on the dumps. Later more attention was given to this lower grade material, and when numerous concentrators had been built for its treatment, the method of mining and handling ore was naturally improved.

In almost all cases the present practice in developing ore is to sink vertical shafts on the vein and drive drifts at short intervals, 50 or 75 feet in many mines, and usually less than 100 feet. Other veins are reached by cross-cuts and developed by winzes and drifts in a similar manner. At most mines there is a central hoisting shaft where all the ore from several veins is raised to the surface.

Instead of leaving the vein on the wall, it is in most mines now the practice to keep the vein well within the working face. The rock on each side for a few feet, and in many cases for several feet, usually contains enough silver to pay for milling. In some mines care is taken to keep the high grade vein matter from mixing with the broken rock. It is picked out and bagged in the mine. In other mines the practice is to do no sorting whatever underground. All is allowed to mix and is raised to surface, where it is washed, screened and hand picked. The undersize is jigged or shipped direct to the smelter.

In stoping the ore some mines use a shrinkage system. The ore is broken down onto the lagging and just enough drawn off to give room for the miners. In this way a block of ore is stoped from one level to another, and there is, consequently, in a stope just finished about 60 per cent. of the broken ore still underground.

**Open Cut on main vein, O'Brien Mine, Cobalt**



Early workings on Little Silver vein, Nipissing Mine

Silver vein, O'Brien Mine

In other mines the practice is to put in stulls and lagging at short intervals in the stope, and then there is often a comparatively small amount of broken ore necessarily present in a stope at any one time. This is done in mines where the practice is to raise the ore as soon as possible after it is broken.

In one mine, the Crown Reserve, square sets are used, but so far as I am aware, this method of timbering is not used in any other. Good examples of the shrinkage system are the Nipissing and Coniagas mines. The practice of the Nipissing is briefly as follows:

### Method of Mining at Nipissing Mine.

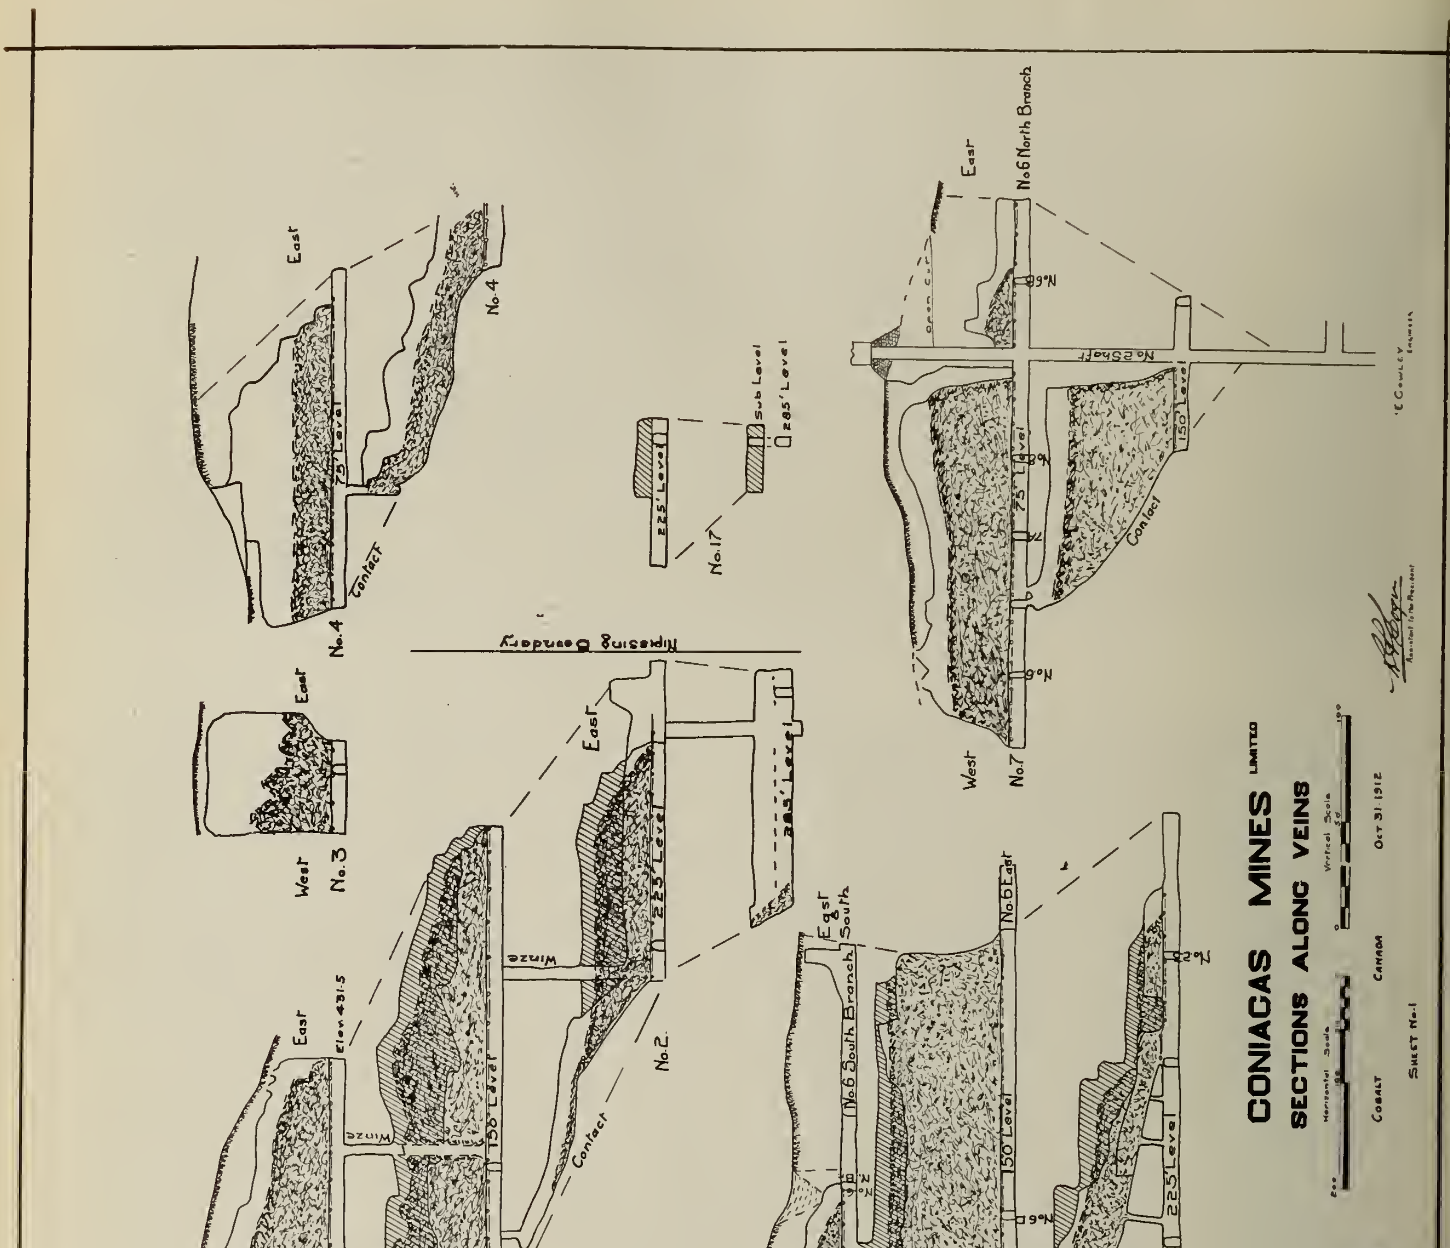
In mining a block of ore drifts are commonly run 14 feet high and 5 feet wide. If the walls are good milling rock, or if there are two or more veins close together, the drifts are carried much wider—in some cases 12 feet. The veins are kept well within the breast.

The drilling for the whole 14 feet is done from one set up, so each set up is for an advance of 5 or 6 feet with a height of 14 feet and a width of 5 to 12 feet. A cut 8 feet high is taken 5 or 6 feet in advance of the remaining 6 feet, which is drilled by uppers.

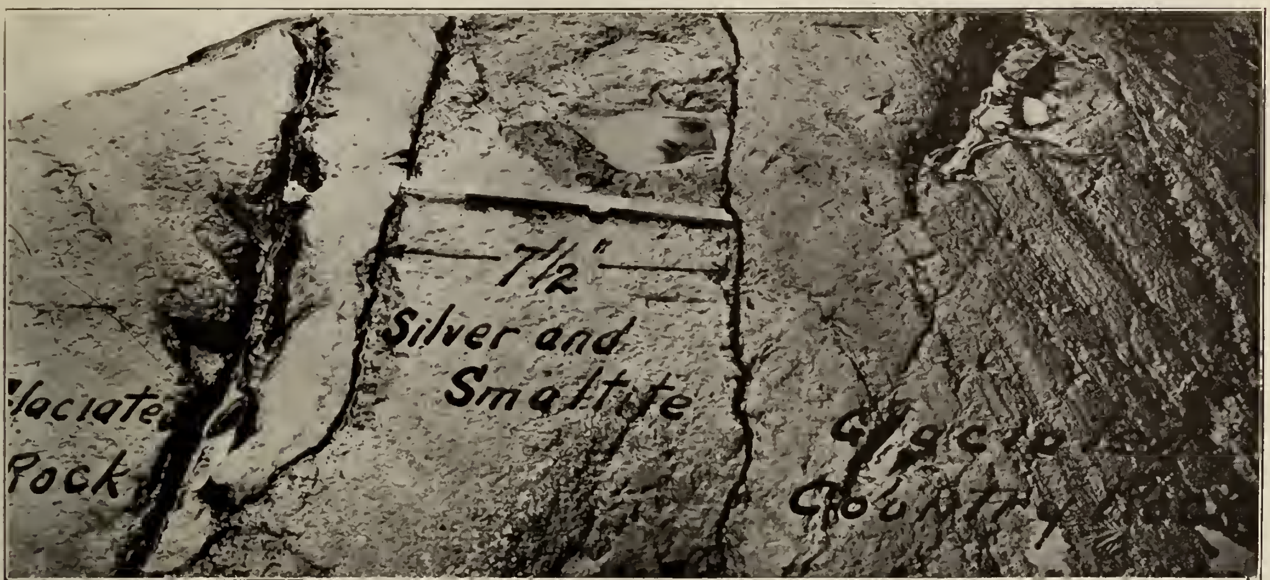
The drift is now timbered. The level is protected by a lagging of poles laid on caps supported by posts. Chutes are built at intervals of about 25 feet.

Before stoping a large block, raises are put through to the next level. These are cut by two men using small stoping drills. A manway is timbered off and the remainder of the raise is filled with ore as it is broken. The miners work on a platform which protects the manway and extends across the broken ore. To keep the desired working space ore is drawn off from a chute at the bottom of the raise. This chute is afterwards used for ore from stoping.

When the raise is completed it is used to provide a stoping face and the ore is broken on either side. The raise provides ventilation, and is used to lower the steel and as manway. The high grade and low grade ore



Section showing method of developing and mining veins at Coniagas Mine.



Rich silver vein and glaciated country rock, Lawson Mine, La Rose Mines, Cobalt

are not kept separate, but all is allowed to lie as it falls when broken. Enough is drawn off to provide space for the miners. The cars are taken to surface on a cage,

### Method of Mining at Coniagas Mine.

The methods of developing and mining at the Coniagas are similar to those at Nipissing, but some variations may be noted. Drifts are run 8 feet high and later enlarged by a cutting-out drift, giving 8 feet additional height. The lagging is supported by stulls set in hitches. Where the drift is wide posts are used to support stulls in the middle. Chutes are built at intervals of about 25 feet.

When the timber is ready, stoping is begun by breaking some ore carefully onto the lagging, and then continued by the shrinkage system. To avoid pot-holing and sledging of large chunks of rock, care is taken to break the rock comparatively small. Heavy charges are not used.

Considerable high grade ore is picked out by sorters underground. In the drift-stopes a sorter looks over the ore as it is loaded into cars and bags the high grade. In the stopes there are no sorters, but the miners, without making very careful examination, pick out considerable high grade. While at the Nipissing all the ore is sorted at the surface, a very considerable percentage of the Coniagas high grade ore is bagged underground, and is brought to the surface ready for shipment to the smelter.

The Coniagas does not use a cage in hoisting. The ore is trammed to the shaft and emptied into pockets. Thence it is drawn off by chutes to a specially designed skip. The skip dumps automatically at surface over a grizzly to a chute down which the ore runs to the mill bin. The ore is crushed before another product is taken, and mine fines are treated together with fines from the crusher.

The Coniagas uses two man drills in stoping as well as in sinking and drifting. The drill used is the Redington, designed by Mr. John Redington and manufactured on the property.

Silver vein, Nipissing Mine

# APPLICATION OF GENETIC THEORIES TO THE SEARCH FOR ORE†

By George E. Collins.

The science of economic geology advances in bounds only to overreach itself and fall back; but it never recedes quite to the starting place. In each of the fashionable theories which from time to time spring up, there is a kernel of solid truth, which remains as a permanent addition to the stock of human knowledge, after the husks have been blown away by the searching blast of criticism.

The reasons for the failure, in practice, of so many deductions based upon generally accepted theories of ore deposition and local enrichment, have been clearly and fairly stated by R. A. F. Penrose in a recent paper entitled "Some Causes of Ore Shoots," published in Economic Geology. I quote from the paper the following paragraphs:

Page 100. The great difficulty in classifying ore shoots is that many totally different causes have often combined to produce any one shoot, and the evidence of some of these may have been much obscured or even obliterated since that time, so that the determination of just what cause has been uppermost in influence is often impossible.

Page 131. The influences that may produce ore shoots do not necessarily do so. An ore shoot is the exception and not the rule, and even when apparently the most favourable combination of influences exists, there may be no ore shoots. Moreover, the causes that have produced a shoot in one region may have no such effect in another region, or in another deposit in the same region, or perhaps in another place in the same ore deposit.

As a matter of fact, most of these influences seem to be practically without effect in far more cases than they have effect, and in some cases they have actually been injurious to the quantity, or quality, or both, of the ore.

Many of us used to criticize the geologists, and in particular those of the United States Geological Survey, for publishing obituaries; and to suggest t' they were to blame for not being ready with an exhaustive study of a mining district until its deposits were worked out. Yet, if we cast aside the temptation to indulge in cheap sarcasm, how is the geologist to furnish a complete explanation of the facts, before the facts themselves have been laid bare? On reflection, we should admit that no final and convincing description of any mining district can ever be written, excepting as an obituary. The object of such work is to arrive at general truths which may ultimately be applied elsewhere; and in our hurry for something which the geologist cannot supply—reliable deductions as to the nature and form of ore bodies that the miner has not yet found—we rush him into furnishing descriptions of phenomena which we cannot recognize when we look for them, and hazarding opinions which too often prove unfounded. Yet the fault is not so much his as ours, who expect the impossible. The result is to confuse the popular mind; to discredit science herself, instead of the fallacies and half truths which are delivered in the name of science.

We must learn to ask at once less, and more, of the geologist. In new and partially opened districts, he can give us a useful and indeed essential aid—a study of the structural geology. He can read for us the relative ages of veins and rock formations; can assist us by collecting and correlating the data, many of which are unknown to or overlooked by the technical man who is most familiar with any given district; and can inform us what is known of ore occurrences elsewhere, where the conditions are sufficiently similar to suggest possible analogies in the deposits which result from the conditions. The less he ventures into the realm of concrete prediction, the better for his peace of mind, and for the progressive unfolding of correct scientific conceptions.

This groundwork or outline furnished, it remains for the miner to fill in the details. It is here that the role of intelligent hypothesis, based on sound scientific conceptions, and on detailed observations drawn from practice in comparable localities, comes in. There are only two ways of conducting mining exploration. The one is essentially empirical, prospecting by shafts and levels at regular distances on a plan adopted with a view to subsequent convenience in working; or by bore holes spaced at more or less regular intervals. This method, in its multitudinous ramifications is eminently suitable for regular veins or simple deposits. But just as we must be prepared in metallurgy to deal with increasingly complex and difficult ores, the simpler ones having been already taken care of by our predecessors, so in mining, the future belongs to the man who can find and extract the more irregular deposits; who can unravel the puzzling and intricate cases of complex faulting, and of devious ore channels. The mere mechanical problems incident to mining are so much child's play compared with these, and I cannot but think that eventually the honor, and remuneration, attending professional work will in greater measure be regulated by its difficulties, and the quality of the faculties which are necessary to cope with and overcome them.

It has long been a favourite doctrine of mine that the problems which require to be solved are often more difficult and intricate in a small mine than in a large one, and success is often due more directly to the degree of ability applied. In each case we have to proportion our means to the attainable ends. The successful solution in the large mine is frequently only the application of a simple method on a large scale, by multiplying units. As with smelting, the inherent difficulties are often removed by merely enlarging the scale of operation. From this reflection, which I believe is indisputable, I sometimes pass to the paradox that the remuneration for the work of mine management should be fixed in inverse proportion to the size of the mine.

But to return from this digression. In the development of irregular ore bodies, we must either adopt the same geometrical basis of exploration, which soon leads to bankruptcy, or else direct our exploration according to some working hypothesis. To "follow

*Proceedings of the Colorado Scientific Society, Vol. X.; extract from presidential address, published in Mining Science.

your ore" is an excellent maxim, when you have it; but it does not help very much when your ore is yet to be found. Hitherto, the work of hunting for ore has been left, as a rule, to the so-called "practical man." He also plans his work along the lines suggested by some hypothesis. The trouble is that, as has been pointed out by others, there is no theorist so wild or so inveterate as your "practical man;" none that rides his hobbies so hard or so far. What is needed is the trained mind, acquainted with the literature of ore deposits in various districts; able to observe from day to day all the facts that suggest similar conditions and possibly parallel results in his own, and familiar with all the various theories of ore deposition which are applicable to those conditions. Thus equipped, he is able to form rational hypotheses on which to base exploration, and to realize when the time has come to discard them and adopt others. In other words, the scientific miner of the future will proceed along much the same inductive lines as those which have laid the foundations and built the superstructure of all modern scientific progress; the only difference being that he cannot artificially create the conditions of each experiment, for which reason his progress must inevitably be far slower.

The detailed study of ore deposits, with reference to their origin and distribution, requires four qualifications: First, a thorough grasp of the fundamentals of physics and chemistry; second, a wide first-hand acquaintance with other occurrences elsewhere, for the purpose of comparison; third, a close and continuous study of the deposits under consideration, for the reason that much of the evidence bearing on the genesis of the deposit is removed as rapidly as it is exposed; fourth, and most important of all, imagination, by which alone the mind can conceive tentative hypotheses of origin, to be tested by the observed facts. I have said above that I believe the complete history of any mine cannot be adequately written until the mine has been worked out. To this I would add that it cannot be done without a dependable record of its characteristics as they unfold themselves.

An ore deposit is a palimpsest on which, throughout successive ages, various chemical and physical processes have traced their records. The most legible inscription on its surface may represent only the latest of the many influences which have contributed to the final result. By careful scrutiny we can sometimes discern, hidden perhaps in an obscure corner, traces of the half-obliterated hieroglyphics which record the earlier stages of its development.

In an examination of any such deposit, we can merely see what happens to be exposed in drifts, raises and so forth, at that particular moment. Even of these, only a small proportion, in most mines, is open for examination at any one time; and the openings themselves form only part of the total area. The visiting geologist or engineer therefore sees only a small fraction of the entire deposit, and it is natural enough that in many cases the really significant pieces of evidence escape him. The man who has the best opportunity, to study the deposit is he who is familiar with it throughout the entire period when it is being worked; who sees the freshly broken face of each drift, and the developments from day to day in every working place. A relatively less degree of ability so applied may be expected to yield greater results than an occasional brief visit from an eminent scientific authority. The greatest progress in the study of ore deposits may be looked for when these men become conversant with the fundamentals of economic geology; when the mine superintendent and the mine surveyor have been trained in the methods of the field geologist, to observe accurately and to record their observations.

Even now I do not believe for one moment that the men who do the actual work of underground mining are as unobservant or as incapable as one might suppose, judging from the comparative absence of mention of their observations in the modern literature of ore deposits. I prefer to conjecture that their work has somehow failed to become adequately recognized in the publications; and that many of the luminous observations recorded are really due to the careful study of some unnamed foreman or mine superintendent who conducted the distinguished visitor through the mine.

In the future scientific dealing with the origin of ore deposits, and particularly the localization of their richer portions, I believe that the work of the chronicler will be of equal dignity and importance with that of the official historian. I go further, and express the opinion that when more of our economic geologists take up the actual work of directing and planning underground mining operations, their opportunities for original observation will be improved, and the results will be careers of increased usefulness, and increased scientific progress.

Certainly there is no royal road to the discovery of ore bodies which do not crop out at surface. Yet the study of the subject is not without practical utility. It enables us to substitute intelligent underground prospecting for purely geometrical or empirical prospecting. Our ore bodies are not found, as a rule, where we look for them the first time, or the second; for, as Lindgren says, the shoots "often fail to materialize where in accordance with supposition they should do so." But as the result of a great deal of hard-earned experience I do not hesitate to assert that prospecting based on intelligent hypotheses succeeds far oftener than prospecting which is blind or based on unintelligent hypotheses. Further, the trained engineer, familiar with what is known already of the causes of the localization of ore, and its occurrence under widely different conditions in many districts, has a great advantage in finding ore over the ordinary uneducated tributer.

It has frequently occurred to me that, in discussing the origin of ore localizations containing the precious metals, and also compounds of the base metals, there has been some confusion of thought owing to failure to distinguish sufficiently between the causes which produced enrichments of gold, and those which produced ore bodies of the base metals. The same causes which produced the one by no means necessarily produced the other. In the case of the base metals, we are dealing with appreciable quantities which can be expressed in percentages; and their ores, if sufficiently plentiful to be considered ores at all, are at once visible. With the precious metals, on the other hand, and gold in particular, we have to deal with minute proportions, one two hundred and fortieth of 1 per cent. being a high grade ore—or quantities which, excepting for the relatively simple metallurgy of gold, could not be detected, much less worked. It is probable that other rare elements exist in common ores to at least an equal extent, the presence of which, owing to the absence of equally effective methods of assay, is never suspected. The gold in most ores, in fact, may from the standpoint of the chemist or the physicist be regarded as an insignificant and accidental impurity in the very ore bodies which derive their economic value from its presence.

The geologist who studies this subject has usually no personal knowledge or equipment for investigating at first-hand this most important factor in the distribution of ore values. He is dependent on the engineer or mine superintendent for information of this kind, which all engineers know is most difficult to ascertain precisely, even with close and prolonged study. How frequently it happens that, even after years of familiarity with the ores of a particular mine, with all the assistance afforded by thousands of assays, the engineer still knows little or nothing positive as to the conditions under which his precious metals occur, or the specific minerals with which they are associated. Indeed, we frequently know more, or rather imagine we know more, after the first week, than after the first year. Now, the unfortunate geologist is usually in the same position as we are after the first week: That is, he has absorbed a great many observations which have every merit, except that of being in accordance with the facts. He is necessarily dependent on the information he gets from the local operator, and the stream is no purer than its source. It is by no means true that even a man who is very familiar with a mine, necessarily knows the valuable ore by its appearance. The ore of some mines can be quite accurately graded by a person who is really familiar with them; in other cases it can never be accomplished.

As an aid to the discovery of ore shoots, nothing is so important as persistent sampling. By that I do not mean the systematic sampling employed to delimit and ascertain the value of ore bodies, the methods employed in which have been thoroughly worked out and described for several years past. I mean rather the kind of sampling which is employed—only not nearly so thoroughly as it should be—by the tributer in search of a "pitch." This kind of sampling is directed more to find where values are, than what they are; it tests every separate stringer, regardless of size and every novel vein material, however small in quantity. Its use reminds one of the children's game of "hide and seek," in that directly you get a good assay you may be "warm," for it proves that solutions carrying high values have been at work in that vicinity, and it is time to hunt for their channels. More and more, experience teaches me that this is the essential factor in prospecting. The mineralization being of the right character, there is always a fair chance of finding some place where its effects have been concentrated sufficiently to create commercial ore bodies. On the other hand, I have learnt to distrust the veins, however large or "well defined," which show no evidence somewhere or other of mineralization by solutions which were capable of depositing a workable grade of ore. Nearly every mining district contains plenty of such, which have every requisite for making good mines, excepting pay ore. There was a time when a fine appearing vein appealed to me in itself; and I recollect that at one time I used to suppose that in choosing a place to prospect, it was necessary to select "a fine, large, generous vein," so that if an ore body occurred in it, there would be plenty of space for a large one. I have grown out of all that. Granted the right kind of mineralizing solution, and a fissure, however small, the elements are there already. At some point shattering or faulting will have made spaces enough in which to deposit ore; or, if not, the mineralizers can usually eat out their own receptacle.

# SORTING, ROASTING AND SMELTING NICKEL-COPPER ORE, CANADIAN COPPER COMPANY

The Canadian Copper Company is at the present time mining ore at the Creighton, the Crean Hill and No. 2 mines. In 1912 the ore production was as follows:

| | |
|---|---|
| Creighton | 518,417 tons. |
| No. 2 | 66,371 tons. |
| Crean Hill | 33,506 tons. |

The hoisting, crushing and picking methods are the same at all the mines, and a description of the process at Creighton Mine will suffice for all.

The ore is hoisted in $2\frac{1}{2}$ ton skips by motor-driven hoisting engines. At the top of the rock house the skip dumps over a "grizzly" or screen, formed of rails spaced five inches apart. The fine ore is thus separated

General View of Smelter, Canadian Copper Co.

**Creighton Mine Buildings, Canadian Copper Co.**

from the coarse and falls into the fine ore bin. The coarse ore is fed into two crushers of the Blake type, 18 x 30, which break it into pieces approximately 2½ inches cube. The crushed ore passes through trommels pierced with ⅞ inch openings, which remove the fine ore. The coarse ore passes over picking belts, where any visible rock is sorted out by hand. Of 100 parts material hoisted, about 10 parts are removed on the belts as rock.

**Roasting.**—The coarse and fine ore are taken from the rock house on flat cars and removed to the roast yard at Copper Cliff. Here the ore is roasted in open heaps. A bed of cordwood is prepared, and on this the ore is placed in piles of about 2,000 tons, about six feet high. Fine ore, which is separated from the coarse at the rock houses, and which amounts to about 15 per cent. of the total ore, is used to cover the beds. The wood is fired and the piles allowed to burn under normal conditions for about three months. The sulphur, which in the green ore is 25 per cent., is thus

**No. 3 Mine Buildings, Canadian Copper Co.**

**Crean Hill Mine Buildings, Canadian Copper Co.**

reduced to 12 or 13 per cent., a corresponding oxidation of iron takes place, so that the roasted ore consists of a mixture of iron oxide with the sulphite minerals.

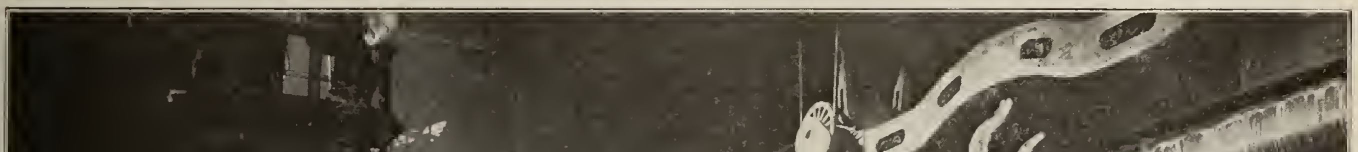
The roast ore is loaded into steel drop bottom cars, holding 50 tons, by a steam shovel. The roast ore is now taken to the smelter and dropped into bins behind the blast furnaces. These bins contain beside the roast ore, all the ore from Crean Hill, which is used as it comes from the mine, without roasting, together with quartz, limestone, coke, converter slag and other materials used in the smelting process. Quartz is used as a flux in the blast furnaces, to combine with the oxide of iron, produced both in the roasting and the blast furnace treatment of the ore. This quartz comes from the Company's quarry in the township of Dill, about twenty miles south-west of Sudbury. It is a

**Roast Yards, Canadian Copper Co.**

**Blast Furnace Charging Floor, Copper Cliff Smelter**

remarkably clean, massive quartzite, containing about 92 to 94 per cent. silica.

**Smelting.**—To understand the smelting operations, it must be premised that copper and nickel matte smelting is entirely opposite in its principle to the blast furnace treatment of iron ores. In the iron furnaces, the operation is conducted in a reducing atmosphere, with the intention of reducing all the iron present to metallic form, and preventing its passage into the slag. In copper and nickel smelting, on the other hand, the operation is conducted in a strongly oxidizing atmosphere, with the intention of driving as much as possible of the iron into the slag, and saving only the copper and nickel with sufficient sulphur to pre-



**Tapping Floor, Copper Cliff Smelter, Canadian Copper Co.**

**Basic Converter Plant, Canadian Copper Co.**

vent their oxidation. Copper and nickel combine with sulphur in the blast furnace to form what is known as matte. This matte contains iron in amounts which vary inversely with the amount of oxidation attained on the roast yard and in the blast furnace. If the ore is roasted to 10 per cent. sulphur, the furnace matte may contain 30 to 40 per cent. copper nickel, and from 40 to 30 per cent. of iron, while if the ore is roasted to about 14 per cent. sulphur, the furnace matte may contain only 10 to 20 per cent. copper nickel, with about 50 per cent. iron. It is evident that if the ore is poorly roasted, the oxidation attained in the blast furnace must be relatively greater than is necessary with well roasted ore. This furnace oxidation is attained by the addition of quartz in the blast furnace. This quartz prevents the rapid smelting of the ore, and by holding it in the blast furnace, under the influence of a powerful blast of air, allows the oxidation of about 50 per cent. of the sulphur and iron, contained in the roasted ore. The iron oxide formed on the roast yard and in the blast furnace, combines with the quartz to form a slag which contains about 55 per cent. iron

**Reverberatory Department, Copper Cliff Smelter**

oxide, in the form of silicate of iron. This silicate of iron can often be found in crystalline form on the slag dump.

Limestone is used as a flux only when the furnaces are in poor condition. The addition of a lime base to the slags lowers their melting point, and thus allows the cleaning of accretions from the sides of the blast furnace. In certain cases, when the ores are very rocky and particularly if much aluminium is present, the addition of a small amount of limestone to the charge is indicated.

The furnace charge is taken from the bins in trains of nine cars hauled by electric locomotives. These cars hold about two tons of ore. The first three cars contain coke, about 11 per cent. of the weight of the charge. This is dumped into the furnace by rolling the cars on their base, so that the coke is spilled over the side of each car into the furnace. The next car contains quartz, which is spread on top of the coke by moving the train along while the quartz is being dumped. In this way the quartz is placed next to the coke, and being thus strongly heated is in a position to combine with the iron which flows down over it from the melting ore.

The ore charge of three or four cars is dumped next above the quartz. The last car or cars may contain converter slag, scrap, or other smelter cleanings, and are dumped last.

The blast, which is introduced through 32 tuyeres near the bottom of the furnace, furnishes oxygen, not only for the combustion of the coke, but also for the combination with the sulphur and iron in the ore. The amount of air blown into each furnace is about 24,000 cubic feet per minute. Each furnace smelts about 300 tons of ore, or 400 tons charge in 24 hours. During this time it receives about 1,300 tons of air, so that the air blown into the furnace is about three times as much in weight as the solid charge.

There are five furnaces 17 feet long, and one furnace 21 feet long, having a total capacity of over 2,000 tons ore in 24 hours. The melted products flow continuously from the furnace into an oval brick-lined settler, 19 ft. 6 in. x 16 ft. x 5 ft. 6 in. In this settler the matte, which has specific gravity about 4.6 to 4.8, separates from the slag, which has specific gravity about 3.7. The slag runs continuously from the settler into 25 ton pots, which are taken to the dump. This slag contains about 33 per cent. silica and about 55 per cent. iron oxide. It carries off about 0.4 per cent. copper nickel. The matte is tapped from the bottom of the settler into eight ton pots and transferred to the converter building. This furnace matte contains about 6 per cent. copper, 16 per cent. nickel, 47 per cent. iron and 27 per cent sulphur. It is treated in the converter department by blowing air through it to convert the iron into iron oxide, which iron oxide, as fast as formed, unites with quartz or mine rock, which is placed in the converters as a flux. The continuous blowing of air through the matte, and the continuous removal of the iron in the shape of converter slag, removes the iron from the matte and leaves a final product containing about 80 per cent. copper nickel, with about 0.5 per cent. iron and 19 per cent. sulphur, which is known as Bessemer matte.

**Interior of Sub-Station, Copper Cliff Smelter, Canadian Copper Co.**

**The converters**, five of which are installed, are cylindrical iron vessels, 37 feet long by 10 feet diameter, lined with magnesia brick and capable of rotation on a horizontal axis. At the back of these converters is a row of tuyeres, 44 in number, and 1½ inches in diameter, through which air is blown into the molten matte at about ten pounds pressure. Each converter requires about 6,500 cubic feet of free air per minute. This air rapidly oxidizes the iron and sulphur in the matte, burning about 120 pounds iron per minute from iron sulphide to iron oxide, with a corresponding liberation of sulphur dioxide. The hot gases escape through

**Hydro-Electric Plant, High Falls, Canadian Copper Co.**

a six foot opening in the top of the converter. A slot shaped opening in the front of the converter allows the slag to be poured off as desired.

The conduct of the operation is as follows: The converter, being empty and heated by a previous charge, about 70 to 80 tons of matte is poured in with 5,000 or 6,000 pounds of dry crushed quartz. The converter is turned back and air blown in through the tuyeres. After an hour's blowing, the converter is turned down and slag poured off. From this time on, every forty minutes one pot of matte is added to the charge in the converter, with about 5,000 pounds of a mixture of quartz and waste mine rock. Air is blown through this for forty minutes. Slag is poured off and matte and flux added. In this way 400 to 500 tons matte may be put into the converter before the iron is eliminated, and a cast of 100 tons Bessemer matte obtained. This "blow," as one complete operation is termed, will last about 70 or 80 hours. The time depends on the grade of the matte put in the converter. Each ton of matte containing 22 per cent. copper nickel will produce about a ton of converter slag. The converter slag contains 28 per cent. silica and 62 per cent. iron oxide, with 2½ to 3 per cent. nickel. This slag is poured on a bed in the yard and sent back to the blast furnace, where its high percentage of iron oxide makes it useful as a flux. In passing through the blast furnace the copper nickel contents are very largely recovered.

The finished matte, which contains 25 per cent. copper. 55 per cent. nickel, 0.5 per cent. iron and 19 per cent. sulphur, is cast into slabs, broken by hand, loaded into box cars and shipped to the refineries in Bayonne, N.J.

---

# NEW PLANT OF THE STEEL COMPANY OF CANADA AT HAMILTON, ONT.*

At Hamilton, Ont., the Steel Company of Canada, Ltd., recently has placed a new plant in operation consisting of a blooming mill, continuous billet mill and continuous rod and merchant bar mill, which combines all of the latest improvements in rolling mill design and operation. As a unit, it is claimed to reach the highest development of more recent steel rooling practice. The features of these works are summarized as follows:

Electrically-driven throughout.

Power is purchased from a hydro-electric plant, the current being transmitted a distance of nearly 40 miles.

The reversing blooming mill is motor-driven.

The motor-driven continuous billet mill consists of four stands, necessitating larger reduction for the four passes than is customary in mills of six and eight stands of rolls.

The combination continuous rod and merchant bar mill is the first of its type to be installed on the North American continent.

Equipment for cooling rods, whereby they are annealed and the formation of scale is reduced to the minimum.

Steel for this new plant is produced in six open-hearth furnaces, two of 80 tons, two of 35 tons and two of 25 tons capacity, the monthly output averaging approximately 15,000 tons. The two 80 ton furnaces have been added recently to meet the requirements of the new rolling mill and have been installed in an addition

*Extracts from an article published in Iron Trade Review, July 3, 1913.

to the existing open-hearth building. Hot metal is supplied by two blast furnaces, the open-hearth charges consisting of 55 per cent. of scrap and 45 per cent. of molten pig. Prior to the operation of the new plant, 6x6 inch ingots were cast, approximately 5 feet long, which were broken down in a roughing mill, this practice and the employment of small ingots, which were the size of large billets or small blooms, having entirely eliminated the blooming operation. The ingots for the new mill are 15x17 inches in section and weigh approximately 4,200 pounds.

The blooming and billet mills and the combined continuous rod and merchant bar mill are located in separate buildings, paralleling each other, and divided by a crane runway, extending at right angles to these structures, which commands the billet cooling bed, loading truck and the large conveyor for the continuous billet heating furnace for the rod and merchant bar mill. Both buildings are of steel construction, the one containing the blooming and billet mills being 60x475 feet and the rod and merchant mill 85x550 feet.

After casting, the ingots are conveyed from the open-hearth department over a standard gage track to one end of the blooming mill building, where the molds are stripped by a 75-ton, 63-foot span stripping crane, installed by the Alliance Machine Co., of Alliance, O. From the ingot mould cars the ingots are transferred to the soaking pits by a 10 ton soaking pit crane, installed by the Morgan Engineering Co., Alliance, O. The two soaking pit furnaces each have four holes, 5 feet x 8 feet 6 inches, which have a capacity of eight ingots each. These furnaces are built almost entirely above the floor level, permitting easy access for repairs. Producer gas is used for heating, this fuel being generated by four Morgan producers located in a separate building contiguous to the blooming and continuous billet mills. The covers of the soaking pit are hydraulically operated from a platform on a level with the tops of the furnace.

From the soaking pits the ingots are delivered by a crane to the approach table of the two-high, 34-inch, reversing, motor-driven blooming mill, which was designed by the Morgan Construction Co., and built at the Lloyd-Booth plant of the United Engineering and Foundry Co., Pittsburg. When breaking down ingots into blooms for the billet mill the steel is given 18 passes, but when breaking down for 6x6 inch blooms, the number of passes is reduced to 15. The blooming mill approach table is operated by a 30 horse power, direct current motor, and the two blooming mill tables are driven by 100 horse power motors. The side guards of the mill are hydraulically operated. In line with the blooming mill is the electrically operated 18 inch continuous billet mill, which consists of four stands of rolls. The blooms are cut by a 10x10 inch vertical bloom shear, which is electrically-driven, but has hydraulic movements. If the blooms are intended for the billet mill, they are conveyed by the electrically operated approach table to the first stand of billet mill rolls. Blooms to be rolled into billets are $3\frac{1}{2}$x$3\frac{7}{8}$ inches in section. However, when larger blooms are being rolled for one of the company's other works or for outside consumption, a section of the billet mill approach table is tilted, and the blooms are discharged onto buggies from which they are loaded into freight cars in the yard. The crop ends of the blooms are discharged into a bucket in a concrete pit, from which the bucket is lifted by the mill crane. A standard gage track at right angles to the length of the building extends the width of the plant between the bloom shear and the continuous billet mill. Supplies, spare parts, etc., are received over this track, and to permit the ingress and egress of cars, as well as loading the blooms intended for the billet mill onto buggies, a section of the billet mill approach table is so constructed that it can be tilted through an arc of 90 degrees.

The billet mill is of the Morgan continuous type, and consists only of four stands of rolls, which marks a radical departure in continuous billet mill construction, as the majority of mills of this type contain six and eight stands of rolls. The amount of reduction in the mill of the four-stand type over that of the six or eight-stand type is considerably increased per pass. When the bloom enters the first stand of rolls, the amount of reduction is 35.5 per cent.; second stand, 28.5 per cent.; third stand, 34.5 per cent., and fourth stand, 25 per cent. This reduction is considerably larger than that of continuous billet mills now generally in operation, which rarely exceed 27 or 28 per cent. during the earlier passes. The billets are rolled into $1\frac{3}{4}$, 2 and $2\frac{1}{2}$ inch sections, according to the size of the finished product, for which they are intended. The mill also is equipped to roll 2x8 inch flats. When intended for finishing by the combined continuous rod and merchant bar mill, the billets are cut to 30 foot lengths, and for the 10 inch hand mill to 15 foot lengths by an Edwards flying shear located at the end of the billet mill runout table. From the shear table the billets are delivered to a skew table, operated by a 75 horse power motor and onto the cooling bed. The cooling bed straightening device and the push-off each are operated by 50 horse power, direct current motors.

# THE COBALT SERIES*

By Morley E. Wilson.

The Cobalt series consist of an assemblage of clastic sediments, conglomerate, greywacke, argillite, arkose, and quartzite. These rocks are not sharply defined members, for they not only pass gradationally into one another, both horizontally and vertically, but conglomerate commonly occurs in the midst of greywacke or greywacke in the midst of conglomerate, and a similar relationship may exist between all the members of the series. Nevertheless, in a general way, there is a succession in most localities, from a basal conglomerate through greywacke and argillite to arkose, which in turn is overlain by an upper conglomerate.

A compilation of all the published observations of the succession and thickness of the various rocks comprising the series throughout the Timiskaming region shows that there is generally an upper and lower conglomerate with greywacke and argillite, quartzite, and arkose as intermediate members.

**Basal Conglomerate**—Wherever the Cobalt series is seen in contact with the rocks of the older complex, the basal member of the series is usually a conglomerate. The outstanding feature of this basal conglomerate is its heterogenity, not only in the size and angularity of the included fragments, but in the variability of the rock, both in texture and composition from point to

*Extracts from a paper published in Journal of Geology, Feb., 1913.

point. In some places it is largely composed of coarse fragmental material with little matrix and, in other places, consists largely of matrix with few fragments. As a rule it is unstratified, but locally a partial alignment of the pebbles can be seen.

The matrix of the conglomerate varies greatly in texture and composition and may be either coarse and feldspathic or exceedingly fine grained and slate-like in appearance; the coarser types are, however, by far the most common. Examined under the microscope the matrix is seen to be composed of angular, subangular, and round fragments of quartz, feldspar, quartz porphyry, mica schist, rhyolite, andesite, basalt, and other rocks inclosed in a cement consisting chiefly of chlorite, but usually accompanied by small quantities of carbonate, epidote and pyrite.

The pebbles and boulders of the conglomerate include, even in a single rock exposure, nearly every variety of rock occurring in the older complex. Fragments of granite occur everywhere, and are commonly many miles from the nearest occurrence of this rock in the underlying basement from which the Cobalt series was evidently derived. As is generally characteristic of coarsely clastic sediments of this character, the pebbles and boulders are commonly subangular or angular in shape though round fragments are also present.

**Greywacke and Argillite.**—The basal conglomerate of the Cobalt series commonly passes gradually upward by the loss of its pebbles and boulders into greywacke and argillite. This greywacke was originally a ferromagnesian sand and the argillite a ferromagnesian mud, both of which are now, however, very firmly cemented, the argillite resembling a slate but differing from a slate in possessing no slaty cleavage. The greywacke and argillite, like the other members of the Cobalt series, vary greatly, and here and there contain beds of arkose, masses of conglomerate, and in some places, single isolated boulders. In a few places the greywacke is unstratified, but as a rule both it and the argillite are uniformly bedded. The microscopic examination of the greywacke shows it to consist of fragments of quartz, feldspar, basalt, andesite, and other ferromagnesian rocks along with an abundance of chlorite. The argillite is much finer grained than the greywacke, consisting of exceedingly minute fragments of quartz and feldspar imbedded in a chloritic cement. Small quantities of sericite, epidote, and carbonate are also commonly present in all of these rocks.

**Arkose and Quartzite.**—The greywacke and argillite are usually replaced on passing upward by arkose or quartzite, the transition taking place by a gradual increase in the feldspar and quartz content or by an alteration of beds of the two rocks. The arkose and quartzite are firmly cemented sands which, when examined under the microscope, are found to consist of round, angular, or subangular fragments of quartz, or of quartz and feldspar along with small quantities of calcite, sericite, epidote, pyrite, and other minerals. They are generally stratified, may show ripple marks, are locally cross-bedded, and in places contain well-rounded pebbles of quartz and jasper in lenticular aggregations.

**Upper Conglomerate.**—Wherever the Cobalt series has a considerable vertical thickness, the arkose and quartzite are overlain conformably by an upper conglomerate which differs in no respect from the lower member of the series and cannot be distinguished from it except where the stratigraphical succession is known.

---

# THE PROBLEMS OF GOLD AT DEPTH*

By Hugh F. Marriot.

Much has been said from time to time during the life of the Rand about the present and prospective decrease of value in depth, and it is now desirable that the line of argument as regards these fields should be put on a definite and rational basis.

The relations between the earlier mining records and those now being produced have been fully set forth in the contributions to discussion from Mr. H. S. Denny and myself on Mr. Schmitt's paper (Transactions I.M.M., London, Chemical, Metallurgical and Mining Society, South Africa), and need no further elaboration here. The present contribution deals rather with the wider geological point at issue.

In dealing with ore deposits as they were chiefly known previous to the discovery of the Rand, it was only natural for the theorists to come to the conclusion that veins and fissures would be found to be poorer the deeper they were opened up, because, until the comparatively recent intense search for valuable minerals throughout the world, the majority of the deposits which had been worked were, by reason of the greater ease of their selection, in that particular class which affords the evidence in support of the formation of a theory on these lines.

All mineral deposits have limits to their extent both laterally and vertically, and, in the cases where the valuable mineral has been introduced upwards from below, the vertical length of each lens naturally tends to be greater than the lateral extension. I use the word "lens" advisedly, for in the succeeding argument all deposits which have defined limits and defined thickness may be considered as variations of lens-formation when spoken of broadly as regards their mass. In the natural process of denudation of the surface, these lenses are weathered down together with the surrounding country, and it is when their greatest thickness—and therefore their most important horizon—is reached that they offer more resistance to the denuding influences than does the country rock, and so stand up above the normal surface, thereby offering easy evidence to the prospector. This evidence is often supplemented by a large amount of surrounding detritus, being the product of denudation. If it happens that the thickest portion of the mass has not yet been brought to the surface horizon, subsequent mining operations will, in time, pass through it, and will thereafter continue down into the narrower portion of the lens until that particular deposit pans out.

*From South African Mining Journal, Sept., 1912.

That is the type of mineral deposit which, till recent years, has formed the subject of the mining operations in the majority of vertical and inclined veins and lenses of the world. Other deposits there are on which denudation has done its entire work, and, when the rich material on the surface which still remains in concrete form in large blocks has been cleared up, the underlying country has been found to contain the merest stringers of what was, in the higher levels, a magnificent deposit. A vast field yet remains for future generations, who will be equipped with appliances for detection, the nature of which are only now dimly indicated by embryonic investigations in the science. Further developments will provide the means to find those lenses, which either give no indication of their contents on the surface at all or present so insignificant an outcrop in size and value, that they are to-day left untouched. This may be taken to apply to the type of ore deposits that have until recent times formed the chief sources of production. The field is now so vastly widened that it is necessary to review the position afresh and to be prepared to discard many of the theories which have of necessity only been formed on one section alone of the mineral wealth of the world.

I have pointed out that the majority of the evidence of decrease of value in depth has been taken from those deposits in which the measurement has been greater in their vertical than in their horizontal axis. Let us now take a broad view of the Rand deposit as seen from the standpoint of nature, regardless of the many small readings with which it has been burdened, based on the comparatively small and haphazard disclosures made by human agency.

Between the extremities of Randfontein and Modderfontein there are about fifty miles of banket, which can be considered from a natural standpoint as one continuous and systematic gold-bearing deposit. Take the present developed depth of the Rand, say five thousand feet vertical or ten thousand feet on the dip, and study the formation diagrammatically by drawing a rectangle with the horizontal side to represent fifty miles in length and the vertical side to represent five, ten, or, if you wish to look far into the future, twenty thousand feet on the incline. In each one of these cases you will obtain a representation that will show far less depth in proportion to the length than is the case between any two levels in any average mine in the normal type of ore deposit. From the point of view of nature, this is one great gold deposit, and it is altogether unreasonable to suppose that the purely fortuitous position of the outcrop horizon, embracing a strip of ground almost of length without breadth, was selected by the various agencies responsible for the deposition of the gold in direct opposition to all the observed procedure in other mineral deposits of the world. Whether the gold came in with the pebbles from above downwards, or from below along the plane of least resistance upwards, or whether it filtered in from the great mass of the surrounding country and found a final resting place in concentrated form in the conglomerate, one thing is certain, that there is no argument that can support the theory that nature has chosen a strip fifty miles horizontal by two miles on the incline, to the exclusion of the remainder of the great stretches of the banket deposit throughout the Witwatersrand series, or, to bring it within practical limits, to the exclusion of the next two miles southwards on the incline. That the weathering away of the surface from unknown heights to the level of the present outcrop has taken place is evidenced by the rich deposits of gold which occurred in the oxidized zone in the vicinity of the surface in the higher grade sections and has been worked out in the early days of the more notable mines. The gold so deposited can have been but a small portion of that which was originally contained in the subsequently denuded banket, but the amount found redeposited in sub-outcrops of the reefs in situ shows that the formation must have been subjected to denudation to the extent of thousands of feet.

As regards the variability of gold content in detail, it is not possible to give any rule for the mode of accretion of what is locally termed the "payable" as against the "unpayable" portion of the deposits. The most that can be said is that the consistently richer portions lie in series of irregularly-shaped areas of which the units can be observed as measuring roughly up to five thousand feet by two thousand five hundred feet on their major and minor axes. There is an indication that evidence will be forthcoming, as the development of the country progresses, that these richer areas form links in a series of huge zone formations, which wind about without limitation of horizon through the great mass of the Witwatersrand beds. The mine development to-day is the greatest where these zones have been bisected by the line of outcrop.

To revert for a moment to the comparison usually made between present results and those of former years and to show how fallacious as a means of argument is the hitherto commonly accepted basis of yield, I will quote one instance where I have made a comparison on a comprehensive scale between the records of the old workings near the surface and those now being prosecuted at the greater depths. The assay values of the tonnage measured over the stope widths stand in the records of the old workings in the upper levels over the various sections of country as 9.7 dwts, over five feet, 17.3 dwts. over four feet six inches, and 10.9 dwts. over four feet six inches. When removed from their richly endowed home in the narrower stoping width that used to be considered sufficient for the moderate ideas and small mills of the early days and translated into figures distributed over the actual stoping widths from which the ore is extracted by the present methods, the above records taken in their due proportion are represented as 8.8 dwts. over six feet six inches, and when compared on a common basis, there is only the difference of a fifth of a pennyweight between the two periods.

There is yet much ore rich in gold-content to be found in the unprobed depths of the Witwatersrand, but to be a profit producer it must, when found, be treated as nature has made it, and be extracted by methods of mining which will enable it to give the full force of its value in the mills in which it is treated. In the meantime, judging the Rand from a comprehensive standpoint, the deepest level work is merely prospecting, and it will not be until the now opened up deeper developments of to-day have been extended throughout their horizon so as to form connecting links in the chain of evidence at the depth of the present deepest line of shafts that we shall be able to select with some degree of accuracy those sections of the Main Reef series which will be, in the depths yet unexplored, the successors to the rich producers at the outcrop.

# PERSONAL AND GENERAL

F. C. Alsdorf has returned to Boston from a trip to Cobalt and Kirkland Lake.

Charles M. Henrotin has returned from a visit to Kirkland Lake properties.

J. B. Tyrrell has returned from Harricanaw district, where he has been investigating reported gold discoveries, and will join the Sudbury Cobalt-Porcupine excursion of the Geological Congress.

The Northern Customs Concentrator has been sold to the owners of Cobalt Townsite and other mines at Cobalt. The contracts have not been sold, however, and a new mill will be built near La Rose mine to treat ore from La Rose and Cobalt Comet mines.

The annual meeting of the American Institute of Mining Engineers will be held in Butte, Montana, on August 18th. Members attending this meeting can, if they wish, join either excursion C-1 or C-2 of the Geological Congress at Vancouver and take part in the return portion of it. They also have time before the meeting to take part in the Session at Toronto.

Mr. Jos. Trethewey, of Cobalt, has been investigating the mineral resources of a part of the Hazelton district, in the Skeena River country, British Columbia, from which district a commencement has been made to send out silver-lead ore, ten cars having lately been shipped from the Silver Standard mine to the Consolidated Mining and Smelting Co.'s smeltery at Trail.

Mr. J. M. Turnbull, of Trail, B.C., has been preparing to do development work on a group of mineral claims near Howe Sound, Vancouver mining division, which property the Consolidated Mining and Smelting Co. will explore under option of purchase.

Mr. J. L. Warner has returned to Rossland and has lately been busy in connection with the installation of some power plant on one of the claims held by the Richmond Consolidated Mining Co., situated in the South Belt of the camp.

Mr. E. R. Wolfe, of Spokane, Washington, is manager for the Florence Mining Co., which is doing work on the Hope property in Ainsworth mining division, British Columbia.

Mr. Geo. W. Wooster, of Grand Forks, B.C., treasurer and director of the Granby Consolidated Mining, Smelting and Power Co., was lately on a visit to the company's property at Granby Bay, Observatory Inlet, where a smeltery is being erected and equipped to treat ore from the company's Hidden Creek copper mines.

Wm. H. Green, formerly of the Toronto University staff in mineralogy, is now at Ironwood on the Gogebic Iron Range, Michigan.

Robert B. Stewart is at Saskatoon preparing for an exploration trip in Northern Alberta.

Mr. W. M. Archibald, of the Consolidated Mining and Smelting Co.'s mining engineering staff, has made Nelson, B. C., his headquarters of late.

Mr. E. Berryman has for more than a year superintended the work of exploring various mineral claims on Copper mountain, Similkameen district, B. C., held by the British Columbia Copper Co., under option of purchase. Mr. F. R. Weekes is resident engineer at these properties.

Mr. James Buchanan, superintendent of the Consolidated Mining and Smelting Co.'s lead and copper smeltery at Trail, B. C., is on a visit to Scotland. Mr. M. H. Sullivan, assistant superintendent, is in charge at those works.

Mr. J. C. Edwards, superintendent for the Treasure Mountain Silver-Lead Mining Co., of Spokane, Washington, which has for nearly two years been developing mineral claims situated in Summit camp, near the headquarters of Tulameen River, B. C., has returned to Treasure mountain from a business visit to Spokane.

Mr. James Humes, for several years connected with mining properties on Vancouver Island, B. C., is now superintendent for the Silver King Consolidated, at Park City, Utah, U. S. A. His son has succeeded him in charge of the King Solomon property on Koksilah mountain, Vancouver Island.

Mr. R. H. Ley, formerly practising assaying at Nelson, B. C., is now visiting various mining districts of that province in the interest of the Giant Powder Co., Inc.

Mr. O. E. Leroy, of the Geological Survey of Canada, is on an official visit to British Columbia.

Sir Richard McBride, Premier and Minister of Mines for British Columbia, will shortly pay another visit to England, whence he will go on important official business.

Mr. Frank E. Pearce, formerly of Baker City, Oregon, but now manager for the company owning the Inland Empire gold mine and stamp mill in Trail Creek mining division, British Columbia, has been on a visit to the coast cities, Victoria and Vancouver.

Mr. Wm. Springer, one of the pioneers of the Slocan, British Columbia, and for the past year in charge of development work on the Idaho-Alamo group of mineral claims for the Finch syndicate, has gone on a prospecting trip to the North Thompson River, B. C.

The capitalization of Canadian Boving Company, hydraulic and general power engineers, has been increased to $1,000,000, and the company is now being operated under the title of Boving & Co., of Canada, Ltd. The company recently purchased the works of the Madison Williams Manufacturing Company of Lindsay, Ontario, and will manufacture water turbines, centrifugal pumps, etc.

In a recent decision in the U. S. Court at Pittsburg, Pa., in the case between Duplex Metals Company, complainant, and Standard Underground Cable Company, defendant, regarding copper clad wire, the case in so far as it is based on alleged infringement of patent, was dismissed on the ground that defendants have not infringed said patent.

It has been announced in a press despatch that Hon. T. W. Crothers, Dominion Minister of Labour, plans to make a flying trip to the Pacific coast in July for the purpose of personally investigating matters in connection with the labour troubles that have caused a suspension of work at some of the coal mines on Vancouver Island, B.C.

Mr. Clarence Cunningham, of Seattle, Washington, whose name has been prominently before the public in connection with coal lands in Alaska, was in the Similkameen district of British Columbia in the latter part of June, examining mineral claims in camps along the Similkameen and Tulameen Rivers. In the same party was Mr. E. F. Fields, of Spokane, Washington, a mining engineer well known in that state.

Mr. J. C. Edwards, who for more than a year has been engaged in directing the developmnt of the Treasure Mountain Silver-Lead Co.'s mineral claims in Summit camp, Tulameen district, B.C., was a recent visitor to Spokane, Washington, in which city his company has its head office.

# SPECIAL CORRESPONDENCE

## COBALT, GOWGANDA AND SOUTH LORRAIN

**Nipissing Finds Branch Vein at No. 73.**—For the month of June the Nipissing shipped $388.883 net, and produced net value $215,418. The shipment included bullion from ore taken as customs at the high grade mill.

The most important development of the month was the cutting of a branch vein at the third level of shaft 73. When first encountered, the vein assayed 3,000 ounces over a width of three to four inches. Twenty feet of drifting has already been done on this branch, and although somewhat smaller the grade remains the same.

The cross-cut at the 650 ft. level of the 64 shaft is in 60 feet. One hundred and twenty feet will be necessary to cut the vein. A calcite seam, several inches in width was encountered at 40 feet, but it is of low assay, and probably is the same vein cut across the shaft at a depth of 500 feet. This is all dead work.

Hydraulic prospecting between the high and low grade mill was completed. A large number of small seams were encountered, most of them showing some cobalt. Two have a width of two to four inches, but have only fair assays. Another one has a width of one inch over a width of 75 feet, and at one point shows high grade ore. All of these veins will be worked this summer. The hydraulic line has been changed and ground is now being prospected between Little Silver Hill and veins No. 19 and 27. Nearly all of the ground to be washed is conglomerate. The high grade mill treated 147 tons and shipped 570,703 ounces of silver. The low grade mill treated 6,291 tons.

**Bailey Mine Opens High Grade Shoot.**—A good shoot of high grade ore has recently been opened up at the west end of the first level of the Bailey mine. The vein is from an inch and a half to two inches wide and at the point where the strike was made is about 150 feet below the top of the cliff. The ore is a heavy niccolite and exceptionally high grade. It has been opened up for about 16 or 20 feet. This is not a continuous shoot of ore, since for several rounds the ore is merely cobalt, with low silver values. The vein on the fourth level has been opened up for 140 feet. All this is high grade ore of an average value of 1,200 ounces per ton, the vein being from two to three inches wide. On the third level the main vein is three to four inches wide, and has been drifted upon for 86 feet. Of this possibly two-thirds is high grade, while the rest will make milling ore.

**McKinley-Darragh-Savage Finds New Ore Body.**—The production for the McKinley-Darragh-Savage mines for the month of June was 185,182 ounces, of which 56,191 ounces came from the Savage and 128,271 ounces from the McKinley. The feature of the month was the discovery of an entirely new ore body on the Savage in virgin territory. This was discovered at the 140 foot level. There is only about 25 feet of ore on this level, where it averaged two to three inches of 5,000 ounces. It has all the appearance of being the apex of an ore shoot, and a cross-cut is being run at the 190 foot level to pick it up. The No. 2 vein on the Savage at the 190 level has been yielding surprisingly well, though for some time it contained nothing but cobalt with low silver values. This was found when raising in the stope near the Provincial line. The new ore shoot at the McKinley-Darragh is on the No. 40 vein, at the 100 foot level. For a hundred feet this vein is in good milling ore, but with no high grade to sweeten it. At this point there is now three inches of 5,000 ounce ore.

**Good Ore From Low Levels at Timiskaming Mine.**—At the bottom of the winze, 40 feet below the 575 foot level at the Timiskaming mine, some remarkable high grade is coming through the ore house. The vein in diabase is at this point fully six inches of bonanza silver ore. Below the contact in the diabase there has been opened up for 112 feet a shoot of high grade. This only goes up to the contact, and has for the most part been stoped out. It is remarkable that while extensions of profitable veins in the Keewatin rocks have been discovered, none of them carry any silver values. The "Diabase" vein is an entirely new ore body, though it is running parallel to those on the upper levels. At the 650 foot level there is good milling ore in another vein, with occasional shoots of high grade.

**The Seneca-Superior Mining Company** declared a dividend of 10 cents on the dollar. The Seneca-Superior, with this disbursement, will have paid 40 per cent. on a capitalization of a half a million dollars, and as the mining of ore only commenced on Oct. 21, 1912, this is a remarkable performance. It was decided to put the company on a bi-monthly dividend basis of 10 per cent., meaning 60 per cent. a year. The mine will also go on a regular production basis of 100,000 ounces per month. Between the main shaft at the 200 foot level and the No. 2 on the opposite side of Peterson Lake, there is an ore shoot over 400 feet in length, which will run between 4,200 and 4,500 ounces to the ton.

## SWASTIKA, KIRKLAND LAKE AND PORCUPINE

**Hollinger Made Good Progress in June.**—With the power trouble over and the strike disappearing on the horizon, the Hollinger profits for June were back to normal, and the costs are rapidly being cut down. Mr. P. A. Robbins, in his June report, says: "Upon June 17 the winze which is being sunk on No. 1 vein has reached a depth of 74 feet below the 300 foot level. There has been no change in the character or value of the ore. Work upon the 300 foot level continues to demonstrate values consistent with those encountered upon the upper levels. The work of sinking upon the No. 7 vein has been commenced, and at a depth of 12 feet the vein is two and a half feet wide and carries $16.50 a ton. This vein is classed under miscellaneous in the last annual report. Working costs have been reduced to $5.47 per ton, and further reductions are hoped for."

The mill ran 94 per cent. of the possible running time, treating a total of 11,867 tons. The average value of ore treated was $16.50 per ton, and the approximate extraction was 95 per cent. Milling costs were $1.398 per ton milled.

**The McIntyre** is now sinking its Nos. 4 and 5 shafts. It is probable that these shafts will be carried down with all expedition to 700 or 800 feet, opening up levels at each 100 feet.

**Ernhous Claims Being Developed.**—Capitalists associated with the Nipissing Mining Company are developing the Ernhous claims in the Kirkland Lake section on a working option basis. These claims adjoin the Hunton, upon which a rich discovery was made some weeks ago. The work consists entirely in stripping.

**Burnside Discovery.**—The discovery on the Burnside claim at Kirkland Lake has aroused more excitement than anything since the Tough-Oakes began to develop. A vein paralleling several others, which had been discovered previously, has now been opened up for 100 feet. It does not appear very rich on the surface, and shots were put in at various places along the fissure, with the result that ore very similar in character to the Tough-Oakes was uncovered. This high grade streak is from 17 to 21 inches wide, and is in places remarkably rich in free gold, and tellurides are plainly visible. Shaft sinking has been abandoned for the present in favour of prospecting. The property is under option to a Haileybury syndicate, consisting of Messrs. C. A. Foster, A. A. Ferland, R. T. Shillington, Fred Shillington, Charles A. Richardson and others. This is the principal discovery in the new gold area, but there have been several of minor importance. A very narrow vein exhibiting gold and tellurides has been stripped on the Robbins claims, and some free gold has been discovered in a wide vein on the Wright property.

**On the Tough-Oakes Claims,** which will be thrown into a stock company known as the Tough-Oakes Mines, Ltd., the shaft is down 180 feet on the incline. The vein is still good at the bottom, though the high grade is broken up into several stringers. A head frame is being erected. Experience at the small five stamp mill has shown that straight amalgamation will not save much more than 70 per cent. of the values, and a larger plant will have to be installed. This will be financed by the new issue of stock in the company.

**The Government Road to Kirkland Lake** is being rapidly constructed. With a little care taken to fix up the bad spots in the road, it will soon be available for traffic.

**The Extension of Time** allowed under the amendment in the Mining Act for assessment work on claims expired on July 15th. The first year's work on a very large number of claims has been sworn in; but as there is no inspection, there is no doubt whatever that far less than the statutory amount has been done in many cases. This has been demonstrated in the Mining Commissioner's court, recently where Mr. Gordson has threatened to bring several witnesses in mining disputes to the attention of the Attorney-General for perjury.

## BRITISH COLUMBIA

As the second half of the year is entered upon, the prospects for continued activity in the chief mining districts of the province are generally favourable, with the single exception of Nanaimo district of Vancouver Island, where the coal mines are idle, owing to the United Mine Workers of America having called a strike, which has caused a suspension of operations since the end of April. There are other parts of the province where miners' unions claim that mining is being interfered with, by their having directed their members to stop work, namely, at the Britannia mine, in Vancouver mining division, and at the Queen mine, in Nelson division, but outside of having reduced the number of workers at the latter by about a score, there is no effective prevention of production.

While no information has been received from the placer gold mining districts, reports from various other parts of the province tell of an unusually cool, and in many places wet, summer, so it is hoped Atlin and Cariboo are experiencing similar weather, for, if so, the effect will be a prolongation of the season during which their gravel washing operations can be continued. Lode mining is being carried on and ore pro-

**Shaft on Property of Burnside Syndicate, Kirkland Lake, Ont.**

Good ore has been recently discovered on this property by stripping duction records show that the output is being maintained on about a similar scale to that of last year. With the exception above mentioned, coal mining, too, is fully up to its customary condition of productiveness.

### Rossland.

Ore production figures show the output of mines in Trail Creek mining division during six months to July 1 to have been approximately 121,000 tons, this amount including about 1,000 tons treated at the 10 stamp mill at the Inland Empire mine, which is situated some miles away from Rossland, and the whole of the remainder from mines in the immediate vicinity of that city. The Consolidated Company's mines produced 101,000 tons (Centre Star group nearly 72,000 tons and Le Roi 29,000 tons), and those of the Le Roi No. 2, Ltd., 18,500 tons. Several small shippers made up the remaining few hundred tons. Of this total about 112,000 tons was shipped to the Consolidated Company's smeltery at Trail, this including between 800 and 900 tons of gold-copper concentrate from the Le Roi No. 2 concentrator at Rossland. Incidentally, it may be mentioned that the total of ore and concentrates received at the Trail works during the six months was between 160,000 and 170,000 tons, and of this aggregate Rossland mines contributed fully two-thirds.

No particulars relative to operations at the Consolidated Company's mines at Rossland are available just now. It is generally understood though that there has been opened in them an abundance of ore, and some of it containing comparatively high value in gold, so that the prevailing feeling in the Rossland community is one of confidence that the mines on Red Mountain will continue to be productive and profitable for many years. An indication that this confidence is well founded is found in a recent announcement that the C.P.R. intends to substitute electric power for steam on its railway to Rossland.

Mining operations this year at the Josie mine of the Le Roi No. 2, Ltd., have been chiefly on the 300, 500, 700 and 900 foot levels. The ratification of the agreement between this company and the Consolidated Mining and Smelting Company of Canada, Ltd., information relative to which has already been published, has had this result—the former company has since been able to do underground work which cannot now be questioned on the grounds of extra-lateral rights of the Consolidated Company. Several new ore bodies have been discovered and worked. The rate of development work and production has been much the same as during the company's last fiscal year, when development was at the rate of rather more than 500 ft. a month, diamond drilling nearly 1,200 ft., and production about 3,000 tons of ore, of which rather more than one-half was sorted out for shipment crude direct to the smeltery, and the remainder concentrated into 140 tons of gold-copper concentrate monthly. Some work has been done on the 1,500 foot level, which corresponds in depth with that of the 1,650 level of the adjoining Le Roi mine, and ore found here of a value of $14 to $15 in gold a ton and 0.33 per cent. copper. Permission has been obtained to use the Le Roi 1,650 foot level from which to open the Josie mine at this depth, and this will for the time being do away with the necessity of sinking the Josie shaft 200 ft. deeper and cross-cutting about 900 ft. A new centrifugal electrically operated pump has been obtained to replace the pumps now in use on the 500 foot level of the Josie mine. This additional pumping power has been provided to admit of the company's neighbouring No. 1 mine being unwatered, as well as of pumping from the Josie, at the one station. Water from No. 1 will be drained along the Josie 500 foot level, the workings of the two mines being separated by only 70 ft. of rock, through which diamond drill holes will give an outlet for water from No. 1 mine. Diamond drilling into the northern ground of the Le Roi No. 2 group has been done, with the permission of the Consolidated Company, from the ninth level of the War Eagle mine, the depth of which about corresponds with the 900 foot level of the Josie. Altogether, the outlook for the Le Roi No. 2, Ltd., is regarded as satisfactory, which is also the condition in respect of other productive mines on Red Mountain, this comprising the main productive area of Rossland camp.

For a while there was no mining, nor preparation for any, in the South Belt of the camp, operations having been suspended at different times during the last twelve months on the Blue Bird, Richmond Consolidated group and Phoenix, all three of which were being worked last summer. Now a power plant, including a hoist and a 12 drill compressor, is being put in at the Lily May, one of the Richmond-Consolidated Company's properties. The Rossland Miner on July 9 gave the following information relative to this property: "At the properties of the Richmond Consolidated there is great activity and 25 men have been employed during the past week in the construction of buildings. All concrete work is finished and the bedplates laid ready for the compressor, as soon as the compressor building shall be covered in. The assay office—a four-room building—is completed, and the compressor building will be this week. The gallows frame is being constructed, and the blacksmith and machine shops will be erected this week. Timbering the double compartment shaft down to 55 ft. from the surface has been completed. Mining will be commenced as soon as all the construction work shall be done. The present outlet from the mine is by wagon road, one mile to the Canadian Pacific Railway from Rossland to Trail, but eventually an aerial tramway will be constructed from the mine to the railway."

### Osoyoos.

The Dividend-Lakeview Consolidated Gold Mining Company is developing its Dividend mineral claim, situated on Kruger Mountain, near Osoyoos Lake. The group includes the Dividend, Lakeview and Gold Dust claims, but at present work is being done only on the Dividend. Ore is being hauled in a 5 ton motor truck to Oroville, nearly seven miles distant, and is taken thence by railway to the Granby Company's smeltery at Grand Forks, Boundary district. Value is in gold and silver, and, owing to the high freight cost, only ore running $25 a ton or higher is shipped. The property is situated within a short distance of the International Boundary line, just across which, in the State of Washington, the Golden Chariot and other claims in the vicinity are also being developed.

### Hedley.

There is little mining work being done in Hedley camp, Similkameen, other than that on the Hedley Gold Mining Company's property. One exception is the New York No. 2 Syndicate, which is operationg two diamond drills, capable of drilling to a depth of 2,500 ft. Both water and compressed-air are conveyed from the Hedley Gold Mining Company's mine, the pipe lines being each about 5,000 ft. long. The claims on which the drilling is being done are held by the syndicate under option of purchase. The object of the work is to prove whether or not the Nickel Plate ore bodies extend into the ground being drilled.

At the Hedley Gold Mining Company's Nickel Plate mine, the greater part of the work is being done from No. 4 adit level, and to facilitate operations buildings are being erected near the portal of this tunnel. A new blacksmith and machine shop—a wood frame building, dimensions 95 by 35 ft., roofed with corrugated galvanized iron—has been erected, and this is being equipped with all necessary power-tools and other mechanical appliances and plant. Another building includes store and warehouse, the former 50 by 35 ft., and two storeys high, and the latter a single storey compartment, 90 by 35 ft. Ground is being graded for a building to comprise cookhouse, dining-room, wash-rooms for men, recreation-room, etc., to be of similar construction to above-mentioned buildings and to provide accommodation for about 1500 men.

Last year's development and diamond drill work having warranted the estimate that the minimum quantity of reserve ore available in the company's Nickel Plate and Iron Duke claims was 413,000 tons, of an average value of at least $11.35 per ton, another incline shaft, known as the Dickson incline, is being sunk to mine the new ore bodies then developed, and others also below the level of No. 4 adit of the Nickel Plate mine. This incline is being sunk to the north-west on the pitch of the lowest known ore body in the mine. The intention is to sink it to a depth of 3,000 ft. It is so situated as to be under all the ore bodies, and will have pay ore above it continuously for 1,100 ft.

No. 5 incline has been sunk, in the same direction as the Dickson, to a depth of 420 ft., and four levels have been opened from it. There are in this part of the mine three known ore bodies, lying directly one above the other, and this incline has been sunk in the middle one. Drifting and sinking have proved the ore to be about 16 ft. between walls, and its average value is $14 a ton. At the collar of the incline the length of the ore shoot is 130 ft.; at the 100 ft. level it has been drifted on 180 ft., and on the third level 120 ft. These drifts are in good ore all the way and, their faces, as well as the bottom of the incline, are in ore. This incline is in favourable condition for ore shipping, with ore pockets on each level and plenty of good ground for stoping.

No work is being done in the company's Sunnyside mine, owing to lack of power, nearly all available being used in connection with operations in the Nickel Plate mine. Some time since the company made application for water rights on Similkameen River, but it has not yet been able to secure the water it requires for additional power purposes, owing to other applicants, stated to be only speculators and not bona fide operators, having forestalled it, and so prevented it this year carrying out its plans for important extensions of its mining and milling operations.

The quantity of ore crushed during five months of 1913, to June 1, was 29,180 tons and the value of the recovered gold $377,483.14. This gives an average recovery of $12.936 a ton, as compared with $10.18 a ton for 27,936 tons crushed during the corresponding period of 1912, and with $10.62 a ton for 70,455 tons crushed during the whole of 1912. Assuming that the total costs were not higher than for 1912, when they averaged $5.14 a ton, it would appear as if the net profit for the five expired months of 1913 has been at an average rate of approximately $7.80 a ton.

### Granite Creek.

Messrs. J. A. Anderson and Andrew Gordon have been working for several years on ground situated about half a mile higher up the creek than Lambert & Stewart's dam. Lately they have been drifting with the object of finding an old channel at a higher level than that of the present creek. Other work done last year on the same bench gave varied results, the best having been a pocket of about 5 oz. of gold recovered in one place. At the present time water is causing the workers much trouble, the seepage from the hill above the drift amounting to quite a stream of water. In order to try to keep the drift dry, an Edison wrecking pump was lately obtained. There are indications that the drift is entering an old channel, and Messrs. Anderson and Gordon, who have been most persistent with their operations, are feeling hopeful accordingly.

Now that the high water season has passed and Messrs. Lambert & Stewart's dam across the creek, just above the mouth of the north fork, has stood the summer freshets preparations are being made to carry out the intended method of working the creek for about 1,000 feet below the dam. As soon as the water shall be low enough for the flume, that has been constructed for the purpose, to carry the stream the water will be diverted, and then a bed-rock flume will be taken up the creek bed and the pay dirt, from the top of which some six feet of overburden has been removed, will be sluiced. Commencing at zero at the lower end of the canyon, the gravel gradually increases in depth to about 15 feet just below the dam. The dirt has been prospected and it is confidently expected to yield good pay in both gold and platinum, in the proportion of about two of the former to one of the latter. Much interest is taken locally in this enterprise, for, if successful, it is expected it will lead to the working of some 12 to 14 miles of Granite creek above Lambert & Stewart's ground.

Coalmont, the new town dependent largely upon the operations of the Columbia Coal and Coke Co., of Winnipeg, Manitoba, is feeling the effect of the suspension of work on that company's coal property. After a long cross-cut adit had been driven and much other work done in connection with it, it was found necessary to abandon it and do work from the Collins Gulch side of the mountain. It is stated some good coal has been opened in the latter workings, but owing to exhaustion of funds all work has been stopped pending making new arrangements for financing the undertaking.

### Salmo.

In a report of meetings of the Labor Commission, which has been holding meetings in various parts of British Columbia, and taking evidence concerning labor conditions, the following reference to the position at the Queen Gold mine, in Nelson mining division, is made: "Queen mine has a labour dispute which is a hopeless tangle. Up to a little while ago there were 45 men employed at the mine; now there are 24. The men who have quit say there is a strike; the men who have remained at or returned to work say there is no strike at all, and that they are good unionists, who are satisfied with their condition. They say, further, that the men who have quit were induced to do so by misrepresentation. To an outsider the whole thing looks like an illustration of the pernicious activity by which a certain type of labour agitator often makes himself a public nuisance. In this particular instance, as in many others, the men who have stirred up the row are reported to have come from the United States."

### Nanaimo.

The Vancouver Board of Trade having offered to arbitrate the differences between the coal-mine owners and mine workers on Vancouver Island, replies were received from the respective general managers of the two larger companies, from which the following are excerpts: W. L. Coulson, general manager of the Canadian Collieries (Dunsmuir), Limited, operating the Cumberland and Extension collieries, each having several working coal mines, replied in part: "We appreciate very much the spirit in which your kind offer of arbitration for the settlement of the strike in the coal trade on Vancouver Island is made. As all our mines are now and have been for some time in satisfactory operation, we have no differences with our employees to arbitrate." Part of the reply of Mr. Thos. R. Stockett, manager of the Western Fuel Co., Nanaimo, follows: "So far as this company is concerned, there is nothing to arbitrate, the issue being solely—shall it turn its property over to the control and dictation of a foreign organization, which is without status in Canada, and not even amenable to its laws, and whose interests are inimical to the best interests of the workmen, the community, and the company? This the company is not willing to do, nor does it consider the question one for arbitration. For the information of your council and board, I may say that under this company's policy of dealing with its workmen as employees, there has prevailed in this community an era of nearly eight years of industrial peace and prosperity that has worked for the good of all, and but for the presence of foreign agitators, who caused the breaking of a working agreement between employer and employees (and without permitting the employees to have a voice in the matter), there is every reason to believe that industrial peace would have continued for many years."

The Pacific Coast Coal Mines, Ltd., has decided to try to operate its mines at South Wellington, three or four miles from Nanaimo, with non-union labour. A commencement has been made to resume getting out coal, but production as yet is on only a small scale. The miners on strike have been ordered to vacate the company's houses, which will be occupied by non-union men as soon as available for them.

## NOVA SCOTIA.

**Dominion Coal Outputs.**—Outputs in July showed a considerable improvement on June. To the fifteenth the production totalled 194,000 tons, and for the month it should reach 420,000 tons. Presuming this output for July the aggregate tonnage from the Glace Bay mines for the seven months ending 31st July, will be 2,715,000 tons, comparing with 2,533,000 tons for the same period of 1912, being an increase of 182,000 tons.

**Albion Mine Fire.**—The fire in the Albion mine has been extinguished. The fire was constantly fought for over a fortnight, in the face of most difficult circumstances and under dangerous conditions. Oxygen breathing apparatus and electric lamps were used, and the flames were combated at close quarters by helmet-men using hose and nozzle. It was finally found possible to isolate the fire area, and to completely submerge the burning material. Your correspondent has the best reasons for stating that it would have been well-nigh impossible to have extinguished the fire in the manner in which it was actually accomplished, had not breathing apparatus been available. In saying this, there is no wish to minimize in any way the heroism and skill with which the staff and men of the Acadia Coal Company fought the fire under almost intolerable conditions. Modern breathing apparatus, accompanied by electric hand lamps, will, however, enable men to breathe and see where, without these devices, life could not exist.

The fire at the Albion mine has given oxygen breathing apparatus probably the severest and longest testing as yet received in Nova Scotia, and when it is considered that these devices were used for nearly a fortnight, under the most strenuous conditions, without any accident, there can hardly be room for doubt as to their usefulness. Oxygen apparatus have been used in fighting mine fires at Sydney mines, at Springhill mines and at the Albion mine, and in every case they have proved invaluable.

The word "rescue" in connection with oxygen breathing apparatus has been consistently objected to by your correspondent, as obscuring the true usefulness of these devices. It is true that many lives have been saved which would otherwise have been lost, had not breathing apparatus been used, but the occasions on which these devices have been of use after mine explosions are but very few compared with the times they have been used successfully in fighting underground fires.

The possibilities of oxygen breathing apparatus are not limited to usefulness in mines, but are now being extended to the needs of the aviator and the submarine boat. The Draegerwerk, of Lubeck, will supply apparatus that will enable the aviator to live at an altitude impossible to the human being unprovided with such apparatus, and they will also supply an apparatus to enable the diver to walk along the sea-floor entirely independently of the surface air, and unhampered by the life-line that the old-style diver must take with him.

The crews of all German submarine boats are provided with breathing apparatus that will enable them to escape from a sunken submarine if the depth is not too great. It must, therefore, be obvious that the uses of breathing apparatus intended for use in mines is a reliable device, but that it will develop further improvements and usefulness may be confidently expected.

**The International Geological Congress.**—The members of the Congress, who will participate in the Nova Scotian excursion, are expected to spend the 23rd, 24th and 25th of July in the neighbourhood of Sydney, Glace Bay and Sydney Mines. Extensive preparations are being made for the visit by the large coal and steel companies in this vicinity, and if the weather is propitious the occasion will no doubt be a very enjoyable one. There is a great deal to see in Cape Breton to interest both the purely scientific geologist and those interested in industrial enterprise in other parts of the world.

**Shipping Coal from Sydney.**—The following extract is clipped from the "Iron and Coal Trades Review" of 20th June:

"There have been several instances of exceptional coaling at Immingham, but last week every record was eclipsed. The s.s. 'Gretchen Muller' commenced at 10.45 a.m. and finished at 4.30 p.m., which, after deducting meal hours and shifts, gives a net time of 3 hrs. 20 minutes during which time 1,586 tons of coal, constituting a full cargo, were shipped, an approximate average of 476 tons per hour."

The Immingham docks of the Hull & Barnsley Railway are the latest word in coal shipping in England, and serve as the main outlet of the South Yorkshire coal field for Baltic and other ports. The record of performance quoted will not, however, strike Cape Breton readers as constituting anything remarkable. It is a usual matter at the Sydney piers of the Dominion Coal Company to ship 7,000 tons of coal in five hours, and the same cargo can be discharged at the Montreal end in seven hours. On the occasion previously referred to in this correspondence when 18,130 tons was raised from the Glace Bay collieries in one day, there was also lifted from the storage banks 6,400 tons of coal, meaning that the Coal Company's railway and piers disposed of the enormous quantity of 24,500 tons of coal in one day. In the six days ending the 28th June the Coal Company's shipments totalled 123,000 tons, or well over 20,000 tons per day.

A notable incident in this connection was the coaling of H.M.S. "Cumberland" at Sydney on the 18th. This large cruiser of 22,000 tons laid alongside the loading pier of the Dominion Coal Company at Sydney, and took bunkers direct from the pier loading-chutes. The officers of the ship expressed themselves as surprised and pleased at the quick dispatch given. Coal was taken on board at the rate of 250 tons an hour, the loading occupying from 5 a.m. to about the same time in the evening. The rapidity of loading was of course limited by the stowing of the bunkers as the piers could have handled a great deal more. Other war vessels in Sydney have usually coaled from lighters in the stream. The commandant of the "Cumberland" is said to have expressed his opinion that Sydney Harbour was ideally suited for a naval coaling station, and that the harbour, railways and collieries should be protected by fortifications. Your correspondent has pointed out the value of Sydney and the coal mines adjacent in case of war on more than one occasion. The whole of Eastern Canada and the railway communication of half the Dominion depends for its motive power on the mines of Cape Breton. At the present time the mines and all means of transportation are entirely unprotected from attack by sea or land. All the mines are visible from sea, and make excellent targets.

# COMPANY NOTES

### DIVIDENDS PAID BY NIPISSING MINING CO.

The Cobalt Nugget prints the following statement of dividends paid by the Nipissing holding and operating companies to the end of June, 1913:

**Nipissing Mines Company (Holding Co.)**

| | | | | |
|---|---|---|---|---|
| 1906 | 3 | | | $ 480,000 |
| 1907 | 14 | | | 840,000 |
| 1908 | 12 | | | 720,000 |
| 1909 | 22½ | | | 1,350,000 |
| 1910 | 35 | | | 2,100,000 |
| 1911—Jan. 20 | 7½ | 450,000 | | |
| April 20 | 7½ | 450,000 | | |
| July 20 | 7½ | 450,000 | | |
| Oct. 20 | 7½ | 450,000 | | |
| | — | —— | 30% | 1,800,000 |
| 1912—Jan. 20 | 7½ | 450,000 | | |
| April 20 | 7½ | 450,000 | | |
| July 20 | 7½ | 450,000 | | |
| Oct. 20 | 7½ | 450,000 | | |
| | — | —— | 30% | 1,800,000 |
| | — | | | |
| Total | | | | $9,090,000 |
| 1913—Jan. 20 | 7½ | 450,000 | | |
| April 21 | 7½ | 450,000 | | |
| July 21 | 7½ | 450,000 | | |
| | — | —— | | 1,350,000 |

**Nipissing Mining Company (Operating Co.)**

| | |
|---|---|
| 1905—To Syndicate | $ 300,000 00 |
| 1906—To Syndicate | 100,000 00 |
| 1906—To Nipissing Mines Co. | 500,000 00 |
| 1907—To Nipissing Mines Co. | 880,000 00 |
| 1908—To Nipissing Mines Co. | 740,000 00 |
| 1909—To Nipissing Mines Co. | 1,370,000 00 |
| 1910—To Nipissing Mines Co. | 2,122,500 00 |
| 1911—To Nipissing Mines Co. | 1,853,430 49 |
| 1912—To Nipissing Mines Co. | 1,842,366 76 |
| Total | $9,708,297 25 |

**Nipissing Mines Co.**

The following is a brief financial statement of the affairs of the Nipissing Mining Company, Ltd., (the Operating Company), as of July 1st, 1913:

| | |
|---|---|
| Cash in bank | $1,090,558.59 |
| Ore and bullion in transit | 224,936.00 |
| Ore on hand and in process and bullion ready for shipment | 147,907.00 |
| | $1,463,401.59 |

The Seneca-Superior Silver Mines, Ltd., at a director's meeting on July 14 declared a bi-monthly dividend of ten cents a share payable on August 15th to shareholders of record at the close of business on the 10th of August, 1913. The company have cash in banks $127,249.00, and have ore in transit to the approximate value of $65,000, and are in the unique position of having shipped since the 11th of November last year, over 975,000 oz. of silver ore. The company have already paid three dividends of ten cents a share on February 15, April 15, and June 15, 1913.

# STATISTICS AND RETURNS

### COBALT ORE SHIPMENTS.

The shipments for the week ending June 25th, were:

| Mine. | High. | Low. | Pounds |
|---|---|---|---|
| La Rose | 1 | .. | 105,780 |
| Crown Reserve | 1 | .. | 45,000 |
| Cobalt Comet | 1 | .. | 78,500 |
| Dom. Reduction | 1 | .. | 89,200 |
| Townsite | 1 | .. | 46,400 |
| Cobalt Lake | 2 | .. | 126,590 |
| | 7 | .. | 491,390 |

The shipments from the Cobalt mines to date are:

| Mine. | High. | Low. | Tons. |
|---|---|---|---|
| Bailey | 4 | 1 | 130.35 |
| Beaver | 8 | .. | 237.43 |
| Chambers-Ferland | 3 | 4 | 223.77 |
| City of Cobalt | 4 | .. | 105.14 |
| Cobalt Townsite | 36 | .. | 1,308.70 |
| Cobalt Lake | 18 | .. | 141.52 |
| Buffalo | 2 | .. | 66.13 |
| Coniagas | 27 | .. | 863.17 |
| Crown Reserve | 14 | .. | 643.44 |

| | | | |

## TORONTO MARKETS.

July 24th—(Quotations from Canada Metal Co., Toronto)—
- Spelter, 5½ cents per pound.
- Lead, 5.40 cents per pound.
- Tin, 45 cents per pound.
- Antimony, 10 cents per pound.
- Copper, casting, 15¼ cents per pound
- Electrolytic, 15½ cents per pound.
- Ingot brass, 11 to 15 cents per pound.

July 24th—Pig Iron—(Quotations from Drummond, McCall & Co., Toronto)—
- Summerlee No. 1, $26.00 (f.o.b. Toronto).
- Summerlee No. 2, $25.00 (f.o.b. Toronto).
- Midland No. 1, 19.20 (f.o.b. Toronto).
- Midland No. 2, $19.00 (f.o.b. Toronto).

July 24th—(Quotations from Elias Rogers Co., Ltd., Toronto)—
- Coal, anthracite, $7.50 per ton.
- Coal, bituminous, $5.00 per ton for 1¼-inch lump.

## GENERAL MARKETS.

July 22—Connellsville coke (f.o.b. ovens).
- Furnace coke, prompt, $2.50 to $2.60 per ton.
- Foundry coke, prompt, $2.85 to $3.00 per ton.

July 22nd—Tin, straits, 41.30 cents.
- Copper, Prime Lake, 14.50 to 14.60 cents.
- Electrolytic Copper, 14.50 cents.
- Copper wire, 15.50 cents.
- Lead, 4.35 to 4.40 cents.
- Spelter, 5.40 cents
- Sheet zinc (f.o.b. smelter), 7.00 cents.
- Antimony, Cookson's, 8.40 to 8.50 cents.
- Aluminum, 23.00 to 23.50 cents.
- Nickel, 40.00 to 45.00 cents.
- Platinum, ordinary, $46.00 per ounce.
- Platinum, hard, $51.00 per ounce.
- Bismuth, $1.95 to $2.15 per pound.
- Quicksilver, $39.00 per 75-lb. flask.

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

# DEPARTMENT OF MINES GEOLOGICAL SURVEY.

## PUBLICATIONS

**The Geological Survey has published maps and reports dealing with a large part of Canada, with many local areas and special subjects.**

A catalogue of publications will be sent free to any applicant. A single copy of a map or report that is specially desired will be sent to a Canadian applicant free of cost and to others at a nominal price. The applicant should state definitely the precise area concerning which information is desired, and it is often of assistance in filling an order for a map or report if he states the use for which it is required.

Most of the older reports are out of print, but they may usually be found in public libraries, libraries of the Canadian Mining Institute, etc.

### REPORTS RECENTLY ISSUED:

CANADA

1085. Descriptive Sketch of the Geology and Economic Minerals of Canada. Accompanied by a geological and mineral map of Canada, by G. A. Young and R. W. Brock.

NEW BRUNSWICK and NOVA SCOTIA

1165. Memoir No. 18. Bathurst District, New Brunswick, by G. A. Young. Maps not yet published.

QUEBEC

1186. Memoir No. 35. Reconnaissance along the National Transcontinental Railway in Southern Quebec, by John A. Dresser.

ONTARIO

1160. Memoir No. 17. Larder Lake District, Ont., and Adjoining Portions of Pontiac County, Quebec, by Morley E. Wilson.

NORTH WEST PROVINCES

1204. Memoir No. 24. Preliminary Report on the Clay and Shale Deposits of the Western Provinces, by Heinrich Ries and Joseph Keele.

BRITISH COLUMBIA

1175. Memoir No. 21. The Geology and Ore Deposits of Phoenix, Boundary District, B.C., by O. E. LeRoy.

YUKON AND NORTH WEST TERRITORIES

1228. Memoir No. 31. Wheaton District, Yukon Territory, by D. D. Cairnes. Maps not yet published.

### MAPS RECENTLY ISSUED:

CANADA

1042. Mineral Map of Canada. Scale 100 miles to 1 inch.

NOVA SCOTIA

1133. Map 13A. Kingsport sheet, Nova Scotia, No. 84. Scale 1 mile to 1 inch.

NEW BRUNSWICK

1181. Map 35A. Reconnaissance Map of Parts of Albert and Westmoreland Counties, N.B. Geology and topography. Scale 1 mile 1 inch.

QUEBEC

1178. Map 32A. Larder Lake and Opasatika Lake, Nipissing, Abitibi and Pontiac, Ontario and Quebec. Geological. Scale 2 miles to 1 inch.

1202. Map 52A. Northeast part of the Serpentine Belt, Eastern Townships, Quebec. Geology. Scale 4 miles to 1 inch.

ONTARIO

750. Grenville Sheet. Parts of Counties of Ottawa, Argenteuil, Terrebonne, Two Mountains and Vaudreuil, Quebec and Carleton, Russell, Prescott and Glengarry, Ontario. Geology. Scale 4 miles to 1 inch. Reprint.

1177 Map 31A. Larder Lake, Nipissing District, Ontario. Geology. Scale 1 mile to 1 inch.

ALBERTA

1132. Map No. 7A. Bighorn Coal Area, Alberta, by G. Malloch. Scale 2 miles to 1 inch.

BRITISH COLUMBIA

1260-1276. Maps 74A-90A. Geology of the Forty-ninth Parallel. Geology and topography of the International Boundary between British Columbia and the United States. Scale 1 mile to 1 inch, contour interval 100 feet.

1237. Map 62A. Nelson and vicinity, British Columbia. Geology and topography. Scale 1 mile to 1 inch.

1247. Map 69A. Route map of part of Nass River, British Columbia. Scale 8 miles to 1 inch.

1168. Map 30A. Mother Lode and Sunset mines. Geology and Topography. Scale 400 feet to 1 inch; contour interval 20 feet

1200. Map 50A. Part of Portland Canal Mining Area. Topography. Scale 2 miles to 1 inch; contour interval 200 feet.

YUKON and NORTH WEST TERRITORIES

1089. Map 9A. Explored Routes on parts of the Albany, Severn and Winisk Rivers. Scale 8 miles to 1 inch.

NOTE.—Maps published within the last two years may be had, printed on linen, for field use. A charge of ten cents is made for maps on linen.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon. Letters and samples that are of a Departmental nature, addressed to the Director, may be mailed O.H.M.S. free of postage.

*Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.*

LIMITED

# Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals, extending northward from the great lakes and westward from the Ottawa River to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The silver mines of the Cobalt district have astonished the world by their richness, and promising gold discoveries have recently been made in Porcupine Lake.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

**HON. W. H. HEARST,**

Minister of Lands, Forests and Mines,

**Toronto, Canada.**

## FOR SALE

# Second Hand Machinery

We have recently changed over from Steam to Electric Drive and offer the following:

One Cross Compound Corliss Steam Driven, Corliss Inlet, two stage BB3 Canadian Rand Co. Air Compressor. Capacity at 95 R. P. M. is 1941 cu. ft. free air per minute.

One 10 x 10 in. Robb-Armstrong Horizontal Side Crank Engine Automatic.

One 11 x 14 centre crank Throttling Engine of the Frost Mfg. Co. make, Galesburg, Ill., with two pulleys.

Two Horizontal Tubular Boilers, Jencks Machine Co., each 72 in. x 18 ft. for working pressure of 125 lbs. per sq. in., complete with regular catalogue fittings, fixtures and smoke stacks.

One Header for boilers made up of pipes and valves.

One Austin Vertical Steam Separator.

One 16 x 42 right hand Corliss Heavy Duty Engine. Jenckes Machine Co., Wheel 12 ft. x 24 in. face.

Three No. 2 McCully Gyratory Crushers, manufactured by Power Mining & Machinery Co. One No. 3 Gates Gyratory Crusher.

Two General Electric Magnetic Belt Separators.

One No. 7 Cameron Vertical Plunger Sinking Pump.

*More details and prices upon application.*

COBALT MONTREAL NELSON VANCOUVER

# Shows Over $1800.00 Annual Saving

Before covering the steam pipes of their Central Power Plant with J-M Asbesto-Sponge Felted Pipe Covering, the Elkins Coal and Coke Co., Morgantown, W. Va., U.S.A., claim that the fuel consumed by the boilers in operating their plant cost them 4.4 cents for every ton of coal mined. A careful check by them after J-M Covering was installed showed that the fuel consumed in mining a ton of coal cost but 3.1 cents per ton, or a *saving of 1.3 cents per ton on every ton mined.* On this basis, J-M Asbesto-Sponge Felted Covering saves them over $1,843.00 per year, so that it paid for itself in less than six months and now continues to earn an annual dividend equal to 230 per cent.

This is but one of many similar tests, showing that a great saving in fuel can be effected by covering steam pipes with

# J-M Asbesto-Sponge Felted Pipe Covering

The secret of the remarkable insulating value of this covering lies in its construction. It is made of many layers of strong felt, composed of the best quality asbestos fibre, and fine particles of sponge, formed like the leaves of a book (see illustration), and confines such a vast amount of dead air that its insulating efficiency is almost 100 per cent.

Pipes insulated with J-M Asbesto-Sponge Felted Covering will carry steam over a mile with practically no loss. And, unlike ordinary pipe coverings, vibration and rough usage will not cause it to crack, break or crumble and thereby lose its insulating value. For durability and long service it is unequalled. Has been found in perfect condition after more than fifteen years' service on underground pipes.

## THE NICKEL INDUSTRY

A very timely report on the nickel industry, with special reference to the Sudbury region, prepared by Prof. A. P. Coleman, of the University of Toronto, has just been issued by the Mines Branch, Ottawa.

During the past few years the demand for nickel has greatly increased, and nowhere is this more evident than in the Sudbury district. The two large producers, the Canadian Copper Company and the Mond Nickel Company, report their business to be in a very satisfactory state. Large profits were made in 1912, and the present year finds the producers scarcely able to meet the requirements. The Mond Company has quite recently completed and put into operation at Coniston a splendid new smelting plant. The Canadian Copper Company last year completed the task of replacing its acid converters with large capacity basic converters, and put into operation a new reverberatory plant for the treatment of fines. This company has now well under way plans for largely increasing the capacity of the smelter.

A third company, the Dominion Nickel-Copper Company, has during the past two years been making very exhaustive exploration of some other properties and has discovered a large body of ore at the Murray mine. The company had made considerable progress with plans for a smelter. Changes of ownership have taken place lately, however, and the new owners have not yet made their intentions public. For the present the preparations for erection of a smelter have been postponed.

The successful operations of these three companies has made the Sudbury district take on new life, and the confidence evidenced by the directors in their last annual reports indicates that the industry will become much greater in the near future.

With the renewed interest in the nickel field, it is very fortunate that an up-to-date volume on the industry is now available. Some years ago Dr. Coleman prepared a report for the Ontario Bureau of Mines, in which he gave a remarkably clear idea of the structural features of the nickel deposits. During the past few years Dr. Coleman has been working in the district for the Canadian Copper Company, and later for the Department of Mines. The information gained has enabled him to produce an excellent revised monograph.

The monograph is accompanied by a general geological map of the district and special maps of the more important mines, the whole representing the advances made in knowledge of the region due to three summers' work in the field.

In addition to descriptions of all the known nickel ore deposits in Ontario, there are accounts of methods of mining and smelting the ores, and of the chief nickel regions of other countries.

In the preparation of the work Dr. Coleman was greatly aided by the mining companies. Information was freely granted by the several companies. The compiling of the accompanying maps and plans has been the work of Mr. R. B. Rose.

## VARIATIONS IN VALUES WITH DEPTH

It has been found by actual experience in mining metals in all parts of the world that ore deposits do not continue with undiminished value to very great depth. In many cases the productive portion has been found to be only that within a few hundred feet of the surface, and mines over 3,000 feet in depth are comparatively rare, though several very important deposits continue profitable to considerably lower levels.

Statements of regularity of decrease in values with depths are, however, often based on insufficient data. It is a common practice to point to the history of mining operations in a locality and call attention to the decrease in values as evidenced by gradually waning production, followed by closing down of the mines. We are then told that the values gradually fell off as the deeper levels were opened, and that there is probably no more ore at greater depth.

As a rule the assay plans, showing exactly where the values occur, are not made public, and the information gained by the operators is ultimately lost. It is, however, often possible to obtain sufficient evidence to show that the change in values with depth is not properly described as regular, that many deposits are richer at depth than at the surface, that the variations with depth are often not unlike the variations with lateral extent, that there is often a noticeable relation between length and depth, that many rich deposits do not outcrop, that there are probably ore bodies at depths far beyond the lowest levels yet reached by mining operations which are not known, simply because they do not outcrop, and that in glaciated areas there is often no good reason to postulate any close relation between the character of ore and the present surface.

To properly interpret figures giving production for successive years, and these are the figures most commonly available to the public, it is evidently necessary to know what portion of the deposit the ore was coming from. Where no assay plans are available, we have often, unfortunately, to assume a gradual deepening on the ore deposit; but even in these cases some information can commonly be obtained to show what portions of the mine were being most energetically worked each year.

As a rule, the first openings in a deposit are made in what is believed to be the central and best portion of it. As depth is attained, lateral extensions are made into the lower grade ore on either side. Without any change with depth the yearly records then show a decrease in values.

In most deposits the ore shoots pitch to right or left with depth. Shafts seldom follow the ore shoots, and if started in them get into poor ore long before the main shoot fails. Again the records show a falling off in values, which is not a true indication of the variation in the character of the deposit with depth.

In some cases, where one ore deposit has proven sufficiently rich to encourage mining to considerable depth, lateral exploration at low levels has resulted in the discovery of other ore deposits, which near surface are valueless, and which would have been undiscovered but for their proximity to a deposit which was rich enough near surface to permit of profitable mining.

One very essential feature to be noted in discussion of variations with depth is the change in character of formations in which the ore deposits occur. It is well known that very remarkable changes occur on passing from one formation down into a lower one. To discuss clearly the influence of depth then, it is evident that all deposits not confined to one series of rocks should be excluded, or that variations found wholly within one series be considered. If this is done, it is found that the general statements regarding decrease with depth in many cases find little support.

In Ontario and the Lake Superior States most of the valuable ore deposits occur in very old rocks which have been deeply eroded and then glaciated and more or less covered with glacial or fluvio-glacial deposits. It is quite unlikely that these deposits have, except for some very minor surface alterations, any close relation with the present surface. There is very good reason to believe that the deposits were formed in Pre-Cambrian or Cambrian times, in rocks that were not at the then surface. They have been exposed later by erosion, which continued down through long geological ages. It is incredible that the depth of such erosion has been in any way influenced by, or bears any close relation to, such minor masses as those which constitute our ore deposits, and on the other hand there is little evidence that the deposits have been much changed since they were exposed. The exposed surface is rather comparable to one which might be sliced off at any arbitrary depth. From general considerations, therefore, there is no good ground to place any reasonable limit on the depths at which ore deposits occur.

There is no necessary connection between the occurrence of ores at great depth below the present surface and the continuance of an individual ore shoot to similar great depth. The former is a probability, the latter has been proven by countless mining operations to be not the case.

# MICHIGAN COPPER MINERS STRIKE

On July 23rd, the Western Federation of Miners called a strike in the Lake Superior copper mining district, and since that date the copper country has been the scene of serious disorders necessitating the calling in of the State Militia. No immediate settlement seems likely, as neither union nor mine managers show any tendency to yield.

For several months the strike has been expected. The union has made no secret of its intention of taking advantage of the present shortage of labor in order to gain a foothold in the Michigan copper district. Previous efforts of the same kind have been flat failures.

It is stated that the demands presented ask for improvement in mining conditions, a minimum wage, recognition of the federation, and a change in operation of the one man drilling machines, the idea being to have an extra man for each two machines.

About 15,000 men are affected by the strike. About 16,500,000 pounds copper per month will be lacking in the production. The men will lose in wages about $1,000,000 per month, and very large amounts will be lost by those who are indirectly connected with the industry. The stockholders will lose an indeterminate large sum, which depends upon the price of copper.

On July 30th, Governor Ferris presented a plan to both sides to settle the strike; but this plan was not acceptable to the operators, who, however, said they were willing to meet committees provided the men came as employees and not as representatives of the Western Federation of Miners.

The less responsible element have been guilty of serious offences, sluggings have been of common occurrence, and an attempt has been made to prevent the operation of the pumps. This wanton damage to life and property naturally results in loss of sympathy for the strikers; but the organizers of the strike disclaim any responsibility for acts of violence. It is scarcely likely that they approve of such acts.

It appears that the strikers are for the most part Finns and Austrians, while Cornish, Irish and Italian miners are for the most part ready to go to work. Many of the Cornishmen returned to England some months ago, intending to stay away until the Federation and the Finnish socialists have settled their differences with the mine operators.

It is of course unlikely that the Federation should call a strike without a cause; but the accounts so far published make it appear that recognition of the union is the chief cause. The operators side of the case is presented in the following extracts from a message to Governor Ferris, bearing date of August 1st:—

"On the 23rd of July the strike called by the Western Federation of Miners took place. It was and is under the direction of skilled and experienced strike leaders of the federation, who are not residents of this district, or of this State. The strike took out only those affiliated with that organization on the morning when it went into effect. Many of our employees continued at work during the day.

"A campaign of violence and riot was at once instituted.

"The officers of the counties were without power to maintain order or to restrain lawlessness.

"By threats publicly made, including threats of destruction of their homes in their absence, violence to their families and death to themselves, the men of the night shift were deterred from going to work underground.

"Mechanics and labourers were driven from their employment by riotous mobs, armed with firearms, clubs, rocks, iron bars and other weapons. Mechanics, miners and labourers who desired to work or while at work, were cruelly beaten, and many were severely injured.

"The officers of the law were helpless, derided, cursed and their authority ignored.

"A deputy sheriff's star was a signal for an attack on the wearer.

"Officers were assaulted and beaten.

"The men were driven from the pumps and the mines were flooded with water, causing great destruction and damage.

"At some of the mines, even the operations of pumps for the fire protection of the community was forcibly prevented and the men driven out.

"At every branch of the mining industry at the several mining locations, the labor of the employes willing and anxious to work, was stopped forcibly, riotously, by threats and intimidation, by violence and assault, by woundings and beatings.

"There was no call by these strikers for conference, or for mediation or for adjustment while they thus completely dominated the situation.

"There is therefore no industrial dispute between the mine owners and employes. Under the circumstances, and because of our knowledge that the majority of our employes have at no time sympathized with the purpose of the federation, and have been and are now willing and anxious to continue in their employment, we cannot recognize the right of the Western Federation of Miners to intervene or to assume to represent our employes with respect to the present conditions, or in any other manner whatsoever."

It is regrettable that the outlook for a settlement seems far removed. The miners and their families are not in a position to stand a long period of enforced idleness, and to many of them even the loss of a few days' wages is a very serious matter. Those who wish to work should be allowed to work, and the State must be responsible for their protection. The stand taken by the operators seems likely to result in a deadlock until the miners are ready to discuss their grievances as employees rather than as members of the union.

# INTERNATIONAL GEOLOGICAL CONGRESS

## SUDBURY-COBALT-PORCUPINE EXCURSION.

On Wednesday evening, July 23rd, 45 members of the Congress left Toronto on a special C. P. R. train to visit the mining districts of Northern Ontario. The excursion was very well arranged, and, from start to finish, proved very interesting. Some of the places visited have become widely known, both on account of their commercial importance and on account of their scientific interest. The structure and origin of the ore deposits has proven an attractive subject to many geologists, and it was a pleasure much appreciated by the visitors to have the characteristic features of the several deposits pointed out to them by men who have made a special study of the several districts.

All over the world the Sudbury deposits are referred to as the most notable example of that particular type of ore deposits supposed to be the result of magmatic differentiation. It was therefore of special interest to have the features of these deposits pointed out by Dr. A. P. Coleman, who has made several years study of the deposits and has long contended that the ore bodies have been formed by segregation of the sulphides from a molten magma which was chiefly composed of the constituents of norite—the rock in which the ore occurs.

The members found little difficulty in finding hand specimens which show apparently secondary deposition of sulphides, especially of chalcopyrite; but as has already been mentioned by exponents of the magmatic theory, this secondary deposition is of minor importance, as the localization of the ore bodies seems to have depended on phenomena of much greater magnitude. The secondary deposits may easily have been formed by local changes within the original massive ore bodies and the neighbouring rock.

**The Sudbury Norite.**—Prof. Coleman first took the party to outcrops near Sudbury and pointed out several exposures of the Sudbury series—McKim graywacke and Ramsay lake quartzite—and the overlying conglomerate. Then, going to Windy lake on the C. P. R. Railway, the rocks which underlie the nickel bearing eruptive were seen. The railway was followed southeastward, giving a section across the eruptive. It was easily seen that the rock becomes, towards the upper and inner edge, lighter coloured and more siliceous. At the outer lower edge it is a dark gray, fine norite. This gradually changes to a coarser-grained rock containing less pyroxene and more reddish feldspar and micropegmatite. At the top it is quite red and siliceous and granite-like in appearance.

Below the nickel-bearing eruptive the rocks are much brecciated. In the vicinity of Sudbury several outcrops were visited and the "crush conglomerate" examined. Prof. Coleman, in calling attention to these outcrops, stated that this is characteristic of the foot-wall rocks all the way around the nickel range. Apparently the intrusion of the norite mass has been accompanied by very extensive crushing of the underlying rocks.

**The Inner Basin.**—Above the nickel-bearing eruptive there is a fine grained siliceous rock, which Dr. Coleman says is characteristic of the whole basin. Outcrops of this material were examined and it was found difficult to distinguish between the acid edge of the micropegmatite and what Dr. Coleman believes to be fused conglomerate.

**AT WINDY LAKE, SUDBURY DISTRICT**

A. W. G. Wilson, Ottawa; W. G. Miller, Toronto; A. C. Lane, Tufts College; Bedford McNeill, London; A. P. Coleman, Toronto; J. B. Tyrrell, Toronto; P. P. Piatnizky, Russia; Jules Szadeczcy, Hungary; A. G. Charleton, London; A. G. B. Wilbraham, London; G. W. Grabham, Khartoum, Africa; A. G. Burrows, Toronto.

Dr. Coleman stated that unaltered conglomerate and micropegmatite are not found in contact, but that in going from the overlying, Trout lake, conglomerate towards the eruptive there is always noted a gradual change from a distinctly fragmental rock to a fine-grained hard rock, which cannot be readily distinguished from felsitic igneous rocks. The change is so gradual that the conclusion reached is that the eruptive has intruded the conglomerate and was at a high enough temperature to alter it very extensively before solidifying.

Above the conglomerate is a dark coloured siliceous rock known as the Onaping tuff. Good exposures of this were examined at Onaping falls. At Onwatin lake outcrops of the overlying Onwatin slate were examined. It was found by several of the party that these rocks are specially productive of red raspberries. Asked as to the possibility of the Trout lake conglom-

erate, which overlies the nickel-bearing eruptive, and the basal conglomerate near Ramsay lake, being of the same age, Dr. Coleman replied that he considers this improbable. He stated that all around the inner basin the Trout lake conglomerate occurs and is always of the same character—a dark gray, hard conglomerate characterized by numerous pebbles of gray chert. He pointed out that the Ramsay lake conglomerate is quite different in appearance and composition and was probably not formed at the same time.

Having made examination of the several types of rock and of exposures which show their structural relations, visits were then made to the nickel mines.

**Murray Mine.**—The first mine visited was the Murray. This property, which is on the main line of the C. P. R., and was discovered by the building of the railroad, was worked several years ago; but has not been producing for ten years or more. During the past two years, however, the property has been systematicall prospected by diamond drilling and excellent results obtained. According to Mr. Hitchcock, who is in charge of the drilling operations, holes are being put down vertically at intervals of 200 feet and several million tons of ore has been discovered. The deposits worked in the early days are said to have dipped at about 45 degrees; but the drilling indicates that the

**AT SUDBURY**

J. A. Dresser, Sault Ste Marie, Ont.; G. Merciai, Pisa, Italy; E. Mattirolo, Torino, Italy; F. H. Forest. Rigaud, Quebec.

large body of ore penetrated by the drills dips at a considerably lower angle.

The Dominion Nickel Co. has done about 90,000 feet of drilling at the Murray and other properties in the Sudbury district in the past two years. About 20,000 feet of this was done at the Murray.

Having found a large body of ore the company employed a staff of engineers to work out methods of mining and treating the ore. Quite recently there has been a change in ownership and the property is now supposed to be under control of Dr. A. F. Pearson and associates. At present it is being operated under the names of the trustees of the property. Plans for the smelter are well advanced; but the owners have decided not to go ahead with the construction for some time.

According to Dr. Coleman, the nickel ore body at the Murray is now known to reach a depth of 1,100 feet and to include more than 10,000,000 tons. Several holes are being drilled to explore the deposit at greater depth.

**AT SUDBURY**

**A. G. Charleton. Past-President Institution of Mining and Metallurgy.**

**AT SUDBURY**

**Dr. A. C. Lane and Prof. J. Barrell discussing the grain of rocks.**

After pointing out the extensive gossan outcrops, Dr. Coleman led the party to exposures of the underlying rocks. The norite rests on a complex of ancient lavas showing in places, amygdaloidal and pillow structures.

**Creighton Mine.**—The following day was spent at the mines and smelting plant of the Canadian Copper Company. First the Creighton mine was visited. Dr. Coleman led the party past the open pit to an outcrop east of the mine, where is shown a characteristic contact of norite with the older gneiss. At the open pit the foot-wall rocks, the ore, the norite and a dike of diabase which cuts the ore were examined. The ore forms a somewhat pear-shaped body dipping to the north and pitching to the west. The mine is at present by far the largest producer of nickel in the world; but it will be far surpassed by the No. 3 mine. The Creighton is being mined as an open pit to the depth of 300 feet and underground mining is being done at lower levels. On returning to the train the party were presented with copies of a well-illustrated booklet describing the company's plants and methods, and with fobs of monel metal and specimens of pentlandite—the mineral which yields the nickel.

**Roast Yards.**—Leaving the Creighton mine, the party next went to Copper Cliff. The train was stopped in the roast yards and the burning piles of ore were examined, while members of the Company's staff explained the process of roasting.

**Offset Deposits.**—Dr. Coleman then led the party to exposures on the east shore of Macdonald lake, where a typical "offset deposit" was seen and trace southward to No. 2 mine. It was pointed out that the basic edge of norite narrows to a funnel leading to the long and important Copper Cliff offset, passing through granitoid gneiss, greenstone and graywacke. No. 2 mine, with its open pit 300 feet deep, is a typical columnar offset deposit.

The Copper Cliff mine is not now working, but was one of the richest of the early mines. The ore body

**Waiting for the special train at Levack. Mr. Bedford McNeill in contemplative mood.**

**DR. COLEMAN DESCRIBING STRUCTURAL FEATURES AT CREIGHTON MINE**

Mr. and Mrs. J. B. Tyrrell, Toronto; A. G. Charleton, London; Miss Eubank, Toronto; G. A. J. Cole, Ireland; Dr. Coleman, Toronto; O. F. Pfordte, Cairo, N.Y.; G. Merciai, Italy: A. E. Kitson, Gold Coast, West Africa; C. W. Knight, Toronto; S. Cerulli-Irelli, Italy.

formed an irregular chimney, which has been followed for 1,300 feet on an incline of 70 degrees to the east.

**Canadian Copper Company's Smelter.**—In the afternoon the guides took the party over the smelting plant and explained the process of treating the ore. This was described in detail in the August 1st issue of the Journal.

**No. 3, or Frood Mine.**—Leaving the smelter the party proceeded by train to Frood and examined the enormous outcrops of gossan at what is believed to be by far the largest nickel deposit yet discovered. According to Dr. Coleman, it is estimated to contain at least 35,000,000 tons of ore, and perhaps as much as 100,000,000 tons. From No. 3 the gossan-covered ridge extends almost unbroken for a mile to the southwest and almost as far to the northeast, where the Stobie mine once produced more than 400,000 tons of ore.

The deposit is being developed from two shafts on the property of the Canadian Copper Company. On adjoining property the Mond Nickel Company is sinking a vertical shaft, which is expected to reach the ore at a depth of about 800 feet.

At No. 3 mine the deposit has been developed for some distance at the 200 and 300-foot- levels. At the 200-foot level ore is being stoped by widening out crosscuts on reaching the ore and gradually extending the stope by making a fan-shaped opening, as has been done at some of the other properties.

**OPEN PIT, CREIGHTON MINE, CANADIAN COPPER COMPANY**

Supt. Kaeding; Fred Searls, Goldfield, Nevada; F. L. Ransome, U.S.G.S., Washington, D.C.

**ON OUTCROP OF CONTORTED IRON FORMATION, MOOSE MT., ONT.**

C. V. Corless, Mond Nickel Co.; F. A. Jordan, Moose Mt. Ltd. and Dr. J. F. Kemp, Columbia University.

At the 300-foot level a very different mode of attack is planned. Crosscuts through the ore body are being run at intervals of 50 feet. From the crosscuts inclined raises will be put up at intervals of 30 feet on each side, staggered at 15 feet.

The ore at No. 3 mine differs considerably from that at the Creighton. It is not commonly massive sulphide; but has a distinctly spotted character. The sulphide minerals occur as grains distributed with a regularity equal to that of the silicate minerals.

The orebody is more regular in shape than that at Creighton. It is a thick tabular mass dipping rather steeply at surface and, so far as can be told from drilling, flattening somewhat with depth.

While No. 3 ore is considerably lower grade than Creighton ore, the deposit is expected to prove even more valuable on account of its greater size.

**Entertainment by Sudbury Board of Trade.**—After returning to Sudbury on Friday evening, the members assembled in the Town Hall to partake of a supper given under the auspices of the Sudbury Board of Trade. A lengthy toast list kept the party up late in spite of Dr. Coleman's earnest requests to the speakers to be brief. It was generally conceded that Prof. Coleman made the speech of the evening when in response to a toast to the ladies he said: "The ladies are asleep. God bless them." Speeches of welcome to the visitors and of thanks to the Board of Trade and citizens of

Charging a basic converter at new smelter of the Mond Nickel Company at Coniston, Ont.

Sudbury for a splendid reception were received with much applause.

**Moose Mountain.**—Saturday morning the party was taken over the Canadian Northern Railway to Moose Mountain. Here the iron ore deposits and associated rocks were examined. At No. 1 mine, which is worked largely as an open pit, the ore is magnetite more or less interbanded with hornblende and green epidote. At No. 2 mine the ore consists of interbanded magnetite and silica without hornblende or epidote.

The ore mined is crushed and then concentrated by magnetic separation. By this means a marketable product is obtained. Much of the ore runs only 35 to 40 per cent. iron; but by a simple treatment the grade is brought up to 60 per cent.

In the vicinity of the mines many interesting structural features are well exposed. In places the banded ore is cut by dikes of granite and by thin seams of epidote. Where the iron formation crosses the Vermilion river interesting crumplings and foldings of the banded ore were pointed out by Dr. Coleman. A variety of interesting small scale structural features, such as anticlines, synclines and faults were also seen in the old rocks.

Recently Mr. Lindeman of the Department of Mines has been studying the district and has prepared a magnetometric map of the iron formations. Copies of this map were received just in time for distribution to members of the excursion.

After visiting the outcrops and mines, the party was conducted through the concentration plant and the methods of magnetic separation and briquetting of the ore were explained.

The officers of the company then entertained at a luncheon in the schoolhouse. A good meal, nicely served by the ladies of the village, was followed by several happy speeches. After luncheon a start was made southward. At several points the train was stopped to allow examination of outcrops along the railway. At Garson lake several of the party showed more interest in the water than in the rocks, and by general consent a stop was made to permit of a more intimate acquaintance with the lake. Refreshed by a swim, the party was then taken to the Coniston roast yards and smelter.

**At Coniston** the Mond Nickel Company has recently constructed a very complete smelting plant for the treatment of nickel-copper ores, and much interest was shown in the methods of handling the ore and furnace products here. The officers of the company conducted parties through the plant and explained the processes. Several labour and heat-saving devices have been introduced in the new plant.

In the evening the party returned to Sudbury, and on Sunday afternoon the train pulled out for Cobalt and Porcupine.

(To be Continued.)

## MARITIME PROVINCES EXCURSION.

### Visit to the Sydney Coalfield.

Cape Breton Island, within the past few years, has been visited during the summer months by many associations and congresses, and bodies of persons joined together for some ostensibly educative purpose. These parties have curiously coincided with hot weather in other parts of the American continent, and it has been shrewdly surmised that a desire to feel the cool Atlantic breezes was not altogether unconnected with the presence of these gatherings in Cape Breton, and there has been a feeling that business was sometimes interfered with unnecessarily in receiving and entertaining the visitors, for it is in the summer time that the coal mines and steel works are most busy, and interruptions are sufficiently numerous without further additions.

A pleasing exception, however, is the recent visit of a portion of the International Geological Congress to the Sydney coalfield. The geologists who composed this party were very evidently not on a junketing excursion, and the inspection of any undeveloped country by a discerning and well-informed party of specialists such as made up the Maritime Provinces excursion of the Geological Congress, cannot but be followed by an increasing interest in its resources and a more exact knowledge of its geological characteristics.

The Sydney trip commenced on Wednesday, the 23rd of July, with a visit to the Point Edward limestones, where the party inspected Limestone Point. Here the bedded limestones are seen dipping under the northwest arm of Sydney Harbour, and can be observed to disappear under the Millstone Grit on the other side of the arm. Several of the party evinced considerable interest in a curious appearance shown by weathered fragments of the limestone, the surface of the rock being covered by closely packed circular knobs showing a distinct concretionary structure. One learned gentleman remarked that the rock had "a curious botyroidal structure resembling sheep's brains." More may be heard of this, when the specimens reach Europe! An old quarry, known as Louisburg Quarry was next visited, which is said to have furnished lime for the French fortifications at Louisburg. Here numerous shell fossils were to be seen and further nodular specimens. The Nova Scotia Steel Company's quarries at Point Edward Post Office were then visited, where the full bench of the bedded limestone was exposed in working face. The limestone bed was covered with from ten to twenty feet of reddish drift, and in some places the top of the limestone was curiously water-worn.

Taking the ferry steamer at Leitches Creek, the party sailed down the Northwest Arm and landed at the Quarantine station on Point Edward, about on the axis of the anticline, which divides the two arms of Sydney Harbour. Here an exposure of black shale was visited that yielded a large number of small fossil fauna, particularly the minute fossil shell Leaia. One of the German geologists picked up from the underlying sandstones a fine specimen of a fish-spine about eight inches in length, and a compatriot was the proud possessor of a slab of sandstone showing a well defined cast of mud-cracks arranged in rough pentagons over its lower surface. The black-shale bed occurred just about breast-high, and in a favourable position for attack. An interesting photograph might have been had of some forty persons ranged in a continuous row vigorously attacking the crumbling shale with their hands, and all, apparently, well pleased with their finds.

From Point Edward the geologists proceeded to North Sydney, landing there and taking the tram-car to the point where the Millstone Grit, said to be here over 3,000 feet in thickness, gives place to the true Coal Measures. The party descended the cliffs and walked at the base as far as the outcrop of the Sydney Main Seam. Several members of the party preferred the highway to the rocky base of the cliffs, remarking that they had seen Millstone Grit before; but by the time coal-bearing measures were reached the whole party were interested examiners. The coast section between North Sydney and Sydney Mines is an imposing one, and probably ranks next in interest to the Joggins exposure, which the party expected to see in the following week. Some magnificent specimens of fossil trees were to be noticed. One Sigillaria in particular was in an ideal position for inspection at the base of the cliff. It was 2 feet 7 inches across the base, and about four feet of the trunk was exposed, the remainder being hidden in the overhang of the cliff. The carbon envelope, always present around fossil plants in the coal measures, enclosed the trunk completely, passing between the base and a small seam of impure coal, on top of which the trunk had apparently been deposited uprightly. The position of the fragment and its surroundings was evidence of the quiet conditions under which it must have been deposited. The trunk was finely marked with the characteristic flutings and pits of the Sigillaria. In several other places at the top of the cliff, where the marls had crumbled under the action of the waves and the atmosphere, there were visible a number of semi-circular shafts where the fossil trees had been, but had fallen out. Near the outcrop of the Sydney Main Seam was a wealth of fossil remains. At least a dozen large and well-preserved specimens of Sigillaria, Lepidodendra and Calamites were to be seen within a space of two yards.

The shale bands in close proximity to the coal seams were found rich in small shell specimens, among which were noticed ostracods, anthracosia (or carbonicola, as it is now the fashion to term this variety), anthracomya and naiadities. Fish scales were also to be found and the delicate iridescent shell estheria. Various ferns and such forms as asterophyllites and sphenophyllum were present in considerable numbers, but the geologists appeared to be more particularly taken with the shell horizons.

A fairly good idea of the nature of the strata overlying the coal seams in the submarine areas can be obtained from an inspection of the cliffs. The colouring is in places very pretty. A variety of shades characterize the marls, red, green, blue, purple, grey and black all being visible. A characteristic of the mudshales is a star-like marking, such as might be occasioned by the splashing of a stone into mud or soft clay. Numerous lines can be seen radiating from a central point, that is usuallly a lighter colour than the surrounding shale, being evidently the decomposed remains of a root with its surrounding rootlets, seen end-on to the observer. In some places a longitudinal section of such a root could be seen. In a rock at the base of a cliff washed by the tide could be seen a stigmaria, extending for five to six feet in length, with rootlets in situ.

After walking along a portion only of the Sydney mines exposure, one appreciated the industry of the late R. H. Brown, who measured the vertical depth of these measures from end to end of the Sydney coalfield, and sketched with excellent precision the whole shore exposure from North Sydney to Cranberry Head. A comparison of Mr. Brown's sketches, made in 1870 or thereabouts, with the exposure as it is to be seen to-day would be interesting.

After reaching the crop of the Sydney mine seam the party left the cliffs and regained the highway, proceeding to Sydney, which completed the first day's work. The conversation in the crowded tram car was very cosmopolitan. A gentleman from Holland was to be heard explaining in halting French to a group of Frenchmen the customs of the natives of Java and Batavia. On the opposite side an Austrian was relating a college story to a German, and close by was an interesting Japanese gentleman from Dairen, Manchuria, who said little but missed nothing.

On the second day the party divided into four groups—one group going to the Princess pit of the Nova Scotia Steel and Coal Company, Sydney Mines, a second group to the works of the Dominion Iron and Steel Company at Sydney, a third group to No. 2 Colliery of the Dominion Coal Company, while a small party visited the old French fortifications at Louisburg. Your correspondent can only detail the journeyings of the party who visited No. 2 Colliery. The Rescue Station was visited, and a group of trained men wore the Draeger apparatus for the benefit of the visitors, who were also shown the Pulmotor, electric lamps and other accessories of this well-equipped station. The superintendent of the station has for some time been accumulating fossils from the Glace Bay mines, chiefly flora, and these were also shown to the geologists. Some large and excellent specimens of the predominating tree and fern fossils were in the collection, including a really fine sigillaria, five feet long by eighteen inches wide, and the only specimen of Bothodendron punctatum your correspondent has known to be discovered in the Sydney field.

From the Rescue Station a portion of the party visited Table Head, and what is popularly known in Glace Bay as the Burnt Mines. In reference to this vicinity, Mr. Brown's book quotes from the memoirs of M. Pichon, the secretary of the French Governor of Louisburg, who relates in his history of Cape Breton, published in 1760, that "the English had a coal pit at Burnt Head, defended by a fort of considerable strength, where, with fifty men, they successfully repulsed the attacks of the savages and kept possesssion of the fort." M. Pichon further relates that the pit took fire in 1752, when the fort was also entirely consumed. Traces of this fire may still be seen along the outcrop of the Hub seam, and in places the heat of the burning coal has changed the shale cliffs into masses of slag.

The party of geologists were informed that they were standing approximately in the centre of the trough of the Glace Bay synclinal basin, and that beneath their feet were at least seven workable coal seams, aggregating thirty-nine feet of coal, in the comparatively shallow depth of 1,300 feet of strata. They were also told that seaward there was, for all practical purposes, an illimitable supply of submarine coal. One gentleman, whose name is not altogether unknown in Canadian geology, confessed that the day being fine and the air salubrious, he had lain down on the grass and betaken himself to sleep.

While one portion of the party was inspecting the Burnt Mines, the other portion had descended No. 2 shaft and seen the unique weighing and hoisting arrangements in the Phalen pit bottom. Many questions were asked of those who accompanied the party, but none more incisive than those of Mr. Kido, of Manchuria, who insisted upon sketching everything that caught his fancy, and jotted down in his note book the names and addresses of the makers of the machinery.

In the afternoon the scattered parties gathered together and were the guests at lunch of the Dominion Steel Corporation and the Nova Scotia Steel and Coal Company. On the following day the party proceeded to inspect the limestone quarries on the George's River limestone series, from there to Antigonish and thence to the shale cliffs at Arisaig. F. W. G.

# CONGRESS PERSONALS

Dr. A. E. Barlow

Wladimir Loewinson-Lessing, of St. Petersburg, Russia, is one of Europe's leading geologists, and stands foremost among the Russians. He is an authority on rocks and the author of several papers.

John Walter Gregory is one of England's leading mining geologists. He was for some years professor of geology at the University of Melbourne and director of geological surveys of Victoria. He has studied the mining fields of several countries, and is the author of several papers on mining geology, including Mount Lyell mines, Victoria gold and tin fields, Ballarat gold field, South Rhodesian gold fields, etc.

Edward O. Ulrich, geologist, U. S. Geological Survey, is one of America's leading paleontologists. He has studied especially stratigraphy and invertebrate paleontology.

Walter Harvey Weed, consulting geologist and mining engineer, New York City, is one of the most prominent mining geologists in America. He has mapped several mining districts for the U. S. Geological Survey, and has contributed numerous articles on the origin of ore deposits. His writings include reports on geology of Mexico, coal of Montana, copper deposits of Butte, and copper mines of the world.

Waldemar Lindgren, professor of geology, Massachusetts Institute of Technology, is one of the foremost authorities on metalliferous deposits. He has made many valuable contributions to the literature on gold, silver and copper deposits, especially on the gold deposits of Colorado and California and the copper deposits of Clifton, Arizona.

Dr. Charles Kenneth Leith, professor of geology, University of Wisconsin, is a prominent authority on the geology of the iron districts of the United States. With Dr. Van Hise he has made careful study of the Lake Superior district, and has done much towards determining the structure of the ore deposits and their origin.

Dr. Frederick Leslie Ransome is chief geologist of the U. S. Geological Survey. He is a native of Greenwich, Eng., and a graduate of California University. He has taught mineralogy at Harvard and geology at Chicago University. He joined the staff of the U.S.G.S. in 1897, and has written for the Survey several important works. His special studies have been the geology of gold, silver, lead, and copper deposits in Western United States.

William Herbert Hobbs, professor of geology, University of Michigan, makes a specialty of structural and dynamical geology and seismology. He has a reputation as a fault-finder. Dr. Hobbs has published numerous articles on mineralogy, petrography and geology, and is the author of books on earthquakes and general geology. He is an authority on the fracture systems of the earth's crust.

Dr. Charles Doolittle Walcott, Secretary of the Smithsonian Institution, Washington, D.C., ranks among the leading geologists of the world. He has made a special study of the oldest fossiliferous formations, and he has written numerous volumes on the stratigraphy and paleontology of the Paleozoic rocks. Dr. Walcott has done some very valuable work in the Canadian Rockies and has given remarkable descriptions of them. After being for several years on the staff of the U. S. Geological Survey, Dr. Walcott was appointed director of the survey in 1894. This position he held until 1902, when he joined the reclamation service. In 1907 he was appointed secretary of the Smithsonian Institution.

Louis V. Pirsson, professor of geology, Yale University, is one of the most prominent American geologists. He has described the geology of several of the districts of central Montana and of parts of New Hampshire. Dr. Pirsson has made a special study of rocks and rock minerals, and has published a text book on petrology.

Dr. Richard Beck

**Dr. Charles P. Berkey**

Dr. Fred E. Wright has made an especial study of microscopic methods and the microscopic properties of minerals and artificial products, made in the Geophysical Laboratory, Washington. He was formerly instructor in petrography at the Michigan College of Mines and Assistant State Geologist of Michigan.

Dr. Alfred C. Lane, Professor of Geology Tufts College, Mass., and formerly State Geologist of Michigan, is an authority on Michigan copper mines. He has published numerous papers on economic geology. He has made a special study of mine waters and the grain of igneous rocks. Dr. Lane is a graduate of Harvard and Heidelberg. He was instructor in mathematics at Harvard and later taught geology in the Michigan College of Mines. He was State Geologist of Michigan, 1899-1909.

Bedford McNeill, consulting engineer, London, Eng., is well known as author of "Bedford McNeill's Code," published in 1893 and 1908. He has inspected and reported on numerous mines in Germany, Transylvania, Colorado, Georgia, and Mexico, and has been consulting engineer to Anchor T. Mine, Ltd., Bacis Gold and Silver Mining Co., Ltd., Waterson Gold Mining Co., Ltd., etc. Mr. McNeill has long been a prominent member of the Institute of Mining and Metallurgy, and is now president.

John W. Evans, delegate of the Geologists' Association, London, Eng., was in 1891-92 geologist and mineralogist to the Matto Grosso Gold and Exploration Concessions in Brazil. Later he became State geologist and chief inspector of mines and explosives, Mysore, India. In 1901-02, Mr. Evans traveled in the Eastern Andes and the lowlands of Bolivia and Matto Grosso and Amazonos, Brazil, for the Bolovian Syndicate. More recently he has been instructor in Economic Mineralogy to officers of the Colonial Service.

Albert E. Kitson, director of the Geological Survey of the Gold Coast, has made surveys and examinations in all the Australian States, Tasmania and New Zealand, and was for some time in charge of the Coal-Fields Survey, Victoria. Later he was Principal of the Mineral Survey, Southern Nigeria, British West Africa. Mr. Kitson conducted geological explorations and mining operations in Southern Nigeria and Dahomey. He has examined metal and coal mines in the British Isles, Germany, Austria and Italy, and repórted on lignite and its manufacture into briquettes.

Harry F. Bain, Editor Mining and Scientific Press, San Francisco, was for some time geologist on the Iowa State Survey. During the period 1901-03 he was manager of mines at Idaho Springs and Cripple Creek, Colo. After being for a few years geologist on the staff of the U. S. Geological Survey, he was appointed Director of the Illinois Geological Survey. This position he left in 1909 to take up editorial work.

J. B. Tyrrell, consulting mining engineer, Toronto, has taken a very prominent part in the development of the mineral resources of Canada. As geologist on the staff of the Geological Survey, 20 years ago, he explored the Rocky Mountains north of the International boundary. Later, in Alberta, he determined the source of gold in the Saskatchewan River, and located most of the coal seams in the province. In 1893 Mr. Tyrrell began the exploration of a great unknown region between the Mackenzie River and Hudson Bay. In 1898 he began the investigation of the geology of the Klondike goldfields and of other parts of the Yukon Territory. Later he resigned from the Geological Survey and practiced as mining engineer in Dawson, reporting on many large properties and engaging in mining on his own account. Mr. Tyrrell moved to Toronto in 1906.

Arthur George Charleton, Past President of the Institution of Mining and Metallurgy, was at one time assistant manager of Canadian Consolidated Gold Mines, Deloro, Ontario, and later of mines in Nevada. In 1884 he reported on Wynaad and Mysore Gold Fields, India. Then he became general manager of Disraeli Gold Mining Co., Queensland, and in 1888 of the new Queen

**H. F. Bain**

Dr. Waldemar Lindgren

Gold Mining Co. In 1895 he founded the firm of Charleton and Co., in partnership with F. W. Grey, reporting on mines of gold, copper, silver-lead, manganese and cobalt, in different parts of the world. In 1894 Mr. Arthur Dickinson joined the present firm, Charleton, Dickinson and Co., who acted as consulting engineers to the Cornish Consolidated Tin Mines, Ltd.; the Anglo-Spanish Copper Co., etc. Mr. Charleton is the author of numerous papers on mining, milling and mine accounting.

William Harvey Emmons is a native of Mexico, Mo. He was for several years on the staff of the Geological Department, University of Chicago. As geologist on the U. S. G. S. he studied and described many of the ore deposits of Nevada, Montana and Colorado.

Reginald Aldworth Daly, Professor of Geology, Massachusetts Institute of Technology, Boston, is a Canadian who ranks among the leading geologists of the United States. He has contributed many very important papers on the geology of igneous rocks and is regarded as a leading authority on the subject.

Dr. Edmund Otis Hovey, Curator of the American Museum of Natural History, has made a special study of volcanoes, meteorites and earthquakes. He has described the volcanoes of the Lesser Antilles and eruptions of Mount Pele, Martinique and the Soufriere, St. Vincent.

Alfred Harker, Fellow of St. John's College and Lecturer in Petrology, Cambridge, is well-known for his studies in petrology and for his text books on rocks. His work, "Petrology for Students" is in use in many colleges. Among his publications is an admirable work on the "Natural History of Igneous Rocks."

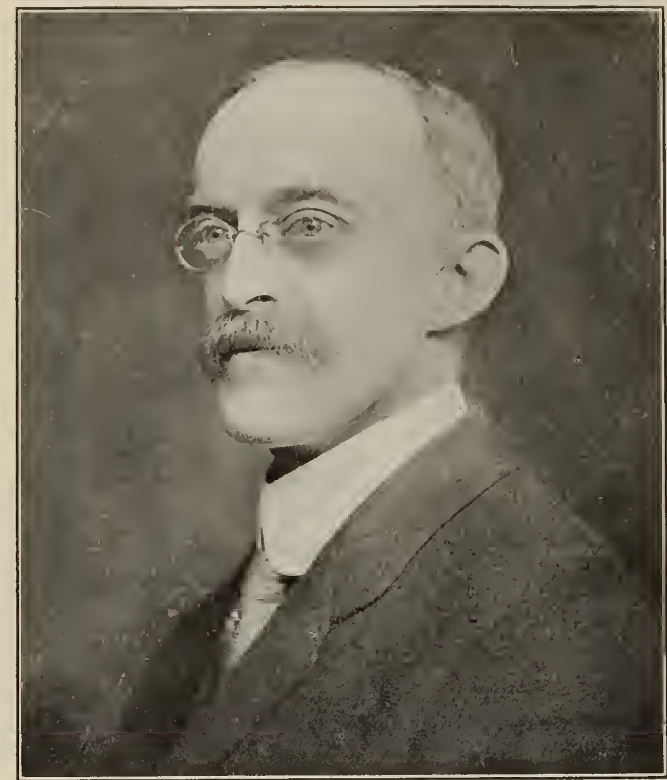
William Wallace Mein, Consulting Mining Engineer, New York, is well known in Ontario through his position as consulting engineer for the Dome Mines Co. and the Canada Exploration Co. Mr. Mein has held very important positions on the Rand, South Africa, being general manager of French Rand Gold Mining Co., Crown Reef, Robinson, Robinson Central Deep, Ferreira, Village Main Reef, Village Deep, Turf Mines, City Deep, New Modderfontein and Modderfontein Extension. In Alaska also Mr. Mein held important posts, being consulting engineer to Alaska Treadwell Group of Mines, Douglas Island, Alaska.

Dr. Florence Bascom, Professor of Geology at Bryn Mawr, Pa., enjoys the distinction of being the most prominent woman geologist in America. For several years she has been a member of the staff of the United States Geological Survey, and has written a number of valuable works on general geology and on the geology of Pennsylvania. Miss Bascom is a regular attendant at the meetings and excursions of the several societies to which she belongs. She took part in the last meeting of the Geological Congress in Sweden.

Professor Joseph Barrell of Yale University, New Haven, is a prominent authority on the origin of rocks. Of late he has written several illuminating papers on the importance of land-formed sediments among the old formations. Professor Barrell was, in 1893-97, instructor in mining and metallurgy at Lehigh University. After practising for two years as a mining engineer, and spending three years as United States geologist in Montana, he was, in 1900, appointed Assistant Professor of Geology at Lehigh. In 1903 he received an appointment at Yale and became professor in 1908.

Dr. Heinrich Ries, Professor of Geology, Cornell University, is the foremost authority on clays. He has made many valuable contributions to our knowledge of the clays of America. Dr. Ries has been engaged by the U. S. Geological Survey and by the State Surveys of Michigan, Maryland, New Jersey, Texas, Wisconsin and Virginia to report on clays. Recently he has done similar work for the Canadian Geological Survey.

Horace V. Winchell



**W. F. Ferrier**

Henry Shaler Williams, Professor of Geology, Cornell University, is a paleontologist who has made a special study of Devonian paleontology; geological history of organisms; evolution and geographical and geological modification of fossil faunas. He has published articles on changes in composition and modification of species in relation to change of location and succession in time as means of geological correlation and identification of their time relations.

Frank Leverett, Geologist, U. S. Geological Survey, is a leading authority on glacial geology, physiography and water resources. He has made numerous glacial investigations in the Upper Mississippi and Great Lakes regions. Mr. Leverett is lecturer on glacial geology, University of Michigan.

Horace Vaughn Winchell, Consulting Mining Engineer and Geologist, Minneapolis, is one of America's most prominent economic geologists. He makes a specialty of the determination of value and modes of extraction of ores and minerals. Mr. Winchell was, in 1889-91, Assistant State Geologist of Minnesota. He was then appointed Geologist in charge of explorations on Mesabi and Vermilion iron ranges for the Minnesota Iron Co. In 1893 he practised as consulting engineer and geologist and has been geologist (1898-1906) for the Anaconda Copper Co., and (1906-1908) for the Great Northern Railway Co.

### The Reception in Ottawa.

A luncheon tendered them at the Experimental Farm by the Government, at which they received an official welcome from Premier Borden on behalf of Canada, and the unveiling in the afternoon by Hon. T. W. Crothers of the tablet erected by the Congress in honour of Sir William Logan, founder of the Canadian Geological Survey, formed the features of the visit to Ottawa, August 1, of some 200 delegates to the International Geological Congress at Toronto.

Arriving in the city the previous night the delegates were taken around to see its sights in the morning and then conveyed to the Experimental Farm. In Auditorium Hall there luncheon had been arranged at which about 350 sat down. At its conclusion speeches were made by Rt. Hon. Mr. Borden, who just returned in time for the event; Controller Parent, President Frank D. Adams and other delegates hailing from many countries.

After welcoming the Congress to Canada, Premier Borden expressed his appreciation of the coming of so many distinguished gentlemen representing nearly all the civilized nations of the world; a visit which meant much to a country like Canada, still busy with its first problems of development. This country, in fact, was so large that just a few months ago the Government had sent an expedition north to find just how far its boundary extended in that direction. It was expected to be heard from in about four years' time. He hoped the visit would give the delegates a new idea of Canada's resources and that she might learn from them some things that would help her to solve the problems of the future.

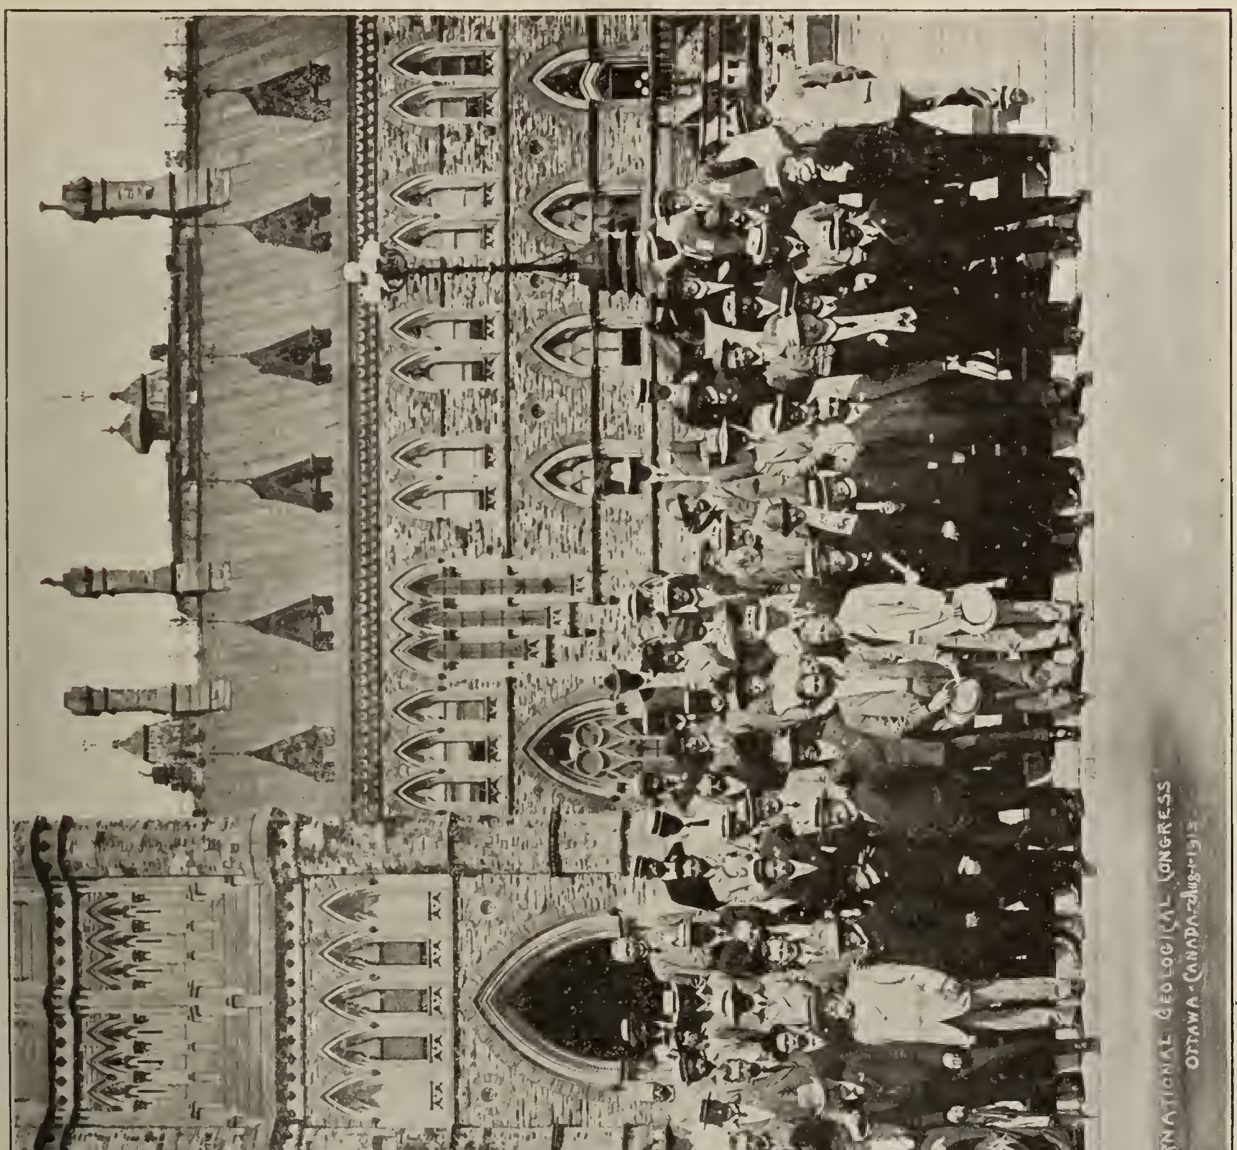
After a few words of welcome from Controller Parent on behalf of the city, Dr. Frank D. Adams, dean of the Faculty of Applied Science at McGill University and president of the International Geological Congress, replied on behalf of the latter body. He referred to the magnificent scale on which Nature's geological formations were visible in the Dominion. Its climate, too, was varied, and he had found great difficulty in convincing many of the delegates that "Our Lady of the Snows" could ever boast of even an inch of such frosty covering. In announcing the future programme of the party he made the interesting statement that on visiting Caughnawaga several of the delegates would be made chiefs of the Iroquois tribe.

Other brief addresses were delivered by Dr. A. Strahan, director of the British Geological Survey; Dr. P. M. Termier, of Paris, director of the French Geological Survey; Dr. Max Belowsky, of Berlin, president of the university there; Prof. J. F. Kemp, of Columbia University, New York; Dr. J. H. Sederholm, director of the Geological Survey of Finland. Hon. Mr. Perley, who acted as chairman, also spoke a few words.

### Tablet Unveiled.

At the conclusion of the luncheon the visitors were shown over the Farm and were then taken to the Victoria Museum for the unveiling of the tablet to the founder of Canada's Geological Survey and first director. The tablet has been affixed to a huge specimen of the Laurentian formation, the one with which Sir William Logan's work was chiefly connected. It was procured in Rockcliffe and has been set on a concrete pedestal in front of the main entrance of the Museum. On the tablet of copper is the following inscription: "Sir William Logan, Kt., LL.D., F.R.S., 1798-1875, the father of Canadian geology, founder and first director Geological Survey of Canada, 1842-1869; erected by the International Geological Congress of Canada, 1913."

The tablet was unveiled by Hon. T. W. Crothers, Minister of Labor, in the absence of Hon. Louis Coderre, Minister of Mines. After a few remarks by Mr. James White, of the Conservation Commission, Hon. Mr. Crothers accepted the tablet on behalf of the Government of Canada. He referred to the importance of the pioneer work which had been done by the late Sir William Logan in the interests of the Dominion and congratulated the Congress on its commemoration of his memory.



**Some of the members of the A 1, A 2, and A 3 excursions visiting the Dominion Parliament Buildings at Ottawa.**

Dr. A. E. Barlow, chairman of the Logan Memorial Committee, also said a few words, stating that besides the present tablet one had already been erected in Perce, in Gaspe Peninsula, where much of Dr. Logan's early work was carried on. President Adams, of the Congress, then gave a sketch of Sir William Logan's career. A Montreal man, he had gained experience in Wales and then returned to Canada as first director of the Canadian Geological Survey. He had been given the munificent sum of fifteen hundred pounds and told to go out and survey Canada with it, a work to which he devoted not only all his energy, but considerable private resources.

At the conclusion of the ceremony the delegates were entertained to tea in the Museum, and then left for Montreal.

### Reception in Montreal on August 2.

The scientific and intellectual world of Montreal on August 2 entertained nearly three hundred geologists, who have gathered from every civilized country in the globe to meet in Toronto next week in international conference. To these men belong the functions of digging out and reading in rocks and stones the early history of the earth, and to make guesses at the riddle of existence. It was not a band of "fossils," but of keen analytical professors, that were entertained by a committee, presided over by Dr. Milton Hersey and representatives of the Universities of McGill and Laval. Many persons marked the absence of an official reception from the civic corporation, due to an oversight in not providing funds in time; but the distinguished entertainment committee made such excellent arrangements in providing for the reception and care of their guests as to more than make up for an absence of civic recognition. It was a highly intellectual party that stayed at the McGill Union over night, sent representatives to the McGill Convocation, had luncheon at the Windsor, and went on an excursion to Lachine, visited the Indian village of Caughnawaga, witnessed the historic and traditional tribal rites, and had an exciting trip down the Rapids, where the boat was somewhat damaged and had to be hurriedly docked.

The day's round of duties began with the Convocation of McGill University at Royal Victoria College. Here a very distinguished audience witnessed the oldest Canadian university confer her highest, her most prized degree of Doctor of Philosophy, honoris causa, on six distinguished visitors. The recipients all expressed their deep sensibility at receiving this mark of signal appreciation, and at being enrolled among the McGill alumnae. The proceedings were plain and direct.

Shortly after 10.30 o'clock, the time set for the convocation to meet, a procession, headed by Dean Moyse, the acting principal, and made up of members of the faculty and the six recipients of the Degree, made its way to the Hall of Convocation.

Those who were honored by Degrees were: Prof. Helge Backstrom, of Mineralogy and Petrography, in the University of Stockholm; Prof. Alfred Bergeat, of Geology of the University of Koenigsberg, Germany; Prof. James Furman Kemp, of Geology, of Columbia University, New York; Lecturer Alfred Harker, of Petrology, in Cambridge University, and Prof. Alfred Lacroix, of the Museum of Natural History, Paris.

Each candidate for the degree was introduced by a member of the McGill faculty; Dean Moyse said over a few words of Latin, and he became a Doctor of Philosophy.

After the procession reached the platform, Prof. John Macnaughton opened the proceedings wth prayer. Then came the work of conferring Degrees.

Prof. Howard Barnes, introducing Prof. Helge Backstrom, of Stockholm University, the first to be honored, said that Swedish savant was a representative of the distinguished school of geologists, whose studies of ancient geological formations of the far north of Scandinavia have shed so much light on the early history of the world. He is an author of scientific repute, and a member of the Upper Chamber of the Swedish Parliament.

Dr. Backstrom, in reply, expressed his deep gratitude at the honor conferred upon him by the Canadian geologists, whose studies were similar to their own. He took this as a testimonial that the work of the Swedish geologists was appreciated in this country. Sweden had water powers and a similar climate to this country, and he expected that from these aspects the civilization of the two countries would develop on similar lines. In conclusion, he expressed a hope that this would lead to greater intercourse in future.

Professor Dale, who was sponsor for Prof. Alfred Bergeat, of the University of Koenigsberg, the next recipient, sketched the career of the distinguished scientist. He had particularly studied geological formations in connection with ore, the developments of which had such a far reaching influence on the progress of the world. He had done distinguished work in Mexico, and his book had a far reaching effect.

In reply to the honour conferred, Prof. Bergeat spoke in German, thanking them for their interest in and honouring of his work. He spoke of the great physical aspects of Canada, and said it was important in the geological world. He modestly disclaimed any special distinction in his labours, and said the standing of McGill as a university was recognized in Europe.

Prof. Alfred Harker, lecturer on petrology in Cambridge University, was presented by Prof. Macnaughton. Prof. Harker, he said, represented the most distinguished learned societies in the English-speaking world. First came the Royal Society, founded to follow out the scientific studies opened out by Bacon. He referred to the great work of Prof. Harker in studying the rocks of Scotland. His work in the Highlands has added much to the problem of metamorphism, and he has written eminent works on his studies.

In replying to the honour, Prof. Harker said he took this distinction, not as paid personally to him, but as a tribute to his university. He would be a blind and indifferent man if he did not take a deep interest in the progress of this country, particularly education. He had deep interest in McGill University. Everywhere they went they found strong evidence of vitality and evidence of the prominent part this university is playing in the life and development of this country.

Prof. McLeod said in presenting Prof. James Furman Kemp, who occupies the chair of geology at Columbia University, as the most distinguished geologist in America. His studies of the rocks of the Adirondacks was well known. His work on the studies of ore deposits was the best compendium they possessed. For twenty years he had been a professor in Columbia University, New York, and his lectures attracted not only large bodies of students from the United States, but also from foreign countries. Prof. McLeod said he also wished to express the thanks of McGill for the brilliant courses of lectures he has delivered to her students.

Prof. Kemp said in reply that he certainly felt very much at home in a McGill audience, and in a McGill alumni. He spoke of the great part geology has played in progress, and he referred to the great work that McGill has done in this sphere. He recalled the labours of Sir William Dawson and Sir William Logan in the rocks of Ontario and Nova Scotia, of Prof. Harrington, of Dr. George Dawson, the intrepid explorer of Northern America, of the regiment of McGill graduates who have explored the north. Geologists turn to McGill from all over the world when they want knowledge of the interior of the earth, and seek it from Prof. Frank O. Adams. One member of the geological conference will carry back to his home deeply felt recollections of the significance of this day.

Dean Adams introduced Prof. Alfred Lacroix, member of the French Institute for the degree. He did much work in Guiana, Madagascar, Martinique after the volcanic eruption, where he was sent in a French battleship. His writings were numerous, and he was the most distinguished mineralogist of the present day.

In replying, Prof. Lacroix said he was deeply touched by the honour. He paid tribute to Canada as a fine country. He had been a student for twenty-five years. He spoke of the influence of McGill as high in promoting scientific research, and of the importance of the study of minerals in solving scientific problems, and the furthering of human progress.

Dean Adams said they were glad to have in Canada such a distinguished body of scientists from all the Seven Seas. He hoped they might go away well pleased with the Dominion, and he hoped that they would come back again to Canada for another geological conference. He also hoped that they would meet again before that date.

Dean Moyse, in the name of Principal Peterson, gave them a hearty welcome to McGill University. It is a young university, said he. It was founded in 1821 and in 1829 it began its work. It nearly perished, but the medical faculty, the doctors, kept it alive. Then came Sir William Dawson, a Scotchman. McGill is a Scotch university, many of its professors are Scotch, but the English professors do much to hold their own. So far as geology is concerned, McGill is the Mecca of geologists, and he cannot see why they should meet in Toronto. Canada was a country of boundless resources, and her universities were busy in turning out men to grapple with them. But they must not forget they have an arts faculty and turned out a Rhodes scholar, who won the blue ribbon of Oxford scholarship. He regretted that they had not received a civic welcome, and he hoped that when they came again they would receive one that would make up for the absence of one this time.

From the Convocation Hall adjournment was made to the Windsor Hotel, where the visitors were the guests of the Montreal reception committee to a luncheon. An orchestra played the national airs of the countries represented by the geologists.

Dr. Milton Hersey, in behalf of McGill, and Laval Universities, the local committee, and the various learned societies, conveyed their greetings to the party. Various so-called international conferences had been held in Canada at various times, but this was the first one held here worthy of the title, international.

Geologists, said Dr. Hersey, are the only persons who can go back to the earliest stages of the earth's history. This was a new country, only three hundred years old, but within a stone's throw of this hotel were rocks of the oldest geological formation.

Dean Adams, of the McGill Faculty of Applied Science, and president of the conference, thanked Dr. Hersey for the splendid reception. He then read off a list of no less than twelve excursions from Montreal, got up for the visitors. The majority go to Toronto and Niagara Falls, and leave at various times.

---

# IMPROVEMENTS AT THE CONSOLIDATED COMPANY'S SMELTING WORKS AT TRAIL, B.C.

By E. Jacobs.

The Consolidated Mining and Smelting Company of Canada, Limited, continues to make improvements and additions to the plant at its lead and copper smelting works at Trail, British Columbia. That it is smelting a larger quantity of ore this year than last is evident from the following comparison, which also shows a generally higher value of ore smelted. During five months ended May 31 of this year the quantity of ore and concentrates smelted was 134,660 tons, the gross value of the metal contents of which was $3,526,436. This compares with 296,458 tons of ore smelted during the company's last fiscal year and a gross value of metal contents of $5,083,078. The monthly average smelted this year was 26,932 tons, gross value $705,287, as against that for the last fiscal year of 24,705 tons a month of a gross value of $423,590.

The chief changes and betterments made during recent months are as below:

### Lead-Smelting Department.

In the lead sampling mill provision has been made for finer crushing, so as to obtain a better product for good roasting. The crushing had been done by a Gates gyratory crusher, one set of Traylor Engineering Co.'s heavy duty rolls 42 in. diameter and 16 in. face, and two sets of lighter rolls by the same manufacturers. Now the light rolls have been replaced by two more sets of the heavy ones.

Conveyor belts are being placed under all lead beds. These will feed direct to the hoppers of the roasters, and so do away with the use of the annual labour that has been necessary for tramming from lead beds to roaster hoppers.

Part of the old Huntington-Heberlein plant building has been taken down, leaving but 175 feet of the old building standing. In place of that removed a wooden building has been erected, dimensions 61x234 ft. The roof trusses are wood with iron tie-rods, making an excellent roof that stands wind and rain and carries the snow of winter. A similar roof at the company's lead refinery building has been serviceable and lasting. An electrically operated Niles 20-ton crane is used in this building; the rails that carry the crane are spaced 58 ft. centres.

Seven Huntington-Heberlein roasters are in use, and preparations are well forward for putting in two Wedge roasters, early receipt of which is expected. Space has been provided for the latter by hydraulicking away a gravel bank, and the firebrick to be used in construction is on the ground. It is intended to have the Wedge roasters in operation late in the ensuing autumn.

There has been a rearrangement of the converter pots, of which there are thirty-six in the building. These have been placed in four rows of nine each, and in convenient proximity there has been erected a large concrete bin in which the roasted ore is collected, being taken to it from the roasters on a steel conveyor. The converter pots are placed below the bin and filled from it and are then lifted to the converter stands by the Niles crane. After its contents have been sintered and cooled, the crane takes the converter pot and drops the sinter hard down on a floor, thus breaking up the large cakes. A Hayward clam-shell bucket, the largest size made, lifts the sinter and dumps it in a hopper that feeds a 24x36 inch Farrel crusher, from which it is taken to bins by a steel conveyor. At the upper end of the conveyor the sinter is passed over coarse and fine grizzlies which eliminate the fines and leave a better product for smelting in the lead blast furnaces. The fines are mixed with fresh roast from the roasters and reconverted.

A gas producer is being installed to provide gas fuel for all the roasters and such other purposes as it shall be found advantageous to use the producer gas for.

A new building has been erected alongside the H. & H. building, for housing the small Roots blower used for the converter pots, and for a centrifugal fan giving 16 oz. pressure. In the upper story of this building are an office for the shift boss, and change and lunch rooms for the men, so that they may be away from the lead dust when eating or resting.

Three new lead blast furnaces are being constructed. Dimensions at tuyeres are 45 by 216 in. They have wrought-iron jackets, with 14 tuyeres; also cast iron jackets with single tuyeres, as at present in use on the old furnaces. Height from centre of tuyere to feed floor level is 17 feet 6 in. These new furnaces will have their feed floor on the same level as that of the copper furnaces instead of the higher level found convenient for hand feeding. With mechanical feeding arrangements, one level for the feed floor of all furnaces, both copper and lead, admits of more economical handling of furnace charges, etc. To provide room for the new furnaces, the main furnace building has been extended eastward by the addition of another bay of about 40 feet, with a lean-to on the south. The lowering of the tapping floor of the lead furnaces by 10 feet below its former level involved the removal of gravel to that depth as a minimum, and this was done by hydraulicking it out to the dump. Meanwhile the feed tracks of the two old furnaces (which are to be taken out), columns of building, etc., had to be held up while the changes were being made and until concrete piers and I-beams had been put in to form a new foundation and substructure.

**Copper Smelting Department.**

In the copper smelting department, the improvements in hand include putting in a conveyor to convey the ore from the copper sampling mill to a stock pile when there is more ore coming from the mill than can at the time be held in the furnace charge bins. A new storage bin has been built, with a tunnel under it. This bin has floor and sloping sides, so that the ore may run into the discharge chutes.

All stock pile floors and bins now have tunnels under them, so that cars for removal of materials may be run in and so be loaded with less labour, the work of shovelling being thus entirely done away with.

In place of the 4-ton motors formerly used there are now two 7-ton electric locomotives for hauling to the charge bins, while larger cars are being made, the intention being that these improvements shall allow of each day's hauling to the charge bins being done in one shift. One of the 7-ton locomotives is also used for hauling cars of lead anodes from the furnace tapping floor to the refinery, instead of by railway locomotive as before.

The copper smelting plant has for some time included five blast furnaces. Of these, No. 2 has been taken out and in its place there has been constructed a 42-in. by 35 ft. furnace with 28 standard tuyeres on each side. This furnace has an arched top and flat flue, the latter arrangement admitting of goosenecks being done away with to allow of putting in a travelling crane overhead for handling purposes on both furnace floors. It is expected that the new furnace will be found to possess such advantages that two similar furnaces, also of 450 tons capacity, will be substituted for three smaller furnaces, thus providing for treatment of 1350 tons of copper ore a day (exclusive of fluxes) in three blast-furnaces.

On the new No. 2 furnace, the water-feed pipes have been so arranged that all valves can be reached from the tapping floor, and discharge pipes so placed that the furnace-man can at all times see what waste water is coming from the jackets. The overflow trough has been made larger and placed farther out, so that no water will spill on to the furnace man when engaged underneath punching the tuyeres. This furnace has centre feed, the charge train being pushed into it by the electric motor, the charge cars running on water-cooled rails on track level. After the tunnels under the charge bins shall have been enlarged, wheels will be placed on the upper part of the charge cars and these will then, while in the furnace, run on rails placed at the proper height.

Crushing and granulating copper matte is not now done here as formerly, so the old plant used for that purpose has been taken out, thus giving more room at the west end of the furnace floor and allowing of a rearrangement of the tracks about No. 1 furnace. All low-grade copper matte is put through this furnace with siliceous ore to raise the copper content and give a matte of 35 to 40 per cent. copper for shipment to works at Tacoma, Washington, for converting.

No copper ore roasting is now done at Trail in the Huntington-Heberlein pots. Copper concentrate only, chiefly from Rossland mines, is sintered on the Dwight-Lloyd machines, the grates of which have been changed from the herring-bone grate previously used to straight slot self-cleaning grates.

**In the Blower Room.**

Blast is delivered to the furnaces at 32 to 34 oz. pressure. Six blowers have been in use—four Roots and two Connersville. Another No. 11 Roots is being added, this to give 401. cubic feet per revolution, and be driven by two 300 h.p. induction motors.

### General Notes.

The pyrite smelting of raw copper matte, commenced in the early part of 1912, has been discontinued at Trail. While this practice was followed the charge consisted of 4,200 lbs. of matte, 2,000 lbs. of siliceous ore, 13.5 per cent. of lime rock, and 4 per cent. of Crow's Nest coke.

The ore treated in the copper smelting department is obtained chiefly from the company's mines at Rossland. An approximate analysis of this ore is:

| Fe. | $SiO_2$ | CaO | $Al_2O_3$ | S | MgO |
|---|---|---|---|---|---|
| 17.0 | 44.0 | 5.5 | 15.5 | 8.0 | 3.5 |

This ore is smelted with 30 per cent. of lime rock and 16 per cent. of Crow's Nest coke.

# NOTES ON ASBESTOS VEINS AND THE MINERAL NEPHRITE

By W. J. Woolsey.*

During a recent study of thin sections made from the serpentines of the Thetford-Danville areas, my attention was attracted by a mineral with characteristics foreign to the recognized components of our asbestos bearing serpentines. In the investigation I had the good fortune to discuss the matter with Dr. Ernst Kalkowsky, director of the Royal Geological Museum at Dresden, who at once recognized the mineral as nephrite; a mineral upon which the doctor is a leading authority, having made an exhaustive study of the deposits in Italy and New Zealand, results of which are included in a †monograph published in 1906.

My purpose in the investigation of these serpentines was to discover, if possible, any new characteristics, and if by chance I might find a thin section which would throw further light on the origin of asbestos veins as discussed in my paper to the ‡C. M. I. in 1910, in which appears a §microphotograph showing an asbestos vein growing from a centre outward in both directions. In Plate M. of this article I append a photo of a thin section from Danville serpentine showing outward growth, I found quite a number of similar examples, but nowhere have I observed any intimation of an asbestos vein crystallizing from the sides inward. This theory of outward growth is now firmly advanced by the German school, and they further hold the opinion that the growth of the fissure is synchronous with the growth of the asbestos vein and caused by its crystallizing force.

Having accepted the theory of outward growth of these veins there still remains the difficult task of harmonizinz it with what is observed in the field. The multitude of asbestos veins found in every deposit show apparently unmistakable evidence of an inward growth of the fibres. In Plate N will be observed an excellent example of one nephrite in the process of crystallizing and if we dare to assume that the presence of this nephrite in the asbestos veins would determine the crystal manner, we would then understand how inward growth is also possible. This would mean that our asbestos veins are to a considerable degree composed of nephrite which, of course, would not be evident by chemical analysis.

**N—Microphotograph of Nephrite vein, magnified 30 times, showing inward growth**

**M—Microphotograph of Asbestos vein, magnified 60 times, showing outward growth**

Since learning of nephrite I have observed it quite plentifully in the Danville deposit, and in the Broughton series, where what was formerly an asbestos vein has been changed to nephrite. In the sections I examined of Thetford serpentine there was no evidence of the mineral, nor have I observed it there in place. In the monograph above referred to, it is held that all or practically all nephrite is derived from serpentine. The Broughton series being older than the Thetford series, and also older than the Danville series, in action of the formation at least, it might be expected to find it more plentiful in this older series.

# THE COAL RESOURCES OF THE WORLD*

This monograph, which is intended to form a companion work to the Iron Ore Resources of the World, published under the auspices of the Eleventh Congress, consists of three quarto volumes of 1,360 pages in all, illustrated by upwards of 175 maps and figures in the text, and accompanied by a 68 page atlas of geologically coloured maps.

The preparation and publication of a Monograph was entrusted by the Executive Committee to a Coal Resource Committee, consisting of G. G. S. Lindsey, convenor; F. D. Adams, R. W. Brock, D. B. Dowling, Charles Fergie, James McEvoy, J. B. Porter, and William McInnes.

The work is edited by Messrs. William McInnes, D. B. Dowling and W. W. Leach, of the Geological Survey.

In the main body of the monograph there are reports on 64 countries, varying in length from over 100 pages for some of the countries with important reserves of coal, to a few pages in the cases of those with less important reserves. The greater number of the reports are in English; ten are in French and six in German. In the Summary of the Reports, which appears in the first volume, all the reports are summarized by editors, in English.

Mr. Brock, the general secretary of the Congress, contributes the preface to the book, in which is explained the conditions under which the publication was undertaken. Attention is called to the very cordial support given by Geological Surveys and other similar departments of Governments throughout the world. Through official sources such as these, the greater part of the information has been gained, although certain very valuable contributions are from the pens of specialists unconnected officially with the fields about which they write, but who were considered to have had unequalled opportunities for the study of these fields. An instance of a contributor of this character is Dr. Noah Drake, who writes on the Coal Resources of China, and whose long university experience in China has given him opportunities which few have had for the study of China's mineral resources.

Owing to the lack of uniformity in the usage of the different countries of the world in regard to the commercial classification of coals into anthracite, bituminous coal and lignite, it was found necessary to adopt an arbitrary classification, which might be used by all and thus make the results more easily comparable. A committee to whom the subject was referred drew up a scheme of classification, dividing the coals into A, B, C, and D groups, with various subdivisions, based mainly on composition and heating value. In this scheme A roughly corresponds to anthracite, B and C to bituminous coal, and D to sub-bituminous coal, brown-coal and lignite. With few exceptions the reports submitted conform to the classification asked for, as they do also to the other requirements regarding the depths to which computations were to be carried and the division of the reserves into actual, probable and possible reserve, though in some cases the information at hand has not been full enough to warrant strict compliance with the specified form on all these points.

In the Introduction Mr. Dowling summarizes the results, dealing first with the distribution of coal in the various geological systems. The range of important fields in the Palaeozoic extends from Lower Carboniferous, in the case of the fields of Central Russia, Scotland and the Arctic Island, through Upper Carboniferous, to which the very large deposits of Western Europe and Eastern America appertain, to Permo-Carboniferous, in which are embraced most of the very extensive fields of China, India and Australia. The Mesozoic, though not so widely spread, contains very important coal basins in Europe, Western America and Asia. The Tertiary contains deposits of importance in most parts of the world, including fields in Central and Western Europe, in Japan, in New Zealand and throughout the great plains region of North America.

The total reserves of the world, compiled from all the reports received, amount to 7,397,533 million tons, of which nearly 4,000,000 millions are bituminous coals, nearly 3,000,000 millions are brown-coals of various grade, and nearly 500,000 millions are anthracite coals. Of the anthracite coals, Asia, with the great Chinese fields, has by far the largest supply of any of the great continental divisions, furnishing 407,637 million tons; in bituminous coals, America, with 271,080 million tons, leads by a great margin, as she does also in the various grades of brown-coals. The world's production of coal for the year 1910 was about 1,145 million tons, so that, though much must be allowed for loss in mining and for areas that for various reasons cannot be economically mined, there still remains many hundreds of years before exhaustion of the supply may be looked for. Taking up the individual countries, however, it is found that in more than one case the end is in sight.

In other tables the reserves of the different continental areas are classified as actual, probable and possible reserve, and in others the reserve of the individual countries are classified in a more particular way, thus Canada is shown to have actual reserves, in million tons:

Nova Scotia, Class B, 2,138; Class C, 50. Alberta, Class A, 668; Class B, 3,209; Class D, 384,908. British Columbia, Class A, 7; Class B, 23,764; Class D, 60; or totals of, A, 675; B and C, 29,161; D, 384,968 million tons; and to have probable reserves in addition of: A, 1,483; B and C, 254,500; D, 563,482 million tons.

The production of Canada at the present time is only in the neighborhood of twelve million tons annually, and though the output may be expected to increase rapidly the figures given above show that actual exhaustion of the supply lies very far in the future.

Following the Introduction is a Summary of the Reports by the Editors. In this a resumé, in English, of each of the extended reports in the volumes is given, together with brief compiled statements regarding a number of countries, including among others Greenland, from which comprehensive reports were not received. Lists are given also of the countries from which statements were received that they have no known coal resources.

The main part of the volumes, comprising 1,266 pages, is taken up by the extended reports received from the different countries of the world which have coal resources in one form or another. A glance over the index is sufficient to show how rare it is in any quarter of the globe, to find a country without fossil fuel of some kind. Volume I. contains reports from the Islands of Oceania, including besides the Australasian Island, the Philippines, Netherlands, India and the Antarctic continent, which is dealt with

*The Coal Resources of the World, an enquiry made upon the initiative of the Executive Committee of the Twelfth International Geological Congress, Canada, 1913. Three quarto volumes and an atlas in colours, 13½ x 19½ inches, bound in heavy paper covers. Morang & Co., Limited, Toronto, Canada.

by the well-known authority, Dr. David; and Asia. Under Asia is a very full report by Dr. Noah Drake on China, supplemented by one covering portions of China in detail and illustrated by 16 figures of different coal fields, by Kinosuke Inouye, of the Imperial Japanese Survey; the reports on China are very valuable contributions to our knowledge of the coal reserves of the world, since each of them contains much information not hitherto published, in the case of the Japanese report containing information acquired by various officers of the Japanese Geological Survey corps; articles by Inouye on Corea, Manchuria and Japan, all illustrated by figures and containing much new information; a very well written paper by H. H. Hayden, director of the Indian Geological Survey, on British India and neighbouring countries, and reports on the Malay States, Siam, Persia, and French Indo-China.

Volume II. contains reports concerning Africa, North, South and Central America, the West Indies, and part of Europe. Under Africa there is a report on the States of the South Africa Union, furnished by the Department of Mines, which contains good descriptions of their coal-bearing Karroo system, which lies upon a glacial conglomerate; and from eight other divisions, including Southern Nigeria, Rhodesia and Belgian Congo. North America begins with a report by J. P. Howley on the coal areas of Newfoundland, which, although they have not yet been exploited, Dr. Howley thinks are worthy of development and constitute extensions of the Nova Scotia fields. The article on Canada, which follows, is furnished by D. B. Dowling, who deals with the coal fields in order from east to west, describing each in turn, and tabulating its actual and probable reserves. Mr. Dowling estimates a total reserve in Canada of all classes of coal of 1,234,269,210,000 metric tons. The fields in the United States are taken up by M. R. Campbell, of the United States Geological Survey. Mr. Campbell estimates that the original content of the United States coal fields, not including Alaska, was 3,225,394,300,000 metric tons, of which up to 1910, 11,220,532,560 tons had been exhausted. Alaska is given separate treatment by A. H. Brooks and G. C. Martin, who consider that the known fields contain nearly 20,000 million tons over half of which is lignite. Robert T. Hill, late of the U. S. Geological Survey, contributes the paper on Mexico.

For Central America, the West Indies and South America, there are reports from Honduras, Panama, Trinidad, Colombia, Argentine and Chile. The chilean fields, which seem to be all of Tertiary age, are described by Miguel R. Machado, and the Argentine fields by E. Hermite, the director of the Argentine Geological Survey.

The rest of Volume II. is taken up with a part of the European reports. Great Britain is treated of by Dr. Strahan, of the British Survey, and Ireland by Grenville A. J. Cole and E. St. John Lyburn. The greater part of the coal is bituminous, and the total possible reserve for the Kingdom is estimated to be 189,534,-749,920 metric tons. The report for Portugal is from the Department of Agriculture, and that for Spain by Luis de Adaro.

France is written off by M. Defline, one of the most eminent of the French corps of Mining Engineers, who estimates for France a reserve of coal of 17,584,625,000 tons, a large part of which is of bituminous grade. The French report is very fully illustrated by a series of geologically coloured maps in the atlas, showing all the principal coal fields of France in detail.

Other papers of exceptional interest in the second volume are those of Switzerland and Turkey; the former for the reason that it presents the case of a country whose resources in coal are almost depleted, the total actual reserve of Switzerland amounting to only 4,000 tons of anthracite and 500 tons of bituminous coal. Turkey, on the other hand, which is dealt with by Leon Dominian, M.E., has very considerable amounts of brown-coal in her Asiatic provinces and deposits of camel-like bituminous coal in the province of Adrianople. Reports from Italy, Greece and Bulgaria complete Volume II.

The 368 pages of Volume III. contain the reports from the remaining fourteen countries of Europe. All these reports are of a most interesting character, and all are the work of most eminent specialists in the various countries to which they refer; Denmark's contribution is by Dr. N. Hartz, that of the Netherlands by W. A. J. M. van Waterschoot van der Gracht, and that of Belgium by Armand Renier, M.E.

Germany contributes a most exhaustive description of the different coal fields of the Empire, written by twelve distinguished geologists, each describing a district with which he is particularly familiar. Very full tables of reserve accompany the German report; summarized, they give for Germany a total actual reserve of 94,865,000,000 tons of Stein coal and 9,314,300,000 tons of brown-coal, with in addition a large probable reserve.

The interesting report on Hungary is by Dr. Ludwig von Loczy and Dr. Charles de Papp, and that for Austria by Dr. Petrascheck, the eminent director of the Austrian Geological Survey; each of these reports is illustrated by maps, that of Austria being accompanied by a very valuable set of coloured maps in the atlas, which have been especially prepared for the work by Dr. Petrascheck. Bosnia and Herzegovina, Servia and Roumania are represented by papers contributed, in each case, by men who are in a position to speak with authority for each country.

Sweden, which has considerable resources in bituminous coal, is described by Dr. Edvard Erdmann. Norway's possible coal reserves, which are confined to some of the northern islands, are dealt with by Dr. Hans Reusch, and the interesting fields of Spitzbergen are the subject of an additional special paper by Bertil Hogbom, who estimates for that island a probable reserve of bituminous coal of 8,750,000,000 tons.

The volume closes with a paper, in English, on the coal fields of Russia, including Russia in Asia. Dr. Th. Eschernyschew, the director of the Russian Geological Survey, who in an introduction summarizes the Russian report, estimates for the Empire a probable reserve of coal of all grades of 239,997,000,000 tons, of which 18,001,000,000 tons are of anthracite coals.

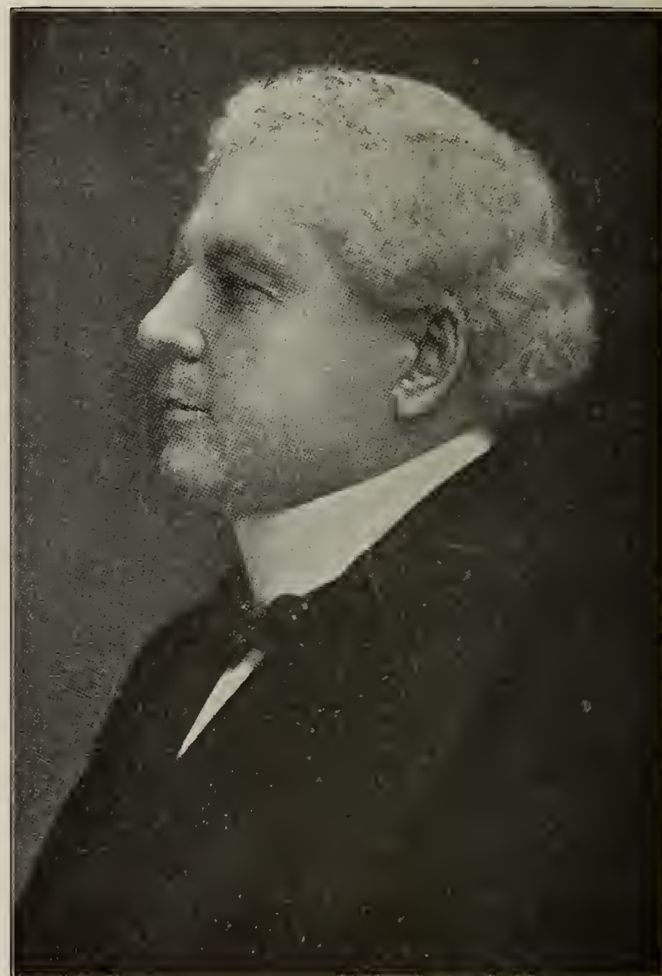
For the purposes of the report, the Russian dominions are divided into thirteen districts, which are described separately, each by an author who has had especial opportunities of studying the particular field he describes. The collation of the information for this report, and the same is true of many reports contained in the volumes, entailed a large amount of field work, undertaken for the special purpose of the investigation, so that the 120 pages devoted to Russia are all of intense interest.

The reports contained in the volumes are illustrated by upwards of 175 maps and figures and by many tabulated statements.

The Atlas, which presents a very bright and attractive appearance, contains 68 pages of maps, most of them in colours. It opens with a map of the world in hemispheres, geologically coloured to show the distribution of Tertiary, Mesozoic and Palæozoic coals throughout the world. Especially noteworthy among the plates are, perhaps, the colonred maps of China, Corea, Manchuria and Japan, those of Austria and of France; the eight maps of the coal fields of Canada and those of Servia, Ronmania and Sweden. The Atlas closes with a geologically coloured map of the island of Spitzbergen.

# ANNUAL REPORT OF THE MINISTER OF MINES FOR BRITISH COLUMBIA FOR 1912

The Annual Report of the Minister of Mines for British Columbia for the year 1912 was issued last month. It fills about 35 more pages than that for 1911, and, generally, is a comprehensive aceount of the progress of the mining industry of the provinee. It shows the mineral production for the year under review to have been of a total value of $32,440,800, as compared with $23,499,072 for 1911 and $26,377,066 for 1910. The comparison with the last mentioned year is the fairer one, for the 1911 produetion was adversely affected by labour difficulties at Crow's Nest Pass coal mines and consequent lessening of output of minerals, while during 1910 conditions were normal.



SIR RICHARD McBRIDE, K.C.M.G.

Premier and Minister of Mines of British Columbia

### Quantities and Value of Production.

The quantities and value of the several products are shown in the following table:

| | |
|---|---|
| Gold, placer | $ 555.500 |
| Gold, lode, 257,496 oz. | 5,322.442 |
| Total gold | $ 5,877.942 |
| Silver, 3,132,108 oz. | 1,810,045 |
| Lead, 44,871,454 lb. | 1,805,627 |
| Copper, 51,456,537 lb. | 8,408,513 |
| Zinc, 5,358,280 lb. | 316,139 |
| Total metallic | $18,218,266 |
| Coal, 2,628,804 tons of 2,240 lb. | 9,200,814 |
| Coke, 264,333 tons of 2,240 lb. | 1,585,998 |
| Miscellaneous (building materials, etc.) | 3,435,722 |
| Total value of mineral production | $32,440,800 |

Summary—

| | | Value. |
|---|---|---|
| Metalliferous minerals | | $18,218,266 |
| Non-metalliferous minerals— | | |
| Coal and coke | $10,786,812 | |
| Building materials, etc. | 3,435,722 | 14,222,534 |
| Total | | $32,440,800 |

In January the Department published a "Preliminary Review and Estimate of Mineral Production" for 1912, in which the estimate of the Provincial Mineralogist, Mr. Wm. Fleet Robertson, was that the total value of the mineral products was $32,606,000. The revised figures show that this estimate was $165,200 in excess of the actual value of the produetion—a quite small amount in comparison with the total, and an evidence of the care taken in endeavoring to ascertain the position before returns had been received from the producing mines. There was variation in totals of value of separate mineral products, the chief of which were an underestimate of that of gold by about $417,000, and an overestimate of that of building materials, etc., by about $814,000. However, the total value, as eventually ascertained, was so near to that given in the preliminary estimate, that the usefulness of having the latter prepared and made available for the information of the public, as had also been done in two immediately preeeding years, was again demonstrated.

### The Statistical Tables.

The various statistical tables included in the report under review give much information to those interested in the mineral production and progress of the mining industry of British Columbia. Table 1 shows the gross value of each of the more important of the minerals produced, and that the aggregate value for all years is $430,137,522, in the following proportions:

| | Value. |
|---|---|
| Placer gold | $ 72,194,603 |
| Lode gold | 70,859,022 |
| Total gold | $143,053,625 |
| Silver | 33,863,940 |
| Lead | 27,520,753 |
| Copper | 73,723,562 |
| Other metals (zinc, etc.) | 1,528,403 |
| Total metallic | $279,690,283 |
| Coal and coke | $132,871,155 |
| Building stone, bricks, etc. | 17,576,084 |
| Total non-metallic | $150,447,239 |
| Aggregate value of production | $430,137,522 |

Table II. shows the value of each year's total production over a period of 20 years—1893-1912. It is seen that the total for 1912 was the highest—by $6,063,734, or 23 per cent, higher than that of the previous highest—of all years in the history of mining in the province.

Table III. exhibits the quantities and value of production for three years—1910, 1911 and 1912—the figures from the last year, shown in the first above-printed table, are taken from this. There was a general increase in production, save only in building materials, as compared with 1911, while comparatively small decreases in lode gold and coal was abundantly compensated for in other minerals, to a net total, as already stated, of more than $6,000,000.

### Production by Districts.

Table IV. exhibits the output of minerals by districts and divisions for three years. Omitting divisions and taking that of districts only for the years 1910 and 1912 for comparison (1911 production not having been normal), the figures are as under:

| Districts. | Value of Production. 1910. | 1912. |
|---|---|---|
| Cariboo | $ 239,000 | $ 268,000 |
| Cassiar | 283,807 | 467,579 |
| East Kootenay | 6,121,832 | 5,723,004 |
| West Kootenay | 5,088,186 | 6,165,255 |
| Boundary | 6,998,519 | 8,716,406 |
| Lillooet | 9,832 | 5,000 |
| Coast | 7,635,890 | 11,095,556 |
| Totals | $26,377,066 | $32,440,800 |

It will be seen that the only decrease worth noting was that of East Kootenay, of nearly $400,000. The largest increase was in the Coast district, which, however, made a gain of only $516,500 as compared with 1911, in which year labour difficulties did not affect this district as they did the Kootenays and Boundary. The increase made by West Kootenay district came from Ainsworth and Slocan in largest amount ($1,160,000), and Trail Creek in smallest ($249,000), against which there was a loss of $294,000 in Nelson division and $38,000 in other parts, leaving a net gain for the district of $1,077,000. Of Boundary district's gain of nearly $1,718,000, about $1,459,000 was in the value of copper produced. More than half of the gain made in Coast district was in copper and the remainder in structural materials.

### Various Mineral Products.

Table V. gives some details of the miscellaneous products included in the year's mineral production, mostly of the various building and other structural materials, such as cement, lime, building stone, rock, sand and gravel, clay products, etc. While these figures are not complete, they are believed to fairly represent the approximate value of those products so far as it has been practicable to ascertain it.

Tables VI., VII. and VIII. are the customary record of yearly totals of placer gold, lode metals, and coal and coke, respectively. An examination of these will show that the total for placer gold was in 1912 the highest for four years; that for lode gold second only to 1910 in all years; that for silver the highest since 1906; that for lead higher than for any preceding year since 1907; while the total value of copper constitutes the highest on record in the province. In coal and coke the figures were the highest yet recorded, except for 1910, when the total for these minerals was nearly $322,000 higher.

Table IX., which is the most elaborate table in the Report, shows details of metalliferous production for four years—1909-1912—and the districts and divisions in which such production was made. Tonnage of ore mined and its metallic contents and market value are also included in this table.

Table X. presents in graphic form the facts shown in figures in other tables, and demonstrates to the eye the growth of mineral production and the fluctuations to which it has been subjected.

### Comparison With Other Provinces.

Table XI. compares graphically the output of certain mineral products of British Columbia with the combined output of similar products in all the other provinces of the Dominion. An analysis of the figures gives the result that British Columbia produces more lode gold, lead and copper than all the rest of the Dominion combined, and is to be credited with nearly 30 per cent. of the value of the coal and coke production of Canada.

### Men Employed in Mining.

A summary of the figures showing the number of men employed in several classes of mines follows:

There were 86 mines that shipped ore in 1912 (51 of them more than 100 tons each), and there were employed in these a total of 3,402 men—1,229 above and 2,173 below ground. The non-shipping mines numbered 96, of which 51 were idle and 45 working; in the latter 435 men were employed—130 above and 300 below ground. The total number employed at metalliferous mines was, therefore, 3,837.

The coal mines gave employment to a total of 7,130, this number including 221 boys among the 6,391 whites, and the following other classes of labour: Japanese 117 and Chinese 622. The proportion employed underground was 5,275, of which 4,952 were whites and only 323 were of other races.

From the foregoing it will be seen that there were employed at metalliferous mines 3,837, and at coal mines 7,130; total, 10,967. It may be taken for granted that men engaged in prospecting were not included, and probably the figures omit as well men employed at smelting works, but of this there is not any mention.

(To be continued.)

## CROWN RESERVE.

Owing to falling off in production from the Carson vein the Crown Reserve Mining Company's profits have been recently much diminished, and it is announced that the 3 per cent. monthly bonus will not be paid regularly in the future. The announcement followed a sensational drop in the market price of the stock.

# CLASSIFICATION OF COALS

By J. M. Gordon, Montreal.

Many attempts have been made to classify coals, but no classification to-day is strictly accurate. A classification very much in use by the commercial man is the classification of coal by the length of flame, but as this can only be comparative we have in different districts the same phrase meaning an entirely different degree of the physical properties exhibited by the coal when under a state of combustion. For example the long flame coals of the North of England are very different from the long flame coals of Scotland. Again flaming coals mined at Aachen (Aix le Chapelle) would, on a Westphalian basis, be classified as dry, and under the same classification the coke coals found in the Saar District would be named flaming coals. The flame depends on the quantity of hydrogen and carbon volatalized. No classification can be formed from a volatile matter basis. This will be seen when the two following Welsh coals are compared. They each have approximately 35 per cent. volatile matter:

| | Carbon | Hydrogen | Oxygen and Nitrogen |
|---|---|---|---|
| *Vivian & Sons, Morfa. | 88.27 | 5.66 | 6.07 |
| Machine rock vein .... | 75.98 | 5.15 | 18.87 |

These coals have the same volatile matter, but are far apart in composition and in calorific value.

These terms apply whether the low agglomerative power of the oxygen or volatile matter content is high or low.

This classification makes no discrimination between a high carbon non-coking coal and a low carbon high oxygen non-coking coal; they are both thrown into the same heap and called sand coals. If there is to be any classification at all, surely it should discriminate between an anthracite coal and a very poor steam coal or lignite. The classification runs as follows:

Combined hydrogen under 2% carbon:

Disposable hydrogen under 4% carbon is a dry or sinter coal, or anthracite.

Disposable hydrogen over 4% carbon, coking coals.

Combined hydrogen over 2% carbon:

Disposable hydrogen over 4% of carbon, difficulty coking gas coal.

Disposable hydrogen under 4% of carbon, non-coking gas and sand coals.

On examination of the above it will be noticed that the properties of coking are attributed in both cases to the coals containing disposable hydrogen over 4% of carbon. This classification cannot be considered accurate since cannel coals will not conform with the rule; neither will some of the Scottish steam coals. Since this classification was drawn up it has been infallably proved that oxygen as a primary base to work on will lead to no true scientific classification. Hilt on grasping this drew up a classification based on volatile matter expressed in percentage of the amount of coke. It reads as follows:

Schondorff's Classification of Coals

| Surface. | Colour. | Coherence. | Schondorff Term. | Sylers Term. |
|---|---|---|---|---|
| Rough like fine sand. | Black. | Entirely pulverulent | Sand coal. | Discretive coal. |
| Rough like fine sand. | Black. | Just coherent flat. | Sintered sand coal. | Semi-accretive. |
| Rough like fine sand. | Black. | Just coherent all over flat, radial cracks in coke. | Sinter coal. | Accretive. |
| Rough like fine sand. | Dull grey | Solid with bud-like projections from surface. | Coking Sinter coal. | Semi-Concretive. |
| Smooth. . . . . . . . . . . | Metallic grey | Solid more or less swollen. | Coking coal. | Concretive. |

In 1865, in Uber die Steinkolen Deutchlands Fleck published a classification, based on combined hydrogen, or in other words, he employed an oxygen basis. As Syler has pointed out this classification is most inaccurate, and to demonstrate this he shows that between the limits of 90 and 93 per cent. of carbon the hydrogen is given at 4 to 4.5, and volatile combustible 10 to 18 per cent., while the statement is made that this coal is lean or anthracite with a pulverulent coke. Actually between these limits are coals carrying from 3.4 to 5.2 per cent. of hydrogen, and from 6 to 24 per cent. of volatile matter. These coals vary from hard coals, which are non-coking to very pronounced coking coals.

Schondorff, who so strongly condemned Greners classification, brought out a classification based on coking properties:

Lean Anthracite coals ..... 5 —10 per 100 of coke
Sinter coals poor in gas....10 —15.5 per 100 of coke
Coking coals .............15.5—33.3 per 100 of coke
Coking gas coals ..........33.3—40 per 100 of coke
Gaseous Sinter coals ......40 —44.4 per 100 of coke
Gaseous sand coals .......44.4—48.0 per 100 of coke

Along with this classification can be taken Gruners' which runs as follows:

*Syler.

**Gruner's Classification of Coals (Exclusive of Lignites) as Regards Their Industrial Value.**

| Names of the Five Types, or Classes. | Real calorific power. | Evaporative power. K. | Percentage composition of the organic constituents. Carbon. | Hydrogen. | Oxygen. | Number of parts by weight of oxygen ,taking the weight of H as 1.* | Weight of volatile matters yielded by 100 parts of coal. | Weight of coke yielded by 100 parts or pure coal. |
|---|---|---|---|---|---|---|---|---|
| 1st Class—Dry coals, burning with a long flame ... | 8,000 to 8,500 | 6.70 to 7.50 | 75 to 80 | 4.5 to 5.5 | 15 to 19.5 | 3 to 4 | 55 to 60 | 45 to 40 |
| 2nd Class—Fat coals, burning with a long flame, or gas coals ............. | 8,500 8,800 | 7.60 8.30 | 80 85 | 5 5.8 | 10 14.2 | 2 3 | 60 68 | 40 32 |
| 3rd Class—Fat coals, properly so-called, or furnace coals................. | 8,800 9,300 | 8.40 9.20 | 84 89 | 5 5.5 | 5.5 11 | 1 2 | 68 74 | 32 26 |
| 4th Class—Fat coals, burning with a short flame, or coking coals .......... | 9,300 9,600 | 9.20 10 | 88 91 | 4.5 5.5 | 5.5 6.5 | 1 | 74 82 | 26 18 |
| 5th Class—Lean (maigre) coals, or anthracites .... | 9,200 9,500 | 9 9.50 | 90 93 | 4 4.5 | 3 5.5 | 1 | 82 90 | 18 10 |

*This amount includes the nitrogen, which Gruner states rarely exceeds 1 per cent. of the organic constituents, but this is rather under the average amount.

The nature and appearance of the coke in the 1st class was pulverulent or at the most fritted; in the 2nd class caked but porous, and very brittle; in the 3rd class caked, moderately compact, and more or less swollen; in the 4th class caked, very compact, but little friable; and in the 5th class somewhat slightly fritted but more frequently pulverulent.

Muck has already disposed of these classifications by shewing that the coals of the Ruhr district do not agree with them, since they contain 10 to 15 per cent. of volatile matter and so would be classified as non-coking coals while they are decidedly coking coals; while again in the Ruhr district coals are mined containing 30 to 32 per cent. volatile matter, which are distinctly long flame bituminous coals, but which would be classified by Gruner as Smith coals. I cannot see where there could be any correlation between coking properties and volatile matter. Generally speaking, the coals found in the Westphalian district in Germany are much poorer in volatile matter per degree of hardness of coke than in most other districts in Europe, while the contrary is to be said about the coals of the Saar district. Below 75 per cent. of carbon Gruner considers the coals no longer bituminous, but lignite. This is quite erroneous, for many of the Scottish carboniferous coals go below this percentage in carbon. Cannel coal does not agree with this classification.

**Andrae Classification of Coals.**

| | Carbon | | Hydrogen | | Oxygen and Nitrogen | | Specific Gravity | |
|---|---|---|---|---|---|---|---|---|
| Anthracite.............................. | 90 | to 95 | 4.5 | to 3 | 5.5 to | 2 | 1.4 | to 1.6 |
| Semi-bituminous .................... | 89 | 92 | 5 | 4 | 6 | 4 | 1.35 | 1.40 |
| Bituminous, clear burning ........... | 88 | 91 | 5.5 | 4.5 | 6.5 | 4.5 | 1.31 | 1.35 |
| Bituminous, flaming ............... | 84 | 89 | 5 | 5.5 | 11 | 5.5 | 1.29 | 1.31 |
| Bituminous, fuliginous .............. | 80 | 85 | 5 | 8.5 | 14.2 | 10 | 1.25 | 1.29 |
| Gaseous.............................. | 75 | 80 | 5.5 | 4.5 | 19.5 | 15.5 | 1.22 | 1.25 |

Like Gruner's classification this one also takes in limits of hydrogen concomitant with carbon. The hydrogen range, like Gruner's, is wrong, so also is the range of specific gravities. For example he allows 1.22 to 1.25 for gaseous coals; that is coals from 75 to 80 per cent. in carbon. He has not taken into consideration the weight of ash, nor will his specific gravities anywhere compare with the Scotch coals ranging about 76 per cent. in carbon lie around 1.29 to 1.31. Here also he makes his minimum of carbon 75, and thus cuts out a large percentage of the coals of Scotland.

The following classification was brought forward by C. Syler:

1. Anthracite Carbon Plane:—
   (a) Ortho-hydrous; H. under 4; Vol. under 9 (5-9) ortho anthracite.
   (b) Per-hydrous; H. over 4; Vol. over 9 (9-15) semi-anthracite.
2. Carbonaceous Plane: C. 93.3-91.2:—
   (a) Sub-hydrous; H. under 4.2 (1) Vol. 7. 7-12; sub-carbonaceous.
   (2) Vol. under 7.7 pseuda anthracite.
   (b) Ortho-hydrous; H. 4. 20-4.45 Vol. 10-14; carbonaceous.
   (c) Per-hydrous; H. over 4.5 Vol. 14.21 semi-bituminous.
3. Hydro-carbonaceous or Bituminous Plane C. 91.2-84.
   (1) Meta-bituminous: 91.2-89.
   (a) Sub-hydrous H 4.5-4.9 Vol. 16-23: Sub meta bituminous.
   H 3.7-4.5 Vol. 10-16 pseudo carbonaceous.
   H under 3.7 Vol. under 10 pseudo anthracite.

(b) Ortho hydrous H. 4.9-5.7 Vol. 23-30.

Anthracite Carbon Plane—

Arthohydrous coals are quite descretive( non-coking) the residue being powdery. Volatile matter is not proportional to hydrogen.

Perhydrous coals: The higher percentage of hydrogen gives this coal no longer the properties of anthracite, but those of a dry non-coking car bonaceous coal.

Carbonaceous Plane—

Orthohydrous coals: Coke partly firm, coherent, or hard and partly in powder. This is what Schondorff calls a sintered sand coal (semi accretive Seyler.) Includes the famous Welsh Aberdare smokeless and some Westphalian Esskohlen.

Sub-hydrous: All these coals are sand or discretive coals, include certain dry steam coals and bastard anthracites.

Perhydrous: The coke is generally well formed near the lower limits of hydrogen the coke is sometimes black, rougher flat or the coal is of the accretive class, like the normal hydrous coals of the carbonaceous plane.

Bituminous or Hydrocarbonaceous Coals: Meta bituminous plane—

Ortho hydrous: This class belongs to Gruners short flame bituminous coal or coke coal proper.

Sub-hydrous: As the hydrogen goes down the coals become almost discretive.

Ortho Bituminous or Ortho Hydrocarbonaceous plane—

These correspond to the true bituminous coals of Gruner. Most of the coking coals of Westphalia belong to this class.

Para Bituminous—

Splint and free burning steam coals; Silkstone of Yorkshire.

Carbo-hydratous—

All coals down to the true lignites.

Exceptions to the correlation of hydrogen and volatile matter are those by Muck of the Pseudo cannies that associate coals in Westphalia.

C. Syler in his classification makes his lowest plane, which he calls carbohydratous, contain from 84 to 75 per cent. of carbon. Everything below this he calls a lignite. It may be pointed out that there are few places in the Scottish carboniferous coalfields in unfaulted zones, or in zones that have not suffered from regional metamorphism, where the coals do exceed 75 per cent. of carbon. Syler has deduced nearly all his facts from South Wales—a coalfield which has suffered a good deal both from dynamic and regional metamorphism. Nor will Syler's classification apply to the Westphalian pseudo-cannels and their associates, some of the Vancouver Island coals, or the Scottish or English cannel coals.

Recently in Canada a classification, called the "Split-Volatile ratio" has been in use. The classes adopted for this method are:

| | |
|---|---|
| Anthracite | 15 |
| Semi-anthracite | 13 —15 |
| Anthracite coal | 10 —13 |
| High carbon bituminous | 6 —10 |
| Bituminous | 3.50— 6 |
| Low carbon bituminous | 3 — 3.50 |
| Lignitic coal | 2.50— 3 |
| Lignite | 1.20— 2.50 |

These figures are derived from a formula concocted as far as I can see on no legitimate hypothesis. As a matter of fact it has a few different forms. As submitted by D. B. Dowling it reads:

$$\frac{\text{Fixed Carbon} \times \frac{1}{2} \text{ Volatile Combustible.}}{\text{Moisture} \times \frac{1}{2} \text{ Volatile Combustible.}}$$

and reads as follows when quoted by Professor J. B. Porter, of McGill in the Investigation of the Coals of Canada:

$$\frac{\text{Fixed Carbon} \times \frac{1}{2} \text{ Volatile Matter.}}{\text{Moisture} \times \frac{1}{2} \text{ Volatile Matter.}}$$

Surely there is a great difference between volatile combustible and volatile matter, also in the present monograph the word volatile alone is used, which has no meaning whatever. As the first is the original, and I presume the correct one, we shall proceed to discuss it. As already mentioned there is no relation between fixed carbon and volatile matter. It is on this point, mainly, that this formula falls down. Secondly, it works on an inadequate, and to my mind practically useless analysis, known as proximate analysis. I have seen it time and time again used without first eliminating the ash and proportioning the other factors, and as the formulae has two factors which have to be added before the ratio is derived, it is a mathematical inexactitude to use the units of the analysis without first eliminating the ash and foreign matter. Few remarks are to be passed on this classification, for it will not apply with the coals in Europe, nor to many of the coals on this continent. For example, take the steam coals in Eastern Fifeshire, in Scotland. Here we are told that there is nothing but lignites if we use the split volatile ratio. A few of the seams are as follows:

| Seams. | Split Volatile ratio. |
|---|---|
| Barn craig tops | 2.30 |
| Barn craig bottoms | 2.02 |
| Coxtool | 2.31 |
| Chemiss splint | 2.07 |
| Chemiss sewel | 2.03 |
| Pilkembare | 1.66 |
| Brankstone | 2.08 |
| Bowhouse | 1.95 |

Charles Clapp, of the Geological Survey, in the Transactions of the Canadian Mining Institute, gave the analysis of a few of the Nanaimo coals. One of the analysis shows the split volatile ratio as 2.92, but he does not adhere to the classification resulting from the formulae, for he calls this coal a "bituminous coal of fair grade," and states that it yields a coke, the character of which is firm and coherent. This coal according to the split volatile ratio is a lignitic coal. Again, in the above quoted publication, a coal mined 200 miles from San Francisco is referred to in a paper by Foster Bain, on the "Fuel Problems of the Pacific." In the discussion of this paper R. V. Norris, of Wilkesbarre, and also by E. W. Parker, of the U. S. Geological Survey, state that this coal contains volatile combustible matter of 50 per cent. and fixed carbon of from 42 to 43 per cent., with low sulphur and ash, and they classify it as "a true bituminous non-coking coal." However, by the split volatile ratio method this coal would be classified as a lignite. Again Dowling's classification does not hold for cannel coal. From experience in different coalfields in various countries in the world, I have come to the conclusion that these abortive attempts to classify and subdivide coal by its chemical analysis is absurd and a useless waste of time. The old method of broadly classifying by physical properties is still the best. An examination of the following list it will be seen that no classification can be formed by chemical analysis:

Cannel coal conforms with none of the chemical classifications, nevertheless it is a true coal. I have seen many cases of splint coal having the same analysis as a steam coal, but yet these coals can never be classified by an engineer under the same heading. The splint coals are mostly microsporaceous while the steam coals, speaking in a wide sense, are megasporaceous; while again the spores of cannel coal are found to have been once highly resinous. This is the keynote for proper classification. The classification of coal cannot be performed in a chemical laboratory, it should be undertaken by the petrographer. Why are certain coals much more open in texture than others which lie within a depth of sixty feet of them, but yet contain practically the same chemical properties, the one being a good steam coal, the other being of practically no use but for household purposes? The petrographer can tell you what a chemist cannot. In Scotland we have the high oxygen long flame coal, while in Yorkshire, Durham and Northumberland we have coals contemporaneously deposited, with a base containing much lower oxygen and is different type of coal. It has been proved that the flora which went to constitute the Scottish fields was generally of a different nature to that of the English fields.

The Scottish coals I mention which are classified by the split volatile ratio as lignite, are judging from their chemical analysis, much poorer than the Belly River lignites of Canada; yet this type of coal is greatly exported to Northern Europe for the purpose of steam raising. In burning the Scottish steam coals you can always see slight belling of dark heavy oils when the coals are on the combustion. This is never seen when burning lignite.

But after all, why all this unnecessary classification? Coal is sold to steam raisers. All they require to know is how many pounds of water can be raised to steam from 212° F., by one pound of coal, and if the coal clinkers. The householder wants a coal that is clean to handle and at the same time has an ash heavy enough to remain in the grate or the ash pan, and not blow about the house. Until a proper petrographical classification is established, I prefer, therefore, to adhere to the old and simple method, whereby costs are known as anthracite, steam, household, cannel, lignite (brown-pitch).

TABLE SHOWING CHEMICAL ANALYSIS OF COALS

| | | C. | H. | O. | N. | S. |
|---|---|---|---|---|---|---|
| 1. | Steam navigation | 92.83 | 3.51 | 2.61 | .21 | .87 |
| 2. | Gas (Cannel) | 89.76 | 6.66 | 3.58 | * | |
| 3. | Gas (Cannel) | 88.50 | 6.11 | 5.39 | * | |
| 4. | Steam | 88.38 | 5.64 | 2.65 | 1.83 | 1.50 |
| 5. | Gas, coke, steam and household | 86.95 | 4.97 | 5.23 | 1.06 | .89 |
| 6. | Gas, navigation and coke | 86.80 | 4.63 | 6.81 | 1.02 | .89 |
| 7. | Gas (Cannel) | 85.81 | 5.85 | 8.34 | * | |
| 8. | Gas (Cannel) | 85.48 | 5.90 | 8.62 | * | |
| 9. | Steam | 85.23 | 5.68 | 5.82 | 1.57 | 1.70 |
| 10. | Gas (Cannel) | 85.20 | 6.17 | 8.63 | * | |
| 11. | Steam | 84.73 | 5.58 | 6.63 | 1.67 | 1.40 |
| 12. | Household | 84.13 | 5.60 | 5.70 | 1.30 | 3.27 |
| 13. | Gas (Cannel) Scotch | 84.03 | 9.15 | 6.82 | * | |
| 14. | Steam navigation | 84.01 | 4.96 | 8.78 | 1.30 | .95 |
| 15. | Steam | 83.95 | 5.24 | 8.17 | 1.51 | 1.13 |
| 16. | Household and gas | 83.89 | 5.95 | 7.56 | 1.79 | .81 |
| 17. | Household | 83.58 | 6.79 | 8.17 | 1.42 | .06 |
| 18. | Steam navigation coking | 83.16 | 5.12 | 9.33 | 1.28 | 1.11 |
| 19. | Household | 82.87 | 5.73 | 8.67 | 1.18 | 1.55 |
| 20. | Household | 81.71 | 6.30 | 7.20 | 2.27 | 2.52 |
| 21. | Navigation | 80.42 | 5.95 | 11.32 | .52 | 1.79 |
| 22. | Steam | 80.22 | 5.55 | 10.07 | 2.51 | 1.65 |
| 23. | Gas Cannel (Scotch) | 79.61 | 11.24 | 9.15 | * | |
| 24. | Gas Cannel (Scotch) | 78.44 | 8.90 | 12.66 | * | |

*Including nitrogen and sulphur.

## ASBESTOS ROOF STOPS CONFLAGRATION.

The ability of asbestos roofing to resist fire and check the progress of a blaze was again demonstrated by a fire which broke out in one of the sheds of the Export Lumber Company, Charlestown, Mass.

Due to the high wind blowing at the time, sparks and burning embers fell on the highly inflammable roofs of buildings for a radius of a quarter of a mile around. The result was a score of small fires that gradually grew until several acres were ablaze at one time.

The fire burned its way from the sheds of the Export Lumber Company to a large storehouse which is covered with asbestos roofing manufactured by the H. W. Johns-Manville Co. Falling embers and sparks had no effect on this roofing.

# PERSONAL AND GENERAL

Mr. Henry E. Allen, for four years silver mining in Mexico, left that country recently and is now at Victoria, B.C.

Mr. J. P. Keene, for several years manager of the Cariboo gold mine and stamp mill, in Camp McKinney, B.C., is now directing development work at the Wonderful silver-lead mine, near Sandon, Slocan district.

Mr. J. P. McFadden, formerly of Michigan, is now superintendent of the Surprise silver-lead mine, near Cody, Slocan, British Columbia.

Mr. J. W. D. Moodie, vice-president and general manager for the Britannia Mining and Smelting Co., Ltd., has returned to Britannia Beach, Howe Sound, B.C., from a trip to Montana and Utah.

Mr. John E. Rinta, after ten years' active connection, as foreman and superintendent successively, with the Rambler-Cariboo silver-lead mine, Slocan, B.C., has been appointed manager in successor to Mr. W. E. Zwicky, resigned.

Mr. Charles Graham, of Middlesboro, Nicola Valley, B.C., superintendent for the Nicola Valley Coal and Coke Co., has been appointed superintendent for the Corbin Coal and Coke Co., which is operating a coal mine at Corbin, Crow's Nest district, South-east Kootenay, also in British Columbia. He expected to take up his new duties about the middle of August. Mr. Robert Fairfoull, who has been overman at the No. 2 mine, Middlesboro colliery, is his successor as superintendent for the Nicola Valley Company.

Mr. W. M. Brewer, of Victoria, B.C., has gone to the Bridge River section of Lillooet district to investigate mining conditions there for the British Columbia Department of Mines. Mr. Donald G. Forbes is similarly engaged in the Coast district of that province.

Mr. H. H. Johnson, of London, is on Vancouver Island, B.C., where he is preparing to operate a copper property, to be known as the Ptarmigan mine.

Mr. Ralph S. G. Stokes was in Vancouver, B.C., recently.

Mr. W. P. Alderson, formerly in the metallurgical department at the Hollinger mine, Porcupine, is now general manager of the Motherlode Sheep Creek Mining Co., at Sheep Creek, Nelson mining division, B.C.

Mr. Ben Hughes, of Cobalt, was in Toronto last week.

Mr. Roy E. Margenau, instructor in metallurgy at the Michigan College of Mines, has accepted a position with the Buffalo Mines Co. at Cobalt.

Mr. A. A. Cole, of Cobalt, is in Toronto attending meeting of the International Geological Congress.

Mr. Ralph Scott, of the Dome Mines Company's staff, has been appointed mine engineer.

Mr. J. Swent has joined the engineering staff at the Murray mine in the Sudbury district.

Mr. H. Portis, who was for some time on the staff of the Jacobs Asbestos Mining Company at Thetford, is now in Chicago.

F. J. Jordan, manager of Moose Mountain Iron mine, visited Cobalt and Porcupine with the A3 excursion of the Geological Congress.

Dr. J. M. Bell is in Toronto.

Norman L. Bowen, formerly connected with the Bureau of Mines, Ontario, and now on the staff of the Geophysical Laboratory at Washington, D.C., is in Toronto for the Congress meeting.

Dr. H. S. Sjogren, the prominent Swedish authority on iron ores, visited the Moose Mountain iron mines with the A3 excursion.

Among those who visited the Quebec Asbestos mines on the A5 excursion this month were: Hans Arlt, Germany; Karl Boden, Germany; O. B. Boggild, Denmark; Leon H. Borgstrom, Finland; T. C. Denis, Canada; J. A. Dresser, Canada; L. L. Fermor, India; Mrs. L. L. Fermor, India; H. Frechette, Canada; S. McL. Gardner, Scotland; George Gurie, Germany; R. Harvie, England; R. E. Hore, Canadian Mining Journal; Jas. Howley, Newfoundland; Mark Hurll, Scotland; J. McG. Hurll, Scotland; J. P. Krusch, Germany; Andrew Lawson, U.S.A.; A. Mailhot, Canada; Dr. C. Palache, U.S.A.; Dr. Fred Von Grote, Germany; O. A. Welter, Germany; E. Wigglesworth, U.S.A.; J. E. Wolff, U.S.A.; Berkey, U.S.A.; Bain, U.S.A.; P. Fabrega, Spain; C. Kido, Japan; R. B. Murray, England; Dr. Edgar Wherry, U.S.A.; H. B. Wallis, England; P. Zoude, Belgium; A. G. B. Wilbraham, England; B. Weigand, Germany. Mr. T. C. Denis, Superintendent of Mines for Quebec, and Mr. J. A. Dresser, geologist for the Lake Superior Corporation, were the leaders, and they made the excursion a very interesting one.

H. B. Wallis and A. G. B. Wilbraham, mining engineers of London, England, were members of the Sudbury-Cobalt-Porcupine excursion, and will go west to the Pacific Coast and up to the Yukon after the Toronto meeting.

Among the members of the A3 excursion who visited the Kirkland Lake gold fields last month were Bedford McNeill, president, and A. G. Charleton, past president, of the Institution of Mining and Metallurgy.

## OBITUARY

Mr. Thomas G. Procter, managing director of the Lucky Jim Zinc Mines, Ltd., operating the Lucky Jim mine, near Bear Lake, Slocan district of British Columbia, was killed near his home at Oak Bay, in the vicinity of the City of Victoria, late on the night of July 9. He had taken the last car from the city and immediately after stepping off the car was struck by a passing automobile. When lifted to the sidewalk he was still alive, but expired before the arrival of the doctor a short time afterward. Mr. Procter was born in Lancashire, England, in 1862, and at the age of 14 years joined the British navy. Several years later he left the navy service and came to America where, in the middle Western States, he for some time was engaged in cattle ranching. In 1891 he went to the Kootenay district of British Columbia, with which he has since been actively connected steadily increasing his interests in the country and taking a prominent part in the development of its varied interests. During a long period of residence in Nelson, he did much to promote the advancement of that town, while his efforts were also directed toward the profitable utilization of the chief resources of Kootenay district—mining, lumbering, and the clearing and cultivation of land. He was one of a number who did much work and spent much money in developing mineral claims in Ainsworth and Slocan mining divisions of West Kootenay, and up to the time of his death he continued his activities in that direction. About two years ago he removed his office to Victoria and made his home in the neighbouring suburb of Oak Bay, paying frequent visits to Kootenay from the coast. Among numerous other affiliations, he was a member of the Canadian Mining Institute, and was one of the western members who attended its semi-annual meeting held in Victoria last September.

# SPECIAL CORRESPONDENCE

## PORCUPINE, SWASTIKA AND KIRKLAND LAKE

**Plant for Porcupine Crown Mine.**—All the machinery for the cyanide plant at the Porcupine Crown is on the ground, and the management confidently expects to have the enlarged plant running in six weeks' or two months' time. This will give it a capacity of about 100 tons per day.

Ten more stamps have been added. The concrete work for twenty stamps was finished at the time the first section was built, so that the other ten stamps had only to be erected, the building enlarged, and the cyanide plant added.

The present ten stamp mill is treating about 65 tons per day. During July it was making an extraction of 82 to 87 per cent., and with cyanidation it is confidently expected to bring that up to 95 per cent. at least. The ore is more free milling than at the Hollinger. Ore taken from development right across the drifts has run about $22 per ton. The July cleanup amounted to $25,000.

Plans for a refinery have been drawn, and the plant at the Porcupine Crown will be very complete by the time the snow falls.

**The Lucky Cross Mine at Swastika has shut down** in order to make alterations and repairs to the mill. It is also probable that there will be a change in the management. Just before closing down the richest shoot of ore ever encountered in the mine was opened up on No. 9 vein at the 100 foot level. The vein in the face of the drift is three feet wide and is full of free gold. Tests show the presence of telluride. This is the first indication of this mineral nearer than Kirkland Lake. The vein has been drifted on for about fifty feet and has shown consistent values, but it was not until the last shoots were put in a little while before closing that the high grade was encountered.

**Schumacher Opens a Good Ore Shoot.**—What promises to be one of the most important strikes of the year in the Porcupine camp has been made on the property of the Schumacher mine. At the 100 foot level the vein is five feet wide. Of this three feet is very high grade ore and two feet of $10 ore. It had at the beginning of the month been drifted on for twenty feet, and the face was as good as where the vein was first struck. Work at the Schumacher mine was last year hindered by an unfortunate accident, which made it impossible to drift further towards the lake on the 100 foot level. There was a change of mine management and Mr. Joe Houston counselled diamond drilling. This was one of the veins from which good cores appeared in the drill.

**Jupiter Mill.**—Owing to various reasons it has been decided to delay the building of the Jupiter mill. It will not be built this year. The working staff, which was at one time this summer the fourth largest in camp, will be reduced and underground development will proceed at a normal rate of progress.

**The McIntyre** has struck its vein at No. 5 shaft, 45 feet below the 200 foot level. The ore is said to be of an excellent grade. This will now provide another point from which the new mill can be supplied with ore. It is proposed to build an aerial tramway across Pearl Lake from No. 4 shaft.

**The Hughes Porcupine** is now sinking to the 400 foot level. About fifty feet of drilling has been done both ways from the winze. At the 300 foot level the vein is still good.

**Burnside Property.**—A rich but small vein has been found on the south lot of the Burnside property at Kirkland Lake. This claim adjoins the Wright-Hargraves property. The vein is not more than an inch wide on the surface, but the fissure has been traced for fifty feet and some very rich specimens have been taken out.

**Exploring Party Returns from Hudson Bay.**—Another party has returned from the east shore of Hudson Bay without finding either placer gold or precious stones. The party left Cochrane early in May and went to Rupert's House and their proposed destination via the Harricanaw. They arrived back in Cochrane at the end of July. While disappointed at the failure of the expedition, the members are optimistic as to the possibilites of the country as a field for exploraton.

**Vipond Mine.**—There is a possibility that the Vipond mine may be started up again shortly. It is understood that all outstanding debts have been met and that the shaft will be dewatered soon and work commenced. The mine has been shut down since the fall, when the strike disorganized labour.

**The Teck-Hughes** vein at the 100 foot level of that Kirkland Lake property has been cut and shows good high grade ore. It was found sixteen feet from the conglomerate porphyry contact. It is fourteen inches of typical Kirkland high grade ore. The shaft was put down on the vein, but it dipped out at about forty feet. A winze will now be sunk on the ore and the vein followed down to the 200-ft. level. As the vein on the surface has been traced and stripped for a thousand feet on the Teck-Hughes and the Wettlaufer, with good values on the surface, the strike at the 100 foot level seems significant.

**Tough-Oakes Finds More Ore.**—In cutting the station at the 100 foot level of the Tough-Oakes mine an additional four inches of high grade ore was encountered about nine feet from the main vein. A station and ore pocket is now being cut at the 200 foot level, and the shaft will be carried down with all despatch to the 300 foot level. Five claims in Teck and Lebel township, in which Mr. C. A. Foster has a controlling interest, have been incorporated into the Tough-Oakes Gold Mines, with a capitalization of $3,000,000, in 600,000 shares, with a par value of $5. Four hundred and fifty thousand shares have been paid to the original holders for the claims and 50,000 shares will be offered to the public at $4 a share in order to finance the building of a mill.

## COBALT, SOUTH LORRAIN, GOWGANDA AND ELK LAKE

### Concentration Methods at Cobalt.

At the reception given to the A3 excursion of the International Geological Congress by the Cobalt branch of the Canadian Mining Institute, Mr. Fraser Reid, of the Coniagas, gave a most interesting resume of the development of the concentration of Cobalt ores. Mr. Reid, as a patentee of a table that is making a marked gain in saving, was very competent to give this paper. He has been in charge of the Coniagas mill since its building, and has watched the various processes for the reduction of the ore as they were evolved. Mr. Reid is a graduate of Queen's, and had the distinction also of being one of the pioneers of the Cobalt camp. He has done much to bring the process of straight concentration to its present efficiency in the camp.

He stated to the visitors that to-day the camp has 500 stamps in operation, with a dropping weight of 625,000 pounds and roll mills to the equivalent of 150 stamps, giving a total dropping weight if all were stamps of 800,000 pounds of metal.

About 75 per cent. of the total ore milled is crushed by stamps, the stamps being in favour owing to the hardness and toughness of the ore, and simplicity and reliability of it as a crushing device.

After describing the process of straight concentration in detail, Mr. Reid said that up to the latter part of 1912 the cyanide process played a minor part in the recovery of silver. But with new additions to the Dominion Reduction mill and the advent of the Nipissing low grade mill the process had now become a more important factor in the production of the camp.

Amalgamation is employed in three mills, the Nipissing and Buffalo high grade mill treating high grade ore and concentrates, and the Dominion Reduction treating concentrates only. These mills recover the values in the form of marketable bullion. Amalgamation does not play any part in the recovery of values from the low grade ores.

There were thirteen mills in the camp using straight concentration, three using cyanide as an adjunct to concentration, the Buffalo mill cyaniding the slimes only, the Dominion Reduction and the O'Brien, which reground the sand tailings from the concentration process and cyanided the whole. One mill only, the Nipissing low grade, used an all sliming cyanidation process.

An analysis of the total silver production of the camp would show approximately the following figures: recovered by sorting underground, about 50 per cent.; recovered by preliminary treatment in mills, 20 per cent.; recovered by mechanical concentration after stamping, 17 per cent.; recovered by cyaniding, 13 per cent.

The ratio of concentration by mechanical concentration averaged 37 tons of ore to one of concentrates.

Mr. Reid also described lucidly the process in vogue at the Nipissing low grade and at the O'Brien mill, giving them as instances of divergence from the general practice in the camp.

Mr. A. A. Cole, now recognized as the authority on the statistics of the Cobalt camp, also gave an example of his versatility in exhibiting slides of veins underground. In their photographic perfection and completeness these are probably unique, and the visitors were delighted with the graphic nature both of the slides and the description Mr. Cole gave of them.

### Reception Appreciated by Geologists.

As indicative of the appreciation the geologists felt for the treatment they received at the hands of the local committee and the Cobalt mine owners, the following letter received by the committee speaks for itself:

"We, the undersigned members of the Twelfth International Geological Congress, wish hereby to tender and express to the local committee members, Messrs. E. V. Neelands, A. A. Cole, B. Neilly, Fraser Reid and Chas. Watson, our hearty appreciation and thanks for the thoughtfulness, hospitality and executive ability which have made so remarkably effective and delightful our visit to Cobalt, under the leadership of Dr. Miller, the godfather of the district. We beg to express also to the managements of the Coniagas, Crown Reserve, Beaver and Timiskaming mines and of the Nipissing high grade mill, and to the ladies, our appreciation of the cordial reception, worthy of so uniquely prosperous a mining district."

**Lumsden Mine.**—A twenty ton car of high grade ore from the Lumsden mine, now being treated at Campbell and Deyell's, is interesting, inasmuch as it is the first ore shipped from this property. Most of it has been stored for some time. The Lumsden property is controlled and very largely owned by Mr. John Lumsden, of Ottawa. It is situated on Brady Lake, adjoining the Rochester and the Badger, and is separated by one claim from the Timiskaming and the Beaver, the only two other producing mines in this portion of Coleman township. Short shoots of very rich ore have been found on the Lumsden property from time to time, and this has been taken out as it has been found. This is the ore that is now being shipped. It came from the 250 and 300 foot levels. Three drills are working on calcite veins, on the 225, 250, and 300 foot levels. While these veins have yielded some high grade ore, they now show only low values in silver.

**Orion Realty Company's Ore Seized.**—An unusual occurrence was witnessed in the camp this week, when a car of concentrates belonging to the Orion Realty Company was seized to pay debts. The car was valued at $11,000. The Orion Realty Company was working the old Silver Cliff property on a lease, but ran out of funds. The car has since been released and has gone to the smelters.

**Hudson Bay Output for June.**—Owing to the fact that operations at the Hudson Bay mine have necessitated the handling of much waste rock, the heads at the mill ran as low on an average as 20.20 ounces to the ton. This, of course, did not include high grade. The reduction for the month of June was 42,814 ounces, the ore concentrated amounted to 2,096 tons, mill heads, 20.20 ounces to the ton, tails, 3.60 ounces to the ton, extraction, 82.70 per cent.; ore crushed in 24 hours 77.6 tons. A fire during the last week in July destroyed the engine house at the Hudson Bay, and the output for that month will therefore be lower than usual, as operations had to be suspended. The Hudson Bay is one of the many Cobalt companies seeking new mining ventures. They are now stripping a vein on a property in Beattie township near Painkiller Lake, with a view to taking a working option on it if the vein fulfils expectations. They have, however, finally abandoned their claims at Hangingstone Lake, near Gowganda. They are starting work on some claims of their own staking at Kirkland Lake.

**The June Mill Report of the Buffalo Mines Reads:** Mill ran, 610 hours; ore milled, 5,955 tons; average assay per ton before milling, 31.15 ounces; ounces silver recovered, 161,331; ounces of silver paid for during the month, 33,621 ounces.

**The Mapes Johnston Mining Company,** working near Elk Lake, has bought the plant of the Montreal James, also an Elk Lake property, but long shut down. This fall the Mapes Johnston intend to open up their property on a larger scale, all working being carried on by hand so far.

# STATISTICS AND RETURNS

### Cobalt Ore Shipments.

The ore shipments for the week ending August 8th, with the classifications, are:

| Mine. | High. | Low. | Pounds. |
|---|---|---|---|
| Coniagas | 4 | 0 | 337,120 |
| Cobalt Townsite | 1 | 0 | 61,500 |
| Trethewey | 1 | 1 | 92,083 |
| McKinley | 2 | 0 | 129,500 |
| Cobalt Lake | 1 | 0 | 64,200 |
| Seneca Superior | 1 | 0 | 62,500 |
| Casey Cobalt | 1 | 0 | 45,000 |
| Timiskaming | 1 | 0 | 61,330 |
| Miscellaneous | 1 | 0 | 79,000 |
| Total | 13 | 1 | 932,233 |

The shipments from the Cobalt camp, for the year to date, are:

| Mine. | High. | Low. | Tons. |
|---|---|---|---|
| Bailey | 5 | 1 | 158.15 |
| Beaver | 8 | | 237.43 |
| Chambers-Ferland | 3 | 4 | 223.77 |
| City of Cobalt | 4 | | 105.14 |

314-15 People's Nat. Bank Building - - Scranton, Penn.

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

# BUYERS AND SELLERS OF METALS

## ALPHABETICAL INDEX TO ADVERTISERS

# The Canadian Miner's Buying Directory.

**malgamators—**
Canadian Allis-Chalmers, Ltd
Fraser & Chalmers, Ltd.
Krupp, Fried. A. G., Germany.
Northern Canada Supply Co.

**ssayers and Chemists—**
Milton L. Hersey Co., Ltd.,
Campbell & Deyell, Cobalt Ont.
Ledoux & Co., 99 John St., New York.
Thos Hayes & Son, 124 Yonge St. Toronto.

**ssayers' and Chemists' Supplies—**
C. L. Berger & Sons, 37 William St., Boston, Mass.
Lymans, Ltd., Montreal, Que.
Stanley, W. F. & Co., Ltd.
John Davis & Sons.
Peacock Bros.
Consolidated Optical Co.

**all Mills—**
Canadian Allis-Chalmers, Ltd
Fraser & Chalmers, Ltd.
Peacock Brothers.
Mussens, Limited.
Krupp, Fried. A. G., Germany.
The John Inglis Co., Ltd.

**Beams—Steel—**
Canadian Allis-Chalmers, Ltd.
Dominion Bridge Co. ... ...
Krupp, Fried. A. G., Germany.
Mussens, Limited.

**Belting—**
Canadian Allis-Chalmers, Ltd
Mussens, Limited.
Northern Canada Supply Co.
Jones & Glassco.
Canadian Fairbanks - Morse Co., Ltd.
Federal Engineering Co., Ltd.

**Blasting Batteries and Supplies—**
Canadian Allis-Chalmers, Ltd.
Thomas & William Smith.
Can. Ingersoll-Rand Co., Ltd.
Curtis & Harvey (Canada), Limited.
Mussens, Limited.
Northern Canada Supply Co.

**Blowers—**
Canadian Allis-Chalmers, Ltd
Fraser & Chalmers, Ltd.
Krupp, Fried. A. G., Germany.
Mussens, Limited.
Northern Canada Supply Co.

**Boilers—**
Canadian Allis-Chalmers, Ltd
E. Leonard & Sons.
Fraser & Chalmers, Ltd.
International Engineering Works, Ltd.
John McDougall Caledonian Iron Works Co., Ltd.
Waterous Engine Works Co., Ltd.
Jenckes Machine Co.
Canadian Fairbanks-Morse Co., Ltd.
Mussens, Limited.
Peacock Brothers.
Northern Canada Supply Co.
Canadian Ingersoll-Rand Co., Ltd.
The John Inglis Co., Ltd.

**uckets—**
Canadian Allis-Chalmers, Ltd.
Peacock Bros.
M. Beatty & Sons, Ltd.
Waterous Engine Works.
Mussens, Limited.
Jenckes Machine Co.
Northern Canada Supply Co.

**Building—Steel Frame—**
Dominion Bridge Co.
Canadian Allis-Chalmers, Ltd

**Cable — Aerial and Underground—**
Canadian Allis-Chalmers, Ltd.
Fraser & Chalmers, Ltd.
Northern Canada Supply Co.

**Cableways—**
Canadian Allis-Chalmers, Ltd
Fraser & Chalmers, Ltd.
M. Beatty & Sons, Limited.
Mussens, Limited.
Jenckes Machine Co.

**Cages—**
Fraser & Chalmers, Ltd.
Jeffrey Mfg. Co.
Jenckes Machine Co.
Mussens, Limited.
Northern Canada Supply Co.

**Cables—Wire—**
Standard Underground Cable Co. of Canada, Ltd.

**Cars—**
Jeffrey Mfg. Co.
Canadian Fairbanks Co.
Mussens, Ltd.
Northern Canada Supply Co.
Jenckes Machine Co.
Peacock Bros.

**Cement Machinery—**
Canadian Allis-Chalmers, Ltd
Krupp, Fried. A. G., Germany.
Mussens, Limited.
Northern Canada Supply Co.
Peacock Bros.

**Chain—**
Jeffrey Mfg. Co.
Peacock Brothers.
Jones & Glassco.
Mussens, Limited.
Canadian Fairbanks-Morse Co.
B. Greening Wire Co., Ltd.
Northern Canada Supply Co.

**Chemists—**
Canadian Laboratories.
Campbell & Deyell.
Thos. Heys & Son.
Milton Hersey Co.
Ledoux & Co.

**Coal—**
Dominion Coal Co.
Nova Scotia Steel & Coal Co.

**Coal Cutters—**
Canadian Allis-Chalmers, Ltd.
Jeffrey Mfg. Co.
Sullivan Machinery Co.
Can. Ingersoll-Rand Co., Ltd.
Peacock Brothers.
Mussens, Limited.

**Coal Mining Explosives—**
Curtis & Harvey.

**Coal Mining Machinery—**
Can. Ingersoll-Rand Co., Ltd.
Fraser & Chalmers, Ltd.
Peacock Brothers.
Jeffrey Mfg. Co.

**Coal Punchers—**
Sullivan Machinery Co.
Canadian Ingersoll-Rand Co., Ltd.

**Coal Washeries—**
Jeffrey Mfg. Co.
Mussens, Limited.
Peacock Brothers.

for

## Mining Service

Designed for severe exacting service by engineers of wide experience and built in new especially equipped shops by skilled mechanics.

We build all regular types in standard sizes up to 6000 cubic feet per minute.

Let us talk Compressors and Rock Drills with you! We promise to be interesting. Write, wire or 'phone our nearest office.

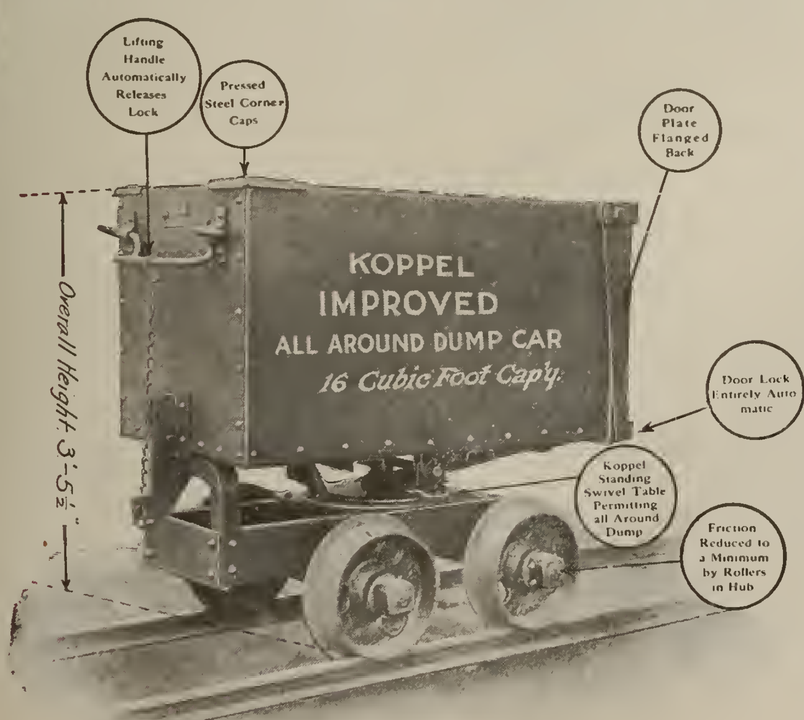
# Koppel Improved Type of All Around Dump Car



This type of car is especially adapted for mine service.

The swivel table permits all around dumping. It is a very easy running car as the friction is reduced to a minimum by rollers in the hubs of the wheels.

We construct these cars for 12 and 16 cu. ft. capacity and for 18 or 24 inches gauge. They are carried in stock at Koppel, Pa.

Our catalogue on "Koppel Railways in Mines" will be of interest to you.

## GENESIS OF BUTTE COPPER ORES

Mr. Reno H. Sales has prepared for the Butte meeting of the American Institute of Mining Engineers a very thorough description of the ore deposits at Butte, Montana. The general geology of the district, structural features, rocks, rock alterations, superficial alterations of the veins, ground-water, mineralogy of the veins, the ores, vein systems and genesis of the ores are discussed. The paper is accompanied by a series of instructive maps, which show the structural relations of the veins and fissures, important areas of rock alteration and distribution of ore shoots.

The origin of the deposits is believed by Mr. Sales to have been in the granite magma.

"The original source of the ores at Butte was the granite magma. Quartz-porphyry dikes formed a local closing phase of the igneous activity connected with the intrusion of the parent rock, and these dikes structurally and areally are in such close association with the ore deposits that they appear to be a direct factor in the localization of the ores. Heated waters and gases escaping from the cooling magma were the carriers of the metals to their place of deposition. The elements thus transported and deposited in the veins were cilicon and oxygen as $SiO_2$, sulphur, iron, copper, zinc, manganese, arsenic, lead, calcium, tungsten, antimony, silver, gold, tellurium, bismuth and potassium. Small quantities of potassium are believed to be added to the granite in the sericitization process. Other elements, as sodium, calcium, and manganese, were undoubtedly carried by these solutions, but, as shown by analyses, they were extracted from the granite in the alteration process instead of being added as in the case of the first-named elements.

"The chemical composition of these ascending waters varied in significant particulars as the process progressed. The granite wall rock was decomposed, furnishing much sodium, calcium, and possibly magnesium to the solution. Iron was also freed from the iron minerals of the granite to form pyrite with the sulphur of the invading waters. These interchanges affected the solvent capacity and character of the ore-bearing waters by the subtraction of the acid radical sulphur and the addition of alkaline radicals. While hydrogen sulphide and acidic conditions may have prevailed at the initial stages of ascent, the waters would tend to become alkaline through interaction with the wall rock. Along circulation channels, however, this action would gradually become less pronounced after a barrier built of sericitized granite had been formed bordering the fissures, thus protecting the solutions from further reaction with the fresh granite, and permitting the acidic conditions to ascend to higher horizons. Also, the earliest vein minerals, chiefly quartz and pyrite, would tend to insulate the solution from the granite. And finally, increasing alkalinity of the solutions and lower temperature would lessen action on the granite at points further removed from the central source.

Applying the above reasoning to the facts of ore occurrence, it is found that chalcocite as a primary mineral is the latest important copper sulphide of the ores; it is, moreover, found only in association with the highly altered phases of the granite. From these facts the conclusion may be drawn that under the geologic conditions existing in Butte, the more acidic conditions were necessary for the deposition of this mineral. Similarly, enargite is associated with highly sericitized granite, and is therefoie believed to have been deposited only under certain conditions pertaining to the temperature and relative alkalinity of the solution.

"Sphalerite, rhodochrosite, and galena are increasingly abundant toward the intermediate and peripheral zones, suggesting their formation under lower temperature conditions with relative high alkalinity. Quartz and pyrite are everywhere present, and evidently are formed under all conditions. Pyrite is more abundant in the central and intermediate zones than in the peripheral zone. Quartz is more prominent as a gangue mineral in the peripheral zone than elsewhere.

"Structurally there is no good evidence for distinct periods of mineralization in the Butte veins. It is here held that there was but one period of mineralization, varying in intensity, possibly, from time to time, with important changes in chemical character of solutions. But the mineralogical difference in vein material of the central, intermediate, and peripheral zones can be adequately explained, it is believed, by the reasoning herein set forth, which assumes that the copper mineralization indicates high temperature and acidic conditions versus lower temperature and alkaline conditions as the solutions migrated toward the peripheral fractures now represented by the manganese-silver veins.

"Concerning the formation of chalcocite there is much geologic evidence, mainly structural, to support the theory above outlined, which assigns to this mineral a primary origin from deep-seated waters."

The subject of chalcocite formation is of exceptional interest and is given special treatment by Mr. Sales. He does not agree with Mr. Weed, who considers the Butte chalcocite to be secondary.

"W. H. Weed has set forth some facts which, in his opinion, tend to prove the secondary origin of the Butte chalcocite. He observes generally that the old quartz-pyrite veins were originally of very low grade and they became commercially valuable through the later addition of enargite, bornite, chalcocite, and other copper minerals. He believes that this copper mineralization followed various periods of faulting, the enargite and bornite being the first to appear, probably contemporaneous in a general way with the Blue and Steward fault system. Chalcocite, which forms the bonanza ores of the district, is thought by him to have been almost entirely a product of descending sulphide enrichment processes, acting at great depths, however, only where the older quartz-pyrite veins were crackled and broken by faults, thus permitting a ready passage for the downward-seeping waters. He cites many examples of such intersections of faults and older veins in support of this view, and maintains that the old quartz-pyrite veins are workable only where thus fractured.

The writer's own observations do not confirm Weed's conclusions as above outlined. Actual examination of a great many intersections of old quartz-pyrite veins by later faults have shown conclusively that as a general proposition the east-west veins are no richer at or near intersections with Blue vein faults than at other points along the vein except in cases where the fault vein ore shoots cross the older vein. It is extremely difficult to form even an approximate idea as to the extent of primary enrichment in the older veins due to the late faults of the Steward system. Mineralization processes were active in the early veins prior and subsequent to the Blue vein period, so that it is impossible to determine, in the absence of any characteristic minerals, what influence was exerted by the later faults upon the older veins. As might be expected, the fault vein intersections are usually accompanied by a breaking and shattering of both the older vein and the country rock in the immediate vicinity, thus developing favourable factors tending to greatly influence ore deposition at such points. In any case, where a chalcocite enrichment of a vein of the Anaconda system is shown to have resulted from the influence of an intersecting fissure of the Blue or Steward system there remains the strong probability that such enrichment is due to primary waters, if, as believed by the writer, the primary chalcocite was deposited in great quantities, after the appearance of these faults, not only within the faults themselves, but in the fractured older veins."

## ASBESTOS MINING

The Black Lake, Thetford and adjoining districts in the Eastern Townships of the Province of Quebec, produce about 90 per cent. of the world's supply of asbestos. The industry is a large one; but of late years the financing in connection with the merging of several of the companies has brought it into well deserved disrepute. Overcapitalization accompanied by over production of the mineral, brought trouble to both those who were responsible for the manipulation and to those who were conducting their business on a sensible basis. The market did not absorb the uncalled for increase in production, and prices fell to unnatural low levels, when buyers discovered that the sellers were over-stocked.

Reorganization and saner methods of conducting the business have happily resulted in bringing the industry recently into a much improved condition. A good and steadily increased demand is being found for asbestos. New uses are being found for the lower grades, which are more difficult to dispose of than the long fibre. To-day the mines are busy and the outlook is bright. It is to be hoped that the lesson has been learned. Naturally the industry should become yearly a larger one. The reserves of mineral are enormous, and the uses are rapidly increasing.

# SUDBURY-COBALT-PORCUPINE EXCURSION

Continued from Aug. 15th Issue

The A3 excursion train of the International Geological Congress arrived in Cobalt Sunday evening, July 27th. In the morning a trip was made on foot to visit exposures in the vicinity of Cobalt and Cart lakes. The first stop was made at the Little Silver mine, where one of the first discovered veins has been worked out. The old workings give a very good idea of the structure of the silver deposits, and of the sedimentary rocks, which comprise the Cobalt series. A narrow vertical vein has been removed by mining just enough of the rock to allow the rich ore to be taken out. It was worked before concentrators were available, and only high-grade ore was saved.

The rocks in which the opening was made are, in ascending order, a well laminated mud rock or argillite, a gray quartzite and a massive conglomerate, containing pebbles of numerous types or rock, granites being especially noticeable. The Cobalt series has usually some conglomerate below the argillite, but the exposure in Little Silver cliff does not show the lowest part of the series. A photograph of the exposure was reproduced in the August 1st issue of the Journal. Near the base of the hill there is a fault displacing the vein a few feet to the south.

A short distance from the Little Silver vein, close to the T. and N. O. railway track, exposures were then examined, which show the conglomerate which forms the base of the Cobalt series lying on Keewatin rocks. All such exposures were critically examined by those interested in the origin of the Cobalt conglomerate, and proved productive of much discussion on the probable glacial age in Huronian times.

### The Provincial Mine.

The party next visited the Provincial mine, where Dr. Miller told of Ontario's experience in the mining business. At the time when silver was first discovered at Cobalt, a large section, known as the Gillies' limit, lying south of the Nipissing property, was not open to prospectors. The Government had sold to lumbermen the timber on this property, and it was not considered fair to the purchasers to allow prospectors to work there until the timber had been removed. Owing to its location, the northern portion of the timber limit was considered very valuable mining property, and the problem of disposing of it properly became a vexatious problem. The Government decided to prospect on its own account, and in 1906 Dr. Miller, the Provincial Geologist, was given charge of the work. Much of the area was found to be of little value, but finally a very promising vein was discovered. Having assumed the role of prospector, the Government now undertook to do some mining, and the then inspector of mines, Mr. E. T. Corkill, was given charge of the mining operations. Some rich ore was taken out; but the development work showed that the deposit was much leaner at depth, and the mine was never a large producer. The Government then sold the mine and several adjoining lots by tender, and went out of the mining business.

From the Provincial the party proceeded along the shore of Cart lake. On the rock dumps at the south end of the lake, the conglomerate was found to be not strongly cemented and pebbles were easily freed from the matrix. Numbers of them were examined for possible glacial markings, and a general discussion of the causes of striations on pebbles ensued.

### Diabase Contracts.

The party next visited an old adit driven in at the base of Diabase mount at the contact of the diabase sill, with the underlying argillite. Dr. A. C. Lane was especially interested in this exposure, and took several specimens of diabase from measured distances to study from the standpoint of his theory of the grain of rocks.

The party then turned north to Peterson lake, where Dr. Miller pointed out exposures of diabase lying on the older rocks near the west shore of the lake. The several exposures give unmistakable evidence of the sill-like character of the diabase mass.

### Exposures on the Nipissing Property.

In the Keewatin rocks, Mr. Knight pointed out lawprophyre dikes, which have a decidedly conglomerate appearance, owing to the enclosure of numerous fragments of lighter coloured rocks.

A large portion of the Nipissing property has been washed clean of debris, and presents numerous excellent exposures of Huronian and Keewatin rocks. Near the pumping station on Cobalt lake, some of the party were shown excellent exposures of ripple marked quartzite overlain in places by thinly laminated argillite, and in other places by argillite containing numerous large boulders, some of which lie almost immediately upon the ripple-marked surface. The most evident explanation here is that the conglomerate has been formed under water in which fine silt and sand were accumulating while icebergs dropped numerous boulders.

### Visits to Timiskaming, Crown Reserve and Coniagas Mines.

In the afternoon, the party was divided into three groups, and the Timiskaming, Crown Reserve and Coniagas mines were visited. At the Timiskaming a rich shoot of ore has recently been taken from the diabase, which here underlies the Keewatin rocks. The 650-foot level was visited to allow examination of this vein.

At the Crown Reserve mine some typical high-grade veins were seen, and Mr. Cohen gave some account of the development of this wonderful property, which until recently has paid over $1,000,000 yearly in dividends. The mine has produced at the end of last year 15,227,143 ounces of silver, and promises to make a further very large production, though the production from the Carson

**AT COBALT, ONT.**

**Examining the wall rocks of the Little Silver vein Nipissing mine**

vein during the past few months has been very dissappointing. It is planned to drain the lake this summer, to allow of recovery of ore under Kerr Lake. The necessary preparations are now being made, and it is expected that in two months after the pumps are started, the water will have been removed.

After coming up from the mines the members were entertained by Mrs. Cohen at Crown Reserve, and Mrs. Rogers at the Coniagas. Tea was served, and a very pleasant half-hour was spent before returning to the train.

In the evening the local branch of the Canadian Mining Institute, tendered the visitors a reception at Massey Hall. Mr. A. A. Cole described some of the characteristic features of the silver veins, illustrating his talk by projected views of some of his excellent underground photographs. Mr. Fraser Reid presented a much appreciated paper on the treatment of the Cobalt silver ores. Chairman Neelands called upon some of the visitors for a few remarks. Mr. Chas. McDermid, Secretary of the Institute of Mining and Metallurgy; and Mr. G. A. J. Cole, Director of the Geological Survey of Ireland, commented on the remarkable richness of the Cobalt mines, and were pleased to have an opportunity of thanking the citizens of Cobalt for the splendid reception accorded the excursionists.

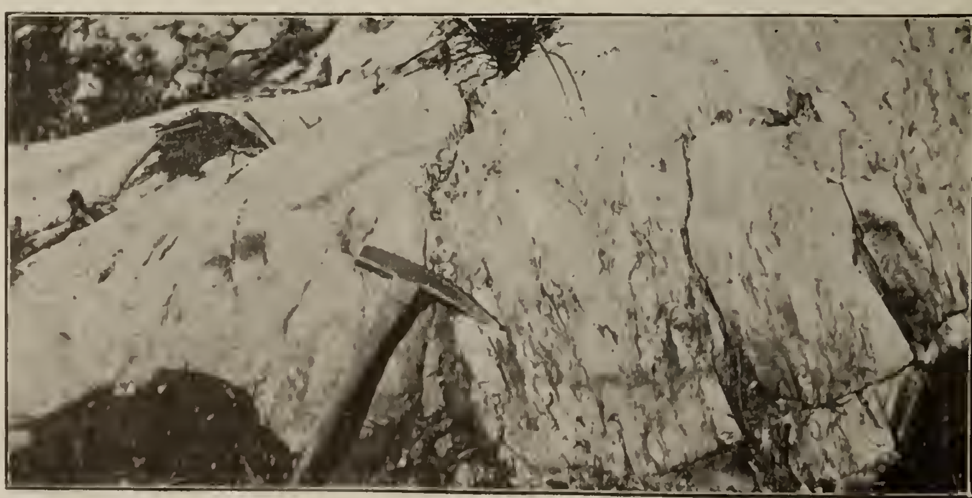
Refreshments were then served, and dancing concluded a very much appreciated evening's entertainment.

On Tuesday morning those who had visited the Timiskaming and Crown Reserve, went underground at the Coniagas mine. Here the best example of the mode of occurrence of the silver ore was seen. The party was conducted through the stopes, and saw the numerous thin but rich vertical veins in the sedimentary rocks. The method of mining these was described in the August 1st issue of the Journal.

### Nipissing High Grade Plant.

While some were underground at the mines others were taken through the remarkable plant in which the high-grade silver ore of the Nipissing mine is so successfully treated by a combined amalgamation-cyanidation process which will be described in a later issue of the Journal.

In the afternoon the train proceeded to Haileybury, and a steamer trip was taken down Lake Timiska-



**AT DOME MINE, PORCUPINE; ONT.**

**Contact of ellipsoidal Keewatin greenstone, at left, with Timiskaming conglomerate, at right.**

AT DIXON MINE, PORCUPINE, ONT.

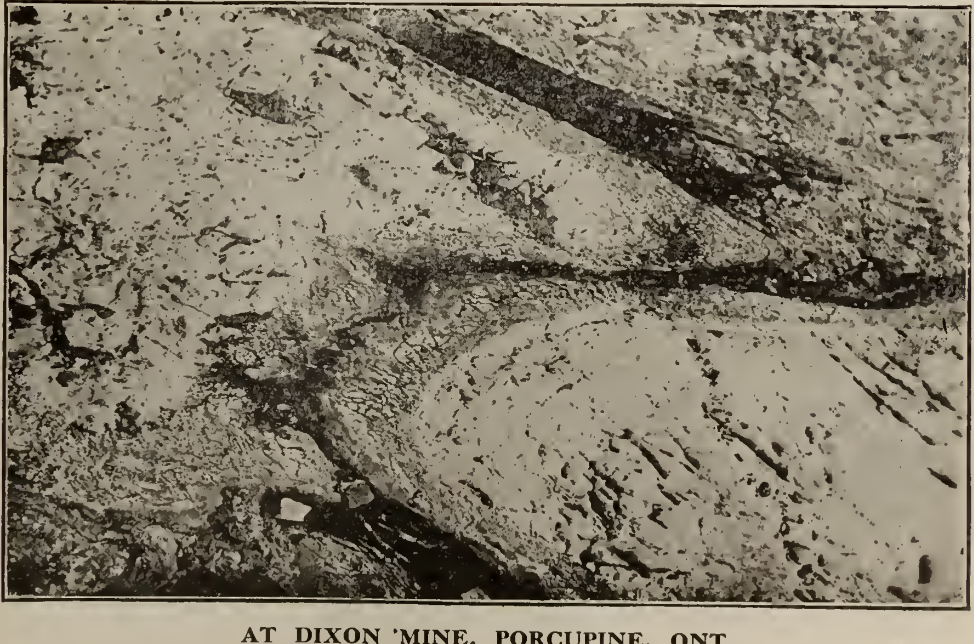
An outcrop of ellipsoidal Keewatin greenstone.

ming. Several exposures near the shore were examined, and the sail on the lake proved very enjoyable.

### Visit to Kirkland Lake.

While the greater number were on the lake, fifteen members of the party went on by special train to Swastika to see the recently discovered gold deposits at Kirkland lake, described in the July 15th issue of the Journal. At the station, Mr. Foster had stages awaiting the party. The road has been only recently made and is not yet completed, and the visitors were able to see a Northern Ontario mining camp in the making. The first few miles are fairly good for a new road, but for some reason the work has been discontinued about one mile from the Tough-Oakes mine, and is almost impassable for loaded wagons. The visitors, however, were men used to rough tramping, and were much pleased with their journey out. It offered an excellent opportunity to judge of the character of the country in which the new finds have been made and presented some of the difficulties to be encountered by those who are opening up the district.

The property was reached late in the afternoon, and Messrs. Foster, O'Connell, and Hotchkin aided Mr. Burrows, who is making a geological study of the district for the Ontario Bureau of Mines, in pointing out the geological features. The veins and the country rock were closely examined, and many interesting specimens obtained. In the article published in the July 15th issue, the writer called attention to an abundance of black graphitic material in the ore. Mr. Foster stated that analyses show this to be partly, and perhaps wholly, molybdenite. Specimens were obtained, which show the characteristic features of this mineral, and Dr. Walker suggested that some of the black graphitic looking material may be a mixture of molybdenite with crushed rock. Mr. Chas. Spearman stated that tests on some of the material showed



AT DIXON MINE, PORCUPINE, ONT.

Keewatin greenstone showing ellipsoidal structure characteristic of submarine volcanic rocks.

**AT HOLLINGER MINE, PORCUPINE, ONT.**

**The A 3 party visiting the large quartz outcrop where the gold was discovered in 1909.**

molybdenite in some cases and graphite in others. Another feature which attracted considerable attention was the character of the tellurides which occur in the ore. Mr. Foster stated that in some material analyzed by Messrs. Campbell and Deyell, of Cobalt, it was found that none of the gold occurs as telluride, but that some native gold is mixed with lead telluride. Some of the party collected specimens which they consider to be tellurides containing gold, and Mr. Spearman stated that he has obtained gold, silver and lead globules on roasting some clean particles of the minerals. He believes that the ore contains a telluride containing all three metals.

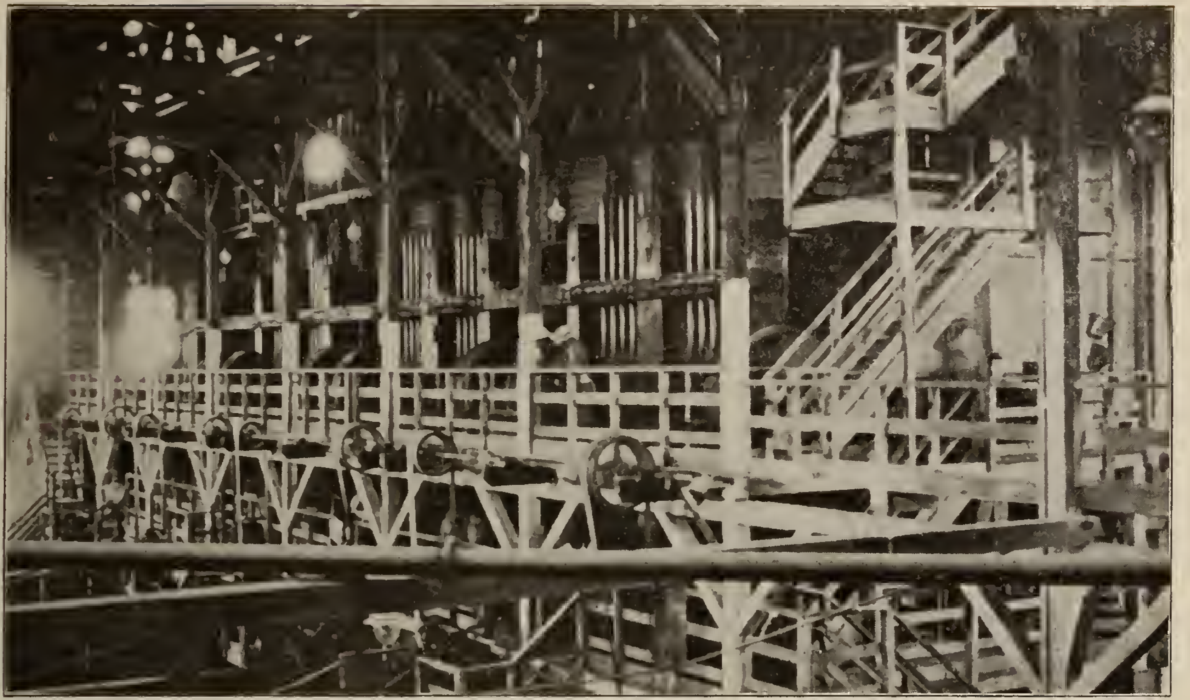
After examining the outcrops on the Tough-Oakes property, a visit was made to the Burnside property, where similar ore was seen. At the Burnside a shaft is being sunk on a recently discovered vein. It is a dark-gray vein a few inches in width, enclosed in gray conglomerate similar to that on the Tough-Oakes property. The vein, so far as opened, is nearly vertical and apparently conforms to the bedding of the conglomerate. It varies much in thickness, and is in places very rich.

About 8 p.m. the much interested visitors were reminded that they had not yet had supper, and were invited to partake of the hospitality of a Northern Ontario mining camp. A splendid meal was furnished by the Tough-Oakes company, and was done full justice to. At its conclusion, Mr. Bedford McNeill in a few words presented the hearty thanks of the party, and Mr. Foster in reply, stated that all Canadian mining men were pleased to have such visitors, and wished them a pleasant and interesting visit to the other mines.

Immediately after supper the party was taken underground to see the No. 2 vein at the 100-foot level. The cutting of a station here has exposed the vein well and gave a good opportunity for examination. In cutting into the hanging wall, another thin vein of good ore has been recently exposed.

Without going to the bottom of the mine, the party returned to surface and started for Swastika. The

**Breaking down gold quartz in open pit, Dome Mine, Porcupine, Ont.**



The 8 Stamps, Hollinger Mill, Porcupine, Ont.

first mile's walk in the dark over the unfinished portion of the Government road, gave the foreigners some new sensations and brought to those familiar with the district vivid recollections of the Porcupine trail, as it was in 1910. Without serious mishap, the party reached Swastika before midnight, and about an hour later were picked up by the excursion train and taken on to Porcupine.

### Dome Mine.

On Wednesday morning we looked out on the blackened tree trunks and scorched ground north of the Dome mine. The train was later run in close to the mine workings, and the mine officials joined Mr. Burrows in conducting the party over the property. First the rich ore, known as the "golden stairway," was examined. The most spectacular surface showing of gold has been removed, not by members of the party; but similar coarse gold was seen by descending a few feet into a raise which has been brought to surface in the rich ore.

The party then visited the open pits, where there are numerous excellent exposures of gold quartz and wall rocks. The irregular shape of the large quartz masses and intricate structure of the veins was pointed out by Mr. Burrows and the mine officials.

Mr. Burrows then conducted the party to several exposures near the mine, where the contact between the Dome conglomerate and the underlying Keewatin rocks can be seen. As pointed out by the writer in the October 15, 1910, issue of the Journal and in a paper presented at the 1911 meeting of the Canadian Mining Institute, the conglomerate is quite unlike that in which the silver veins at Cobalt occur. It seems to overlie the Keewatin greenstones, and may be either a sedimentary series of late Keewatin time or of early Huronian, or, as suggested by Dr. Coleman, may perhaps be not properly correlated with either Keewatin or Huronian. Mr. Burrows and Dr. Miller correlate it with similar rocks near Cobalt, and call the series of which it forms a part the Timiskaming series. They

Ellipsoidal Keewatin greenstone, Porcupine, Ont.

**AT DOME MINE, PORCUPINE, ONT.**

**Examining "golden stairway" vein**

S. Cerulli-Irelli, Italy; F. L. Ransome, Washington; Fred Searls, Nevada; A. G. Burrows, Toronto; H. F. Bain, California; A. C. Lane, Mass.

do not assign it definitely either to Huronian or Keewatin.

The writer in order to locate its position with relation to the Huronian series in Michigan, would correlate the Timiskaming with Lower Huronian, and the Cobalt series with Middle Huronian. There is, however, a possibility that the Timiskaming is considerably older than any of the known Huronian.

The Bureau of Mines geologists have found according to their published reports plenty of evidence that the Timiskaming series is older than the Cobalt series and younger than the Keewatin greenstones; but do not consider that there is sufficient evidence on which to correlate these series with those of the original Huronian area.

After Mr. Burrows had pointed out the exposures showing the relationships of the rocks and the character of each series, the mine officials took some of the party underground, while others inspected the mill and cyanide plant.

Much of the ore thus far milled at the Dome mine has been broken down in open pits, drawn off at the 45-foot level, trammed by mules to an inclined shaft, and thence hoisted to the surface. Here it is crushed and then elevated to the mill bins.

At the 100-foot level the deposit has been extensively blocked out by drifts and cross cuts as at the 45-foot level. It is not intended to hoist the ore from deep levels up the inclined shaft, however. The vertical No. 2 shaft, now about 300 feet deep, will be made the

**AT THE EDGE OF OPEN PIT, DOME MINE, PORCUPINE**

H. S. A. Sjogren, Sweden; P. P. Piatnizky, Russia; H. F. Bain, California; J. J. Barrell, New Haven.

main hoisting way, and the ore will be trammed on surface from this shaft to the mill.

After a busy morning at the Dome mine, the party boarded the train and was taken to Timmins. Immediately after lunch Mr. Burrows conducted the party to the numerous exposures on the Miller-Middleton, Hollinger and Dixon properties. The characteristic features of the ore deposits were pointed out and typical rock types were examined. Some excellent exposures of Keewatin greenstones showing ellipsoidal structures were shown on the Dixon property.

Having viewed the surface, the underground openings at the Hollinger and McEnaney were then examined. At the Hollinger a great deal of work has been done, and the party was conducted through a

**Head frame at Tough-Oakes Mine, Kirkland Lake, Ont.**

maze of drifts and cross cuts, in which splendid exposures of the gold quartz and enclosing rock were seen.

The most common wall rock of the ore-bearing veins is a fine grained gray rock, composed largely of sericite, carbonates and quartz. It is largely secondary and is probably an alteration product of quartz porphyry or feldspar porphyry. Considerable interest was evidenced by those who examined this rock, as its original character has been almost entirely obscured by secondary changes. Mr. Knight in his early work in the district, described it as probably an altered quartz porphyry, and the writer in a paper on the nature of the ores and rocks presented at the 1911 meeting of the Canadian Mining Institute, confirmed Mr. Knight's observation.

Having visited the underground workings, the party was then conducted through the Hollinger mill and cyanide plant. The process of treatment was described by the guides. The officials of the company did much to explain all that was seen on the surface, underground and in the mill, and the courtesy was much appreciated. Before leaving the property, the visitors were invited to view the mine maps and a glass model of the workings which is now being constructed.

### At Temagami.

During the night the train was moved down to Temagami. The morning was spent in a delightful sail down the lake to Temagami Inn and Bear Island. At Bear Island there is a Hudson's Bay Company post and an Indian village. Much interest was manifested in the Indians, some of whom were found at their tents making moccasins, curing hides, etc. An amusing little bear cub, belonging to Chief White Bear, attracted great attention, and one of the Toronto ladies with no great difficulty induced her husband to purchase it as a mascot for the Congress. During the afternoon, most of the geologists were busy examining outcrops in the vicinity of Temagami; but the natives gathered around a well known explorer, who was amusing himself and spectators on the station platform with his new-found pet. When the train started south, the pet, labelled "a bear called Congress," was in a box addressed to 14 Walmer road.

While the bear was being looked after at the station, Dr. Miller and Mr. Knight were conducting members of the party to exposures of the jaspilite, which forms the ridge paralleling the northeast arm of Lake Temagami and to exposures of the contact of Huronian conglomerate with the underlying Keewatin schists. These exposures, of some of which photographs may be seen in the Journal of Geology, 1910, were examined especially with a view to obtaining evidence of the origin of the conglomerate. Dr. Ransome electrified one group of searchers by finding what appeared to be a glaciated surface under the conglomerate; but which was soon found to be quite similar to a lower surface in the Keewatin rocks, and probably smoothed by a slipping action at the contact. Similar exposures were pointed out further south by Mr. Knight, and much discussion of the principles of sedimentation was brought out by the examinations. Most of the party seemed to be of the opinion that the deposits are glacial. Some, however, including Dr. Miller, hesitated to accept this view until more evidence has been found. At Doherty, Mr. Knight pointed out an excellent exposure of the conglomerate lying on granite and containing large boulders of the latter. Similar exposures occur a few miles west at Herridge lake.

The examination of the basal conglomerate concluded what every member of the party voted a very interesting and instructive excursion. The trip was admirably arranged and carried out and a vote of thanks to leader, guides and secretary, proposed by Mrs. Tyrrell, was heartily seconded. The railway men also received much well deserved praise for the manner in which the train was handled.

From Temagami the party proceeded to Ottawa, where, joined by members of A1 and A2 excursions and several new arrivals, a day was spent as guests of the citizens of Ottawa, the Dominion Government and the Geological Survey. On Saturday the members were entertained at Montreal by the Montreal local committee. The splendid reception accorded to the visitors in these two cities has been recorded elsewhere in this issue.

# MILLING PRACTICE IN COBALT CAMP*

By Fraser Reid.

In the first three years of the life of the camp, there was practically no attempt made to recover the values locked up in the low-grade ore. A large percentage of the ore was sacked underground and the balance hoisted to the surface and washed, the high-grade being hand sorted, the low-grade going to the dump. Later sorting houses were operated. Here the ore passed over a grizzly, the resulting fines averaging 125 ounces being shipped direct to the smelter. The oversize passed on to a bumping table where the first-class ore of from 2,000 to 4,000 ounces, and second-class ore averaging around 400 ounces to the ton were sorted out by hand and the discards with a value of from 15 to 30 ounces went to the low-grade dump. It was this rapidly accumulating low-grade product that caused the mine operators considerable concern and in the fall of 1907 the first concentrator in the camp started to operate on this low-grade ore. It was a five-stamp mill, built and operated by the McKinley-Darragh Mining Co., and had a capacity of from 12 to 15 tons per day.

Shortly after this the Coniagas Mill started, with a capacity of 60 tons per day; then followed the Buffalo, Cobalt Central and others, until today we have seventeen mills in operation, with a total daily capacity of 2,000 tons, producing silver at the rate of 14,000,000 ounces per year, or nearly 50 per cent. of the camp's present production.

To-day the camp has 500 stamps in operation with a dropping weight of 625,000 pounds and roll mills to the equivalent of 150 stamps, giving a total dropping weight (if all were stamps) of 800,000 pounds of metal.

The general practice in the camp is to hand-sort the high-grade ore in the mine as closely as possible and send the remainder containing a portion of vein matter to the mill. Here it is crushed in breakers, sized, and given a preliminary treatment on jigs and reciprocating tables and in some cases further hand-sorting is resorted to. This preliminary treatment before fine crushing usually yields from 30 to 50 per cent. of the total values milled and practically means the recovery of vein matter. The wall rock containing finely disseminated minerals and fine leaf silver passes on to the regrinding machines for further reduction and concentration.

About 75 per cent. of the total ore milled is crushed by stamps, the stamps being in favour owing to the hardness and toughness of the ore and the simplicity and reliability of the stamp as a crushing device. The stamps in some cases are followed by tube mills. The remaining 25 per cent. of ore is crushed in rock breakers, further reduced by rolls or their equivalent and finally ground to the desired size by Chilian or Hardinge mills.

In straight concentration mills this re-ground material is classified, the sands treated on Deister, Wilfley or James tables and the slimes on James and Deister slimers or Frue vanners.

In some mills the tailings from the slimes are re-treated on canvas tables, when a further recovery at a profit is possible.

Up to the latter part of 1912 the cyanide process played a minor part in the recovery of silver, but with new additions to the Dominion Reduction mill and the advent of the Nipissing low-grade mill, this process has now become a more important factor in the production of the camp. Owing to their complex nature, the cyaniding of Cobalt ores presents unusual difficulties, and it is in this field that the greatest advances have been made in the development of new processes.

These are of sufficient importance to warrant fuller discussion and will be referred to presently.

Amalgamation is employed in three mills, the Nipissing and Buffalo high-grade mills treating high-grade ore and concentrates, and the Dominion Reduction treating concentrates only.

These mills recover the values in the form of marketable bullion, thus dispensing with smelting.

Amalgamation does not play any part in the recovery of values from the low-grade ores.

In the treatment of low-grade ores in this camp two processes are used, mechanical concentration and cyaniding, some idea of their relative importance may be gained from the following considerations. There are thirteen mills in the camp using straight concentration. Three use cyanide as an adjunct to concentration, namely, the Buffalo mill, cyaniding the slimes only, and the Dominion Reduction and O'Brien, which re-grind the sand tailings from the concentrating process and cyanide the whole.

One mill only, the Nipissing low-grade, uses an all-sliming cyanidation process after stamping.

An analysis of the total silver production of the camp would show approximately the following figures.

Recovered by sorting underground about 50 per cent.

Recovered by preliminary treatment in mills, 20 per cent.

Recovered by mechanical concentration after stamping, 17 per cent.

Recovered by cyaniding, 13 per cent.

The ratio of concentration by mechanical concentration averages 37 tons of ore to 1 of concentrates.

In an all-sliming and cyanidation process below the stamps the ratio of concentration ranges from 500 to 1,000 tons of ore to one ton of bullion according to the richness of the stamp discharge.

The complex nature of Cobalt ore has developed two processes of importance which are a distinct departure from the general hydro metallurgical treatment of gold and silver ores.

Early in the history of the camp, Prof. S. F. Kirkpatrick, of Queen's University, undertook some experiments on the cyanidation of Cobalt ore. He found the ore as treated by him fairly amenable to cyanidation, but found that zinc as a precipitant had a great tendency to foul the solution and produce a bullion below the market standard.

He finally tried aluminum as a precipitant. This had been discovered and patented by Moldenhauer, who claimed that not only was it a satisfactory precipitant for silver, but that it re-generated the cyanide in chemical combination with silver.

Moldenhauer used the aluminum in the form of plates, which soon became coated with aluminum hydroxide and the action was seriously retarded and the process was consequently impracticable.

*Paper read at a reception to visiting geologists at Cobalt July 28.

Professor Kirkpatrick substantiated all the claims of Moldenhauer and made the process commercially successful by using aluminum in the form of dust. This aluminum percipitation process has been very successful, as it leaves the solution unimpaired and gives a marketable bullion.

It is now in use in the O'Brien mill, the Deloro smelter and, in a slightly modified form, in the Nipissing mill and the Buffalo high-grade mill.

The other process referred to is the de-sulphurizing process, as worked out by Mr. J. J. Denny, resident metallurgist of the Nipissing mine, and is in operation at the Nipissing low-grade mill.

This mill represents the very latest practice in the cyanidation of silver ores, and is a credit to the Cobalt Camp in general and in particular to Mr. R. B. Watson general manager of the Company, to the metallurgical staff, and to Mr. James Johnston who designed and erected the plant.

The details of this process have not yet been made public and are, therefore, not available, though we trust they will be in the near future.

This can be said, that by this process refractory silver compounds such as sulph-antimonides, which are with great difficulty dissolved by the ordinary cyanide process are broken up and desulphurized and rendered readily soluble. This process not only increases the extraction, but shortens the time of treatment.

The importance of this discovery may be realized when it is said that the process is equally applicable to the cyaniding of refractory gold ores.

The process, therefore, marks a distinct advance in the art of hydro metallurgy and will undoubtedly be generally used in the treatment of refractory gold and silver ores.

In conclusion, I might say that I have not attempted to touch on the relative efficiencies of the different mills, as this is a very delicate question and is as complex to the mill man as the origin of ore deposits is to the geologist.

# THE INFLUENCE OF DEPTH ON THE CHARACTER OF METALLIFEROUS DEPOSITS

By J. F. Kemp.

Modern improvements in the art of mining have made possible the sinking of shafts to greater depths. The copper mines on Keweenaw Point, Lake Superior, have several which exceed 5,000 feet and a larger number between 3,000 and 4,000 feet. The deepest of these shafts attains the lowest point beneath the earth's surface yet reached by man himself, but as is generally known, the drill, although not in search of metals, has gone 1,500 or more feet deeper. We are thus learning by actual observations the mineralogical conditions at increasing depths and also the effect of depth upon values.

The questions thus raised have three sides, all of much interest. On the one side is the actual engineering problem of deep mining. Assuming that ore maintains values such as we customarily obtain to-day, we may raise the question, how deep is it feasible to sink for its extraction? Hoisting cables, when used in single lifts, have a limit beyond which their own weight makes them impracticable. Hoisting must therefore be performed in several steps, and power must be transmitted to some sort of engines at successive depths. Rock pressure upon excavations becomes very great, making the support of roof and walls increasingly serious. Water can, however, almost always be impounded in upper levels, so that pumping need not be a drawback, but in regions of recent vulcanism, such as the Comstock Lode, it may be an important factor in depth. Happily, well-nigh universal experience shows that water is practically limited to the upper one or two thousand feet of the earth's crust. Increasing temperature is, however, a great handicap on the miner. If, as in the deep mines of Keweenaw Point, men must work in confined drifts and stopes at the temperature of a hot summer day, only the exhaust of compressed air from the drills makes conditions favourable for effective labour. Some years ago, Dr. Alfred C. Lane, at the time State Geologist of Michigan, the state which contains the very deep mines, discussed the question, "How deep can we mine?" and reached the conclusion that 10,000 feet was the practical limit. Were, however, unusually rich ore to be had, a somewhat greater depth might be reached.

On another side the whole problem is affected by what we have learned with regard to the values of ore with increasing depth. Recorded experience is multiplying, and at least two observers have summarized worldwide results in mining. To this topic we will return in a moment, after stating the third point of view, which is the purely scientific one of the effect of increasing depth upon those geological conditions which influence the percipitation of ores. In casting light upon this phase of the matter we have the results of some artificial experiments in producing minerals and in the behaviour of rocks under pressure which are of decided interest.

It is also important, in the preliminary way, to bear in mind the metal or metals in whose search our deepest shafts have been sunk, and to comment on the types of ore-body which they have developed. In the citations below a general summary of the deepest is given and to this one or two others may here be added. Copper in the native condition is the object of deep mining on Keweenaw Point and is a very unusual form of this metal. We would normally expect sulphides. The ore-bodies now sought are not in veins or deposits which fill old fault lines or crushed zones and their attendant waterways, but are impregnations of conglomerates and amygdaloids. There are, indeed, a few old mines based upon fault fissures, but they have never been followed to depths beyond the ordinary. The precipitation of this vast quantity of a native metal which is found in the usual course of mining only in the gossan, presents an exceptional problem. The native copper has been followed nearly or quite a vertical mile below the level of the ground-water and obvi-

A paper read at Toronto Session, International Geological Congress, August, 1913.

ously cannot be due to descending surface waters when the enclosing rock had any such attitude with regard to the surface as at present. These deep mines do not throw much light on the circumstances attending the ordinary precipitation of sulphides.

The other very deep mines, say, below 4,000 feet. are not many and have chiefly been sunk for gold. Two shafts developed saddle reefs in Victoria, and one, doubtless soon to be the deepest of all, follows a vein at Morro Velho, in the State of Minas Geraes, Brazil. The deep shafts in Kolar district, India, seek gold-quartz. The deep shafts in the Transvaal have likewise been sunk for gold, but, of course, not upon ordinary fissure veins. The famous Adalbert shaft at Przibram sought silver and attendant base metals down to 3,600 feet. On the Comstock Lode silver and gold were the objects, and the deepest shaft was 3,350 feet. Copper, with attendant silver, has already been followed to 3,000 feet at Butte, Montana, in sulphides and sulpharsenides. Silver-bearing galena in brecciated quartzites has been developed to 2,500 feet below the crest of the overlying ridge at Wardner, Idaho. Tin in cassiterite has been obtained at still greater depths in Cornwall. Yet in summary we must admit that the very deepest shafts of to-day have had native copper or gold-quartz as their objectives, and the deepest experience which is now available relates to these two metals. We do know, however, aside from such pyrite as may occur with native gold, of sulphide ores, from 2,500 to 3,600 feet below the present surface. In time additional data will undoubtedly be gained regarding others.

Returning to the second point enunciated above, there is no doubt that, in most cases, values in ores decrease in depth after a moderate section of the vertical extent of the vein has been passed. This experience is not universal but it is the rule. The subject is generally discussed in our larger text books on ore deposits, and to these and to several older papers, two important ones have been added in the last two years by engineers of wide experience. If, therefore, the yield of veins or other forms of ore-bodies is considered at the extreme depths now reached in mining, say, 3,000 to 5,000 feet, we must realize that general experience points to lessening values, and the commercial probabilities are discouraging for any new and unexplored property. The experience thus far gained, as noted above, chiefly relates to copper and the precious metals, and to gold much more than to silver.

Several considerations are, however, of interest. In all ore-bodies involving sulphides of copper; to a large degree in those containing gold in association with pyrite; and to an important degree in those involving sulphides of lead and zinc, the three zones in vertical order from above downward, viz., the oxidized zone, the zone of enrichment and the zone of sulphides, must be considered. They have led to important changes in the distribution of values. Even gold itself, when associated with pyrite and manganese, and not in the presence of calcite or dolomite, undergoes secondary enrichment, as W. H. Emmons has recently and acutely shown.

The oxidized zone does not extend below the permanent ground-water level. It is of no importance in connection with the questions before us, except in very arid regions, where the ground-water lies unusually deep. Even then, however, the depths are not such as we are at present considering.

The extent of enrichment in depth is a matter of greater interest. It primarily depends upon the vertical depth to which we are prepared to admit that descending, acidified, metal-bearing solutions, produced by the leaching of the oxidized zone by meteoric waters, may slowly diffuse themselves in the standing ground-water. Obviously, the chief reactions will take place near the ground-water level. We cannot reasonably expect the influence to extend very far. The production of oxidized and enriched ores of zinc is practically limited to a few feet above and below the water level. Lead is very intractable and its enrichment is practically a matter of oxidization and removal of other and more soluble associates above the water level. The behaviour of silver is a matter on which we need light and on which there is a difference of opinion among engineers. Some have regarded the argentite of Mexican silver mines as the result of secondary enrichment and have inferred its disappearance at comparatively moderate depths. On the other hand, in the microscopic study of at least one suite of ores, from the State of Guerrero,—in the endeavour to decide this point, since it affected exploration below a fault,—the writer could find no evidence that the argentite was not one of the original vein minerals. Explorations subsequently undertaken seemed to justify this conclusion, as the vein, with ores unchanged, was found below the fault. Depths of 700-800 feet were involved. Silver becomes so readily locked up as the relatively insoluble chloride, ceragyrite, through the precipitating influence of ordinary surface waters, that it is not so favourable a metal for secondary enrichment as are several others. Gold, though at first sight a comparatively insoluble metal, does yield to the solutions afforded by oxidizing pyrite, in the presence of manganese, as was mentioned above. To what depth, however, the slow diffusion of descending solutions would bring the enriching effects below the water level is a question. Probably the range would not be great and the presumption is strong that the native gold found rarely in large nuggets at great depths in quartz veins is an original precipitate in the vein filling. For great depths, such as those in the Bendigo saddle reefs, it is impossible to refer decreasing yields to waning secondary enrichment.

Copper is the metal of pre-eminent importance in matters of secondary enrichment. Reported falling off in values as greater depths have been attained, has made the influence of this process of special importance. The appreciable decrease in copper percentages which were widely published fifteen years or so ago, regarding the Rio Tinto mines, called attention to it even at this early date. That enrichment may take place for several hundred feet below the permanent water level seems fairly well established both by the experience gained from the disseminated copper deposits ("porphyry coppers") of recent development, and by that gained in our deeper copper mines. In the disseminated copper mines experience shows that, from a condition of maximum enrichment, percentages gradually decline until, within a very moderate vertical range of a few hundred feet, we reach the original lean, copper-bearing and unchanged pyrite. In the great mines at Butte, of which we have descriptions from W. H. Weed, and more recently from R. H. Sales, the latter shows that the demonstrable, secondary chalcocite only extends a short distance below the water level, say two or three hundred feet, although the distance of the water level from the surface is remarkably variable in the different mines. So far as the original vein-filling is concerned, there seems to be no identifiable mineralogical difference in vertical range, so far as we have yet gone, down to 3,000 feet. There is, however, a marked change as we radiate horizontally outward from a central area of copper minerals with no manganese and little or no zincblende, through a zone with decreasing copper and increasing zinc and manganese, to a zone with little or no copper and with silver in association with zincblende, a little galena and great quantities of rhodonite and rhodochrosite.

If, therefore, when we consider behaviour with depth, we focus attention upon the same minerals, at the most, lessening in quantity, or much the same minerals with lessening content of the precious metals,—in mass a very small part of the veins,—we would naturally seek the influence of physical conditions to account for less abundant or less profitable ore.

One other consideration should be first mentioned before briefly referring to the physical conditions. Vein formation in our workable deposits has usually taken place from one to several geological periods ago. Erosion has been active since and has removed an appreciable section of the rocks which existed when the deposition took place. In very ancient veins, such as appear in pre-Cambrian strata, the lost section may be important. Mr. Garrison has laid especial stress upon this phase of the subject, and has remarked Mr. Lindgren's inference that the lowest explored Bendigo saddle reef had formed when at least 7,000 feet from the surface; that the ores of the Mother Lode, California, had been precipitated at 6,000 feet; that the gold-bearing veins of the southern Appalachians must have been deposited over a vertical range of 7,000 to 8,000 feet; and the conclusion of Mr. F. L. Ransome that erosion has removed 2,000 to 5,000 feet of rock from Cripple Creek, Colorado. We may add that Dr. S. F. Emmons stated his belief, in his famous monograph on Leadville, Colorado, that the ores had been precipitated when 10,000 feet below the surface. Many other cases could be easily cited, but these will suffice to make clear that even the ores which we mine to-day, and which have been unaffected by secondary enrichment, were originally precipitated at much greater depths than the present workings. The physical conditions involved in vertical depth, down to 6,000 to 10,000 feet, would not seem to be of themselves prohibitive of the precipitation of commercial ore.

Still another feature of veins is the distribution of ore in shoots, with barren stretches between. Shoots succeed one another both in vertical and in horizontal distribution. Exploration is much more expensive at great depths than nearer the surface, and under these circumstances operators may much more easily become discouraged in the search for new veins when old ones become exhausted. We can hardly say that ore does not persist, even though it may not be commercially profitable to sink or drift for it.

The matter of possible cavities deserves a word of comment. While, as has been so ably shown by the honoured President of this Congress, Dr. Frank D. Adams, cavities are still possible at depths of 10 or 12 miles, yet large open spaces such as would form a resting place for ores, aside from replacement, would be naturally best developed within moderate distances from the surface. Mr. Rickard has commented upon this feature of the subject, and doubtless it is one of the serious factors influencing the final result.

As time passes, students of these phenomena seem to be increasingly convinced that the veins, such as would be considered in connection with profound depths, have been filled by uprising heated solutions. Since high temperatures generally favour solution and heavy pressures cannot be without their influence as well, decreasing temperatures promote precipitation with increasing efficiency as the surface is approached. Undoubtedly in these influences we have an explanation deserving confidence. There may well be a vertical range, wherein precipitating influences are at their best—one which corresponds with the section marked by our profitable ore bodies in the mines. The slow erosion of the tops of veins, with the attendant sinking of the groundwater level, serves further to enhance values by the processes of enrichment. Ore bodies of metals, other than iron, which have been precipitated at or immediately below the surface by uprising heated waters are extremely rare. Sulphur Bank, California, and Steamboat Springs, near Virginia City, Nevada, with their relatively small yields of quicksilver, are almost the only ones which suggest themselves. Mr. Lindgren has also remarked that ore bodies in purely surface flows of eruptive rocks are relatively rare. Ore bodies are much commoner in association with intrusive rocks or with others which have been deeply buried.

We are now pretty well assured both from the study of mineral springs and from the artificial production of some of the minerals common in ores, that the uprising solutions are alkaline in character. Only in the descending meteoric waters which leach the outcrops, do we find acid solutions. The deep-seated waters are carbonated and often charged with hydrogen sulphide. The descending waters are oxygenated. The most common and widespread sulphide in veins in general, is pyrite, and it has special claims to interest because of its parallel mineral, marcasite. Messrs. Allen, Crenshaw and Johnston of the Carnegie Geological Laboratory in Washington have recently made some experiments in the production of these two which are of extreme interest. On page 171 of their paper is the following passage: "The pyrite of deep veins, metamorphic contacts and hot-springs, as well as magmas, has been formed by hot solutions, and such solutions never contain strong mineral acids, but are generally, if not always, alkaline. The pyrite and marcasite of surface veins, on the other hand, are formed from cold solutions, which often contain considerable sulphuric acid." In their experimental production of pyrite, hydrogen sulphide was the quite invariable precipitant; the reduction of sulphates seems to be an assumption, not corroborated by experiment. With the reagents employed, pyrite formed very slowly at room temperatures, but much more rapidly at 200 degrees C. On p. 192 the following passage appears: "Pyrite, being a stable form, probably crystallizes under a considerably wider range of conditions than marcasite. The evidence of synthetic study is that the formation of pyrite is favoured by high temperatures and by solutions which contain little or no free acid. In accord with these we have the following geological deductions. First, pyrite is the product of hot-springs. In the springs of Carlsbad, which have a temperature of 55 degrees C, recent pyrite is observed. The waters contain sulphates and a trace of hydrogen sulphide and are slightly alkaline. The lagoons of Tuscany are depositing pyrite from their hot waters. Bunsen found that the hot vapours of the fumaroles of Iceland were gradually changing the ferrous silicate of the basalts into pyrite. More important geologically is the fact that the product of deep veins by ascending waters is always pyrite, never marcasite. Such waters are naturally hot, and commonly, if not always, alkaline. We can now see that the separation of pyrite from a magma is entirely possible, while the temperature of any magma would doubtless be incompatible with the existence of marcasite."

As bearing on the problem of the continuation of ore in depth we can only conclude from the experiments and observations of Messrs. Allen, Crenshaw and Johnston that pyrite can precipitate at a depth fully as great as any shaft yet sunk.

Very similar conclusions have been established by Messrs. Crenshaw and Allen for the two sets of parallel minerals sphalerite and wurtzite and cinnabar and metacinnabar. On p. 396 of the citation they summarize their conclusions as follows: "Comparing the genetic relations of the minerals sphalerite and wurtzite, cinnabar and metacinnabar, with the genetic relations of pyrite and marcasite, we find certain remarkable regularities. The stable forms, sphalerites, cinnabar and pyrite, are always obtained by crystallization from alkaline solutions (solutions of the alkali sulphides), while the unstable forms, wurtzite, metacinnabar and marcasite, are obtained from acid solutions only. The stable forms may also be crystallized from acid under certain conditions. Of these, temperature and acid concentration seem to be the important ones.

Certainly with pyrite and marcasite, and in all probability with sphalerite and wurtzite, the higher the temperature the greater the percentage of the stable form obtained, while the higher the acid concentration at any temperature, the greater is the percentage of the unstable form obtained. These facts appear to agree remarkably well with the field evidence, which relates to the genesis of the natural minerals, while they give new significance to the general geologic distinction between deep-seated and surface waters in nature."

The experiments of these investigators clear up for us the fundamental chemical differences between the processes of primary precipitation and of secondary enrichment, but as regards the continuation of ore in depth, we can only say:

1. While there seems to be nothing to prevent precipitation at greater depths than we have yet reached, yet conditions seem to be specially favourable in those portions which lie between the present surface and 2,000 to 4,000 feet in depth.

2. Secondary enrichment has increased the yield of those portions of many veins which are above 1,000 feet in depth, the vertical extent of its action being limited to a relatively short stretch below the groundwater level.

# THE COBALT AREA*

By WILLET G. MILLER.

In 1903, during the construction of the Timiskaming and Northern Ontario Railway, which is owned and operated by the Ontario Government, rich veins of cobalt-silver ore were discovered near what is now known as Cobalt Station. The railway track runs almost over the top of one of the most important veins yet found.

At the time the discovery was made, the veins attracted little attention, the discoverers not being men whose vocation was that of prospecting or mining.

Niccolite is a characteristic mineral of the area, and, as its German name, kupfer-nickel, indicates, its colour is somewhat like that of copper. Hence, it is not surprising that some of the first persons to see the deposits mistook the niccolite for copper ore, and, not having their attention drawn to the native silver, which occurred in profusion in parts of the veins, should have decided that the deposits were of the less precious metal. A sample of the niccolite, received at the Bureau of Mines towards the end of October of the year mentioned, aroused the writer's interest, and he decided to visit the locality from which it came.

The great Sudbury nickle area lies 90 miles to the southwest of Cobalt, and in a report on a trip of exploration to the vicinity of what is now Cobalt, in 1901, the writer had said:

"It will be seen from what has been stated on preceding pages that the district examined contains as great a variety of rocks as probably any other part of the province of equal area. . . .

"Although few discoveries of economic minerals have been made in this territory, it may reasonably be expected, judging from the character and the variety of the rocks, that deposits of value will be found when the district is more carefully prospected, as it will be in a short time, owing to the rapid settlement which is now taking place. . . . It would seem that at least some of the conditions of the Sudbury district are repeated in this more eastern field."*

Naturally, on the receipt of the sample of niccolite, it appeared that this prediction might have been verified, and that deposits of nickel vastly richer than those of Sudbury might have been discovered.

On examining the veins then discovered, four in number, all near the shore of Cobalt Lake, an unexpected and astonishing assemblage of minerals was seen, the most prominent being native silver, niccolite, smaltite and cobalt bloom. In the first paper he published on the area, describing one of the veins, the writer said:

"Here a perpendicular bare cliff, 60 or 70 feet high, faces west. The vein. . . . cuts this face at right angles, having an almost vertical dip. . . When I saw it first it had not been disturbed. Thin leaves of silver up to two inches in diameter were lying on the ledges and the decomposed vein matter was cemented together by the metal, like fungus in rotten wood. It was a vein such as one reads of in text-books, but which is rarely seen, being so clearly defined and so rich in contents."*

The veins are narrow, averaging not more than four inches (10 cm.) in width. This feature discouraged certain of the first mining engineers who examined the outcrops, and caused them to doubt whether the veins were of economic importance. However, the large number of veins and their great richness has more than compensated for their narrowness.

It was soon proved by comparatively little work that Cobalt was really a "poor man's camp." One of the first operators, for instance, extracted ore having a value of approximately $250,000 at a total cost of $2,500. Statistics show that during the period of mining in the

*Extracts from Guide Book No. 7, published by Geological Survey of Canada for the Twelfth International Geological Congress.
*11th Report, Ontario Bureau of Mines, p. 229.

area dividends distributed have been equal to over fifty per cent. of the value of the output.

In the earlier years of mining there were no refining plants, in North America at least, that could economically treat the ores. Owing to the unusual and complex character of the ores there was waste of other constituents in extracting silver, there being present in addition to the precious metal, arsenic, cobalt and nickel in important quantities.

The Cobalt area is not unique in Ontario in possessing an unusual ore, other representative economic minerals of the province when discovered being without a market or requiring the development of a refining process. The Sudbury deposits, for example, were opened up for copper, nickel being afterward found to be present. A considerable period elapsed before refineries were developed and a market made for the nickel by proving to the nations of the world its value as a constituent of steel for armour plate. Again, in the earlier years of apatite mining in Ontario, the amber mica, which is now so highly prized, associated with this mineral, was thrown on the waste heaps. And when the corundum deposits were discovered, a process had to be developed for milling the rock and a market had to be made for the material. Other instances could be cited, but the examples given show that the characteristic of the minerals mined in Ontario's pre-Cambrian rocks is uniqueness.

It is gratifying to know that within the comparatively few years that mining has been prosecuted at Cobalt, plants capable of refining all of the constituents of the ore have been erected in Ontario, the processes employed being either improvements on those in use elsewhere or invented especially for these ores, such as that employed at the Nipissing mine for the extraction and refining of silver. This metal is refined at several other plants, and white arsenic and cobalt and nickel oxides are produced. The plants for refining cobalt oxide in Ontario are of capacity sufficient to supply the world's demand for the material. The white arsenic produced from Cobalt ores represents about 20 per cent. of the world's output. Cobalt is the world's greatest producer of silver, its output representing about 13 per cent. of the whole.

In 1904, the year in which the first shipments were made, there were produced 158 tons of ore. The average percentages of the four metals in this ore were:

Silver. . . . . . . 5.34 per cent., or 1,309.33 ounces per ton.
Cobalt . . . . . . . 10.21 " "
Nickel . . . . . . . 8.86 " "
Arsenic . . . . . . 45.56 " "

In 1905, there were shipped 2,144 tons of ore of the following composition:

Silver. . . . . . . 3.90 per cent., or 1,138.72 ounces per ton.
Cobalt . . . . . . . 5.50 " "
Nickel . . . . . . . 3.49 " "
Arsenic . . . . . . 25.60 " "

The ore shipped till near the end of 1907 was sorted by hand, or with crude mechanical appliances. Since then extensive concentrating plants have been erected.

**Production of Cobalt Mines, 1904—1912.**

The following table summarizes the production of the Cobalt and adjacent areas:—

| Year. | Ore shipped. Tons. | Nickel. Tons. | Nickel. Value. $ | Cobalt. Tons. | Cobalt. Value. $ | Arsenic. Tons. | Arsenic. Value. $ | Silver. Ounces. | Silver. Value. $ | Total Value. $ |

*Does not include ore refined at Cobalt.

For some time after mining began at Cobalt, the ore was shipped to the sampling works of Ledoux and Company, New York. The richest shipment contained 7.402 ounces of silver to the ton, the next in order being 6,909; 6,413; 6.163 and 5.948 ounces to the ton. The average percentages of other metals in the 366 carload lots sampled by this firm were: cobalt, 5.99; nickel, 3.66; arsenic, 27.12.

Concerning the high-grade ore at Cobalt, Mr. R. B. Watson recently has said: "A typical ore carries 10 per cent. silver, 9 per cent. cobalt, 6 per cent. nickel, and 39 per cent. arsenic; the rest is lime, silica and smaller amounts of antimony, iron, sulphur, tellurium, etc.*"

The most productive vein in the area is that known as the Carson, on the Crown Reserve property. It has been estimated that this vein, with its extension on the Kerr Lake property, will have produced before being exhausted 20,000,000 ounces or more of silver from that part of it above the 200-foot level.

The richness of the ore in various mines is well shown by what it has cost, on the average, to produce an ounce of silver. In 1911, for example, the cost per ounce, including mining and all other expenses, given in the annual reports of certain companies, was: at the Crown Reserve, 10.761 cents per ounce; at the Coniagas, 8.8; at the Nipissing, 13.95, and at the Kerr Lake, 14.69.

The chief object in building the Timiskaming and Northern Ontario Railway was the development of the agricultural areas at the head of Lake Timiskaming, to the north of Cobalt. It was also felt that the railway would increase the value of the timber lands through which it passed, but, it is safe to say, the most sanguine supporters of the policy of railway building little dreamed of the mining development to which the construction of the road would lead. It is true that mining at Sudbury had been pursued for some years before it was decided to build the railway into the Timiskaming country, but Sudbury had never excited much interest among the people of Ontario. Those who were inclined to invest in mines had little faith in the mineral resources of their own province. The discovery of Cobalt,

Eng. and Min. Jr., Dec. 10th, 1903.
†Cobalt oxide, etc. ‡Refined.
*Eng. and Min. Jr., Dec. 7th, 1912.

however, has given confidence in the province's mineral industry and has led to the development of Porcupine and other areas tributary to the railway. The value of the ore produced at Cobalt, in less than ten years, is equal to about five times the cost of constructing and equipping the 252 miles of railway from North Bay to Cochrane, together with branch lines, and the dividends alone are equal to two and a half times the total cost of the railway.

Moreover, the discovery of Cobalt, which lies near the southern edge of the great pre-Cambrian regions that occupy nearly one-half the surface of Canada's 3,750,000 square miles of territory, has given confidence in these regions as storehouses of economic minerals and ores that future prospecting will bring to light.

### The Rocks and Their Relationships.

At first, owing to the surface being covered with green timber and to the presence of much drift material, contacts and good exposures were difficult to find. Now, that the timber has been removed parts of the area have almost the appearance of a large model, e.g., between the northwestern face of Mount Diabase and Peterson and Cart lakes, or on the Nipissing property to the west of Peterson lake, where the loose deposits have been removed from the surface by hydraulicking.

From the maps of the area that have been published, it will be seen that there is considerable variety in the pre-Cambrian series. On the shores and islands of Lake Timiskaming, a few miles to the north or northeast of Cobalt Station, the Clinton and Niagara of the Silurian system also show prominent outcrops. Between the Niagara and the Pleistocene or Glacial there are no formations represented in the district.

The following table shows the subdivisions, based on age relations, that have been made among the rocks of the Cobalt area proper. Representatives of most of these subdivisions of the pre-Cambrian are found in other areas that have been carefully mapped in the surrounding region.

In the Porcupine gold area, one hundred miles to the northwest of Cobalt, the Keewatin and Timiskaming series are prominent. The Cobalt series is also present in this area, and certain dikes are believed to represent the Nipissing diabase of Cobalt.

In the Gowganda silver-cobalt area, which lies fifty or sixty miles to the west of Cobalt, the Nipissing diabase and Cobalt series occupy much of the surface. The Timiskaming series is found in good exposures in part of the area. The latter series has also been found at Swastika and Larder lake, at Abitibi lake, 75 miles north of Cobalt, and eastward across the boundary in Quebec. It is thus known to occur at various points over a large region.

It is possible that unconformities that have not been discovered exist in the pre-Cambrian of the Cobalt and adjacent areas. Moreover, the relationship which the Cobalt and Timiskaming series have to the fragmental rocks of the classic Huronian area of the north shore of Lake Huron is not known. Hence, in the following table the name Huronian is not employed. If the Huronian is considered to include all the post-Laurentian and pre-Keweenawan fragmental rocks of the region, then both the Cobalt and Timiskaming series come under this heading.

The dual subdivision of the pre-Cambrian into Algonkian and Archean, or Proterozoic and Archeozoic, employed by many authors, is not adopted by the writer, since he believes that the Grenville series, which includes limestones and other sediments of great thickness, is of pre-Laurentian age. Thus a dual subdivision of pre-Cambrian rocks, based on arguments that have been employed in its behalf, fails. If a name is desired for the pre-Cambrian rocks, to correspond with Paleozoic and Mesozoic, the well-known name Eozoic may be used.

### Age Relations of Rocks of Cobalt and Adjacent Areas.

**Palezoic (Silurian, Niagara).**—Prominent outcrops of Niagara limestone, with basal conglomerate and sandstone, occur on some of the islands and the shores of the north end of Lake Timiskaming. (Great unconformity.)

**Eozoic or Pre-Cambrian (Later Dikes).**—Aplite, diabase, basalt.

**Nipissing Diabase (Intrusive Contact).**—This diabase, which is of such great interest in connection with the cobalt-silver veins, is believed to be of Keweenawan age. Certain aplite dikes are genetically connected with the diabase.

**Cobalt Series (Unconformity).**—The Cobalt series includes conglomerate, greywacke and other fragmental rocks.

**Lorrain Granite (Intrusive Contact).**—This granite occupies a considerable part of the Township of Lorrain and has large exposures elsewhere in the vicinity of Lake Timiskaming.

**Lamprophyre Dikes (Intrusive Contact).**—Lamprophyre dikes are to be seen near some of the mines at Cobalt.

**Timiskaming Series (Unconformity).**—Like the Cobalt series, the Timiskaming consists of conglomerate and other fragmental rocks.

**Keewatin Complex.**—The Laurentian, gneiss and granite, which in age lies between the Keewatin and Timiskaming, is absent in the Cobalt area proper, but is found in the surrounding region.

Under the heading Keewatin are grouped the most ancient rocks of the region. They consist essentially of basic volcanic types, now represented by schists and greenstones, together with more acidic types, such as quartz-porphyry.

With the Keewatin are included certain sediments, such as iron formation or jaspilyte, dark slates and greywackes, which probably represent the Grenville series of southeastern Ontario.

Certain dike rocks that are grouped with the Keewatin may be of post-Timiskaming age, but since they have not been found in contact with the Timiskaming series their age relationships are unknown.

(To be Continued.)

# ON THE ORIGIN OF THE PORCUPINE GOLD DEPOSITS*

By Reginald E. Hore.

Gold occurs at Porcupine in quartz bodies of very numerous forms. Many of the deposits may be classed as one of four types*:—1, quartz veins; 2, quartz vein systems; 3, quartz masses; 4, quartz-ferrodolomite lodes. The quartz veins are well defined, single fissure fillings, commonly varying considerably in thickness and forming numerous lenticular portions, but having on the whole a somewhat tabular form. The vein systems are made up of two or more veins, close together and more or less parallel. The quartz-ferrodolomite lodes

*A paper presented at the Annual Meeting, Canadian Mining Institute, Toronto, 1912.

*Illustrations of these types were given in Canadian Mining Journal, November 1, 1910, pp. 649-656. Descriptions of a number of the deposits are given by A. G. Burrows, in his report on "The Porcupine Gold Area," pp. 20-31, 20th Annual Report, 1911, Bureau of Mines.

are made up of ferrodolomite traversed by numerous veins and veinlets of quartz. The quartz masses are of irregular and for the most part of unknown shape. Some have been described† as kidneys and chimneys. Others show a tendency to elongation in two directions and appear to be members of a series of thick lenticular masses lying at intervals along a fissured zone.

The rocks enclosing ore are of several different types. A common one is a gray sericite-carbonate-quartz schist that was probably originally a quartz porphyry. Other wall rocks include basalt, porphyrite, conglomerate and gray slate.

It appears that neither the form of the opening or the character of the country rock were the chief factors in the formation of the ore bodies. These are important factors to be considered in the study of the individual ore shoots; but will not enter into the present discussion. Attention is here directed rather to characters common to all. These characters indicate a common origin and by their nature give some clue to the process involved in the formation of the deposits.

Characters of the Gold Ore Determined Optically.—The ore in all cases is native gold* in pyritic quartz. The gold is partly in coarse grains, visible to the naked eye, but is chiefly in very minute particles, intimately associated with pyrite. Some of the gold is actually intergrown with pyrite; but most of it is not. Some of the gold intergrown with pyrite is in very small grains, visible only with the aid of a microscope, and it is quite probable that there are similar particles which are not visible on account of their smaller size. Some gold is in calcite or ferrodolomite. Galena, sphalerite and chalcopyrite occur frequently, but in small quantity. Tourmaline, feldspar‡, scheelite and some yet unidentified minerals also occur.

The pyrite associated with native gold is in some cases in large, well-formed crystals; but most of it is in small and, for pyrite, very poorly-formed crystals.

The gold and pyrite are not distributed uniformly through the quartz and are commonly most abundant near the wall rock or pieces of rock enclosed in the quartz. Large areas of vein material are quite free of opaque minerals.

The quartz in some cases has a ribboned appearance due to the presence of dark coloured aggregates of minerals in minute crevices. The aggregates are made up chiefly of pyrite, sericite, carbonates, chlorite and a brown serpentinous substance of unknown composition. The same minerals also occur irregularly through white quartz giving some of the ore a spotted appearance. From the mode of occurrence of these dark coloured aggregates it seems likely that they were formed after the quartz had been crushed. From the occurrence of gold with these aggregates it seems likely that some of the metal has been deposited much later than the quartz.

The quartz is made up partly of large grains, which probably represent the form in which it was originally deposited; but largely of very small grains, which have evidently been formed by subsequent crushing or granulation. The individual grains in almost all cases when examined in polarized light exhibit evidence of strains. In the specimens examined microscopically, most of the gold is in parts of the quartz which have been granulated.

The quartz contains very numerous fluid inclusions, and was therefore probably deposited from a hot solution at considerable depth. Such inclusions are very common in quartz which is known to have been deposited hot, as in the case of the formation of such rocks as granite. The mere presence of inclusions is not of itself sufficient evidence of high temperature and depth, for there is reason to believe that some inclusions have been formed after the solidification of the quartz. The inclusions are frequently arranged in rows, and some of these run through adjacent quartz grains without interruption. Many of the rows, however, terminate at the quartz grain boundary, and there appear to be fewer inclusions in the granulated than in the original quartz grains.

There are other characters which suggest that the solutions were hot and probably partly of magmatic origin. Pyrite is commonly formed from hot alkaline solutions. Tourmaline is frequently and scheelite occasionally present, and these two minerals are generally found in what are believed to be acid differentiation products. Sericite, so abundant in the wall rocks, is a mineral that is generally thought to be formed by hot solutions.

From optical examination it seems likely that the gold, pyrite and quartz were originally deposited from the same solution and that the solution was hot. Subsequently the deposits were crushed and fractured and secondary minerals were deposited in the fractures. It is probable that some of the gold was dissolved and re-deposited in other parts of the vein. It appears especially probable that the coarse grains were formed by such a secondary process.

Some writers have interpreted their observations to indicate that the fissures were first filled with barren quartz and that the gold was introduced later. It is of course possible that such was the case; but I can find no necessity for such an assumption and hence prefer the simpler hypothesis. The constant occurrence of quartz and pyrite with the gold and the paucity of gold in those enclosing rocks in which quartz and pyrite are not abundant, seems sufficient evidence for the assumption of a common origin for the three minerals. Gold, quartz and pyrite were probably deposited together, and, so far as I am aware, there is a lack of evidence that gold-bearing quartz has been introduced after the first filling of the fissures. Subsequent solution and redeposition of some of the constituents of the primary filling and of the country rocks would account for the phenomena observed.

**Characters of the Gold Ore Determined by Assays.**—Assays have shown that the gold is not regularly distributed through the quartz, but, as is commonly the case, it is chiefly in parts referred to as ore shoots. The ore is fairly high grade; but owing to the difficulty in distinguishing it from waste or mining it separately when distinction is possible, it is not improbable that the run of mine ore in some cases will be more properly referred to as low-grade. In the high-grade ore shoots the values have been found to be very irregularly distributed.

The gold is chiefly confined to the quartz veins or masses. The country rock in some cases contains pay values, but so far as I can learn there has not yet been found any important body of ore in rock that is not penetrated with quartz. The constant association of gold and quartz indicates clearly a common origin.

Assays show that the gold is chiefly in parts of the quartz near wall rock or pieces of enclosed rock, and especially in parts of the quartz that have been crushed. Most of the gold occurs with pyrite and non-pyritic quartz in the same deposit is commonly barren.

At the Hollinger it has been found that the occurrence of visible gold does not necessarily mean payable values, and that quartz streaked with fine lines of

†P. A. Robbins, Annual Report Hollinger Mine, Jan. 1, 1912, p 6.

*It is not unlikely that some tellurides of gold occur; but, so far as I can learn, none have been found. Mr. Robt. Harvie has found tellurides in similar deposits at Opasatica Lake, Quebec, which he described in a paper in vol. xiv., pp. 164-170.

‡C. W. Knight describes in Notes on Bureau of Mines Map, veins on Miller Middleton claims, having the composition of granite. See also A. G. Burrows' report, p. 19, 1911. J. Stansfield describes occurrence of feldspar in ore from Vipond Mine.

pyrite in the cleavage is generally more consistant in gold values than the clear masses carrying occasional spectacular showings. Mr. Robbins found the main vein to present an unbroken ore shoot for over 1,000 feet horizontally, to be 2 ft. to 20 ft. wide, and to be usually richer in the wide portions. The occurrence of galena was found to portend rich gold values and to a lesser degree the occurrence of sphalerite proved to indicate gold values. Large, blocky crystals of pyrite are usually attended by low values in gold, while finely crystalline pyrite occurs with relatively higher values.

It seems likely that the spectacular gold has formed by the growth of some gold grains at the expense of others in the immediate vicinity, and consequently much of the quartz near coarse gold is practically barren. The occurrence of gold with the poorly crystallized small grains of pyrite indicates that the deposition of the gold took place under conditions which were very unfavourable for the crystal growth. It is likely that the auriferous pyrite was deposited much more quickly than the non-auriferous pyrite. The different degrees of crystallization may have been due to rapid solidification from a hot solution in one case and slow growth from more gradual cooling or removal of solvents in the other. Evidently the conditions favourable to growth of large pyrite crystals were also favourable for the formation of coarse gold grains. Both are probably the result of redeposition under conditions quite different to those which obtained in the first deposition. The deposition in both cases, however, was probably at depth and from hot alkaline solutions.

The irregular distribution of the fine gold indicates that in the primary deposition there was a tendency for the gold and pyrite to segregate somewhat from the main mass of silica. There is no good reason to suppose that the contemporaneous deposition of gold, pyrite and quartz would result in very uniform distribution of the gold throughout the whole mass of quartz. The most favourable place for deposition of gold was evidently the vicinity of enclosing or enclosed rock.

**Characters of the Gold Ores Determined by Mechanical and Chemical Treatment.**—While all the ores are examined optically, it is done for the most part in a rather cursory manner, and by those who do not record their observations. The samples examined microscopically are very small and may not be representative. The samples assayed are much more numerous and larger, and we have found that the assays are in a general way such as might be expected from the ores described from optical tests alone. A consideration of the results obtained by milling and cyaniding should show whether the ore thus tested was similar to that examined microscopically and to the samples assayed.

Tests on the ores of the Dome and Hollinger Mines show them to be very free milling. Much of the gold is in clean quartz, from which it is very readily freed by crushing and then readily recovered by amalgamation. The remainder is rather readily recovered by regrinding and amalgamation, followed by cyanide treatment.

The results obtained in testing Dome Mine ore have been published in The Canadian Mining Journal, Feb. 15th, 1911, pp. 126-127. The ore was at first considered to be an ideal concentrating ore. The gold being closely associated with the pyrite, a high-grade concentrate was obtained. The tailings, however, were sufficiently valuable to warrant cyaniding. By regrinding the concentrate, it was found that a large percentage of the gold could be recovered by amalgamation. By grinding to 90 per cent. through a 200-mesh screen, 84 per cent. of the gold was recovered by amalgamation. The ore tested was found particularly free from cyanides, the only difficulty arising from the presence of a small amount of carbonaceous material, which made it necessary to lengthen the period of agitation to avoid a secondary precipitation. Mr. W. C. Merrill, designer of the plant, has recently been quoted as saying that the total recovery is expected to be not less than 95 per cent.

The results obtained in testing Hollinger Mine ore have been published in the first annual report, January, 1912. Tests for extraction were run upon a sample containing 2.1 oz. per ton. This sample was found to contain 4.86 per cent. of concentrates, and the concentrates contained 82.6 per cent. of the gold contents of the ore. (Shows intimate association of gold with pyrite, for very fine gold in clear quartz would not be in concentrate.) Following concentration the residue was leached with cyanide solutions, and after 114 hours' treatment, it was found that cyaniding had extracted approximately 60 per cent. of the remaining values.

In the second test the ore was ground in the mill to pass 120-mesh and split into two lots. The first lot was concentrated, the concentrates removed and the impoverished residue agitated by air in cyanide solution. After 34½ hours' treatment, the extraction by cyaniding of values contained in residues was found to be 95.1 per cent. and the combined extraction by concentration and cyaniding was 99.56 per cent. of the total original gold contents of the sample. The second lot of finely crushed ore was concentrated, but after pan-amalgamation of the concentrates, they were returned to the agitator to be treated with the tailings from the concentrator. The combined extraction by this method was practically 100 per cent., as the residue after 36 hours of cyanide treatment carried only a trace of gold. In these tests the concentrates amounted to approximately 37 per cent. of the total ore treated, and the consumption of cyanide was in the neighbourhood of two pounds per ton. Mr. Robbins states that the net result of the tests on Hollinger Mine ore was to show the necessity for fine grinding and also the advisability of extracting the concentrates for separate treatment.

Results of tests on ore from the Vipond Mine are given by E. M. Flynn in H. P. Davis' Handbook of the Porcupine Gold District, 1911, pp. 38-39. The ore was stamped to pass 20-mesh, passed over amalgamation plates, the pulp from the plates concentrated on Wilfley tables and the tailings separated into sand and slime. The sand was leached for 72 hours with 0.2 per cent. KCN solution. The recovery on the plates was 73.46 per cent., on the tables 14.06 per cent., and by cyanidation of sand tailing 3.20 per cent. Further cyanide tests proved that the extraction could be considerably increased by fine grinding of the sands. It was found that concentrate (25-1) from high-grade ore ($100 to $200 per ton) contains about the same gold as that from lower-grade ore ($20 to $30). The concentrate in each case was rather low-grade ($50 to $150), indicating that comparatively little gold is enclosed in pyrite.

From the intimate association of gold with pyrite, it is evident that on coarse grinding nearly all the microscopically visible gold would be contained in a concentrate comprising a very small part of the ore. Mr. Kirby's test, 82.6 per cent. of the total gold to be in concentrate comprising 4.86 per cent. of the ore.

From the microscopically visible gold enclosed in clear quartz and other light minerals, it is evident that many of the finer particles of gold would not be reached by cyanide solution unless finely ground. Mr. Kirby's test on the residue shows 40 per cent. unrecovered, and his screen test shows 61 per cent. of these values to be in sand coarser than 60-mesh.

Most of the microscopically visible gold associated with pyrite is not completely enclosed in pyrite or even in actual contact with it, and it is evident that if finely ground, it would be very readily amalgamated. All the mill tests show this to be the case.

From microscopic examination it is known that gold occurs in very minute particles, and it seems not unlikely that the invisible gold is present also as the native metal, but in particles of sub-microscopic size. The mill tests show results which would be expected if such very fine particles of native gold were present, and there seems no good reason to assume that the gold in pyrite is other than a mechanical mixture. There is then no evidence of the former existence of the gold in some mineral other than the native metal, and it is safe to conclude that part at least is in the form in which it was originally deposited.

**Characters of the Wall Rocks.**—The wall rocks are of several types, originally quite different, but by secondary changes having in common a high content of sercite, ferrodolomite and quartz. The wall rock of most of the ore bodies is a gray sericite-carbonate-quartz schist that was probably originally a quartz porphyry. Other wall rocks include basalt, porphyrite, conglomerate and gray slate. These are all much altered, and near the veins there is usually much pyrite present. It is commonly in well-formed cubical crystals. As a rule the amount of pyrite in the rocks is much greater than in the veins.

The characters which are common to all the wall rocks are of secondary* origin. It is evident that similar solutions penetrated and altered the different rocks and replaced some of the constituents by sericite, ferrodolomite, calcite, quartz and pyrite.

These minerals are especially abundant in the immediate vicinity of the quartz veins, and it is reasonable to suppose that they came through the fissures† which were subsequently filled by gold quartz. It is furthermore probable that the solutions came from the same source as the gold quartz.

**Conclusion as to Origin of the Deposits.**—We have in the Porcupine District pyritic gold quartz deposits enclosed in rocks characterized by an abundance of ferrodolomite, sericite and pyrite. The nature of the ore and the wall rock suggests that the gold was introduced into the fissures along with the chief constituents of the minerals mentioned. The solution which contained the gold probably contained also in some form iron, sulphur, silica, potassium and carbon dioxide. From the solution practically all the potassium and carbon dioxide escaped into the wall rocks and aided in the formation of sericite and ferrodolomite. Part of the iron and sulphur also escaped into the wall rocks and there formed pyrite crystals and contributed iron to the formation of ferrodolomite. Part of the iron and sulphur and nearly all of the gold and silica was deposited in the fissures themselves. It appears that the walls were more readily penetrated by some constituents than by the others, and in this way much of the water, carbon dioxide, potassium, sulphur and iron escaped. In proportion as these constituents escaped the solubility of the gold in the remaining solution would be decreased and the deposition therefore aided by removal of solvent as well as by lowering of temperature. The pyrite first formed in the veins was comparatively poorly crystallized and was probably formed quickly. The pyrite in the wall rocks and some pyrite in the veins that is probably of secondary origin is in well-formed crystals and evidently formed slower or at least under some more favourable conditions than did the original auriferous pyrite of the quartz veins. The gold and pyrite were not evenly distributed originally. Evidently in the first crystallization they tended to segregate here and there, and the especially favourable place for deposition was near the walls or around masses of enclosed rock.

After the filling of the fissures with quartz, gold and pyrite, the veins were shattered and the quartz granules strained or crushed. In the crushed zones a secondary set of minerals, including sericite, chlorite, calcite, ferrodolomite and pyrite and some gold were deposited. These probably originated in the vein and wall rocks. Much of the gold thus formed is in coarse grains, which probably grew by slow accretion of small particles by a process continued over a long period. It is probable that this coarse gold grew at the expense of the fine gold contained in the vein matter in its immediate neighbourhood, thus leaving much very low-grade quartz in the vicinity of the spectacular specimens. The coarse gold to which a secondary origin is here attributed, while showy, is usually quite subordinate in amount to the fine gold, much of which may well be still in the form in which it was first deposited with the pyrite and quartz. Some fine gold, however, is probably secondary, and there are cases in which the amount of secondary gold is greater than the amount of primary.

There is nothing to indicate that the character of the deposits has to any considerable degree been changed since the glaciers cleaned away the surface rocks, and there is therefore no reason for believing that the ore will show any appreciable dependence on the present surface. The secondary changes which have taken place are not surface alterations, but rather of a character which might be expected to take place at considerable depth.

From the information at present available, therefore, no remarkable change in the character of the ore with increasing depth is to be expected. It is also likely that in some cases at least similar ore shoots exist below those exposed. To what depth the individual ore shoots exposed at surface extend cannot be predicted, but unequal depths may be expected. Of those which had originally somewhat similar vertical dimensions, it is probable that some had lost very largely and others comparatively little by erosion. A first approximation is therefore obtained by assuming that one-half has been eroded. If we assume also that the vertical and lateral dimensions were originally somewhat nearly the same, our best guess, where no development work has been done, is that the ore shoot now extends to a depth equal to one-half the horizontal length. It is quite possible and, from the geological evidence, very probable that some of the deposits continue to great depth.

*Microscopic descriptions by C. W. Knight and A. G. Burrows of some of the wall rocks are given in the reports published by the Ontario Bureau of Mines. The ores and wall rocks of the Vipond mine were described by J. Stansfield in Canadian Mining Journal, Feb. 15, 1911, pp. 109-115. The ores and wall rocks at the Dome, Hollinger and Rea mines were described by R. E. Hore in a paper submitted to this Institute in 1911, pp. 171-184, vol. xiv.

†Remarkably similar characters were found by Lindgren in wall rocks of California gold quartz deposits. He gives descriptions and chemical analyses of these rocks in a paper on "Metasomatic Processes in Fissure Veins." Genesis of Ore Deposits read at Washington meeting (1900) A. I. M. E., and republished on pp. 586-588. In another paper entitled "Metasomatic Processes in the Gold Deposits of Western Australia," Econ. Geol. Vol. 1, 1905, pp. 530-544, Mr. Lindgren describes similar features of the Kalgoorlie gold fields, and concludes that the remarkable similarity of the rock alteration at the Mother Lode (California) mines to that at Kalgoorlie gold fields, and concludes that the remarkable similarity of the bearing veins from solutions practically identical in their general composition.

# THE NICKEL DEPOSITS OF SUDBURY DISTRICT

By A. P. Coleman.

The nickel ores which give economic importance to the region are of a very uniform and monotonous character. In all the larger mines the ore consists of pyrrhotite in largest amount with subordinate quantities of pentlandite, (Ni Fe)S and chalcopyrite. The pentlandite may be finely disseminated through the pyrrhotite and not apparent to the eye, but polished surfaces of the ore, as shown by Campbell and Knight, prove its presence under the microscope. The ore always contains small quantities of the norite minerals and sometimes fragments of norite or country rock. The country rock may be any of the older formations, sediments of the Sudbury series, acid or basic eruptives, or Laurentian gneiss, without in any way affecting the ore deposits; but no ore deposit has yet been found without norite. "No norite, no ore," is the law of the district. There are, however, long stretches of the norite edge where no ore occurs, where the sheet is unusually narrow, or where the country rock bends inwards instead of outwards. There are cases where the norite edge is gossan covered continuously for more than a mile, as in the vicinity of the Murray mine.

The ore bodies may be divided into two principal kinds, marginal deposits, at low points or bays on the edge of the norite; and offset deposits, where channels lead out from such bays conveying the ore mixed with norite to various distances from the edge, sometimes even three or four miles.

The best example of a marginal deposit is at Creighton, where one of the largest bays of the norite edge has furnished the greatest nickel mine worked in the district or in the world up to the present. The Creighton mine began as an open pit, which is now nearly 300 feet deep, with lower levels worked by underground mining. The country rock is granitoid gneiss and the ore body which rests upon it dips 34 degrees inwards towards the central line of the nickel basin. The ore is unusually rich, containing about 6 per cent. of nickel and copper, the latter making up a quarter of the whole, and specimens showing pentlandite are often found. It may be distinguished from the enclosing pyrrhotite by its octahedral cleavage and brassy colour as compared with the bronze of the more common mineral. The greenish yellow of the chalcopyrite is more easily recognized.

It is interesting to find that the dikes of fresh diabase cutting the rock and ore in various directions are glassy against the ore, which was a good conductor of heat, and only fine grained against norite or gneiss where the chilling was not so rapid.

The best examples of offset deposits are at Copper Cliff, where a large bay of norite narrows towards the southeast into a dike-like band of norite and ore which ends in the great columnar ore deposit of No. 2 mine. The open pit gives a good opportunity to see the shape of a characteristic offset deposit, which has been followed downwards for more than 600 feet.

A quarter of a mile to the south is the once renowned Copper Cliff mine, a still better example of this type, which reached nearly 1,300 feet in depth on an incline of 77 degrees to the east, and for years supplied the richest ore in the district, averaging nearly 9 per cent. Most offset mines are richer in copper than the marginal mines and the Copper Cliff ore contained more copper than nickel, justifying its name.

Two other deposits have been worked to the southwest and south at intervals of a quarter of a mile and of three quarters of a mile, but they were of minor importance. All of these ore bodies are associated with some norite spotted with blebs of ore, but they show no surface connections with one another or with the main mass of norite and must have been supplied by devious channels between the shifting blocks of country rock. Whether these channels still exist beneath the surface or were above the present level is uncertain. Probably the present surface is thousands of feet below the original one, so that connections from above might have been eroded away.

The columnar deposits at Copper Cliff and No. 2 mine are not the most extraordinary of their kind, since two still smaller columns have been followed downwards for 1,600 feet at Victoria mine.

The Copper Cliff offset deposits occur in contact with a variety of country rocks such as granitoid gneiss and greenstone among eruptives, and greywacke and pink quartzite of the Sudbury series among sediments, without any change in the character of the ore; and they are cut by dikes of granite and diabase which have likewise had no appreciable effect in changing the original ores.

In addition to typical offset deposits where the connection with the basic edge of the nickel eruptive is manifest, there is one very important band of gossan and ore which runs nearly parallel to the edge of the norite with no suggestion on the surface of any connection. This is the Frood-Stobie offset north of Sudbury, the largest known body of ore in the district. There must have been subterranean channels through which the pyrrhotite-norite and ore reached their present position in this unique case. The Frood-Stobie offset runs as a narrow gossan covered ridge with one or two interruptions for nearly two miles from southwest to northeast, and touches several types of rock, such as greywacke and greenstone, but nowhere comes within three-fourths of a mile of the norite edge.

Diamond drill cores prove that the deposit dips at first with an angle of 60 degrees or 70 degrees toward the norite, while at a greater depth the inclination flattens decidedly suggesting a broad underground connection wih the parent eruptive sheet.

The Frood-Stobie offset has been proved to contain more than 35,000,000 tons of average ore and far surpasses in magnitude any other known ore body in the Sudbury region. It has already furnished half a million tons of ore, and shafts are now being sunk by both Canadian Copper Company and the Mond Company, so that it will soon add greatly to the quantity mined in the district.

# ANNUAL REPORT OF THE MINISTER OF MINES FOR BRITISH COLUMBIA FOR 1912

(Continued from August 15th Issue.)

### Quantity and Sources of Ore Mined.

The total quantity of ore mined in 1912 was 2,688,-532 tons, which was 472,104 tons more than in any other year, equivalent to an increase of 21.3 per cent. over the tonnage of 1910, previously the highest year. The percentage of production of the several districts was as follows: Boundary, 74 per cent.; Rossland, 9.07 per cent.; Coast, 8.03 per cent.; Slocan, 5.07 per cent.; Nelson, 1.94 per cent.; East Kootenay, 1.87 per cent.; all other parts of province, 0.02 per cent.

Taking the province as a whole there was 790 tons of ore mined during the year for each of the 3,402 men employed in and about the shipping mines. The quantities ranged, in connection with divisions or districts that produced more than 50,000 tons in the year, from 2,354 tons a man in Boundary district, down to 178 tons in Nelson division.

### Output of Coal and Coke.

The gross output of coal mined in 1912 (which includes the coal made into coke) was 3,025,709 tons (2,240 lb.) as compared with 2,297,718 tons in 1911 and 3,139,235 tons in 1910. Had it not been for labour troubles at the mines of the Canadian Collieries (Dunsmuir) Limited, during the last quarter of the year, a result of which was that the output of those mines was about 150,000 tons less than in 1911, there is little doubt that 1912 would have been the record year for production of coal in the province. However, the year's output was only 113,526 tons less than that of the record year—1910—so that with this single exception it was greatly in advance of that of any other year. The net output of coal, that is, after deduction of 396,905 tons made into coke, was 2,628,804 tons, as compared with 2,193,062 tons in 1911 and 2,800,046 tons in 1910. In the last mentioned year, though, the quantity made into coke was somewhat smaller—339,-189 tons. The coke production for three years was: In 1912, 264,333 long tons; 1911, 66,005 tons; and 1910, 218,029 tons. Only in one other year has there been a larger production of coke than in 1912, namely, in 1905, when the output was 271,785 tons. It will be seen that while there was a net decrease in output of coal in 1912, as compared with 1910, of 171,242 tons, there was an increase in coke of 46,304 tons. The difference in value of coal and coke produced in 1912, as compared with 1910, was $321,523, the respective totals having been $10,786,812 in 1912, as against $11,108,335 in 1910.

The gross production of the several collieries was as follows:

| | Long tons. | |
|---|---|---|
| Vancouver Island— | | |
| Canadian Collieries (Dunsmuir) Ltd. | 741,569 | |
| Western Fuel Co. | 576,797 | |
| Pacific Coast Coal Mines, Ltd. | 151,589 | |
| Vancouver-Nanaimo Coal Co., Ltd. | 88,253 | |
| | | 1,558,208 |
| Queen Charlotte Islands— | | |
| British Pacific Coal Co., Ltd. | | 32 |
| Nicola Valley— | | |
| Nicola Valley Coal & Coke Co., Ltd. | 142,973 | |
| Inland Coal and Coke Co., Ltd. | 31,300 | |
| Diamond Vale Collieries, Ltd. | 3,310 | |
| | | 177,583 |
| Similkameen— | | |
| Princeton Coal and Land Co., Ltd. | 28,174 | |
| United Empire Mining Co. | 500 | |
| | | 28,674 |
| Crow's Nest— | | |
| Crow's Nest Pass Coal Co., Ltd. | 950,706 | |
| Hosmer Mines, Ltd. | 188,243 | |
| Corbin Coal and Coke Co., Ltd. | 122,263 | |
| | | 1,261,212 |
| Gross production of coal | | 3,025,709 |

Of the 264,333 tons of coke, the Crow's Nest Pass Coal Company produced 218,954 tons, and the Hosmer Mines, Ltd., 45,379 tons.

A table in the Report shows the output of coal and per capita production of the districts and province over a period of six years—1907-1912. Taking two years (for reasons previously explained 1911 is not taken), the following figures will be of interest:

| | Districts. East Kootenay. | Coast. | Whole Province. |
|---|---|---|---|
| For year 1910— | | | |
| Gross tons of coal mined | 1,365,119 | 1,774,116 | 3,139,235 |
| Total number of employees | 3,111 | 4,647 | 7,758 |
| Tons of coal mined in year per employee | 439 | 382 | 404 |
| Number of men employed underground | 2,374 | 3,529 | 5,903 |
| Tons of coal mined per underground employee | 575 | 502 | 532 |
| For year 1912— | | | |
| Gross tons of coal mined | 1,261,212 | 1,764,497 | 3,025,709 |
| Total number of employees | 2,410 | 4,720 | 7,130 |
| Tons of coal mined in year, per employee | 523 | 374 | 424 |
| Number of men employed underground | 1,780 | 3,495 | 5,275 |
| Tons of coal mined per underground employee | 708 | 504 | 574 |

### Markets and Prices for Coal and Coke.

The following excerpt from the comments of the Provincial Mineralogist will serve to give brief information relative to the markets for the coal and coke produced, and prices ruling for the former:

"The coal fields of the province which are at present producing may be divided into main divisions—those of East Kootenay district and of the Coast district. These fields, from their geographic positions—the one at the extreme eastern boundary of the province, and the other at the extreme western edge—are in no way competitors in the market, their markets being quite separate and ruled by completely different conditions.

"The market of the East Kootenay field is provided primarily by the railways of the south-eastern part of the province and of the northern parts of the adjoining States of Montana and Washington, approximately two-thirds of the coal sold as such being exported to those states, while the other one-third goes to supply the demands of the south-eastern part of the province —its domestic needs, railways, steamboats, mines, and smelters. Coke, a product of the coal mines, is sold in the same markets, with the difference that the local consumption—chiefly by the smelters of Trail and the Boundary district—takes more than 80 per cent. of the product, while 20 per cent. is exported to the states mentioned. As regards the marketing conditions in this field, the East Kootenay collieries are, however, brought into direct competition with the collieries of Alberta just over the provincial boundary line, all these collieries being in the same coal field, with practically the same grade of coal and working under similar conditions. This competition has kept the price obtainable for coal from $2.25 to $2.50 a ton, with little probability of any material increase in price, owing to the facility with which new collieries can be opened and the very large reserve areas of coal in that district.

"The Coast district may be subdivided into two fields—the Nicola-Princeton and the Vancouver Island fields—in which the markets differ considerably. In the former field the consumption is chiefly by the local railways, while a small amount of coal finds its way to Vancouver, even under the handicap of what seems to be an excessively high freight charge. The Vancouver Island coal market is provided by the domestic and manufacturing requirements of the Coast cities, and of the ocean-going steamers calling at these ports. The demand for coal from the larger coasting steamers and from the railways has in the last two years diminished, as the Canadian Pacific Railway main line engines are nearly all burning California crude oil, and a large coasting steamer burning coal is now an exception. Notwithstanding the heavy consumption of crude oil, the coal sales have remained about constant, approximately 70 per cent. of the coal sold having been for use in British Columbia, 20 per cent. exported to the United States, and 10 per cent. to other countries, chiefly Mexico. In the Coast district the demand for export coal has been so great and constant, particularly on the seaboard, and the prices obtainable so satisfactory to the shippers, that it has permitted of the domestic price being kept at a figure so high as to admit of the importation from California of fuel oil as a competitive fuel, where conditions permit of its use. It would appear, therefore, that the present price of coal on the seaboard, of from $4 to $4.50 f.o.b, is not liable to decrease for some time."

### Where the Bulk of the Metals is Mined.

Of the total of $555,500 for placer gold, $230,000 is from Cariboo and Quesnel divisions, $290,000 from Atlin, and the remaining $35,500 from other parts of the province, which are comparatively small producers of this metal.

Rossland mines contributed lode gold to the value of approximately $2,730,000, which was rather more than one-half of the total (of $5,322,442) for the whole province, Boundary district mines $2,167,000, Nelson division mines $362,000, those of the Coast nearly $52,000, and about $11,000 from other parts.

Of the total value of the output of silver—$1,810,-000—Slocan and Ainsworth silver-lead mines are credited with $1,132,000, Boundary district (in which the precious metals occur in association with copper) $225,000, East Kootenay $222,000, Nelson $95,000, the Coast about $61,000, Rossland $50,000, and Lardeau $25,000.

Lead was produced chiefly in the Ainsworth-Slocan district and in East Kootenay. The former produced $877,000 out of a total for the province of $1,805,000, while East Kootenay's output was valued at $824,000. The proportion from Nelson division was $92,000, that from Lardeau $9,000, and a small quantity from Portland Canal division.

Boundary district produced copper to the value of $5,453,000, the Coast $2,536,000, and Rossland $415,-000. The small remainder of the total of $8,408,000 was from Nelson division.

The production of zinc was about $308,000 from Slocan mines and $8,000 from North-east Kootenay.

### Some Noteworthy Features of Report.

In addition to much interesting and valuable comment by the Provincial Mineralogist, under the head of "Progress of Mining," there are other features of the report that are noteworthy. These include the reports of the Provincial Assayer and the Secretary of the Board of Examiners for Coal Mine Officials, respectively; those of the gold commissioners for the more important of the districts; the several special reports and compilations by the Provincial Mineralogist, and an illustrated report by Mr. C. F. J. Galloway on the "Coal Measures of the Peace River Canyon."

Among subjects of interest concerning which there also is information are the following: Reports of the Provincial Mineralogist and Mr. Geo. Watkin Evans on the Groundhog coalfield; that of the Provincial Mneralogist on his further investigations into the alleged finding of platinum and metals of that group in certain dikes in the vicinity of Nelson; several short reports on field work by the Provincial Assayer; on Dease Lake district, by the Provincial Mineralogist, and a comprehensive review of coal mining in the province by the same official. A valuable feature is the lengthy report of the Chief Inspector of Mines (Mr. Thomas Graham), who took office on January 1, 1912, in which are included a review of accidents in coal mines, mine rescue work, first aid to the injured, metalliferous mine accidents, an account of attendance at the Fourth Annual Convention of the Mine Inspectors' Institute of the United States of America, held last summer at Columbus, Ohio, and a report on an explosion at the Diamond Vale coal mine in March, 1912. The several reports of the district inspectors of mines are also of value.

### Report is Well Illustrated.

Reproductions of photographic views are numerous in the report, many of the half-tones being excellent, and well printed. Zinc-line cuts and lithographs are also used for illustrative purposes; among these is a sketch map of part of Laird, Stikine and Skeena mining divisions, compiled and drawn by Mr. Harold T. Nation, of the Provincial Mineralogist's office.

A full index makes the report complete. Generally this publication is well up to the high standard reached in other recent years, and is a really useful publication, reflecting credit on the Provincial Mineralogist, who did the chief work in its preparation, on the officials who assisted him, and on the British Columbia Government printing office for its excellent printing and press work.

# MICHIGAN COPPER MINERS' STRIKE

A representative of the Western Federation of Miners has given out the following statement in reply to that of the operators, from which we quoted in our last issue:

"At a later date I may compare the records of the Mine Operators' Associaton with that of the Western Federation of Miners. When I do it will not be necessary for me to bolster up our cause with such falsehoods as disfigured the operators' statement. The naked truth will be sufficient to win the plaudits of mankind for an organization that has been instrumental in putting more eight hour laws on the statute books of states and provinces than all others combined, has raised wages, improved working conditions, has been the voice of the silent ones who could not tell the story of their wrongs and whose individual protests were met by a time check in the hands of employers who were ruthless toward human rights. The mine operators of Michigan may eulogize themselves. No one else will. The 5,000 mine workers who have left the district because of wages and working conditions and the solid organization of those who remain makes sufficient comment. The Western Federation of Miners has done all in its power to alleviate and improve the conditions of the metal mine workers. When western miners have asked for improved conditions the operator has pointed to Michigan with its low wages and long hours. They have complained of the unfair advantage Michigan competitors have. Michigan operators deluded themselves with the idea that a time check for men bold enough to express discontent and a judicious use of "con" seasoned with grape salt tears at the miners' picnic could take the place of decent wages and working conditions. But neither tears nor fine words nor time checks can satisfy the workers' demands. The same men who are eulogized at picnics are lined up in the Federation and will not be satisfied until their demands are granted.

"To say that men who have been working from ten to thirteen hours a day do not desire the eight hour day enjoyed by other miners is to fly in the face of common sense. To say that miners working on company account for about $2.70 a day, and when on contract sometimes get a cipher with the rim knocked off; to say that such men will not accept a minimum of $3 a day, except under the duress of a mob, does not sound over-reasonable. That is on a par with many other statements. They wanted them so badly that not even the sheltering arms of the troops nor the tender carresses of Waddell thugs are able to seduce them from their allegiance to the union.

"To say that surface employees, many of whom enjoy the princely wage of $1.85 per day, do not desire and need an increase of 35 cents a day will not appeal to anyone who knows what is required to decently support a family: The hurried call for troops and the Governor's eager response, the evident desire of the commanding officers to put the mines in operation show the forces against us. Men with the instincts of justice and fair play will condemn the call for troops, the response to the call, and the use that is now being made of them—and all for the purpose of saving money for the mine owners and not for the preservation of peace.

"To meet representatives of their employees in conference would break a long record for disregarding the rights of others, to grant their modest demand would give peace to a community and a small measure of justice to those who have long been denied consideration.

"During the thirty-five years of the existence of the organization in Butte, Montana, twenty of it under the Western Federation, during which there have been no quarrels between the employees and employers, refutes some charges made very effectively. The men of Butte are the best paid miners on the continent, and relations between the union and the mine operators are as satisfactory to both parties as can be found. Why should not Michigan operators emulate the example of those of Butte?"

# THE CONDITION OF THE MINING INDUSTRY IN LONDON*

By A. G. Charleton, M. Inst. M.M., A.R.S.M.

Artificial and sudden "booms" are always bad, since they injure legitimate mining business, but we need, in order to make constant and steady progress, to promote sound undertakings, and new ventures are necessary to maintain mining in a flourishing condition. There can be no doubt that mining business in London at the present moment, unfortunately for everybody concerned, lacks that support from the public which is essential for its healthy development, and which formerly it used to command without any difficulty.

The present "slump" in mining is not confined to London, of course, but it is perhaps at its worst here, and the only way to lift it to its proper position is, I believe, to let the public share in its successes in place of letting them in for a succession of failures, and to put the control of operations in the hands of directors and of technical men of unquestionable professional standing, who will look after their interests properly. It is equally futile and dangerous either to generalize or to dogmatize too much in regard to mining, because it presents so many exceptions to the rule; but one may confidently hope that as time goes on the number of failures will be minimized, as education extends and the ethics of finance, as well as the ethics of the profession, are put upon a higher plane, which, properly directed, is bound to come about. It is necessary, however, to educate the public as well as the mining engineer in this conenction, and mining requires new life put into it to be lifted out of the grooves and ruts into which it has lately sunk.

In a paper which I presented to the Institution of Mining and Metallurgy in 1911 I commented upon the future of the mining industry from an economic standpoint, and pointed out the magnitude of the interest involved in the mining and metallurgical industries of the British Empire. The value of mining as a national industry of the first importance cannot be disputed, and Mr. Bedford McNeill, in his presidential address to the Institution of Mining and Metallurgy,

*From Financial Times, London.

delivered on 13th March last, pointed out "the close association of mining and capital," and justly remarked that "at practically all points (commencing at a minimum when prospecting) the mining engineer is in close contact with finance." "It is in connection with the finding and losing of capital that so many difficulties and perils occur to the members of our profession."

The record of the British enterprise will undoubtedly suffer a serious blow if bona fide mining enterprises fail to secure that consideration and public support which they have been accustomed to receive in the past from financiers.

The speculative nature of mining ventures generally cannot, of course, be disputed; but, as Mr. McNeill observes, "each successive advance of the science of mining ought to tend to equalize its increasing hazards." Nor can we lose sight of the changing conditions of the present century, both in technical progress and in financial practice, and the consequences of international competition and the extension of railways in different parts of the world. But the general trend of modern progress, particularly in the matter of technical mining education, should tend to make mining less hazardous than it was formerly, particularly if the higher standard of ethics, that I believe now obtains generally amongst mining men, is taken into account; and it is a most important factor.

The reasons advanced by recent writers for the "slump" in the mining industry do not strike me by any means as covering the ground completely, and when the ebb ends, as it will do in time, the stream of mining business will probably flow along as it used to do, but along different channels perhaps, to those which it has been accustomed to follow. You cannot change industries or malpractices in a year or a day, but they can be, and have to be, altered in process of time to meet the conditions of the day, as the public are contsantly demanding change and novelty. And they get new dresses and new dishes; but the essential components and the flesh beneath remain the same, whilst we learn from experience new and improved methods of mining and new ideas upon finance.

### Causes Summarized.

If we seek and probe the true causes which are responsible for the loss of popularity from which the mining industry is at present suffering, I venture to think that some advance may be made by locating and diagnosing the disease, for it is important to prevent dry-rot—which can be dealt with—spreading. The causes may, I think, be briefly summarized as follows:

1. The excellent security and rates of interest yielded by "gilt-edged" securities.

2. Booming trade, calling for all the available cash for investment in industrial business.

3. Mining scandals and overcapitalization, which have frightened shareholders and done injury to legitimate mining promotions.

4. The higher cost of living, which, leaving them no margin for acquiring interests in mining, has heavily taxed a number of small capitalists.

5. The practical disappearance of the old-time company promoter, who appealed to the public direct.

6. The failure of the public to discriminate between mines of different kinds like those of the Rand, and mines of a more speculative nature, since the lives of mines, like many of those in the Transvaal, are known with almost mathematical certainty, and their revenue and expenditure can be very closely estimated. As a result of this, the uninformed public have been led to expect that the same can be done in all cases, which is not, of course, the case; and to expect all mining ventures to be of this gilt-edged mining class.

7. The general policy of the big financial houses, into whose hands most of the mining business has drifted —namely, that of giving attention only to developed mines whose "present value" can be calculated fairly closely. (In fact, British engineers are not "prospecting" and London financiers are not backing them in exploring and opening up the "black-blocks" of our colonies and elsewhere, in searching for promising mineral deposits as they used formerly to do, and one would imagine that the chances, on the whole, were more in their favour now than they used to be).

8. The fact that the Stock Exchange are disposed to run mining shares too quickly up to a price at which they will not yield a rate of interest that the public expect in order to give them a fair run for their money.

9. The general state of unrest in countries like Mexico, where the mining industry is extensively carried on, and local labour troubles in Australasia and elsewhere.

The causes referred to in Nos. 1, 2 and 3 have been frequently discussed in articles and letters in the press, but little notice has been taken of the other outside influences which I have mentioned.

There have been, it is true, no notable new gold discoveries made during the past three or four years, and the value of mines that have been discovered has been discounted before the shares have reached the public. Of the new mines placed on the market, it is rare to find one that has exceeded expectations; in fact, the general rule has been to fail to come up to financial exigencies, and whilst the promoters may have made money on the deal the public have lost. So long as it is a case of prizes for the one and blanks for the other, just so long will the public hold aloof from the industry which it is so necessary to support. It is their money which makes mining enterprise possible. and when their capital is cut off, as at present, the industry suffers, carrying with it promoters and directors, who are losers in the long run by this shortsighted policy, and incidentally dragging the mining profession after them.

The vast improvements made in economic geology, metallurgy and mining engineering of late years have caused mining valuations to become much more exact, so that the buyer and seller know the value of their deals and such risks as they have to run; hence there is not the excuse there was formerly for over-capitalization or the flotation of valueless mines. If the shareholder had a fair chance to come in on bed-rock to share in the profits to a reasonable extent, and could see his shares gradually increasing in value, in the case of a good property in process of development, he would view mining in a different light and help the industry forward. Members of the mining profession have been gradually opening their eyes to this state of affairs, and in proof of this I may quote a well-known mining engineer, who has written:

During nearly four years spent in Mexico I have never met a representative of an English company who was not looking strictly for large developed properties with ore reserves and good looking bottom levels. In addition he expected to obtain easy terms and to be able to float the property immediately, and to make large profits after having provided working capital.

A developed mine rarely possesses great opportunities for new discoveries; it therefore lacks the allurement of a favourable undeveloped property which might be classed as a speculation. If only mining investments are to be endorsed we must in future confine ourselves to the mines that are now developed. This would kill the mine industry.

While the mining profession is rusting a few wealthy mine operators are gaining a monopoly over the mines and metals of the world. Mine finance companies would be more successful if they would begin to look more strenuously for favourable "prospects" and endeavour to make "mines" instead of working the "markets."

All professional men would like to see the public look upon mining shares as titles to properties instead of gaming chips.

It is time that mining people generally in London took steps to restore and maintain public confidence in mining enterprises.

Some strong remarks have been made recently, with perfect justice, about the use sometimes made of information before it reaches shareholders, and just as the officials of a company are usually precluded from dealing in its shares without the knowledge and permission of the board, the same useful provision in respect of everyone concerned in the management of a company, if put into force, would certainly do much to restore confidence in the industry. Another point to which attention has lately been directed is the suggestion that a mining engineer ought to be upon every board, so as to ensure that all technical reports were thoroughly understood and questions arising out of them might be dealt with, and not shelved without proper consideration.

**Necessity of Opening Up New Fields.**

But granted that these changes and improvements in practice were made, the necessity of opening up new fields for the industry still remains paramount. Little has been done in London of late years to open up new mining fields, and we need the discovery of some new and great gold field to galvanize mining into renewed activity. London did not share in the early development of Cobalt or Porcupine, or other such discoveries that have been made in recent years. In spite of the great advancements made of late by the engineering profession, prospecting and developing mines has been looked upon—without any sufficient reason—with distrust. It has been either from America, Germany or our Colonies themselves, that money has been found for this essential prospecting and development, which is the key to fortune in mining in most instances. You cannot win big prizes in business without taking certain chances and risks; even given the skill and knowledge that can alone command success, when it comes to the point of applying them to a definite object.

In America the trouble in regard to "prospecting," to which I have referred, has been recognized as being a serious one, and a commercial organization was started in Colorado to encourage "prospecting," it being noted that a decline of 33 per cent. had taken place in the production of metals in the State of Colorado in ten years. The Denver Chamber of Commerce, co-operating with other commercial bodies, solicited funds and appointed a committee to make contracts with prospectors and to furnish necessary outfits for a season. Money was raised and 34 parties were sent out, who made 43 "locations." The committee were of opinion that the claims held warranted further development, and a "development company" was formed to work them under the direction and management of a number of eminent engineers and leading financiers. I am not aware of what measure of success it met with, but it appears to have been a serious attempt to promote mining interests, and the people concerned in it seem to have got a fair run for their money.

The second stage—that is, after a mine has passed the point of being a mere "prospect"—is, in my opinion, the one in which the public should be encouraged to participate, because they stand the chance of making most profit out of it, provided that the undertaking is honestly financed (without having to pay too dearly for promotion expenses), intelligently directed and technically well managed.

# COMPANY NOTES

## MOND NICKEL COMPANY.

The thirteenth ordinary general meeting of the Mond Nickel Company, Ltd., was held yesterday at the Hotel Windsor, 46 Victoria street, S.W., the Rt. Hon. Sir Alfred Mond, Bart., M.P., (the chairman), presiding.

The chairman, in moving the adoption of the report and accounts, first dealt with the figures in the balance sheet, and remarked that the first item on the credit side showed an addition of £8,938, which had practically all been expended in the development of the company's mines in Canada. In the next item, the smelting and refining works, there was a large addition of over £168,000, which the shareholders would have anticipated from last year's report, in which the directors informed them that they were building a large new smelting plant at Coniston, Ontario. The largest part of the expenditure was in connection with this new smelter, and the balance was incurred in increasing the refining works at Clydach, in South Wales. On the other side of the balance sheet they had written off the reserve suspense account, £35,000. which represented the greater part of the balance of the old smelting plant, which they had abandoned since the beginning of the current financial year, when the new smelter was started. He was informed that approximately £10,000 would be required next year in order to complete the writing off of that item. The shares in other companies showed a slight increase, which was largely a nominal one. In order to deal with the housing difficulties in South Wales, they had to extend the cottage accommodation for the workmen, and a small internal company was formed for the purchase of the land and the erection of the cottages. The increase in this item consisted almost entirely of shares which they had taken in this new estate company. The suspense account had been increased by £4,000. During the year they had taken an option on a very important property in Ontario, and they always put money which they paid for options to suspense account, pro tem, so that if they did not take up the property they could write it off. The balance at credit of profit and loss account showed the very substantial and gratifying increase of £47,000 over that of the last financial year. He thought shareholders were to be congratulated on this very fine increase in the year's trading. With the sum carried forward from profit and loss account last year of £41,381, the total amount to the credit of profit and loss account after deducting fees was £232,429.

**Appropriation of the Profits.**

The directors proposed to deal with this balance as stated in the report. The dividend on the preference shares, being fixed, called for no comment. The directors had decided to make a substantial increase in the dividend on the ordinary capital. They had, he thought, a right to claim that they had acted in a conservative manner in regard to their dividend distributions. The business was a growing one, and they had every reason to anticipate a much greater development in future years to what they had seen in the past, but they had always felt it right not to pay away their profits up to the hilt. On the other hand, they thought the shareholders were entitled to a reasonable percentage of the year's earnings. The board, therefore, decided to increase the dividend to 21¼ per cent., which was an increase of 5 per cent., and would absorb the sum of £60,031. The dividend on the deferred capital moved automatically with the profits distributed on the ordinary capital. The premium on the debenture stock offered last year—namely, £3,750—had been placed to reserve, and it was proposed to place £16,250 to reserve, compared with £15,000 last year. This would bring the reserve fund up to £220,000, which he thought was a respectable figure for a company with an issued capital of £750,000. The directors had also decided to place to reserve suspense £40,000, compared with £20,000 last year. By writing off £35,000 they reduced the present reserve suspense account to £5,000, and the board felt it a wise thing to re-establish this account to a reasonably larger amount. The balance to be carried forward this year was £49,525, compared with £41,381 last year, so that they had a very substantial balance forward, which they could deal with at any time when they thought it desirable to do so. As stated in the directors' report, the progress of the operations of the company in Canada and England had been very satisfactory. Last year he mentioned that they were building a new smelting plant at Coniston, Ontario, on the most improved and up-to-date lines. It had been a long and difficult task to erect this plant in a country where they had a very long and severe winter. They were promised that the plant would be ready to operate this June, and he was glad to be able to say that so accurate was the planning and estimating of the staff in Canada that the date they gave for its completion, more than two years ago, was anticipated by a fortnight. The plant since it started had been running continuously and seemed to be in every way successful. It was a very fine plant, and occupied a very fine situation, and he and some of his colleagues intended to visit it this autumn. During the year they had been continuing the erection and the extension of the company's works in South Wales, to which he referred last year. The work was progressing satisfactorily, and it was expected that during the present financial year the plant would be completed.

**Further Mining Properties Acquired.**

As he had already mentioned, they had taken an option of one important property in Canada, which they were examining now, and on which it would be premature to express an opinion, but he might say, for the information of the shareholders, that since the closing of the last financial year they had acquired some further valuable mining properties in the neighbourhood of the properties they already possessed in Canada. They had a good opinion of those properties, and the examination which had been made of them seemed to promise valuable results. The ore reserves of the company at the present time were very much larger than they had ever been in the history of the company, and on conservative data they had no reason to doubt that the mines they possessed would supply the company with raw material for many years to come. There was no doubt that the nickel business was a developing one; it was growing every year, and as they had, in his opinion, the finest and cheapest refining process which existed to-day in the industrial world, they would be foolish not to take every opportunity of extending and developing the business from what it was now to a very much larger thing in the future.

Dr. Bernard Mohr proposed the re-election of the retiring directors, Sir Alfred Mond, Mr. Robert L. Mond, and Mr. Emile S. Mond.

Mr. Robert Mathias seconded the motion, which was unanimously agreed to.

# PERSONAL AND GENERAL

J. G. McMillan, who has been making harbour surveys at Moose Factory, James Bay, returned to Toronto August 8th, and went west on the C2 excursion of the Geological Congress.

Mr. Fred Murphy, formerly of the Canadian Copper Company's staff at Copper Cliff, and now chief engineer of the Crow's Nest Coal Company, was among those who guided the C2 excursion party to the properties at Coal Creek. Mr. Murphy is resident at Fernie, B.C.

Mr. Neil Macdonald, formerly connected with development of mining properties in Northern Ontario, is now engaged in exploration of properties in the Rice Lake district, Manitoba. Mr. Macdonald's headquarters are in Winnipeg.

Hon. Louis Coderre, Minister of Mines, Ottawa, accompanied the C2 excursion to British Columbia, and is now at Vancouver.

Among those who visited Sudbury, Cobalt and Porcupine on the C6 excursion were: Dr. Richard Beck, of Freiberg, Germany; Dr. Alfred Bergeat, Universitat, Konigsberg; W. S. Bayley, Illinois; Sir Thomas Holland, England; Dr. J. P. Krusch, Berlin; H. B. Patton, Colorado; Dr. J. J. Sederholm, Finland; Dr. C. H. Smyth, Princeton; Dr. J. E. Woodman, New York; Dr. J. Stansfield, Montreal.

Dr. Donald G. Forbes, an experienced mining engineer, who some years ago was in charge of the Silver Cup, Nettie L. and other mines in Lardeau district, British Columbia, is this field season investigating mining conditions in several Coast mining districts, for the purpose of reporting thereon to the British Columbia Department of Mines.

Mr. Robert R. Hedley, of Vancouver, B.C., has commenced doing preliminary work on the Tassoo copper property, situated on the west coast of Moresby Island, of the Queen Charlotte group, on which property there occurs an ore body more than 300 ft. wide.

Mr. W. H. Trewartha-James, for several years general manager for the Tyee Copper Company, operating in British Columbia, was recently reported by English journals to have returned to London from Northern Nigeria.

Mr. Con Wolfle and associates, of the State of Washington, have bonded some mineral claims situated in the neighbourhood of Quatsino Sound, and intend to proceed with the development of them.

Mr. R. B. Lamb, of Toronto, is in Nevada on professional work, until the end of September.

The Roberts and Schaefer Company, engineers and contractors, Chicago, have closed a contract for the building of a 600 ton capacity Holmen coaling station at St. Lambert, Quebec. Price $17,000.

Mr. W. H. Taylor, of Spokane, Washington, is mining engineer in charge of development work on a group of mineral claims bonded by Mr. P. Clark, and situated in Summit camp, in the vicinity of the headwaters of the Tulameen River.

The Committee of Management of the International Engineering Congress, 1915, takes great pleasure in announcing that Col. Geo. W. Goethals, chairman of the Isthmian Canal Commission and chief engineer of the Panama Canal, has consented to accept the honorary presidency of the Congress, and will preside in person over the general sessions to be held in San Francisco, September 20-25, 1915.

The B. F. Sturtevant Company, of Canada, Limited, have arranged for a plant in Galt, Ont. From this plant the company will handle all business in Canada, and also export to England, Australia and other foreign countries. Some of the more important apparatus which will be built are fans and blowers, planing mill exhausters, propeller fans, heating and ventilating apparatus, fuel economizers, mechanical draft, steam turbines, vertical engines, generating sets and stokers.

The members of the C2 excursion now visiting mining districts in British Columbia and Alberta, are: E. M. Anderson, Geological Survey, Edinburgh, Scotland; John Ashworth, M.E., Manchester, England; Sir Augustine Baker, Dublin, Ireland; H. E. Boeke, Dr., Professeur Mineralogisches Institut, Halle a.S., Germany; Dr. O. B. Boggild, Professeur Mineralogical Museum, Copenhagen, Denmark; Dr. L. H. Borgstrom, Universite Helsingfors, Finland, Russia; A. H. Brooks, Geological Survey, Washington, D.C., U.S.A.; R. W. Brock, Director Geological Survey, Ottawa, Canada; C. Camsell, Geological Survey, Ottawa, Canada; Cosmo T. Cartwright, Mines Branch, Department of Mines, Ottawa, Canada; J. Charbonnier, manager West Canadian Collieries, Ltd., Blairmore, Alberta, Canada; Dr. C. H. Clapp, Geological Survey, Ottawa, Canada; Hon. Louis Coderre, Minister of Mines, Ottawa, and Secretary of State; Mrs. Coderre; Lorent Edward Theodor Dahlblom, Bergmastare in Gefle-Dala District, Falun, Sweden; William J. Dick, Commissioner of Conservation, Ottawa, Canada; D. B. Dowling, Geological Survey, Ottawa, Canada; Rev. Pierre Dupaigne, Licencie-es-Sciences, Professeur des Sciences Physique et naturelles au Seminaire de Philosophie, Montreal, Canada; George Loudon Dunn, Annahill, Kilmarnock, Scotland; Dr. B. E. Fernow, Dean of Faculty of Forestry, University of Toronto, Toronto, Canada; Mrs. Fernow; O. S. Finnie, Department of the Interior, Ottawa, Canada; H. Frechette, Mines Branch, Department of Mines, Ottawa, Canada; H. E. T. Haultain, Prof. of Mining Engineering, University of Toronto, Toronto, Canada; Mrs. Haultain; Samuel McLare Gardner, Mount Vernon Colliery Co., Ltd., Glasgow, Scotland; Prof. J. C. Gwillim, School of Mining, Kingston, Canada; Prof. Dr. B. Gurich, Hamburg, Germany; Bernard Hobson, F.G.S., Sheffield, England; Dr. Thos. Cramer Hopkins, U.S.A.; R. E. Hore, Editor Canadian Mining Journal, Toronto; Dr. F. R. van Horne, Case School of Applied Science, Cleveland, Ohio, U.S.A.; Dr. J. P. Howley, Director Geological Survey of Newfoundland, St. John's, Newfoundland; Mark Hurll, Glasgow, Scotland; John McGlashan Redholmn Hurll, M.E., Glasgow, Scotland; M. Inouye, Director Geological Survey of Japan, Tokio, Japan; Hy. Goodson Ives, Andover, New Hampshire, U.S.A.; J. T. B. Ives, F.G.S., Andover, New Hampshire, U.S.A.; Gerald Jarvis, Arnprior, Ontario, Canada; Chutaro Kido, Superintendent of the Geological Institute of the South Manchuria Railway Company, Dairen, Kantoshu, Manchuria; G. Kennedy, Toronto, Canada; Paul Kukuk, Bergassessor a. D., Bochum i.W., Germany; Leon Jean Benjamin de Lamothe, General de Division, Inspector de Etudes techniques de l'Artillerie, 1 Place St. Thomas d'Aquin, Paris, France; H. M. Luttman-Johnson, H.M., F.R.G.S., Petworth, Sussex, England; C. Lebling; O. E. LeRoy, Geological Survey, Ottawa, Canada; E. Maier, Professeur titulaire en gelogie Universite de Santiago, Santiago, Chili; Dr. Siegfried G. Martius, Assistant am mineralogischpetgraphischen Institut der Universitat Bonn, Bonn a Rh., Germany; J. G. McMillan, 225 Geoffrey St., Toronto, Canada; J. McEvoy, Mining Engineer and Geologist, Toronto, Canada; Mrs .McEvoy; Jean Morel, Ingenieur civil des Mines, Boitsfort pres Bruxelles, Belgium; Donald Sutherland McIntosh, Prof. of Geology, Dalhousie University, Halifax, Canada; Bedford McNeill, London, England; Mrs. McNeill; Dr. Edward Thomas Mellor, Geological Survey, South Africa; Benjamin Leroy Miller, Professor of Geology, Lehigh University, South Bethlehem, Penn., U.S.A.; Frederick B. Peck, Lafayette College, Easton, Penn., U.S.A.; Mrs. Peck; Sidney Powers, Inst. of Technology, Boston, U.S.A.; Dr. G. Saugrain, Geologue publiciste, Paris; S. J. Schofield, Geological Survey, Ottawa, Canada; J. T. Singewald, Jr., Associate in Economic Geology, Johns Hopkins University, Baltimore, Maryland, U.S.A.; C. Spruy, Anvers, Belgium; J. T. Stirling, Chief Inspector of Mines for Alberta, Edmonton, Canada; T. Surzycki, Petrokow, Pologne-russe, Russia; W. J. Sutton, Victoria, B.C.; F. T. Thwaites, Madison, Wisconsin, U.S.A.; Dr. P. F. Hubrecht, Batavia, Netherlands-India; J. H. Valiquette, Bureau of Mines, Quebec, Canada; Stephen Vivian, Inst. M. and M., London, England; H. B. Wallis, London, England; A. G. B. Wilbraham, London, England; Dr. A. W. G. Wilson, Mines Branch, Department of Mines, Ottawa, Canada; Prof. Dr. Th. F. Wilhelm Wolff, Kgl., Landesgeologe, Frohnau b. Berlin, Germany; R. B. Murray, London, England; J. B. Tyrrell, Toronto, Ontario; Dr. B. Weigand, Deutsche Geolg., Geselschaft, Elsoss, Germany; C. W. Wright, Ingurtosu, Sardinia, Italy; Mrs. Wright; Dr. R. Zuber, Professor of Geology, University of Lemberg, Austria. Twenty-one countries are represented by these men. The party has visited the gas producing district at Medicine Hat and the Crow's Nest Pass Coal district. Thence the party proceeded up Kootenay Lake and visited the copper deposits at Phoenix. The Granby Consolidated smelter at Grand Forks, the British Columbia Copper Co.'s smelter at Greenwood, the Trail smelter and Rossland gold and copper deposits. After visiting Vancouver and Victoria the party will visit the coal mines in the vicinity of Edmonton, Alberta, and travelling east on the new National Transcontinental Railway to Cochrane, will come south to Toronto on the T. and N. O. Railway. On Friday, Sept. 5, the party will visit the gold mines at Porcupine, and on Saturday the silver mines at Cobalt. Toronto will be reached on September 7.

# SPECIAL CORRESPONDENCE

## COBALT, SOUTH LORRAIN AND GOWGANDA

Owing to the barrenness of a portion of the Carson vein the dividend has been reduced from 5 per cent. a month to 2 per cent. The dividend has always been paid in the form a 2 per cent. regular and 3 per cent. bonus. This dividend of 5 per cent, or over $88,000, has been a strain on the Crown Reserve resources for some time, but the inevitable cut might have been postponed for some months, or perhaps a twelvemonth longer, if a certain part of the Carson vein which had been counted on to produce as high grade ore as the other sections of the vein had not suddenly shown barren. The values ran out of the vein about February, but development proceeded in the hope that they might be picked up again. The secret was extremely well kept. It is most probable that the news of the barrenness of a section of the vein did leak out from Cobalt to Toronto, but it was not sent to directors. Col. Carson accepted the inevitable, frankly explained the cause of the drop in the stock, and announced the cut in the dividend. The only criticism to be heard in camp is that the cut was not made at once when it was discovered to be inevitable. It would then have been possible to slacken the terrific rate of produc-tion and get down to a low grade basis with reduced costs.

The construction of the pipe lines from Kerr Lake to Giroux Lake is being rushed with all expedition, and pumping should commence about the first week in September. The scow has been almost completed, and the two centrifugal, 3,000 gallon pumps have arrived and can at any time be unloaded on the scow and placed in a position to work.

Development below the 200 foot level of the Crown Reserve has not produced much ore, and the resources of the mine are confined to its lateral development above the 200 foot level and the as yet unprospected territory under the waters of Kerr Lake.

The Nipissing mines for the month of July shipped ore of an estimated net value of $314,115. Some of this ore, however, is customs to the Nipissing's high grade mill. The company mined ore of an estimated net value of $224,216. During July the high grade mill treated 177 tons and shipped 531,099 ounces of silver. The low-grade mill treated 7,268 tons, or almost 250 tons per day.

All the stopes at the third level of shaft 73 continued to produce a large amount of ore. The main vein has a greater height at the north end than was at first expected. The faulted extension of one of the branch veins at the third level was encountered and has a width of from two to four inches and assays three thousand ounces. Ore has been found at the fourth level for the first time. The fourth level has a depth of 330 feet, and was expected to be just below the Keewatin conglomerate contact. The north drift is in conglomerate at a distance of 195 feet from the winze. The vein in the face is two to three inches wide of 300 to 400 ounces. A raise just back of the drift shows higher values ten feet up.

The hydraulic is working on Little Silver Hill near vein 27. A vein from two to three inches wide was uncovered near vein 27 and running at right angles to it. The vein is decomposed and shows no solid material at the surface and assays 63 ounces from the mud. Some open cutting was done on vein 128. It is one inch wide, and while not uniformly high grade, there is some amount showing rich ore. The vein has a length of a hundred feet.

The Gifford mine is to be dewatered at once. A syndicate of Montreal and Toronto men, many of them connected with the Crown Reserve Mining Company, have been picking up Gifford stock on the market for some time. They have now 400,000 shares out of the 600,000 shares of a par value of 25 cents each. The Gifford is partly in Keewatin and partly in granite and adjoins the Beaver. Some time ago a shaft was sunk on contact to the 200 foot level and some drifting done, but nothing of importance discovered.

For the past two months the Cobalt Lake production has been at the rate of 25,000 ounces a week. June and July each showed an output of 100,000 ounces of silver. Alterations and additions to the mill allowed the company to go on this basis of production. Of this amount 80,000 ounces came from the mill concentrates, while 20,000 ounces is accounted for by high-grade ore sorted underground.

Speaking of the drainage of Cobalt Lake, it is hoped that the matter will be before the mining commissioner at his first sitting in September. The plans and specifications will first be presented to the Provincial Board of Health.

On the York Ontario mine a rich shoot of ore has been picked up on the intermediate level between the 70 ft. and the adit level. The vein is from three to four inches of silver in the calcite and holds good for 20 feet. Forty bags of high grade ore have already been taken out from the drift. Two cars of concentrates and high grade ore will be shipped from the mine the latter part of this month.

The Timiskaming and Hudson Bay Company paid its 49th dividend on August 19th. They now have the remarkable record of paying 23,500 per cent. on capitalization, or $1,823,835. The last dividend was for 300 per cent. as usual.

The Right of Way Mining Company has taken an option on the Flynn group of claims in Lebel Township. The properties number seven in all and lie due south of the Tough-Oakes.

Ground has been broken for the new Northern Customs mill on the site leased by them on the Nipissing property near 104, just north of the town. The four acre site has already been cleared of all underbrush and a gang of men has started on the excavations. The intention is to build a hundred stamp mill, though a battery of only eighty will at first be installed. The eighty stamps will give a capacity of 250 tons daily, and for the present will take care of all the contracts held by the company. The flow sheet will be almost identical with that used at the old mill. It is expected that the new mill will be in operation some time before the end of the year. It is a fact that three-fourths of the machinery can and will be manufactured in Northern Ontario at the Wabi Iron works.

The Chambers Ferland is now sinking a shaft to endeavour to pick up the extension of the Nipissing 64. It has now reached a depth of 40 feet. Cross-cutting will commence at between 200 and 300 feet, as prospects appear expedient. The shaft is entirely in the conglomerate. This is an endeavour to open up a section of the Chambers Ferland never prospected before save on the surface.

## PORCUPINE, SWASTIKA AND KIRKLAND LAKE

Financing of future operations of the McIntyre mine will be made by the issuing of bonds to the extent of $250,000. Of this $200,000 is to be offered to shareholders. The proceeds will be used to pay off the heavy debts of the company, extend the mill, and carry on development work.

At the Tough-Oakes property in Kirkland Lake the station has been cut at 200 feet. It is expected that drifts will be started on the main vein at this level in a very short time now, while the shaft will be carried down to the 300 foot level. The vein at 200 foot level shows from 14 to 16 inches of high grade ore, though it is split up into several stringers.

The Hollinger Gold mines report for July shows a gross profit of $129,146 for the four weeks ending July 15th. The profits for the current year to date amount to $851,667. The surplus after dividends have been paid amounts to $573,469. The average value of ore treated was $19.70 per ton, against $16.50 last month. Working costs per ton amounted to $6.209 as against $5.473 in June. Work upon the winze below the 300 foot level has been continued and the winze has now reached a depth of 113 feet. The vein dipped out of the winze at 94 feet. The winze will be carried to a depth of 125 feet, and the next level will be established at 425 feet.

The mill ran 87 per cent. of the possible running time, treating a total of 10,056 tons of an average value of $19.70 per ton. The approximate extraction was 96.5 per cent. Milling costs amounted to $1.648 per ton milled.

The Alexo nickel mine, near Iroquois Falls, shipped 22 cars of ore containing 1,588,500 pounds, during the month of July.

Good results are being obtained by the syndicate leasing the Rea mine at Porcupine. The ore taken from the dump and the stope at the 100 foot level and being fed to the five stamps is running well.

## NOVA SCOTIA

**Dominion Coal Outputs.**—The coal output in July was the largest yet recorded from the Dominion mines, being 425,635 tons, compared with 409,125 tons in July, 1912, and with the highest previous output of 422,343 tons produced in October last. The individual collieries had outputs as under:

| No. | Tons. |
|---|---|
| 1 | 48,331 |
| 2 | 69,515 |
| 3 | 10,636 |
| 4 | 34,018 |
| 5 | 18,770 |
| 6 | 25,942 |
| 7 | 21,369 |
| 8 | 6,638 |
| 9 | 34,733 |
| 10 | 16,514 |
| 11 | 5,414 |
| 12 | 29,175 |
| 14 | 38,235 |
| 15 | 21,748 |
| 16 | 24,917 |
| 21 | 14,158 |
| 22 | 5,495 |
| | 425,635 |

The production from mines Nos. 14, 15, 16, 21 and 22 was the best yet obtained. The output from No. 7 Colliery has only once been exceeded, namely, in July, 1910. Satisfactory as the outputs were, they might have been much greater but for the decided shortage of men.

The total output for the seven months ending 31st July was 2,720,765 tons, compared with 2,533,283 tons for the same period last year, showing a gain of 187,-482 tons.

The output of the Springhill mines in July was 31,409 tons, compared with 31,147 tons last July. For the seven months ending July the total output was 225,206 tons, against 244,241 tons last year, showing a slight drop in production, due, of course, to the mine fire last December.

The production for August from the Cape Breton mines will probably reach 405,000 tons, and will probably be less than the output in August, 1912, as in this year the month contains one working day less than last year.

## BRITISH COLUMBIA

### Aufeas Gold Mines, Ltd.

The West Yale Review reports that on the Aufeas property, on Wardle Creek, the vein has been entered at 385 feet from the portal of the lower tunnel and at a depth of about 450 feet. The ore is similar in character to that found at the outcrop, samples of which assayed from $23 to $30 in gold and also contained a high percentage of arsenic. There was 9 feet of ore and the hanging wall had not been reached. It is intended to construct an aerial tramway and ship ore to the smeltery at Tacoma, Puget Sound, Washington.

In this connection the following excerpt from a report by Mr. Chas. Camsell, published in the "Summary Report of the Geological Survey," for 1911, will be of interest: "A group of three mineral claims, known as the Jumbo group, is situated on the west side of Silver Creek, about four miles south-west of Hope. The claims lie in a steep narrow gorge at an elevation of about 1,000 feet above the sea. The country rock is massive grano-diorite, in places sheared and traversed by fissures. The ore deposits lie in the fissure veins and have a width averaging about eight inches. They contain dull coloured arseno-pyrite and a little chalcopyrite in a gangue of quartz, and gold is the principal valuable metal in them. The value of the ore in the fissure ranges from $10 to $60 to the ton. The claims are devoloped by three tunnels of varying length, and several open-cuts. These claims and adjoining locations are now owned by the Aufeas Gold Mines, Ltd., which has recently made successful arrangements for financing the development of the property. The company intends building a wagon road from the Interprovincial highway at the mouth of Wardle Creek to the camp, and proceeding with the construction of permanent camp buildings, including cook house, bunkhouses, storehouses for supplies and tools, the laying of pipes to supply the camps with water, and the clearing of the right-of-way for an aerial tramway. As soon as the road and camp shall be ready for use, work on the lower tunnel will be begun and will be continued until the vein shall be reached."

It would appear that development work has been carried out, as proposed, and that results are very much better than surface indications gave promise of, for the vein lately cut at depth was only about a foot in width at the surface, where it was uncovered for a length of more than 300 feet.

### An Official Review.

The following information has been taken from a recently issued pamphlet, compiled by officials of the

Mines Branch of the Canada Department of Mines, under the direction of Mr. John McLeish, Chief of the Division of Mineral Resources and Statistics. The pamphlet has been prepared primarily for distribution at the International Exhibition at Ghent, Belgium. It was also intended to distribute copies of it at the International Geological Congress, held August 7-14 in Toronto. The excerpt here given relates only to British Columbia, which is shown as having an area of 355,835 square miles and a population in 1911 of 392,480. A statistical table gives quantities and value of individual mineral products for two years, 1911 and 1912, the total for the former having been placed at $21,299,305, and for the latter at $30,076,635. (In passing it may be mentioned that the Annual Report of the Minister of Mines for British Columbia shows a total value of $23,499,072 for 1911 and $32,440,800 for 1912.) After the table comes the general information, as follows:

"For many years British Columbia was the premier mining province of Canada, and was only displaced in so far as magnitude of output is concerned in 1907, when Ontario forged ahead. In a certain sense, this province is still of first importance, owing to the fact that mining is probably its most important industry. Physiographically the province embraces a series of mountain ranges beginning at the Rocky Mountain range, forming the eastern border, and extending to the Pacific coast.

"Coal and metalliferous ores, including gold, silver, copper, lead and zinc, together with clays, building stone and gypsum, constitute the chief mineral resources. Antimony, platinum, molybdenum and mercury are also found.

"With the exception of the placer gold mining of the Cariboo district, active productive mining operations are at present confined principally to the extreme southern portion of the province and to a district on Vancouver Island, and on the coast. The chief centres of activity are the Crow's Nest coal mines, the metalliferous mines of East and West Kootenay, of which Moyie, Ainsworth, Slocan, Sandon, Nelson, and Rossland are important centres, and the Boundary district, including Grand Forks, Phoenix, Greenwood and Hedley, Britannia Beach and Texada Island on the coast, and Nanaimo and Comox on Vancouver Island. The Portland Canal district has recently assumed considerable importance.

"Much prospecting and development is being undertaken at many points on or near the coast, while the construction of the Grand Trunk Pacific Railway will provide easy access to a number of districts in that portion of the interior which it traverses.

"Important smelting industries have been established at Trail, Grand Forks and Greenwood, in the southern interior, and at Ladysmith on the coast, the fuel for which is provided by the coal mines of Comox, the Crow's Nest, or of Alberta. A new copper smelting plant will be in operation at Anyox or Granby Bay in December, 1913.

"Mining locations are granted under the laws of the province to discoverers, for nominal fees, and absolute titles may be obtained by developing such properties. The mining laws include a 'Placer Mining Act,' 'Mineral Act,' 'Inspection of Metalliferous Mines Act,' 'Coal Mines Act,' 'Coal Mines Regulation Act,' etc., and full information respecting miners' certificates, the mining law and regulations, mining reports and maps, etc., may be obtained on application to the Provincial Mineralogist, Victoria, British Columbia."

**Ore Receipts at Trail.**

Ore receipts at the Consolidated Mining and Smelting Co.'s smelting works at Trail during four weeks ended July 31 were as under:

| | Tons. |
|---|---|
| East Kootenay— | |
| St. Eugene | 66 |

**Slocan Notes.**

Diamond drilling is in progress in the Van-Roi mine, in the vicinity of Silverton. An office note sent out by the company's head office in London, England, was as follows: "The work in the deep levels, Nos. 7 and 9, having established the probability that these had been driven, not on the main vein, but on a southerly vein, a policy of diamond drilling is therefore being adopted as the most rapid, efficient and economic means of exploring the large block of main vein which presumably exists in the vicinity of these workings. During the carrying out of this policy it may be necessary to temporarily suspend milling operations." Work at the company's concentrating mill on Four-Mile Creek has consequently been suspended.

A map of the Slocan mining district has been prepared by Miss Ada I. McDougald, of New Denver, who took Messrs. Drewry and Twigg's map, used in the Report of the Zinc Commission in 1906, and drew it to twice the former size, making it 37 by 52 inches.

Instead of a number on each claim, the name has been used—a useful improvement. The map has been brought up-to-date by the inclusion of all Crown-granted mineral claims in the district, and adding to the detail in other ways. So much work has been involved that the young lady has found it necessary to make a charge of five dollars each for blue-prints of the map, concerning which enquiries have come from even as far south as New Mexico.

### Granville Mining Co., Klondike, Yukon.

On August 2 The Mining Journal, London, included the following information relative to the Granville Mining Co., operating near Dawson, Yukon, in its "The Mining Market" comments:

"Granville Mining.—From a circular issued by the company, it appears that the assets have now taken the following form, the dollar holdings being converted at $4.85 as the equivalent of £1:

| | |
|---|---|
| "Canadian Klondike Mining Company— | |
| Six per cent. convertible debentures | £ 339,381 |
| Shares | 448,455 |
| Canadian Klondike Power Company— | |
| Six per cent. debentures | 247,422 |
| North-West Corporation shares | 1,020,000 |
| | £2,055,258 |

"The company has temporary loans outstanding amounting to about £50,000.

"The Canadian Klondike Mining Company has an authorized capital of $8,000,000 shares and $2,000,000 debentures.

"Of the shares the Granville Company holds 2,750,000 and J. W. Boyle 3,825,000, the remaining 2,000,000 being held in reserve for conversion of debentures. The debentures in issue, $1,646,000, are held by the Granville Company.

"The Canadian Klondike Company holds the whole of the company's interests on the Klondike watershed. Dredging began this season, and up to the present the output has been: Up to May 31, 5,189 oz.; June 1 to 28, 10,202 oz.; June 29 to July 26, 13,402 oz. gold. Mr. Boyle estimates the profits of the company for the current year at about $1,000,000.

"The North-West Corporation represents the holdings in the Indian River watershed. The nominal capital is £1,500,000, out of which the Granville Company holds £1,020,000, the North-West Syndicate £190,000, and £140,000 more was subscribed as working capital, leaving £150,000 in reserve. The plant is expected to come into operation next year.

"The Canadian Klondike Power Company has a share capital of $1,500,000, all of which is held by the Canadian Klondike Mining Company, and $1,500,000 six per cent. debentures, of which the Granville Company holds $1,200,000. The company owns and operates a water-power and electric generator station, which supplies power to the Canadian Klondike, the North-West Corporation, and also to the Yukon Gold and other customers. The Canadian Klondike Mining Company has guaranteed that the income of the Granville Mining Company from its holdings of shares and debentures of the Canadian Klondike Mining Company, and debentures of the Canadian Klondike Power Company shall up to February 20, 1928, not be less than $240,000 per annum. The capital of the Granville Mining Company is £1,500,000, of which £1,400,000 is issued. There are £900,000 six per cent. debentures in issue out of an authorized £1,000,000."

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

## PUBLICATIONS

**The Geological Survey has published maps and reports dealing with a large part of Canada, with many local areas and special subjects.**

A catalogue of publications will be sent free to any applicant. A single copy of a map or report that is specially desired will be sent to a Canadian applicant free of cost and to others at a nominal price. The applicant should state definitely the precise area concerning which information is desired, and it is often of assistance in filling an order for a map or report if he states the use for which it is required.

Most of the older reports are out of print, but they may usually be found in public libraries, libraries of the Canadian Mining Institute, etc.

### REPORTS RECENTLY ISSUED:

**CANADA**

1085. Descriptive Sketch of the Geology and Economic Minerals of Canada. Accompanied by a geological and mineral map of Canada, by G. A. Young and R. W. Brock.

**NEW BRUNSWICK and NOVA SCOTIA**

1165. Memoir No. 18. Bathurst District, New Brunswick, by G. A. Young. Maps not yet published.

**QUEBEC**

1186. Memoir No. 35. Reconnaissance along the National Transcontinental Railway in Southern Quebec, by John A. Dresser.

**ONTARIO**

1160. Memoir No. 17. Larder Lake District, Ont., and Adjoining Portions of Pontiac County, Quebec, by Morley E. Wilson.

**NORTH WEST PROVINCES**

1204. Memoir No. 24. Preliminary Report on the Clay and Shale Deposits of the Western Provinces, by Heinrich Ries and Joseph Keele.

**BRITISH COLUMBIA**

1175. Memoir No. 21. The Geology and Ore Deposits of Phoenix, Boundary District, B.C., by O. E. LeRoy.

**YUKON AND NORTH WEST TERRITORIES**

1228. Memoir No. 31. Wheaton District, Yukon Territory, by D. D. Cairnes. Maps not yet published.

### MAPS RECENTLY ISSUED:

**CANADA**

1042. Mineral Map of Canada. Scale 100 miles to 1 inch.

**NOVA SCOTIA**

1133. Map 13A. Kingsport sheet, Nova Scotia, No. 84. Scale 1 mile to 1 inch.

**NEW BRUNSWICK**

1181. Map 35A. Reconnaissance Map of Parts of Albert and Westmoreland Counties, N.B. Geology and topography. Scale 1 mile 1 inch.

**QUEBEC**

1178. Map 32A. Larder Lake and Opasatika Lake, Nipissing, Abitibi and Pontiac, Ontario and Quebec. Geological. Scale 2 miles to 1 inch.

1202. Map 52A. Northeast part of the Serpentine Belt, Eastern Townships, Quebec. Geology. Scale 4 miles to 1 inch.

**ONTARIO**

750. Grenville Sheet. Parts of Counties of Ottawa, Argenteuil, Terrebonne, Two Mountains and Vaudreuil, Quebec and Carleton, Russell, Prescott and Glengarry, Ontario. Geology. Scalo 4 miles to 1 inch. Reprint.

1177 Map 31A. Larder Lake, Nipissing District, Ontario. Geology. Scale 1 mile to 1 inch.

**ALBERTA**

1132. Map No. 7A. Bighorn Coal Area, Alberta, by G. Malloch. Scale 2 miles to 1 inch.

**BRITISH COLUMBIA**

1260-1276. Maps 74A-90A. Geology of the Forty-ninth Parallel. Geology and topography of the International Boundary between British Columbia and the United States. Scale 1 mile to 1 inch, contour interval 100 feet.

1237. Map 62A. Nelson and vicinity, British Columbia. Geology and topography. Scale 1 mile to 1 inch.

1247. Map 69A. Route map of part of Nass River, British Columbia. Scale 8 miles to 1 inch.

1168. Map 30A. Mother Lode and Sunset mines. Geology and Topography. Scale 400 feet to 1 inch; contour interval 20 feet

1200. Map 50A. Part of Portland Canal Mining Area. Topography. Scale 2 miles to 1 inch; contour interval 200 feet.

**YUKON and NORTH WEST TERRITORIES**

1089. Map 9A. Explored Routes on parts of the Albany, Severn and Winisk Rivers. Scale 8 miles to 1 inch.

NOTE.—Maps published within the last two years may be had, printed on linen, for field use. A charge of ten cents is made for maps on linen.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon. Letters and samples that are of a Departmental nature, addressed to the Director, may be mailed O.H.M.S. free of postage.

*Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.*

McKIERNAN-TERRY

# "BUSY BEE" HAMMER DRILLS

To break up large pieces of stone or for general cleaning up about a quarry, the **"Busy Bee"** Hammer Drill is an indispensable tool. Over 200 feet of blast holes have frequently been drilled with one of these hammers in a day. Real economy in the quarry is attained where "Busy Bee" Drills are used. Full particulars are given in the "Busy Bee" Hammer Drill Bulletin. Send for it.

## Our Plant is Running Full Blast!

We wish to draw the attention of mining, metallurgical, and development corporations to our excellent facilities for compiling, arranging, illustrating, printing and distributing Annual Statements, Special Reports, Descriptive Pamphlets, etc.

We guarantee our work in all respects. In letter-press, half-tone engravings and reproductions in colour, we are prepared to give entire satisfaction.

We shall be glad to furnish estimates to enquirers.

ADDRESS

**Industrial and Technical Press Ltd.,** 46 LOMBARD STREET, TORONTO

OR

**Canadian Mining Journal,** 2nd Floor, 44-46 LOMBARD ST., Toronto

# PROVINCE OF QUEBEC

**Department of Colonization, Mines, and Fisheries**

***The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, Etc.***

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

**MINERS' CERTIFICATES.** First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is $10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

**WORKING CONDITIONS.** During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

**SIX MONTHS AFTER STAKING.** At the expiration of six months from the date of the staking, the prospector, to retain his rights, must take out a mining license.

**MINING LICENSE.** The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of $10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

**MINING CONCESSION.** Notwithstanding the above, a mining concession may be acquired at any time at the rate of $10 an acre for SUPERIOR METALS when more than 20 miles distant from a railway and $20 an acre when less than 20 miles.

For INFERIOR METALS the prices are $2.00 and $4.00 an acre respectively.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

**PROVINCIAL LABORATORY.** Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

**THE HONORABLE THE MINISTER OF COLONIZATION, MINES, AND FISHERIES, QUEBEC.**

# The Minerals of Nova Scotia

The extensive area of mineral lands in Nova Scotia offers strong inducement for investment.

The principal minerals are:—Coal, iron, copper, gold, lead, silver, manganese, gypsum, barytes, tungsten, antimony, graphite, arsenic, mineral pigments, diatomaceous earth.

Enormous beds of gypsum of a very pure quality and frequently 100 feet in thickness are situated at the water's edge.

The Province contains numerous districts in which occur various varieties of iron ore practically at tide water and in touch with vast bodies of fluxes.

The Gold Fields of the Province cover an area of approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Deposits of particularly high grade manganese ore occur at a number of different localities.

Tungsten-bearing ores of good quality have lately been discovered at several places and one mine has recently been opened up.

High-grade cement-making materials have been discovered in favorable situations for shipping.

Fuel is abundant, owing to the presence of 960 square miles of bituminous coal and 7,000,000 acres of woodland.

The available streams of Nova Scotia can supply at least 500,000 H. P., for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

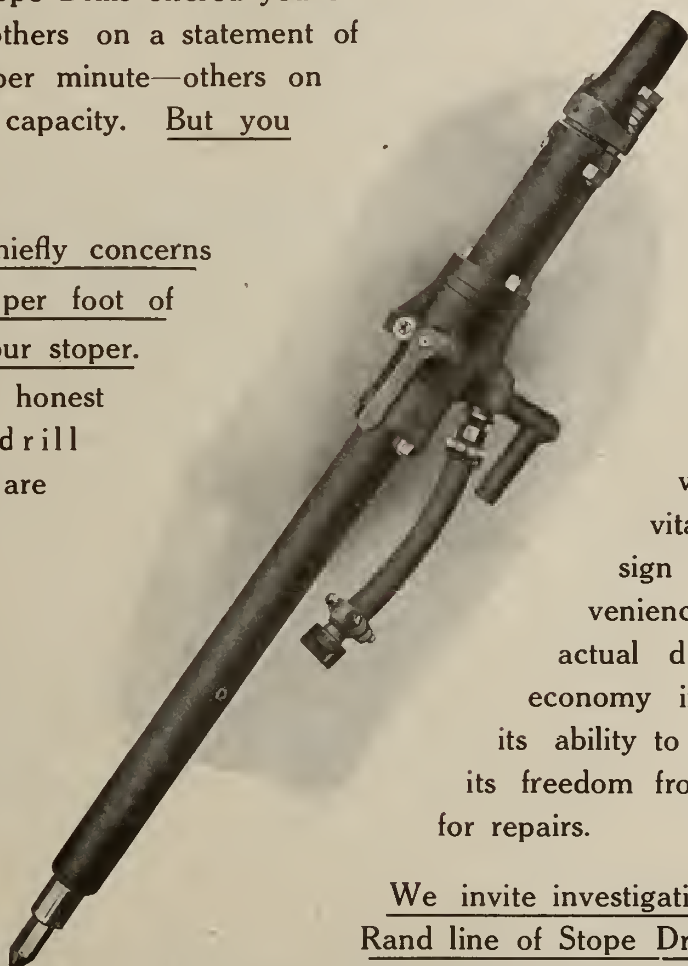
VOL. XXXIV TORONTO No. 18

The Canadian Mining Journal, 2nd Floor, 44-46 Lombard St., Toronto, Ont.

# STOPE DRILL VALUE

You will have Stope Drills offered you on a basis of price—others on a statement of air consumption per minute—others on a rated drilling capacity. But you know better.

The thing that chiefly concerns you is the cost per foot of hole drilled by your stoper. That is a real, honest basis of stope drill value—all others are wrong.



*"BC-21" Butterfly Valve Stope Drill*

Such a measure of value involves such vital items as the design of the drill—its convenience in handling—its actual drilling speed—its economy in the use of air—its ability to stay on the job—its freedom from vexatious delays for repairs.

We invite investigation of the Ingersoll-Rand line of Stope Drills on any or all of these points. We'll abide by your decision.

SOME OF THE GREATEST MINES IN THE COUNTRY HAVE FOUND THE BEST SOLUTION OF THEIR STOPING PROBLEMS IN THE INGERSOLL-RAND LINE. YOU WILL DO THE SAME, IF YOU INVESTIGATE AS CAREFULLY.

## NANAIMO COAL MINERS' STRIKE

The coal mining industry of Vancouver Island has for several months been in very bad condition. Recently grave disorders have occurred and damage has been done to life and property.

It is stated that strikers have set fires underground and burned mine buildings and dwellings. Men trying to put out the fires and save property have been attacked and brutally assaulted. Desperate characters, who were not in the employ of the companies when the trouble started last September, are now present in large numbers. There seems to be reason to believe that such men have been brought in solely to bring about the present conditions at Nanaimo. If this be true, the organization responsible for bringing them into Canada cannot be too strongly condemned.

The trouble started at the Canadian Collieries, where the miners went out on strike last September. Since May 24 the other collieries have also been idle, the men not going back to work after the holiday. A series of riots has occurred.

As the local authorities were quite unable to enforce the law and prevent disorders, the militia were called in. Several of the leaders of the United Mine Workers, the organization which is endeavouring to gain a foothold in Nanaimo, have been imprisoned and order restored.

For the present the most important duty of the Government is to teach the disorderly element that the laws of the country must be obeyed, that violence will not be tolerated, and that prompt punishment will be meted out to offenders. Until this lesson has been taught no lasting settlement of disputes between operators and strikers is likely to be arrived at.

## THE RUSH TO SHUSHANNA

During the past few months there has been a rush of prospectors to the Shushanna district, Alaska. The reports state that Mr. James, the original discoverer, took out $300 per day from the creek bottoms. Others have not been so fortunate; but a large area has been staked. Dr. D. D. Cairnes, of the Geological Survey of Canada, who is familiar with the district, has issued a warning to stampeders, stating that it will be inadvisable to go in without a good outfit. It will be necessary to spend the winter there. Already a large number of prospectors are on the ground and the most promising ground was staked some time ago. There is, however, a large area which may prove to be mineral-bearing, and much prospecting will doubtless be done far from the original discovery.

## MINING IN BRITISH COLUMBIA

Canada's Pacific province has long been one of the most productive of mineral wealth. The industry is in a flourishing condition, and the value of the output for 1912 was much greater than that of any previous year. 1911 was an off year, owing chiefly to prolonged labour troubles in the East Kootenay coalfield, and it is therefore pleasing to record the marked change for the better.

## KOOTENAY MINING MEN WANT A COMMISSION

For several years the Nelson mining district in British Columbia has been known to contain large deposits of zinc and lead ores. A few mines have been profitably operated; but a large number of the deposits are under present conditions not workable. Efforts have been made to secure Government aid, so that a large industry may be built up. It is the belief of several of those interested that with some assistance the district can become a very important producer of zinc. It is desired that the ores should be smelted in Canada; but it is thought that to do this the smelter men will need to have some aid from the Government until the industry is well established.

The Department of Mines has undertaken the investigation of methods of treatment of the ores, and promises to render considerable assistance this way.

On the occasion of the visit of Hon. Louis Coderre, Minister of Mines, to Nelson on August 21, business and mining men presented their case to him and urged that a commission be appointed to investigate its merits. It is likely that this will be done.

Mr. Coderre, who is accompanying the C2 excursion of the Geological Congress, is showing a keen desire to become acquainted with the wants of the mining men of the west.

## DISORDER CONTINUES IN MICHIGAN COPPER DISTRICT

There are as yet no indications of a settlement being reached between union strikers and the mine operators of the Copper Country. A number of the mines are in operation, the miners being carefully guarded. Workers are frequently assaulted by strikers, and it is still considered unsafe to withdraw the militia. At a meeting of strikers in Laurium a resolution was made to appeal to the U. S. Senate for an investigation of the conditions. It is reported from Washington that Frank Morrison, secretary of the American Federation of Labor, has, at the request of President Moyer, issued an appeal for funds to help the strikers. The union officials complain that the operators will not recognize the union. The operators say they are willing to talk with their employees as such; but not with representatives of the union.

It is reported from Houghton that the mine output is steadily increasing. Calumet and Hecla mine is operating twelve shafts, Isle Royal one, Champion two, Timountain one, Quincy two and Superior one. The Mining Gazette reports the output last week to be at the rate of about 5,000 tons of ore per day.

Strikers complain that they have not received the benefits promised them by the agitators. Some are resigning from the union and others leaving the country. Some continue to believe the agitators.

## FOURTH EDITON OF COBALT REPORT

The Ontario Bureau of Mines has published a new and revised edition of the report on the Cobalt district, prepared by Dr. W. G. Miller, C. W. Knight, A. G. Burrows and others of the staff. The third edition, published in 1908, has been out of print for some time.

The mining operations during the past few years have disclosed many interesting structural features, and the revised report contains a number of sections illustrating these. Accompanying the report there are a number of new photographs and maps, which aid in giving the reader a better knowledge of the character of the ore bodies and the rocks in which they occur.

In addition to description of the Cobalt area proper, there are short descriptions of surrounding areas, including South Lorrain, Casey and Harris, Lake Wendigo, Bay Lake, Montreal River, Temagami Forest Reserve, Gowganda, Shining Tree, Florence Lake, Langmuir Township and Otter Township.

A chapter is devoted to the Lake Superior and other Canadian and foreign deposits of Cobalt deposits and the metallurgy of Cobalt. Mr. E. T. Corkill contributes a description of mining and concentration methods at Cobalt.

The newer features of the geological descriptions are contained in the paper by Dr. Miller, prepared for the Geological Congress, and now running in the Journal.

## AN INDEX TO THE PUBLICATIONS OF THE CANADIAN MINING INSTITUTE

Mining men will be pleased to learn that the general index to volume I. to X. of the Mining Institute Transactions is nearly ready. In addition to the index the book contains very useful summaries of the papers. The labor and expense involved in compiling the book has been very considerable, and it is hoped that members will support the effort by subscribing at an early date. The edition is a limited one.

# MOB VIOLENCE AT VANCOUVER ISLAND COAL MINES

Mob rule prevailed for two or three days about the middle of August in Nanaimo coal mining district, Vancouver Island, British Columbia, but the prompt action of the Provincial Government in despatching the militia forces in sufficiently large numbers to enforce the law and keep order, resulted in a speedy termination to the violence and excesses of the brief period during which the local and special police were powerless to prevent the outrages that occurred.

The history of the trouble goes back to the declaration of a strike of the miners then employed at the several coal mines at the Comox (Cumberland) and Extension collieries of the Canadian Collieries (Dunsmuir) Limited, owning and operating the mines acquired about two years ago from the Dunsmuir interests. After the strike was carried out, the company was unable for more than six months to operate its Extension colliery mines, which are situated a dozen or fifteen miles south-west of Nanaimo, and which have their shipping bunkers near Ladysmith, the residence town of most of the Extension miners. Efforts were concentrated during those months on the operation of the Cumberland mines, and gradually a non-union force was obtained, until latterly the mines were being worked at about three-fourths their normal productive capacity, and coal was being sent out accordingly. Having got things going at Cumberland, the company two or three months ago turned its attention to Extension mines, where, despite the boast of local strikers that work would not be resumed until after an agreement with them, it became apparent that the working force there also was gradually being increased and production of coal resumed. Meanwhile efforts had been made, but without success, to induce the men employed at the Western Fuel Company's mines, in the immediate vicinity of Nanaimo, to join in a sympathetic strike. Incidentally, it may be mentioned, that the agreement between the Western Fuel Company and its miners had still several months to run—until September—it has been stated in district newspapers. Other collieries being operated near Nanaimo were those of the Pacific Coast Coal Mines, Ltd., and the Vancouver-Nanaimo Coal Mining Company Ltd., but both these were producing on a much smaller scale than the two larger companies previously mentioned.

At the end of last April a man named Farrington, of Seattle, Washington, prominent in the activities in the North-west of the United Mine Workers of America, instructed the president of the local union at Nanaimo to call a strike at all coal mines on Vancouver Island. Notwithstanding that the U. M. W. of A. did not at that time have on its membership list one-tenth of the men concerned—island newspapers published the statement that its local membership was then only about 200—nearly 2,000 miners and other coal mine employees ceased work, many of them acknowledging that while they wished to keep faith with the company and carry out their agreement, they could not afford to be branded as "scabs," as the U. M. W. of A. was reported to have announced its determination to brand them in Canada, the United States, and Great Britain if they continued at work. A vote was ordered as to whether or not they would return to work, but heeding the warning of the U. M. W. of A. not to vote, approximately three-fourths of those affected abstained from voting. The great majority of those who did vote, however, were favourable to keeping their agreement and working until it should expire. No united action was taken, though, so the production of coal was not resumed.

A short time ago an effort was made by the Western Fuel Company and its two neighbouring companies to start work with a few men, and it was generally understood that a beginning had actually been made. This seems to have so exasperated the strikers that many of them became very violent, ordering non-union workers to leave the district, and even threatening them with death if they did not go. Finding that the law was being broken, and that the few local police were powerless to prevent disorder, the Provincial Government had a number of men sworn in as special constables and sent to Nanaimo, which action so angered the lawless strikers that they hustled the specials back on the train and steamer, and bade them depart or pay the penalty of staying with their lives. Then the gathering mob abandoned all restraint, and a reign of terror was quickly inaugurated. At Nanaimo mines little damage was done by the mob, but at the Pacific Coast Coal Mines Company's South Wellington colliery, five miles away, non-union men were violently assaulted, their lives threatened, buildings were wrecked, and even the police sent from Nanaimo were assaulted and turned back. Then the mob proceeded to Extension, where the working miners were fired on, and compelled to take refuge in the mine entry, their women and children so terrified that they fled into the surrounding bush without clothing other than what they wore, and without food, and some of them had to remain there for 36 hours. When they did return they found their homes torn down or burned, all their belongings either stolen or destroyed, and mine buildings and plant effaced by fire. In the town of Ladysmith, eight or ten miles away, police were of no avail, and strikers were so threatening in their attitude that many residents, whites as well as Chinese, got away by train as soon as possible, and left their homes and belongings to the will of the unruly crowd.

Not long, though, did mob rule prevail, for before the law-breakers knew that the Provincial Government intended sending troops, there were hundreds of militia-men in Nanaimo, having been sent up at night by steamer from Victoria, and more followed from Victoria and Vancouver during the next two days. Now disorder has been effectually checked, and the ringleaders of the mob are trying to evade arrest. Col. Hall, in charge of the militia, and police officials having obtained the names of more than a hundred of those stated to have been active in citing the mob and in taking part in its excessses. There will, doubtless, be stern measures taken to punish the leaders of the mob and all others known to have been largely responsible for the disorder and crime of the few days when the mob ran amuck.

One fatality occurred—a man was shot at the Extension mines, but whether by a striker or a non-union miner has not yet been determined, for he was in the line of fire between the attacked miners and their assailants. A particularly dastardly outrage is charged against strikers at Ladysmith, who are stated to have thrown dynamite, with a short-lighted fuse attached, into a room where several children were in bed. The story told is that the father of the children, realizing their imminent danger, seized the dynamite, but before he could throw it out of the house it exploded in his hand, shattering one of his arms and so injuring the lower part of his body that recovery is regarded as most unlikely. Other cases of brutality on the part of the strikers are alleged, but as yet investigation of them has not been made.

---

# AMALGAMATION AND CYANIDATION OF COBALT SILVER ORES

By Reginald E. Hore.

Both high grade and low grade ores are now being treated by amalgamation in some plants at Cobalt, and low grade ore is being cyanided. At the Nipissing the process for treating the high grade has proven quite successful, and a similar plant has been built at the Buffalo. Amalgamation of concentrates from low grade ore is used at the Nova Scotia mill. Cyaniding is extensively used at the O'Brien and Nova Scotia plants. At the Buffalo. slimes are cyanided, and at the Nipissing high grade mill, tails from amalgamation treatment are cyanided and the Nipissing has recently put into operation a large cyanide plant for the treatment of low grade ore.

Nipissing low-grade plant.

Nipissing high-grade plant.

## High Grade Plants.

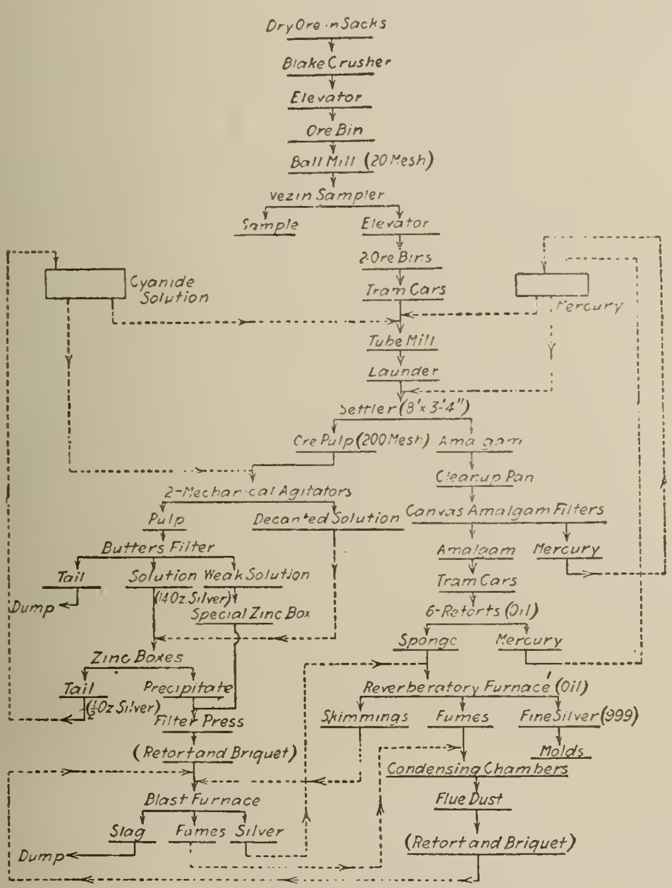
To treat high grade ore on the property without smelting it, the Nipissing management has a very satisfactory process which was worked out by Charles Butters and his assistant, G. H. Clevenger. The crushed ore is ground with mercury in a tube mill. The amalgam sponge is melted in a reverberatory furnace and refined. The tails from the tube mill are cyanided. The precipitates are melted in a tilting furnace and refined in the reverberatory.

The Nipissing high grade mill has been described by Mr. T. A. Rickard in the June, 1912, number of the Mining Magazine, and I quote here his description and comments:

"The ore after being crushed to 70 mesh at the sampler is delivered to the plant with an average content of 2,600 oz. silver per ton. It is fed to a Krupp tube-mill 20 feet long by 4 feet diameter. The charge consists of 3½ tons of ore, 4½ tons of mercury, and a 5% cyanide solution. The tube-mill is closed at both ends. Air, to accelerate chemical action, is introduced through a pipe. There is also an ingenious device whereby the excess of air is subsequently expelled. After nine hours in the tube-mill, 98% of the silver has been extracted from the ore, which in the form of pulp, then passes to a settler, where the amalgam is separated by gravity. Thence it goes to a clean-up pan and drainers. These last are canvas bags for removing any excess of mercury. Meanwhile the pulp and solution, deprived of amalgam, passes to a vat and is fed to a Butters filter, the clarified solution going to boxes in which the dissolved silver is precipitated by zinc shaving. This shaving is in the form of a coarse wire, necessary on account of the strength of the cyanide solution. The residue, left on the filter, is stored, being valuable for its arsenic, nickel and cobalt. As yet no method has been devised for eliminating the arsenic in this residue with a view to marketing the nickel and cobalt.

"Meanwhile the amalgam, containing 80% mercury and 20% silver, is placed in retorts, each of which holds 450 lbs. After the mercury has been distilled, the silver, still containing 1% mercury, is taken to a reverberatory furnace. Here it is melted in a charge of 25,000 ounces. After 15 hours' exposure to a hot oxidizing atmosphere, without addition of any flux, the molten metal is cast in ingots, each weighing 1,100 oz. silver, which is 999 fine. Two oil-burners furnish the necessary heat. The flue from the furnace is provided with a water-jet condenser, whereby 1,000 to 2,000 lbs. mercury is arrested monthly. The gases escape at 100 degrees F. While I was collecting these data a melt was about to be finished, and I was able to see the bath of molten metal before it was tapped into the rows of ingots. During February 550,000 ounces of silver were melted in this small plant.

"The richness of the mine product under treatment and the completeness of the metallurgical operations left a vivid impression. Within a small building it was possible to watch the successive stages by which a complex ore of a refractory type yielded its precious content in metal of such purity as to be ready for the mint. The entire process is so expeditious that the silver is delivered at New York within a week of the day when the ore is received at the mill and a cheque for the yield is received concurrently with the shipment. No less than 20 tons of mercury is in use at a given time. The cyanide has a cleansing effect upon it; indeed, the use of mercury would be impracticable without the cyanide, for the mercury would become 'sick' or fouled so as to hinder amalgamation with the silver in the finely ground arsenical ore. The yoking of amalgamation and cyanidation constitutes another remarkable feature. To the practical man, however, the most memorable note is the fact that a consignment of ore is turned into negotiable paper within seven days."



**Flow sheet, Nipissing high-grade plant.**

A more recent article by Mr. R. B. Watson, general manager, Nipissing Mining Co., in December, 1912, issue of the Engineering and Mining Journal, gives further information. Mr. Watson says:

"The high-grade ore from the picking tables is delivered to the sampling plant at the top of the mill where it is put through a 9 x 15-inch Blake crusher and elevated to a steel receiving bin. From this it is fed automatically into a No. 3 6-foot Krupp ball mill carrying 1,000 pounds of steel balls and fitted with 20-mesh screens. The metallics or silver nuggets which will not pass the screen are removed periodically by taking off a screen, and are melted down in the refinery. From the ball mill the pulp is delivered by a spiral feed to a Vezin sampler and elevated to two 60-ton steel storage tanks, from which it is drawn as needed for treatment in the mill.

"The main operation consists of amalgamating the silver in a 5 per cent. cyanide solution while the 20-mesh material is being ground in a tube mill. The mill used is a Krupp mill 3 feet 11 inches in diameter and 19 feet 8 inches long, fitted with silex liners and run at 37 r.p.m. The weight of ore per charge depends somewhat on the silver content, but with 2,500-oz. ore the ordinary tube-mill charge is 6,500 lb. of ore; 8,500 lb. of mercury; 3,800 lb. of cyanide solution, and six tons of pebbles.

"The materials are charged through a manhole on the top of the mill, and after the cover has been replaced the mill is revolved for 9½ hr., when 99 per cent. of the pulp will pass a 200-mesh screen. This fine grinding is necessary to liberate the fine particles of silver and permit of complete amalgamation. A screen analysis of the final tailing shows that the coarser particles are much richer than the slime; this is also shown by the accompanying screen tests on ore crushed through a 10-mesh screen.

"It was found advantageous to have a certain quantity of silver go into solution in the cyanide, and to this end more air had to be supplied to the charge.

"Each gudgeon of the mill is fitted with a stuffing box through which passes a heavy cast-iron pipe, four inches outside diameter, with a 1½-inch hole through the centre. The casting is held stationary by bolts to the concrete foundation, and the mill revolves about

**Grading Analysis of Nipissing Ore Crushed Through 10-Mesh.**

| Mesh. | Percentage by weight. | Silver oz. per ton. |
|---|---|---|
| + 20 | 12.7 | 6837 |
| + 40 | 26.2 | 3375 |
| + 60 | 11.6 | 2330 |
| + 80 | 6.3 | 1954 |
| + 100 | 6.3 | 1654 |
| + 120 | 2.7 | 1348 |
| + 150 | 1.3 | 1182 |
| + 200 | 3.8 | 1202 |
| — 200 | 29.1 | 706 |

the pipe. Compressed air under 25 lb. pressure is introduced through one of the hollow castings. At the outlet end there is a right-angle turn in the holow casting just inside the mill and the upper end reaches to within ½ inch of the lining. The heavy cast-iron elbow, therefore, remains stationary, the inside leg stands vertical, and the upper end remains above the level of the charge at all times, allowing the compressed air to escape while the mill is in motion. The casting is heavy enough to withstand the battering of the pebbles falling against it. This arrangement allows the mill to be filled well above the centre with a consequent decrease in the power used, but it is found that the best results are obtained by filling the mill to a point two inches above the centre.

"At the end of the grinding period the three manhole covers are replaced by coarse screens and the mill is turned over; the charge falls into a sheet-iron hopper which delivers it into an all-iron settler, eight feet in diameter, fitted with wooden shoes. The tube mill is then washed out twice by revolving it with a ton of solution and 1,500 lb. of mercury. These washes are added to the charge and the settler filled with solution; the charge is kept in agitation by the muller while the amalgam is drawn off into an iron cleanup pan, and from there into canvas amalgam filters, of which there are 24, each holding 400 lb. of amalgam. The pulp is gradually run out of the settler by drawing the top plug, the balance of the charge being washed twice with solution.

General view in Nipissing low-grade plant, during construction.

Building one of the huge tanks.

When the flow of amalgam has ceased, the mercury, as it drains out of the canvas filters, is pumped back to the settler to wash out any remaining amalgam. The bottom plug is finally drawn and the balance of the pulp discharged. It requires two hours to dump the charge and get the amalgam into the filters.

"It was soon found that the amalgam must be kept exceedingly thin, otherwise it would stick in the tube mill and cake under the muller of the settler; hence the mercury used is 15 times the weight of the silver in the ore. After draining in the sacks, the amalgam still carries 78 per cent. mercury. The remarkable part about the whole process is that 97 per cent. to 80 per cent. of the total silver in the ore yields to amalgamation in the tube mill. An ore assaying 2,500 oz. per ton is reduced to 50 to 75 oz. per ton when it leaves the settler.

"The cyanide treatment of the pulp which follows is comparatively unimportant as it deals only with six or seven tons of 50-oz. ore daily. There are four 16 x 7-foot wooden tanks for the collection and treatment of the pulp, and the necessary tanks for storage of solution and water. A charge for agitation is made up of four tube-mill charges or 13 tons of dry pulp. Five pounds of lime per dry ton of pulp are added and the charge is agitated for 36 hr.; the tanks are fitted with mechanical agitators, and the pulp is circulated through a pump as well. The cyanide strength is 0.75 per cent.

"After settling, the solution is decanted, and the pulp, having a specific gravity of 2, is run to a Butters filter of 10 leaves. The specific gravity of the ore is 6, and to avoid the settling of the pulp in the bottom of the filter box while the cake is forming, the charge is kept in circulation by an air lift drawing out of the bottom of the box and delivering at the top. The cake is washed 2½ hr. with weak solution and then discharged. The arsenides of cobalt and nickel go through the process practically unchanged; the residue for the first seven months of this year contained 9 per cent. of cobalt and 4.5 per cent. nickel."

### Buffalo High Grade Plant.

Mr. A. A. Cole, in his report for 1912 to the T. and N. O. Ry. Commission, describes the new high grade plant at the Buffalo as follows:

"During the summer the Buffalo mines erected a mill for the treatment of their high grade ore and concentrates, and the mill commenced operations at the end of November. The method of treatment adopted is very similar to that already in operation at the Nipissing high grade mill.

"The ore is hoisted up an incline from the low grade mill, and discharged into bins near the top of the high grade mill. The ore is first dried and then ground in a Krupp ball mill through a 30 mesh screen, the metallics from the same being separated during the grinding and sent separately to the tilting furnace. After weighing and sampling, the ore is charged into a 5½ ft. x 20 ft. tube mill. The charge consists of five tons of ore, with an equal weight of mercury, with a 40 per cent. moisture of a 5 per cent. cyanide solution. The tube mill is run until the entire charge will pass 200 mesh, or from 9 to 10 hours. The charge then passes to an 8 ft. all iron settler, from which the mercury is drawn off to a 4 ft. clean-up pan. The mercury containing the silver amalgam is strained in 18 canvas bags, the mercury passing through and returning to the mercury reservoir and the amalgam being taken to the refinery. The ore pulp from the settler, along with the overflow from the clean-up pan is passed into a secondary settler for further recovery of the floured mercury. The overflow from this last settler is run to an elevator and elevated to agitation tanks. These are

Moore filter, O'Brien cyanide plant.

Filters, Buffalo cyanide plant.

of the Parral type, three in number, 10 ft. in diameter by 12 ft. high. After sufficient agitation the pulp is drawn off to a 30 ft. Burt revolving filter. The strong solution is filtered into a sump and pumped to a sand filter tank, whence it is drawn off by gravity to the strong solution zinc box. The overflow from the zinc box flows by gravity to the strong solution sump, and from there it is elevated by a 2 inch centrifugal pump to the top of the mill to a tank 9 ft. diameter by 9 ft. high. It is then used in the next tube-mill charge. Air is used to drive out the remainder of the strong solution in the Burt filter. A weak solution is then added, followed by a water wash and the cake dried by air. On lowering the pressure in the Burt filter the cake drops off and is wound out by means of an angle iron on the inside acting as a screw conveyor. The cake falls on a 14 inch conveyor belt and is conveyed to a 60 ft. square concrete bin outside the mill.

"The pulp in the agitators, after sufficient agitation, is allowed to settle and the clear solution is drawn off by means of a floating siphon to a clarifying press, and thence to the storage tanks at the head of the zinc boxes. Coarse zinc shavings are used to precipitate the dissolved silver. The zinc box precipitates are drawn off into a box with a screen to prevent the escape of any short zinc, and are then pumped into an 18 inch square frame precipitating press, by a 5 in. x 5 in. Aldrich ball valve pump. The solution is returned to the barren solution sump. Air is admitted to the press at 100 pounds pressure, and the cake after washing and drying is carried to the retorts furnace, where it is retorted for mercury recovery. It is then charged into the tilting furnace.

"In the refinery the amalgam is charged into four retorts, 14 in. x 60 in., holding 1,000 pounds to a charge. The mercury fumes are condensed and returned to the boot of the mercury elevator. The retorted silver is charged into a refining furnace with a capacity of 30,000 ounces per charge. This furnace also received the silver from the tilting furnace.

"The retort, tilting and refining furnaces are all connected with a three compartment dust chamber, 15 ft. long. One of these compartments contains a coil for heating the air supplied to the refining furnace.

"The fumes are carried through a 30 inch pipe containing three water sprays. This pipe is 100 ft. long, and drains to a box in which there is a baffle to prevent the escape of the fumes. This box also serves as a mercury trap. A Buffalo Forge Company suction draft fan, with a 24 inch square outlet, is placed at the end of the 30 inch pipe, and this discharges directly into a 35 ft. stack, 34 inches in diameter.

"A well equipped laboratory with a competent chemist in attendance is at hand for mercury, silver, cobalt, nickel, and other determinations that are necessary.

"By the 31st of December, 1912, this mill had treated 105 tons of concentrates, along with metallics, precipitates and re-smelted bullion, producing 205,302 ounces of fine silver bullion."

### Low Grade Cyanide Plants.

The plants that are treating low grade ore in most cases use straight concentration methods; but cyanide is used at the Buffalo, O'Brien, Nova Scotia, and the new Nipissing plant. At the O'Brien all fines are cyanided. At the Nova Scotia cyanidation is secondary to amalgamation. At the Buffalo only slimes from the tables are treated and the only silver recovered is that which cannot be readily saved by straight concentration.

### The O'Brien Plant.

At the O'Brien the ore is brought from the shaft houses to the mill by electric tram. It is weighed and then crushed to pass 1½ inches. The ore is hand picked as it is fed to the crusher. The crushed ore is classified into four sizes by a trommel. The over ¾-inch goes to the Harz jig. Under ¾-inch and over ½-inch to a Richards jig, and under ½-inch to a second Richards jig. All under ⅛-inch goes directly to the stamp bin, where it joins tails and middlings from the jigs.

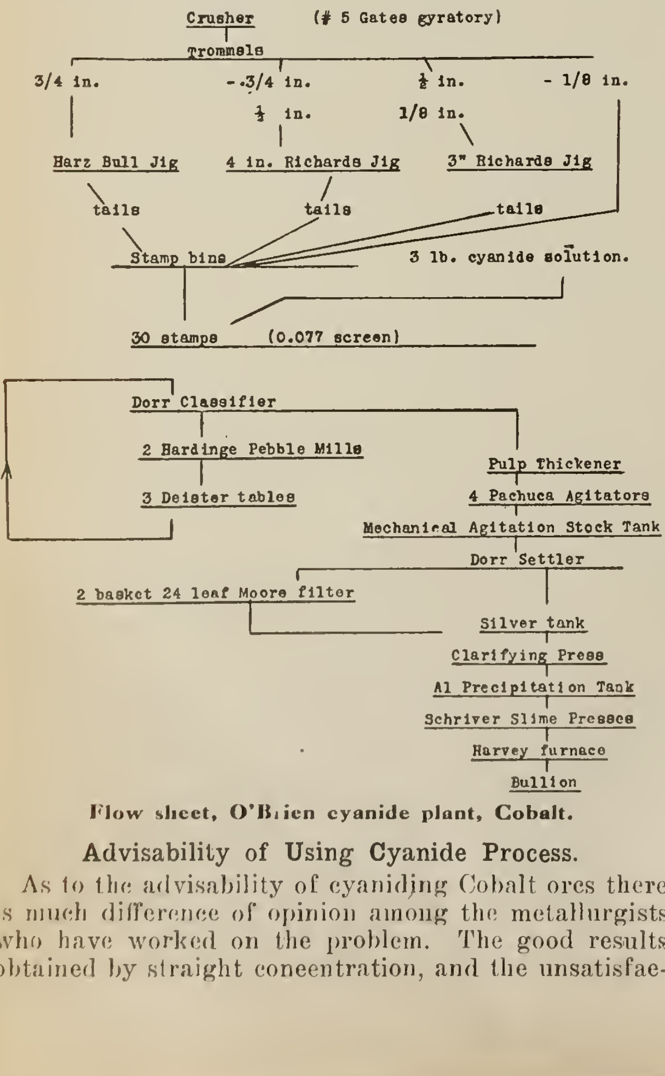
The three jigs together produce about 20 per cent. of the total mill recovery of silver. Most of it is recovered on the Harz bull jig.

The ore is stamped in a 2½-pound cyanide solution to pass a screen with 0.077 inch opening. The pulp is classified in a Dorr classifier and about 70 per cent. of it is reground in Hardinge pebble mills. The reground sand from the Hardinge mills is passed over three Deister tables and about 40 per cent. of the total silver recovery is made here. The tails from the tables are returned to the Dorr classifier. The overflow of the Dorr classifier, of which 80 per cent. is 200-mesh, passes to a 30 ft. Dorr settler.

The slimes, after settling, are pumped to Pachuca agitators where the cyanide solution is made up to five pounds. After agitating forty-eight hours the pulp is filtered in a 2-basket, 24-leaf Moore filter. The solution passes to a clarifying press and thence to the precipitating tank. Here it is stirred for one-half hour with an excess of aluminum dust. This metal is more costly than zinc, but less of it is necessary. It gives a high-grade bullion and regenerates the cyanide combined with the metals to be precipitated. This metal, while more costly than zinc, gives a higher grade product and so decreases refining costs. The O'Brien bullion is over 980, while the bullion as produced by zinc precipitation is commonly under 950 fine. The precipitate is melted without any flux in a Harvey furnace and the resulting bullion is shipped to London. The chief impurity is said to be copper.

Regarding the use of aluminium as a precipitant, Mr. S. F. Kirkpatrick, in the June issue of the Engineering and Mining Journal, says in part: Up to the present, excluding the Nipissing bullion, over 14,000,000 ounces of silver have been precipitated by aluminium from cyanide solutions. Most of this has been recovered by the Deloro Mining and Reduction Company, through the cyanidation of Cobalt high grade ores or speiss produced from these ores, and a minor portion by the O'Brien mill, treating low grade Cobalt ores. Describing the process of precipitation, Mr. Kirkpatrick says: "An amount of aluminium dust, slightly greater than one-eighth of the weight of silver present, is added (to the solution to be precipitated), with about one-half the weight of caustic soda." There is a discrepancy between the theoretical amounts required for the supposed reaction and the amounts actually employed. Mr. Kirkpatrick suggests that this might be accounted for by a partial precipitation according to reactions suggested by Mr. Hamilton in an article describing the use of aluminium at the Nipissing plant, or by loss due to the action of soda and water on the aluminium, or by incomplete solution of the aluminium due to fine particles being coated with silver. The amount of soda required varies with the acidity of the ore treated. Mr. Kirkpatrick gives the cost of chemicals for precipitating 1,000 ounces of silver as follows: 35.6 lb. soda, at 2 cents per lb., $712, and 9.1 lb. aluminium, at 32 cents per lb., $2.91; total, $3,622.

The process at the O'Brien is shown in outline by the accompanying flow sheet.



**Flow sheet, O'Brien cyanide plant, Cobalt.**

## Advisability of Using Cyanide Process.

As to the advisability of cyaniding Cobalt ores there is much difference of opinion among the metallurgists who have worked on the problem. The good results obtained by straight concentration, and the unsatisfactory results of some experiments in cyaniding, lead several mill men to conclude that results obtained by present methods do not warrant the buidling of cyanide plants. Other metallurgists, who believe that straight concentration should be the main process, are in favour of cyanide treatment of the slime tails from the concentrating tables. Still others consider the cyanide process so satisfactory that they have devised plants in which the chief recovery from low grade ore is by cyanide.

**Harvey melting furnace, O'Brien cyanide plant.**

There are differences in the ore from the several mines. Some produce ore containing a greater percentage of cyanicides than do others. The ore in diabase, for instance, is comparatively clean and easy to treat. Of the ore in conglomerate, some contains considerable ruby silver, while ore from other mines or other parts of the same mine is comparatively free of such compounds. Dyscrasite, which occurs in a few rich veins, destroys large quantities of cyanide. It is stated that copper is present in some ore in sufficient quantity to be an important cyanicide; but other ore is almost free from copper compounds. The character of the ore, therefore, is responsible for some of the differences of opinion among the millmen. Variations in the results obtained in straight concentration plants are also responsible.

The new plant built for the Nipissing Mining Company provides for extensive use of cyanide, and it is therefore apparent, that while most of the millmen prefer straight concentration, there are others, who, after much experience with the ores, believe in the cyanide treatment.

# THE MOOSE MOUNTAIN IRON RANGE*

By A. P. Coleman.

At Moose Mountain about 7 miles beyond the northern side of the nickel basin, and 33 miles from Sudbury by the Canadian Northern Railway, one of the largest iron ore deposits in Canada has been found. The iron formation here is separated from the northern nickel range by a band of Laurentian consisting of granite, banded gneiss, greenstone and green schist, all more or less cut by pegmatite dikes. These rocks are far older than the nickel eruptive and underlie the deposits of the northern nickel range as country rock. The Sudbury series is lacking on this side of the nickel basin, so far as known, and nothing suggesting the Grenville series has been found, so that the geology to the north differs greatly from that to the south.

Moose Mountain, rising 280 feet above the plain and the railway, though one of the most important examples of the iron formation in the Keewatin of Ontario, presents less than the usual variety in the accompanying rocks, and the structural relations are more obscure than in some other regions, such as the Helen Iron Range.

In most cases the iron formation of Ontario consists of some form of silica interbanded with iron ore, either jasper with hematite or cherty or quartzitic silica with magnetite. At Moose Mountain the latter material is found. Commonly the iron formation occurs as synclinal belts enclosed in green Keewatin schist; but a definite relation of this sort has not yet been proved at Moose Mountain, perhaps because the regularity has been disturbed by intrusions of greenstone and granite. The accompanying rock is a banded schist alternately light and dark gray. The iron formation here has the usual steeply tilted attitude. Often the banding is fairly straight and uniform for considerable distances, but in many cases there has been crumpling and sometimes crushing and faulting on a small scale. The ordinary banded ore contains 36 per cent. of iron, and from the results of stripping and diamond drilling, the manager of the mine, Mr. F. A. Jordan, estimates that there are 100,000,000 tons of ore of this grade. There are also 6,000,000 tons of higher grade magnetite in which there is much less silica and where the banding is less marked. Here some green hornblende is interbedded with the magnetite.

Laurentian-looking gneiss occurs just south of the iron formation, but its relations to the ore bodies are not very certain; though dikes of granite and less often pegmatite cutting some of the outcrops of ore have probably come from it.

The richer parts of the ore have been greatly fissured and are penetrated in all directions by yellowish green bands or veins of epidote, evidently the last mineral formed. Beside these bands the magnetite is sometimes changed to hornblende which gradually passes into the usual ore within a few inches. The main ore body worked has been provisionally classified by Prof. Leith as belonging to the Pegmatitic type (Jour. Can. Min. Inst., Vol. XI., 1908, p. 93). He defines the type as including "ores which are carried to or near the surface in magmas and are extended from them in the manner of pegmatite dikes, after the remainder of the magma has been partially cooled and crystallized. They are deposited from essentially aqueous solutions mixed in varying proportions with solutions of quartz and the silicates." He has evidently in mind the usual theory of the formation of the Kiruna and other magnetite deposits in northern Sweden. In his special reference to the Moose Mountain deposit, he mentions that the ore shows "such intimate relations with greenstones as to suggest a direct derivation from them."

It should be stated, however, that some of this richer ore is interbanded with belts of the poorer silicious type making up the majority of the whole series of deposits, and it is possible that the downward percolation of hot waters may have produced the enrichment. The latest effect of circulating fluids, the formation of epidote, is generally accompanied by an enrichment of the ore near the small veins of that mineral.

Moose Mountain has been the first iron mine in Canada to concentrate its ores magnetically on a commercial scale. The higher grade ore is crushed to about inch size and separated from the intermixed epidote and hornblende by magnetic means, raising its iron contents to a merchantable grade containing 55.50 per cent. of metallic iron. The plant in use, though small and experimental, has provided 155,000 tons of ore for shipment.

This method is not effective for the 36 per cent. ore in which the magnetite is intimately mixed with silica, and within the past two years a new concentrating mill, much larger and more elaborate, has been erected. Here the ore is crushed to 100 mesh and separated magnetically by the Grondal method. The finely divided magnetite is then compressed to drive off most of the water, briquetted and finally treated in a furnace which sinters it slightly and transforms most of the magnetite into hematite.

Though not so large as the great magnetite deposits at Kiruna and elsewhere in northern Sweden, Moose Mountain promises to become a great producer of ore. The Keewatin iron deposits of Ontario, with the exception of the Helen and Magpie Iron Mines near Lake Superior, are usually similar to the one just described at Moose Mountain. There is a good deal of dispute as to their origin, though the original materials of the iron ranges are admitted by all to have been sediments of some kind.

*Extracts from Guide Book No. 7, published by Geological Survey of Canada for Twelfth International Geological Congress.

---

## HALF YEAR IN COPPER.

According to the Boston News Bureau, the half year to June 30 witnessed the breaking of all records concerning copper exports, the total clearances being 193,936 tons, against 172,441 tons in the first six months of 1912.

Prices have ranged between 17¾ cents and 14⅜ cents. Early in the year a few sales of electrolytic were made at the top figure just before the break, and in the ensuing downward movement the metal sold as low as 14½ cents a pound.

A recovery then took place about the middle of March, during which electrolytic sold up to 15.96 cents a pound, following which another quiet spell brought cheap sellers into the market, and their offerings resulted in sales down to 14⅜ cents, cash, New York.

# THE COBALT AREA

By Willet G. Miller.

(Continued from August 15th issue.)

### The Cobalt Silver Veins.

The cobalt-silver veins occupy narrow, practically vertical fissures or joint-like cracks in rocks of three ages, viz.: Cobalt series, Keewatin series and Nipissing diabase. The relations of the veins to each of these three groups of rocks are shown in the accompanying generalized cross-section of the Cobalt area and in the larger scale, coloured cross-section (plate IV.), published by the Ontario Bureau of Mines. The veins are much more numerous in the rocks of the Cobalt series than in the Keewatin or Nipissing diabase.

It was estimated that up to July 1st, 1911, the yield from the Nipissing diabase had been approximately 7.55 million ounces from 12 veins, or 629,000 per vein, or 7 per cent. of the total production. The Keewatin, with 13 veins, had produced 11.7 million ounces, or nearly one million per vein, or 10.85 per cent. of the total. From 86 veins in the Cobalt series there had been obtained 88.55 million ounces, or a little over one million ounces per vein, representing 82 per cent. of the total production. It is difficult to determine the exact number of productive veins owing to the fact that, being very narrow, parts of one vein may be mistaken for two or more distinct veins. At the present time there are 115 or more productive veins, and the relative productivity of those in the three series of rocks is about the same as it was in 1911.

### Origin of the Veins.

After the intrusion of the Nipissing diabase sill, which, on the whole, dips at a low angle from the horizontal, and penetrates both the Cobalt series and the Keewatin, disturbance, probably due chiefly to the contraction of the sill on cooling, caused fissures and joint-like cracks to be formed. These openings were made in the rocks of the hanging wall of the sill, in those of the foot-wall, and in the sill itself.

Ore-bearing waters working through or along the zone of weakness produced by the sill deposited their burden in the fissures and cracks. The minerals first to be deposited were essentially cobalt-nickel arsenides, and related compounds, and dolomite or pink spar. The fissures and cracks were ultimately filled with these minerals. Then there was a slight disturbance of the veins, reopening the ore-filled fissures and cracks, or fracturing the material deposited in them.

In the interval, between the filling of the fissures and cracks with cobalt-nickel ores and the fracturing of the veins thus formed by a secondary disturbance, the character of the material carried by the circulating waters had changed. Silver was then the characteristic metal in solution, and it was deposited, along with calcite, in the cracks and openings in the fractured veins. There may have been some silver deposited in the earlier period of vein filling, and doubtless cobalt-nickel minerals were deposited after the secondary disturbance, but the latter minerals belong characteristically to the first generation and the silver minerals to the second.

Certain writers on the Cobalt ores have expressed the opinion that the silver represents "secondary enrichment," meaning that it has come from the decomposition of compounds of the metal in the veins that were deposits at approximately the same time as the cobalt-nickel minerals. The present writer believes that at least by far the greater part of the native silver is of primary origin. The recent interesting experiments of Messrs. Chase Palmer and Edson S. Bastin,* on the precipitation of silver from solutions by cobalt-nickel minerals, appear to confirm the opinion that the native silver is a primary deposit, and did not come from the decomposition of silver compounds in the veins. The work of these gentlemen shows that where silver solutions come in contact with cobalt-nickel minerals the silver is deposited rapidly and essentially as native silver. Since there is much calcite in the veins with the native silver, it would appear that the metal was carried in solution as a carbonate, or double carbonate. Under ordinary conditions of temperature and pressure, silver carbonate is slightly soluble in water. For example, sufficient of the carbonate can be dissolved in an ordinary beaker of water to make a distinct precipitate of metallic silver when cobalt-nickel minerals are placed in the beaker.

It has been proved, by the experience gained in mining at Cobalt, that the presence of rich silver ore is dependent on proximity to the diabase sill. Over much of the productive area, not only the upper wall of the sill, but the sill itself, and more or less of its foot-wall have been removed by erosive agencies. Owing to little of the upper or hanging wall remaining in the productive area, most of the ore has come from the foot-wall of the sill, or from what was the foot-wall before the erosion took place. In these veins, in the foot-wall of the sill, it is the exception to find rich silver ore extending more than two or three hundred feet below the surface. Most veins are productive to a lesser depth. After rich silver ore disappears, with increase in depth, cobalt-nickel ore frequently continues downward in the veins. This seems to be due chiefly to the strong precipitating effects that the cobalt-nickel minerals had on the silver in the waters that worked downward beneath or along the sill. The silver was deposited before it reached a great depth. In certain cases, where veins with cobalt-nickel minerals contain no rich silver ore, or in which the silver extends to a comparatively shallow depth, the absence of the precious metal is to be accounted for by the fact that such veins, or parts of veins, escaped fracturing during the secondary disturbance, thus not affording openings for deposition from the silver-bearing solutions.

Frequently, below the rich silver-bearing parts of veins well crystallized argentite and hair silver are found in vugs. These minerals may represent secondary deposition of a little of the silver that has been dissolved from the upper part of the veins and carried downward.

### Former Vertical Extension of Veins.

Certain writers have expressed the opinion that veins of the Cobalt area, that outcrop at the surface or occur immediately below the drift covering, represent the narrower, lower parts of wider veins that extended to or towards the original surface. There is no justifica-

*Ec. Geology, March, 1913.

tion for the holding of such an opinion. The few veins that have been worked to a depth of a few hundred feet in rock of one series give no indication of becoming narrower below, although, when the veins are in the foot-wall of the sill, the ore tends to become less rich as the vertical distance below the sill or the eroded part of it becomes greater. Moreover, "blind" veins, or those which do not reach the present surface of the rock, have been found. These veins have the same character, as regards width and mineral content, as those which are exposed at the surface.

Briefly, it appears that after the intrusion of the diabase, fissures and cracks were formed in the rocks of the hanging wall and in those of its foot-wall, and in the sill itself. The openings in the upper wall probably extended a considerable distance upward beyond the sill, but there is no evidence that they reached the surface or that they were wider in the parts that have been eroded.

Some of these fissures in the upper wall extended downward into the sill itself, e.g., veins on the Timiskaming, Beaver and Nova Scotia. The veins on these properties, worked at the surface in the Keewatin hanging wall, and in the diabase sill below, are the deepest mines in the area. No foot-wall vein has been found to be productive to such a depth.

Then there are veins, e.g., that on the Cobalt Central property, which have been worked at the surface in the diabase and followed downward into conglomerate and greywacke, which at times lie beneath the sill.

Again, blind veins are found in the Cobalt series and in the Keewatin where the sill has been eroded.

There are also blind veins, e.g., one that was worked two or three years ago under Peterson Lake and one on the Silver Leaf property, that lie in Keewatin beneath the sill. These veins run upwards to the lower face of the sill, but not into it.

The types of veins mentioned in the preceding paragraphs are shown in the accompanying, generalized cross-section of the area.

### Relation of Wall Rock to Ore.

The productive veins, as the maps and cross-sections show, are found in three series of rocks, viz., the conglomerate and other sediments of the Cobalt series, the Nipissing diabase sill, and the Keewatin complex. But 80 per cent. or more of the ore has come from the Cobalt series. The chief reason for this greater productiveness is due to the fact that these rocks fractured more readily than did the diabase or the Keewatin. There appears to have been no difference in the precipitation of ores due to physical-chemical influences of the country rocks. Precipitation seems to have taken place as readily in rocks of any one of the three series mentioned in the preceding paragraph as in the others.

Judging from the way in which silver is found in the minutest cracks in granite boulders of some of the conglomerate near the veins, this ore, at least, was precipitated no less readily in acidic rocks than in basic ones. With the exception of these boulders, there are few opportunities afforded of observing the relations of the ore to granite. But in the Timiskaming mine, a few hundred feet below the surface, narrow dikes of Lorrain granite intrude the Keewatin and are cut across by a vein. The surface of the granite is plated with native silver.

The occurrence of rich silver ore depends on the character of the openings in the rocks now occupied by the veins, on whether the veins have been affected by secondary disturbances, and on the proximity of the openings to the diabase sill. Naturally, it would be expected that solutions would work upward through the openings in the hanging wall above the sill more readily than downward into the foot-wall. Unfortunately, owing to the excessive erosions to which the district has been subjected, there is little of the hanging wall of the sill left in the productive area at Cobalt. But of the veins thus far worked the two or three that occur in the hanging wall are productive to the greatest depth reached in the area.

In the foot-wall of the sill, or what was the foot-wall before erosion took place, the rich or merchantable ore is limited as to the depth to which it extends. This depth below the sill is variable, depending on the character and strength of the fissures, and other factors already mentioned. Rich ore descends to a less depth in narrow, more irregular fissures than in wide ones.

As has been said previously, much the greater part of the ore has come from veins in the fragmental rocks of the Cobalt series in the foot-wall of the sill. These veins, on reaching the contact of the Cobalt series with the underlying Keewatin, either end at the contact, or split into stringers, or continue down into the Keewatin. In many cases the rich ore disappears when the veins penetrate the Keewatin. On the other hand, a few veins in stronger fissures have been found to be productive in the Keewatin that, before erosion, lay beneath the sill.

In the veins both in the diabase and Keewatin rocks, ore is found to occur more irregularly distributed than in those of the Cobalt series. In other words, it tends to occur in bunches.

The best veins that have been worked in the diabase are one on the Kerr Lake property and one on the O'Brien. Of those in the foot-wall of the sill, the best vein in the Keewatin has been No. 26 on the Nipissing.

### Ores and Minerals.

The more important ores in the veins under consideration are native silver—associated with which is usually some dyscrasite, argentite, pyrargyrite and other compounds of the metal—smaltite, niccolite and related minerals. Many of the minerals occur mixed in the ores, and for this reason some of them have not been clearly identified. Another character of the minerals, which renders their identification difficult, is the fact that most of them occur in the massive form. Crystals when present are small, being frequently almost microscopic in size. The following minerals have been identified and can be conveniently classed under the headings:

1.—Native Elements:
   Native silver, native bismuth, graphite.

2.—Arsenides:
   Niccolite, or arsenide of nickel, $NiAs$; chloanthite, or diarsenide of nickel, $NiAs_2$; smaltite, or diarsenide of cobalt, $CoAs_2$.

3.—Arsenates:
   Erythrite, or cobalt bloom, $Co_3As_2O_8+8H_2O$; and annabergite, or nickel bloom, $Ni_3As_2O_8+8H_2O$; scorodite, $FeAsO_4+2H_2O$.

4.—Sulphides:
   Argentite, or silver sulphide, $Ag_2S$; millerite, or nickel sulphide, $NiS$; argyropyrite? stromeyerite? $(Ag, Cu)_2S$; bornite, $Cu_5FeS_4$; chalcopyrite, $CuFeS_2$; sphalerite, $ZnS$; galena, $PbS$; pyrite, $FeS_2$.

5—Sulpharsenides:
   Mispickel, or sulph-arsenide of iron, $FeAsS$; Cobaltite, or sulph-arsenide of cobalt, $CoAsS$.

6.—Sulpharsenites:
   Proustite, or light red silver ore, $Ag_3AsS_3$; xanthoconite? $Ag_3AsS_4$.

7.—Antimonides:
Dyscrasite, or silver antimonide, $AG_6Sb$; breithauptite, NiSb.

8.—Sulphantimonites:
Pyrargyrite, or dark red silver ore, $Ag_3SbS_3$; stephanite, $Ag_5 SbS_4$; polybaisite? $Ag_9 SbS_6$; tetrahedrite, or sulph-antimonite of copper, $Cu_8Sb_2S_7$; freibergite? (silver-bearing tetrahedrite).

9.—Sulphobismuthites:
Matildite, $AgBiS_2$; emplectite, $CuBiS_2$.

10.—Mercury:
Amalgam?

11.—Phosphate:
Apatite.

12—Oxides:
Asbolite; heubachite?; heterogenite?; arsenolite; roselite?

13.—Veinstones:
Calcite, dolomite, aragonite, quartz, barite, fluorite.

The table contains a few minerals that have been found in only one or two veins and cannot be considered characteristic. Millerite, for instance, is of rare occurrence, and emplectite has been found only in the Floyd mine, near Sharp lake, in the western part of the Cobalt area. Bornite, chalcopyrite, zinc blende, galena and pyrite are not characteristic of most of the ore, these minerals occurring more frequently in the wall rock or in non-silver bearing ore of the Keewatin, but one or two mines have produced copper with cobalt-silver ore. Apatite in recognizable crystals has been found in the ore of only one mine. Mercury appears to occur in the ore of all the mines that contain high values in silver, but whether it occurs only as amalgam or in other forms has not been determined. Among the veinstones, aragonite is found but rarely, at least in easily recognizable form, while barite and fluorite have not been observed in the veins at Cobalt proper.

A question mark has been placed after the names of several minerals in the table which have been reported to occur in the veins, but the identification of which has not been made complete by chemical analyses or crystallographic measurements.

Gold in small quantity has been found in a number of veins, especially in those in which cobaltite or mispickel are characteristic minerals.

A characteristic of the group is the subordinate part which sulphur plays in comparison with arsenic. Antimony, which is not abundant, is found in some compounds where one would expect to find arsenic, since the latter is so much more abundant. For instance, while both native silver and arsenides occur in abundance, the compounds of arsenic and silver are found only in small quantity. Then one would also expect to find more compounds of bismuth since this metal occurs in the free state in considerable quantities in some parts of the deposits. It might also be expected that native arsenic would occur at times.

Nearly all the chemical groups of minerals found in the celebrated Joachimsthal deposits of Bohemia are present in the Timiskaming ores. The most important exception is uraninite or pitchblende, which came into prominence a few years ago on account of its being the chief source of the element radium.

**Order of Deposition of Minerals.**

The following table shows, in descending order from the youngest to the oldest, the general succession in the order of deposition of the principal minerals of the Cobalt area proper. There appear to be, however, minor exceptions to this order.

III. Decomposition products, e.g., erythrite or cobalt bloom, annabergite and asbolite.

II. Rich silver ores and calcite.

1. Smaltite, niccolite and dolomite or pink spar.

After the minerals of group I. were deposited the veins were subjected to a slight movement. In the cracks thus formed the minerals of group II. were deposited. A few veins that escaped the disturbance do not contain silver in economic quantity.

This order of deposition appears to be the same as that of the minerals in the Annaberg deposits of Germany and in those of Joachimsthal, Austria. At Annaberg the uranium ore or pitchblende is said to have been deposited earlier than the rich silver ores and later than the cobalt-nickel minerals, while barite, fluorite and quartz were deposited prior to the latter. At Annaberg there are thus considered to have been broadly five periods of deposition, while at Cobalt there have been but three, minerals representing the first and third periods being absent.

# MINING AND THE CANADIAN NORTHERN RAILWAY

(Continued from July 1st issue.)

**Marble Quarries at Bronson, Ontario.**

The Ontario Marble Quarries, Limited, is quarrying marble at Bronson, on the Central Ontario Railway, two miles south of Bancroft, in the County of Hastings.

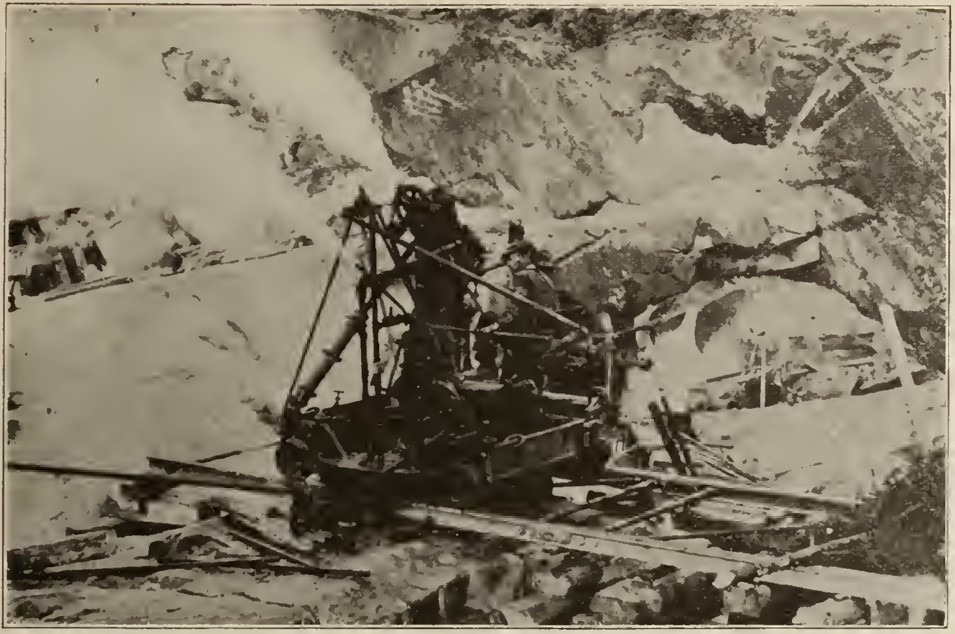
These quarries are producing material which in colour beauty and variety of marking, and size of slabs, compare favourably with any other marble on the market. Among the buildings in which it has been used for interior decoration, are the New Standard Bank Building, King street west, Toronto; the C.P.R. building in Montreal, and buildings in Winnipeg and Vancouver. Their plant is about one-half mile above the station at Bronson. A siding is being built into quarry No. 3, close to the railway, and it will be extended to the plant and connect the three quarries, the farthest of which is about one-half mile from the railway.

**No. 1 quarry**, on lots 28-29, 10th concession, Dungannon, has an excavation about 100 ft. long, 60 ft. wide and 25 ft. deep. The rock is cut in blocks by a channeling machine, which is driven by steam. The blocks vary in size, but they average 6 x 5 x 5 feet, and weigh about 20 tons. The blocks are picked up by a 20-ton derrick placed on a small tram car and taken direct to the mill, run under the saw, and cut into slabs without being removed from the car.

The colour of the marble in this quarry varies. Much of it is a variegated green and white, some of it is white with green veining. East of No. 1 quarry, a little work has been done to show up a fine face of green marble of very beautiful colour and fine grain, which will prove most valuable for interior work.

Dr. W. A. Parks, in his report on Building and Ornamental Stones of Canada, says of the marble at No. 1 Quarry:—

"The general strike of the belt is N. 70 deg., in which direction the continuity of the deposit has been proved by test pits for at least 1,000 feet. The width is stated by Mr. Morrison to be 1,000 feet, but owing to the overburden, it is not easily ascertained.



Cutting marble at quarry near Bronson, Ont. Marble Quarries, Ltd.

"Different types of marble are arranged in bands parallel to the strike. From the north to the south the following varieties are recognized:—

(1) A laminated green variety.

(2) A green variety with broad bands and clouds of white and pink.

(3) A light green marble with bands of white.

(4) A light cream ground with green bands and cloudings.

(5) A pink ground with green, blue and white foliated bands.

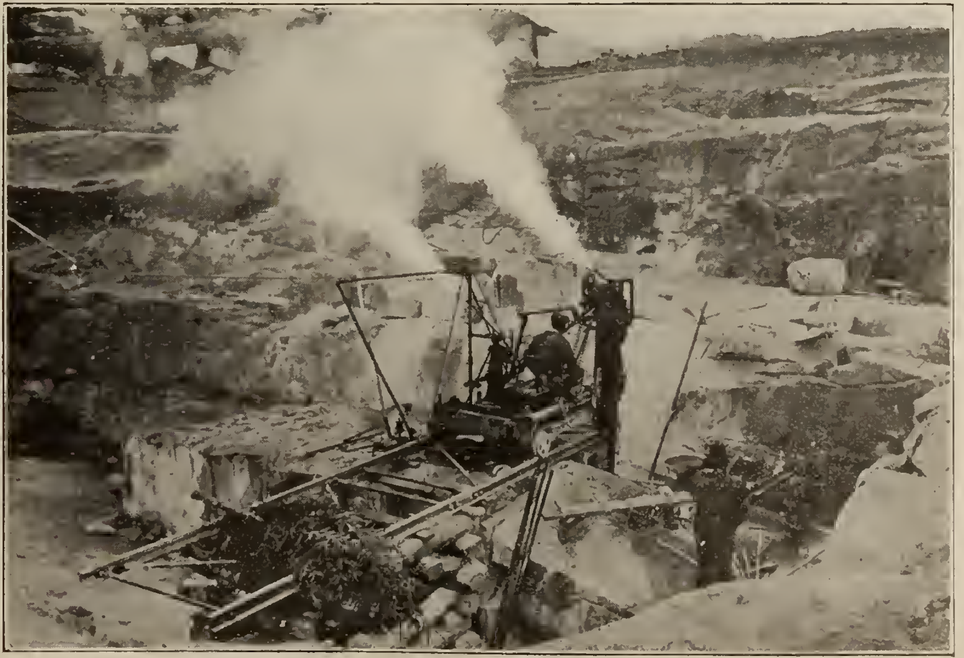
(6) A blue variety with very fine white veins.

"The deposit, as exposed on the hills near the mill, is remarkably free from surface cracking and weathering, which argues well for the durability of the stone. The surface alteration is so insignificant that large blocks with the adhering earth, go directly to the mill and result in an entirely satisfactory product.

"Clean vertical joints striking S 20 deg. E. cut the deposit at an average distance apart of 20 feet. There is very little minor jointing. Blocks 25 feet square could be obtained and several 4 x 5 x 10 have already been quarried. Horizontal partings (floors) occur at intervals of 10 or 12 feet."

**No. 2 quarry** on lot 41 West Hastings Road, is about a quarter of a mile west of No. 1. The marble of this quarry is found in a variety of colours, pink, white with a greenish cast, mottled and brecciated, and very dark green. Some shows a blending of mauve and grey, and some a mixture of red and black.

Dr. W. A. Parks says of the rock on lots 41 and 42, Hastings Road:—



Channeler in operation near Bronson, Ont. Marble Quarries, Ltd.

"The most beautiful and delicate marbles of this property, are exposed along the brow of a considerable hill running north and south towards the eastern border of the lots. The upper 50 feet of the bluff consists of the marbles about to be described, but whether these extend to greater depths or whether they overlie the Rose fantasia, I am unable at the present time to say.

"The general strike of these deposits is 5 deg. S. of E. and the dip 80 deg. to the north. Beginning at the south, the first belt is about 100 feet wide and consists of a beautiful fine grained semi-translucent base with brown and green bands and contorted stripes.

"Towards the north this band is less prominently marked and presents the same base with much fainter cloudings. Then follows a narrow dyke of basic eruptive, north of which the Rose fantasia rises to a higher level and is succeeded by 150 feet of beautiful brecciated varieties.

"This brecciated zone is followed by about 200 feet of a fine grained, delicate pink variety with black bands and clouds.

"A brown veined partly brecciated variety follows.

"The continuity of the exposure is interrupted at this point for a considerable distance, but another opening 750 feet from the southern limit shows a large body of a brown and red veined variety."

**No. 3 quarry** is close to the railway. Here is found a very large deposit of white marble which will have a great commercial value. There are two deposits of this white marble, one 70 feet and the other about 100 feet wide. They are both about 700 feet long, according to the development work done upon them now. None of this has been marketed yet, and will not be until the railway spur has been completed, when the blocks already taken out will be shipped direct to Toronto to be finished.

**Blocks of marble at Ontario Marble Quarries, near Bronson, Ont.**

**The plant** consists of a 90 H.P. boiler, one engine and four gang saws, each of these saws contains about 40 to 45 blades. The blades can be placed to saw any thickness, but the average is about one inch. The cutting is done by feeding sand and water to the saw. When the sawing is finished, it leaves a smooth, soft surface. The marble in this form is shipped to Toronto, where it is polished and cut to size, according to the requirements of the trade. These quarries at present employ about 50 men. Mr. T. Morrison, one of the owners, acts as the manager.

# THE WITWATERS RAND GOLD INDUSTRY IN 1912*

By W. L. Honnold.

In the light of the data now available for the past year it is clear that, taken as a whole, the mines of the Rand have made noticeable advancement. This is true in respect of both operation and intrinsic soundness, as well as of the financial position generally.

A total of 25,486,361 tons were milled by an average of about sixty producing companies, as against 23,888,258 tons during the previous year. The yield in gold amounted to $181,080,211, equivalent to $7.06 per ton, which was $0.26 per ton better than the yield for 1911. The gold won was therefore 10.8 per cent. greater, although the scale of operations increased by only 6.7 per cent. Explanation lies partly in the fact that for the year before the unit recovery was abnormally reduced because several companies mined an unnecessary proportion of unpayable ore. Compari-

*The Michigan College of Mines Alumnus, July, 1913.

son is further complicated by the fact that in both years several companies, for good reasons, worked somewhat above the grade called for by their ore reserves.

The average working cost advanced from $4.38 to $4.54. This apparent advance should not be taken too literally, since, to some extent, it arises out of the fact that the figure for 1911 was unduly low because of the mistaken policy of mining unpayable ore referred to in the preceding paragraph. On the other hand there were certain factors which undoubtedly affected costs unfavourably. Chief amongst these may be mentioned the continued tendency to higher cost of native recruiting and wages, a tendency fortunately now checked by the formation of the Native Labour Corporation, which will deal with the matter co-operatively and correct in some measure the past disadvantages of competition. Costs were also adversely influenced by the greater inefficiency of white labour, the incidence of the eight hour law, increasingly exacting Government regulations, and the expenditure called for in consequence of legislation for the compensation of miners suffering from phthisis. The latter charge is in the way of being largely eliminated by concerted maintenance of a moist atmosphere throughout the mines by liberal spraying. In considering working costs it has also to be borne in mind that in 1912, as in the preceding year, there was a disposition in many instances to charge directly to working accounts extraordinary items which, if money could have been raised as freely in the past, would have been dealt with as capital expenditure.

Working profits totalled $61,742,322, as compared with $55,595,243 for 1911, a gain of slightly over 11 per cent. The per-ton figures for the two years were $2.44 and $2.33 respectively.

In the matter of dividends the showing is outwardly not so satisfactory. There was an increase of $924,851 in the aggregate distribution, making the total for the year $38,731,080, but the per-ton declarations averaged only $1.52 as against $1.58 for the previous year. The explanation lies chiefly in that the money markets were unfavourable to the provision of additional working capital. As in the year before, large amounts had to be appropriated to cover extraordinary expenditures, in connection with additions and alterations, both underground and at the surface, which have had to be undertaken at this stage, more particularly in connection with the recently merged properties. Under more propitious monetary circumstances these appropriations would have been charged to capital account. This point will perhaps be clearer if the following per-ton figures are considered:

1910—Working profit, $2.56; distributed, $1.97; undistributed $.59.

1911—Working profit, $2.33; distributed, $1.58; undistributed, $0.75.

1912—Working profit, $2.44; distributed. $1.52; undistributed. $0.92.

The tendency shown by this comparison would be cause for uneasiness were it not that the special improvements to which it is due are either completed or nearing completion. It has, however, to be borne in mind that, arising out of the hopeful feeling which prevailed in 1910, certain mines over-reached themselves and made a better showing than their intrinsic position warrants. Figures for that year consequently cannot be taken as an absolute basis of comparison, although in the aggregate they were not far out and may be again realized. One is forced to the conclusion, therefore, that the relatively poor showing of the last two years in the matter of dividends is not due to intrinsic deterioration but to an enforced change in financial policy, temporarily inconvenient, no doubt, but in the long run of advantage to shareholders.

Whether and to what extent it may be possible and advisable to bring about a closer relationship between working profit and dividend than that shown above, is a question open to difference of opinion, but not so simple as has been suggested. If we take working cost as covering all head office, maintenance and operating expenses, including the development called for by the equipment provided, then the remaining supercharges against working profit fall chiefly under the headings Interest and Redemption of Loans, Profits Tax, and Capital Expenditure. It would, of course, be possible to add to the published monthly and quarterly costs a fixed charge per ton under each of these three headings, or any others that might be called for. These fixed charges would be based on experience and probability and would be fairly reliable as to loans and profits tax, although in the latter case, owing to its determination being a matter of complex calculation by Government officials at the close of the year, only an approximate figure could be used.

The matter of capital expenditure, however, would present far more difficulty. As commonly interpreted it embraces all the various and varying items of extraordinary expenditure called for in order to conform to engineering progress, meet the demands of expansion, and deal with both incidental and accidental exigencies of major importance, items, obviously that cannot be charged directly to working costs without perversion of the comparative value of the latter and the consequent confusion of the shareholders. It is not surprising that directors and engineers hesitate to forecast expenditure under so problematical a heading. If a true approximation were attempted, those responsible would probably find themselves either trammelled by underestimates or criticized for misleading overestimates. In practice, the latter chance would probably be taken as the lesser of two evils and generous provision would be taken against contingencies, a course hardly favourable to economy.

It may be urged that any resulting surplus could be carried forward or credited to general revenue and expenditure. But this is equivalent to abandonment of the advantage aimed at; for the surplus might equal the margin of uncertainty under the present policy.

Even if it were possible to forcast the expenditure with approximate accuracy, and this forecast were embodied in the monthly and quarterly reports, the showing would still be open to misconstruction owing to uncertainty as to the financial policy that might be called for at the close of the year, more particularly as to the matter of balance forward. Furthermore, the financial policy of a company is open to modification in accordance with market conditions, or other circumstances, and there are a number of companies which at a favourable moment may, by new share issues or otherwise, materially alter their position and thus make available for distribution amounts that have now to be apportioned to capital expenditure. Enough has been said to show that the question is not so simple as has been implied by some critics. The prevailing custom admittedly results in interim reports which do not directly reflect the dividend position. Such perfection, however, is not aimed at—it might be realized by some of the companies some of the time, but not by all the companies all the time, a consideration of special bearing where uniformity is so important as on the Rand. All that is claimed for the monthly and quarterly reports as now published is that they provide confirmation or modification of certain comparative data, the dividend significance of which has been previously foreshadowed by precedent and prophecy with as much certainty as would probably result from a more ambitious attempt. Taken in this light, much can be said in their favour. It should, perhaps, be added that some critics have advocated going to the other extreme and publishing no interim reports whatever, their argument being that, apart from the fact that at best such publications may prove misleading in some degree, there is the practical consideration that they may lead to a somewhat costly struggle for regularity in matters essentially irregular.

With regard to the industry as a whole, it is doubtful if, taken from the standpoint of actual demonstration, it has ever shown greater soundness, i.e., a more satisfactory correlation between salient factors. The financial position of the companies generally is unusually strong. Plants are in good condition and have been enlarged whenever necessary to meet the demands of expansion. Necessary underground haulage ways and mechanical features have been provided to meet the requirements of increasing tonnage and greater tramming distance. Development is well in advance and there is apparently no material change in tenor. The native labour situation is probably more satisfactory than ever before and is in the way of further improvement, partly through the better organization recently effected, and partly through the wider use of machine drills. In the latter connection it is interesting to note that the number in use has increased by about 57 per cent. within the last two years, a total of 5,634 drills now being employed. Unfortunately, the white labour position is not so satisfactory, this country like most others having now to contend against both shortage and inefficiency. This difficulty will probably disappear when it is recognized, as it inevitably must be sooner or later, that the existing prejudice against the employment of natives of superior capacity on certain so-called skilled labour is unreasonable and inadvisable under the circumstances. The prospect in this connection, however, is too vague to be reckoned on at present. Generally speaking, the mines are neither unduly pressed as to tonnage and grade, nor over-strained as to dividends. In fact, there is a reserve of strength in the working position that promises to find expression in a materially improved showing for the current year.

# SILVER LEAD AND ZINC DEPOSITS OF SLOCAN, B.C.*

By O. E. Leroy.

Although the lead deposits in the vicinity of Ainsworth on Kootenay Lake were being worked in the later 80's, it was not until 1891 that the richer and more important ore deposits were staked inland from Kootenay Lake and further to the west. In the early years the transportation difficulties were great, so that it was not until 1895 that important shipments were made. The total production from 1895 to the end of 1911 in round numbers amounts to 795,000 tons of ore, containing 30,875,000 ounces of silver, 2,890 ounces of gold, 269,460,000 pounds of lead with a total value of nearly $29,000,000. The zinc returns from 1907 to 1911 are valued at nearly $1,000,000.

**General Geology.**—The deposits occur in the granitic works of the Nelson batholith, but particularly in the sedimentary rocks of the Slocan series (Carboniferous?). The granitic rocks range from true granite to quartz diorite. They are almost prevailingly of a light grey colour and the texture ranges from medium to coarse grain. Outside of the main area of the batholith the rocks appear in the sedimentaries as dikes, stocks and irregular masses.

The Slocan series consists of interbedded argillaceous quartzites and limestones, and slates or argillites which are more or less carbonaceous. They form an undoubtedly thick series, but the folding, faulting and lithological similarity prevent any section being made that would give even an approximation of the actual thickness. The series is extensively diked by quartz porphyry and lamprophyres which are older than the fissure system containing the ore bodies.

**Veins.**—The veins are nearly all of the fissure type and are much more numerous in the Slocan series. There they almost invariably cut across the strike of the formation, if they coincide in strike they cut across the dip and terminate usually by either turning suddenly and following a bedding plane or by feathering out in the broader bands of the softer slates. The veins vary in length from a few hundred feet to over 4,000 feet and in thickness from a few inches to over 50 feet. In exceptional cases the vein may attain a thickness of 150 feet.

The widest portions of the veins are generally filled with crushed and broken country rock with but relatively small amounts of the gangue minerals. In certain definite areas the fissures form a widely paralled system; the dips range from 40 to 80 degrees and as a rule are well over 50 degrees.

**Ore Shoots.**—The ore shoots are composite in character and consist of widely parallel bands, lenses and masses of galena and zinc blende alternating with siderite and to a less extent with quartz and calcite. As a rule the high grade ore favours the hanging wall side of the vein, though this is not invariably so. The shoots also favour the carbonaceous slates rather than the quartzites, porphyry stocks or dikes, but the reverse again holds in a few instances. Another favourable factor in the formation of shoots is the cross fissures which pass across the vein from either the foot or hanging wall side. These appear to have formed accessible channels for the metal bearing solutions. The shoots vary in length from 15 or 20 feet to 400 feet or over, and in width from a few inches to 40 feet.

The vertical component varies from 10 feet or so to 500 and 600 feet in the larger bodies. In many cases with, however, numerous exceptions, the shoot bears a relation to the topography of the country and pitches out of the hill. With depth the ore gets poorer and passes into slightly mineralized gangue and crushed rock.

**Mineral composition.**—The chief metallic minerals are galena and zinc blende. With freibergite as the important silver bearing ore, ruby and native silver and argentite are found in many of the deposits developed along fractures in the more massive ore.

*Extracts from Guide Book, No. 9, prepared by the Geological Survey of Canada, for Twelfth Session International Geological Congress, August, 1913.

Chalcopyrite and pyrite are almost invariably present, the former in small amount, the latter in increasing quantity as the lead content diminishes. The zone of weathering is very shallow, but originally contained carbonates of lead, zinc and copper and in one instance linarite, a sulphate of lead and copper.

The gangue is composed of siderite, calcite and quartz in varying proportions, the quartz content usually increasing with depth.

At present the metallic contents of the ores mined range from 7 per cent. of lead and 20 ounces of silver to the ton to one carrying from 50 to 75 per cent. of lead and from 80 to 175 ounces of silver to the ton. In some mines there is a little gold which ranges in value from $1.00 to $7.00 to the ton.

**Origin.**—No definite law holds with regard to the order of the formation of the several minerals. In many instances, however, siderite was formed first, followed by zinc blende which replaced a portion of the siderite. Galena succeeded the blende, and freibergite followed, filling in fractures in the galena and to a certain extent in the blende.

The ore appears in great part to be primary and to have been introduced by ascending solutions which deposited their mineral content in the wider portions of the veins at favourable horizons, where the action was aided by decrease of pressure, lower temperature and by the reducing action of the carbon in the crushed rock which forms an important percentage of the vein filling.

The ore was probably derived from some horizon of the granitic rocks of the batholith which underlies the whole area and is perhaps closely connected with the basic lamprophyric dikes. In several instances it was noted that veins followed the same fissures as the dikes, in which cases the ore lay on and along the dike.

Many of the ore shoots so far stoped have been comparatively shallow, but more recent development work has shown ore at greater depths, in one case 1,270 feet (387 m.) below the outcrop. The development of the last two years has encouraged the belief that the ore shoots are not merely surface deposits, but that they will be found to have a much greater vertical range than was formerly believed.

# THE KOOTENAY ZINC PROBLEM

On August 21st at Nelson, B. C., Hon. Louis Coderre, Secretary of State and Minister of Mines of Canada, met a number of members of the Nelson Board of Trade and local mining men, to discuss the zinc problem. The following account of the meeting, published in the Nelson Daily News, contains statements made by several of those present:—

After listening to the statements by members of the Board of Trade and mining men of the district, in which the necessity for the continuation by the Dominion Government of experiments in the treatment of complex zinc ores and for the appointment of a royal commission to make a thorough investigation into the requirements of the mining industry was urged, Hon. Louis Coderre, Secretary of State and Minister of Mines, yesterday morning announced that he had just despatched to Dr. Eugene Haanel, Director of the Federal Department of Mines, instructions to authorize E. Didolph, who is now in Nelson, to proceed at once with the work at the zinc plant in Fairview. Expenses of the work will be covered, he explained, by $30,000, which remains of the grant of $50,000 originally made for the purpose of experiments in methods of treating zinc ores. He inspected the plant yesterday morning.

Evidently deeply interested in the proposal that the Government should name a royal commission on mining, in order that it might be placed in possession of complete information regarding the industry, Mr. Coderre said that he really believed something could be done on that line and promised that he would place the matter before the cabinet next month, and would endeavour to bring about action which would be satisfactory.

Himself bringing up the question of the desire for the creation of a separate portfolio of mines in order that the industry might have the benefit of the complete attention of a minister, Mr. Coderre promised to lay the wishes of the board and the mining men before Premier Borden and the other members of the Cabinet.

**Mr. Coderre Shows Keen Interest in Subject.**—Throughout the speeches of the Board of Trade members and the minimn men the ministers displayed the deepest interest, asking frequent questions in order to clear up points about which he was in doubt.

When he heard that he was expected to visit the West with the members of the International Geological Congress, he had felt pleased because he had realized that the trip would give him an opportunity to see those interested in mining, hear what they had to say, and gain a thorough understanding of the requirements of the industry through personal contact, said Mr. Coderre, in making his reply. Having accepted the portfolio of Minister of Mines, he was most anxious to understand the industry's needs, and learn of the remedies which might be brought to bear.

Speaking of R. F. Green, M.P., the Minister said that he would meet him in Victoria, as the member for Kootenay had taken a great interest in the various mining questions last session. Many times Mr. Green was in the speaker's office pressing on his attention the needs of the industry.

In conclusion, after thanking the Nelson board and the mining men for the entertainment given in Nelson to himself and the geologists, Mr. Coderre said that he believed that the proposed commission could collect all the facts necessary for the Government to make a decision regarding aid to the lead mining industry, the question of zinc ore treatment and other matters of importance.

**Kootenay-Boundary Output Large.**—In introducing the speaker to Mr. Coderre, W. F. Roberts, President of the Board of Trade, recalled that the Nelson board had been instrumental in bringing to the attention of the Government many matters of importance to the mining industry. In 1912, the mineral output of Kootenay and Boundary was about $20,000,000, which was approximately two-thirds of the output of British Columbia, which was one-sixteenth of the total production of Canada. While gold, silver and coal took a prominent place in the total output of Kootenay and Boundary, this district was especially interested in lead and zinc mining, as it produced about 90 per cent. of the total lead output of the Dominion, and practically all the zinc. He concluded by expressing the thanks in which other speakers joined, to the minister and the Government for the extension of the lead bounty and the work at the zinc smelter, and referred to the need for a royal commission to secure evidence as to the best means of placing the lead and zinc mining industries on a stable basis.

**Mr. F. A. Starkey.**—Mining was possibly the most important industry in Kootenay to-day, declared Fred A. Starkey, President of the Associated Boards of Trade of Eastern British Columbia, who related the history of the lead bounty and stated that it had done a great deal of good. The position as to the zinc industry, was that the ore could not be treated in this country and had to be shipped, if sufficiently high grade to stand freight and smelting expense, to the United States. He remarked that he considered it wrong in principle for such a condition of affairs to exist on the ground that an American industry was being built up out of a Canadian natural resource. The suggested royal commission could go into the whole question of assistance to the lead industry, whether by bounty or by duty or by other means, he said.

Speaking of the experiments in the reduction of complex zinc ores, Mr. Starkey suggested that, even if the work did not result in entire success, such results as were attained should be given over to anyone who would build a plant with the idea of improving it. Such a plant should, he suggested, be financially aided by the Government. There were tremendous quantities of zinc ore in the mountains of this district and all that was required was a method of treating it, he said.

**Aids All Other Industries.**—Asking the minister to use his influence toward the appointment of the royal commission, Mr. Starkey declared that the prosperity of the mining industry meant the prosperity of every other industry in the surrounding district.

Speaking of the ore testing laboratory at Ottawa, which has been recently established, Mr. Starkey suggested that it would prove of still greater advantage to prospectors and small mine owners if samples of ore of from 25 to 50 pounds could be sent, instead of from 200 to 500 pounds, as provided under the regulations of the Department. Such a comparatively large amount of ore cost a considerable sum in freight charges, he explained.

**Mr. S. S. Fowler.**—S. S. Fowler remarked that while Mr. Coderre was the fourth Minister of Mines in the present Government, he was the first who had paid a visit to Kootenay in that capacity. The visit of the minister was appreciated very much, said Mr. Fowler, as personal contact was essential to the proper understanding of the conditions and the requirements of the industry. Standing second to agriculture in value of total output in the Dominion, the mining industry should be encouraged and fostered in every possible way.

While British Columbia's total mineral output bore an important ratio to the total production of the Dominion, and while practically all the lead and zinc of Canada was produced within a comparatively few miles from where the minister was sitting, this district was the farthest from the point of production of the things which the industry consumed and the farthest from the point of consumption of its product than any other mining district in Canada, he declared, the industry here having an additional handicap in the high cost of labour and materials, the latter resulting from the distance which goods had to be transported. Another handicap, which applied to the lead mining industry, was that there were no official quotations of the metal in Canada, and the lower London prices consequently had to be accepted.

What the lead and zinc mining industry most needed in order to encourage the investment of capital here. was permanency of conditions as far as it was possible to obtain them. To illustrate his point, Mr. Fowler quoted the lead bounty, which assures the producer £18 per ton, even when the market price is below that figure. The bounty is paid whenever the price falls below £18 and until it drops to £14, thus enabling the mine owner to figure with reasonable certainty upon his returns, explained Mr. Fowler.

**Bounty Keeps Bluebell Busy.**—Were it not for the lead bounty the Bluebell Mine, of which he is manager, and which employs about 100 men, would not now be in operation, he declared. There were, he continued, several of the largest producers of lead which could not exist without the bounty.

Referring to zinc and to the enormous loss suffered by zinc mine owners through the lack of a method of treatment, Mr. Fowler estimated that in the mines of the country there was probably 50 per cent. more zinc than lead, which meant that every pound of lead was accompanied by one and one-half pounds of zinc, which was now being thrown away. If this wasted zinc could be treated, it would, at present prices, return more to the mine owner than the lead.

After congratulating the Government upon what he described as the practical manner in which it was proceeding in its efforts to solve the zinc problem. Mr. Fowler remarked that all these matters could be brought before a royal commission, if such were appointed.

**Should Look to Future.**—While the lead bounty during the years that it had been in operation, had been of very considerable benefit, and the mine owners were grateful to the Government for the extension granted at the last session, the mining industry was one which was not developed in a day, and it was necessary that steps should be taken toward providing for the assistance of the industry in future years, said Ernest Levy, manager of the Van Roi Mine at Silverton, and the Le Roi No. 2 at Rossland, who, in making a plea for the appointment of a commission, emphasized the fact that such a body could gather the information upon which the Government could act when the necessity would arise in about four years, when the lead bounty extension expires.

As a mining district, Kootenay and Boundary, already of considerable importance, would be of very much greater importance, declared Mr. Levy, who said that he regarded the lead bounty more as a temporary expediment than as a permanent form of aid to the industry. What form the aid to be granted should take would be a matter to be decided by the Government on the recommendations of the proposed commission, which could also go into the zinc question, the speaker agreeing with Mr. Fowler that the latter was of as much, if not of greater moment than the lead question.

**Charges Eat Up Zinc Values.**—To illustrate the difficulty of mining zinc at a profit, Mr. Levy stated that on a ton of ore or concentrates which assayed 45 per cent. zinc, the freight and duty when sent to an American smelter, was equivalent to the value of a ton of such ore at a price of $5 per 100 pounds, St. Louis. Therefore, it was only when such a zinc ore contained silver that it could be shipped out at a profit, the zinc values being eaten up by the charges. If the ore could be treated in Canada, much of freight and all duty would be saved. Reports of the progress made on the zine experiments by the Government would be valuable to mine owners, he suggested.

Speaking of the process for the treatment of refractory zinc ores invented by A. Gordon French, J. O. Patenaude declared that he was able to announce that the Consolidated Mining & Smelting Company would next month be producing zinc by this method on a fairly large scale at its plant at Trail. In Nelson Mr. French had experimented with the process until he had it nearly perfect, so that it would save all but 2 per cent. of the zinc in a complex ore, together with a larger percentage of silver and lead than was secured by ordinary smelting methods, he said. In addition, Mr. French's method saved manganese, which was worth about $75 per ton, said Mr. Patenaude. Pure zinc could be produced by the French method for half a cent per pound, he continued.

Questioned regarding the statement made by Mr. Patenaude, R. H. Stewart, general manager of the Consolidated Mining & Smelting Company, stated that the company had not any such announcement to make.

A vote of thanks to the minister for attending the meeting was passed on a motion by Ald. James Johnstone, seconded by W. G. Foster.

Those present were: W. F. Roberts, Fred A. Starkey, J. O. Patenaude, J. E. Annable, Hugh W. Robertson, E. Didolph, W. G. Foster, T. A. Robley, S. S. Fowler, Ernest Levy, A. B. Netherby, L. K. Larson, J. H. D. Benson, W. J. Meagher, Ald. James Johnstone, W. F. Cochrane, E. K. Beeston, Edward Peters, A. T. Eyton, R. Smillie, W. H. Jones and Harry Amas.

# MICHIGAN COPPER MINE MANAGERS STATE TERMS ON WHICH THEY WILL RE-EMPLOY MEN

The following is the text of the statement made by the mine managers of the copper country to Governor Ferris, through Judge Murphy:

"At the recent meeting with you of the mine managers of Houghton and Keweenaw counties, the operations of whose mines is affected by the existing 'strike' conditions, you submitted to us the following question:

" 'Eliminating any recognition now or hereafter of the Western Federation of Miners, what terms and conditions of labour will you authorize me, as the representative of the governor, to present to anyone interested, as the basis for the re-employment of your men?'

"You are authorized as representative of the governor to state that the men will be re-employed on the same terms and conditions of labour as existed at the several properties prior to the inception of the strike. That in such re-employment the fact that a former employee has been a member of, or otherwise affiliated with the Western Federation of Miners, will not of itself be considered as a bar to his re-entering our employ. But we reserve the right to use our individual discretion as to the re-employment of any who may be known to have engaged in acts of agitation, lawlessness, violence or intimidation, or inciting thereto, after such employment and the cessation of strike conditions. Any alleged grievances, affecting the entire body of the employees at any mining property, or affecting individuals, brought to the attention of anyone of us through his own employees, will be given full consideration, with the desire as in the past, of each of us severally, to correct any wrongs that we may find to exist, either in individual instances or in general conditions.

"The foregoing answer to your question is the basis for the re-employment of our men. The great differences in working conditions existing at the various mines have made it impossible to formulate a statement of the terms and conditions of labour which could be made uniformly applicable to the several mines with justice to their respective employees or with fairness to the several mining companies. But you are further authorized, assuming such re-employment ensues, to state with respect to matters mentioned by you at our conference.

"As to wages, let us say that the adoption of a uniform minimum wage is impracticable owing to the great differences in conditions at the several properties. But to you, as the representative of the governor, we will, when the work is resumed, and for a reasonable period thereafter, submit our payrolls and all material data, and if, after being informed as to attendant conditions and circumstances, you find any iniquities in specific individual instances, they will be remedied in accordance with your recommendations. If, taking into full consideration the living and working conditions, the advantages and privileges furnished to or for the employees, the costs of mining and production and all material circumstances, you find at any of our mines that the general rates of wages as to any class or all classes of employees are inadequate, unfair or inequitable, we will severally give full and fair consideration to your recommendations in that regard.

"As to the working hours we have each had for some time under consideration a change in this respect with the intention, if and so far as found practicable, to bring about as near an approach as conditions may warrant to an eight-hour day for our underground employees, a portion of whom have heretofore been in close approximation to that condition. The present situation does not alter our intentions. Any change of this character involves to a great extent a reorganization of the operations, and for that reason must be a gradual one. The time within which it can be brought about cannot now be stated. We can now state only the fact that it has been and is under favourable consideration.

"As to the one-man drill, we can only state that with respect to this, as to all our operations, our efforts, in advance of all other considerations, are exerted toward securing the safety of our employees. The conditions of competition, the low-grade of our rock as compared with other districts, the increasing expense with debts and other conditions have made the use of the one-man drill imperative for the continuation of operations.

"The request for nonemployment of boys under 18 is clearly a matter for the legislature. The foregoing involves as a condition the early cessation of strike conditions, the elimination of any recognition now or hereafter of the Western Federation of Miners and the withdrawal from that organization of those of its members who may be re-employed. This is not imposed to a condition of an arbitrary nature, nor is it stated through illwill, but must be recognized that in view of the nature of the teachings and utterances of such leaders in their addresses to their members and to the public with respect to ourselves, our officials, our employees and our companies, there cannot be a restoration of harmony, good feeling and mutual respect between employers and employees, between bosses and men, or among the men themselves in any other way. To act otherwise on our part, to fail to bring about such restoration, most essential to the welfare of our men and of the community and the state, would be to invite an early renewal of strife.

"James MacNaughton, general manager of the Calumet and Hecla Mining Company, Ahmeek Mining Company, Allouez Mining Company, North Kearsarge mine, South Kearsarge mine, Tamarack Mining Company, Osceola Consolidated Mining Company, Laurium Mining Company, LaSalle Copper Company, Isle Royale Copper Company, Superior Copper Company, St. Louis Copper Company and Centennial Copper Mining Company.

"F. W. Denton, general manager of the Baltic Mining Company, Champion Copper Company and Trimountain Mining Company.

"Charles L. Lawton, general manager Quincy Mining Company.

"Theodore Dengler, agent of the Wolverine Copper Mining Company and Mohawk Mining Company.

"R. M. Edwards, president and general manager of the Franklin Mining Company, Indiana Mining Company, North Lake Mining Company, Algomah Mining Company, and general manager of South Lake Mining Company.

"J. L. Harris, general manager of the Hancock Consolidated Mining Company.

"R. R. Seeber, superintendent of the Winona Mining Company and Houghton Copper Company."

# OPPORTUNITIES IN MINING*

By James G. Ross.

The development of the mineral resources of Canada has been so rapid that mining is now the second greatest industry of the country. The value of the products of the mine is surpassed only by that of the farm. Only a very small proportion of the vast extent of the Dominion, much of which is favourable to the occurrence of mineral, has been prospected. The construction of railroads through regions hitherto difficult of access is opening up districts whose development gives promise of disclosing valuable deposits of mineral.

Of the vast number of men who took to the trail in the early Cobalt days many have become seasoned prospectors trained by hard experience. From these men, acquainted with the northern country, one expects news of new strikes. As districts become more readily accessible they have more time for actual rock knocking in the season and their chances of locating a vein are increased.

The knowledge gained in the north is being used to advantage in every new rush. Promiscuous claim staking is done only in time of excitement in order to hold ground for time to look it over. In cruising a new territory the prospector bides his time, but he finds a showing that holds promise of being worth developing. Many a prospector from experience gained in the newer camps recalls rocks or formations seen in former wanderings and takes the back trail to prospect the Maritime Provinces, Old Ontario, the Rainy River Country, or even British Columbia.

The good work done by the various Geological Surveys in mapping the country is of immense value in showing rock formations and routes. It would be even more valuable were the reports to state a little more definitely the parts of each district mapped most likely to repay careful prospecting.

The individual prospector has not yet been replaced by parties sent out by companies, as too much time is used in transporting supplies to keep a large party. The small syndicate formed to finance the prospector in opening up his property stands to make a good profit, as the market for promising claims partly developed is increasing. Organizations which in a systematic manner examine, buy and operate new properties, have grown out of successful ventures in the more recent camps. These afford to the prospector a ready market and to the small syndicate an opportunity of turning over partly developed claims.

Even in mining regions once thought to have been carefully prospected and in districts fairly well settled discoveries are being made. Tungsten is being shipped from a part of Nova Scotia formerly the scene of gold mining activity. China clay is being mined within 100 miles of Montreal in a country farmed for many years. Oil shale areas are being tested in the neighbourhood of the Alberta Mine, N.B., from which no shipments have been made in a decade.

There are many new districts of promise for the prospector and in which opportunities amy yet come for profits such as the deposits of Sudbury and Cobalt have given.

The coal and gypsum deposits of the Maritime Provinces are rather beyond the scope of the prospector, but afford a field for syndicates and mining companies to open up those areas as still unworked which are favorably situated. The old gold fields of Nova Scotia, probably still contain deposits, which, if properly worked, would yield satisfactory returns.

Iron and manganese deposits in New Brunswick may still be found, and if in suitable locations will receive the attention of capitalists. Molybdenite, tungsten and even tin are reported in Northern New Brunswick. The Transcontinental Railway opens a district from the St. Lawrence River to Moncton, part of which have heretofore been difficult of access.

In Quebec the iron sands of the Lower St. Lawrence are being investigated by the Department of Mines and may yet be the scene of large industrial development.

The Asbestos industry seems to be emerging from its dark days and a new deposit in this area would not be difficult to dispose of. Renewed interest in the copper district of the Eastern Townships is being shown, with the erection of a custom smelter many of the deposits worked in the 60's would be again reopened and a search for new ones actively pursued.

From the extensive country north of the St. Lawrence to Hudson Strait about all that has come out so far are stories of gold samples in the hands of Indians. The Transcontinental Railway and the North Railway will enable many an adventurous party to work contiguous territory more thoroughly now that the larger part of their time will not be required in transporting supplies.

The Hurricanaw, Bell River, Kewagami and Keenewesik countries have furnished alluring samples of gold

*From Journal of Commerce, Aug. 30, 1913.

and molybdenite and are favourably mentioned by the Geological Survey men.

Although trips have been made to Ungava for many years and during the last two years large parties have visited the country and long traverses made but little detailed prospecting has been done. What is required to investigate that territory is a well organized party, adequately financed, led by trained explorers, and composed of men prepared to remain several seasons on the ground to carry out a programme which has been definitely planned after a season's reconaissance.

In Eastern Ontario iron, gold, mica, graphite, galena, feldspar, talc and zinc are all being profitably mined and thorough prospecting in a district readily accessible should reveal more paying deposits.

In Northern Ontario railway construction discovered two unique camps, Sudbury and Cobalt. In the vast area between the Quebec and Manitoba boundaries and northward to the Bay, including the new district of Patricia is a promising field with room for many such areas as Cobalt and Porcupine. The Transcontinental, Canadian Northern and Algoma Central railways now enable much of this country to be easily reached. Though canoe routes through this country have been used by the Hudson's Bay Company ever since its formation, there are still unexplored areas within a few miles of the rivers.

In Northern Manitoba the railways to the Bay are opening a district in which the area of rock exposure predominates and, with supplies in easy reach, the prospector should soon be in here.

In Northern Alberta attention is being directed to occurrences of coal, gas, oil and tar sands.

British Columbia will for long be the happy hunting ground for the prospector. The unknown coal areas of the Crow's Nest Pass, Brazeau, Peace River, and other districts are continually being increased by the work of the indefatigable prospector and men of the Geological Survey.

For the last eight years the country adjacent to the Grand Trunk Pacific Railway from the foothills to the coast has been the scene of many promising finds by prospectors working the country ahead of the construction gangs to be ready to ship when the rails reached them. Many claims have been staked for coal, copper and silver-lead. As progress is slow with pack trains much of the time has been spent in packing in supplies at high rates. With the completion of the railway the prospectors will be able to go farther back to districts yet untouched.

There still remains a great part of British Columbia and the Yukon Territory, the only parts which have been prospected being the routes traversed in Cariboo days, and those only for placer gold. The Sushanna Placer deposits on the White Horse, Yukon, is the latest discovery reported.

As minerals afford so large a proportion of the country's wealth the prospector is worthy of every encouragement, both by the Government and by the railways, a goodly proportion of whose freight is furnished by the mine. The Northern Pacific Railway recognizes this fact to the extent of granting free transportation to the prospector and his outfit in their mountain division. The T. & N. O., Canadian Northern and Algoma Central railways employ their own mining engineers, while the C. P. R. has done much to bring mining to its present high state of production in British Columbia.

The mining industry is well worthy of the serious attention of investors. All the good properties have not been discovered and worked out. The investor, however, should examine a mineral proposition as carefully as any other and insist on capable men having charge of the expenditure of his money and developments of his property.

It seems to be a peculiar feature of investing in mining companies that the ordinary investor makes no effort to secure reliable information on a company in which he contemplates investing. It is quite useless to reiterate the advice so often given that a mining proposition should be as carefully investigated as any other business venture. Not only the probability of the ore yielding a profit as shown by the report of a reliable and competent engineer but also all other conditions such as capitalization, and personnel of directors and management. By regarding a mine as a legitimate industry and not as an adjacent to the stock market the chance of a profitable investment are probably greater than in any other line of industry.

## GRANBY.

The Boston News Bureau says:

The smart advance in Granby Consolidated to 77¼, a rise of 26¼ points from the year's low point( it sold as low as 33 last year) reflects the expectation that within a very few months the company will be in position to show earnings at the rate of between $15 and $20 per share.

If present anticipations are realized, the company on January 1 should begin to produce from its new Hidden Creek property at the rate of 20,000,000 pounds per annum, thus practically doubling the mine's production. Against this new output the only capital charge is $1,500,000 6 per cent. convertible bonds, exchangeable into stock at par, $100. The balance of the sums necessary to make possible this big increase in production has come from earnings.

At the present time Granby has outstanding only 152,000 shares, and for the year ended June 30 showed profits of practically $8 per share, or $1,207,661. This was on a copper market which averaged the company not far from 16½ cents.

The new Hidden Creek mine on a 17-cent copper market, when given time to warm up to its best efficiency, should produce annual earnings of $1,500,000, or $10 per share.

It requires no stretch of the imagination therefore to figure prospective Granby earnings of $20 per share.

In the newly acquired property Granby has blocked out between 8,000,000 and 9,000,000 tons of ore, or sufficient to last between 10 and 15 years, with the smelter treating 2,000 tons per day.

Granby has "come back" in no uncertain fashion. To make good the sudden discovery of declining ore reserves at its Grand Forks (British Columbia) mine, it started at once to secure another mine ,and in acquiring the Hidden Creek it has secured a property far more valuable than the original property.

## LABOUR DISPUTES.

According to the record maintained by the Department of Labour industrial conditions showed an improvement in regard to labour disputes during July. There were 24 in existence, as compared with 27 during the previous month. A still greater improvement is seen when the comparison is made between the present month and the corresponding period of last year when there were 46 strikes and lockouts existing in the Dominion. During July, 1913, about 152 firms and 8,000 employees were involved in strikes and lockouts as compared with 450 firms and 11,957 employees affected by trade disputes during the previous month. There was a slight increase in the loss of time to employees, about 188,000 working days being lost, as compared with approximately 181,000 during June. It may be mentioned that during July, 1912, upwards of 270,000 working days were lost from this cause. Two disputes of importance occurred during July, while of those that were in existence previous to this month, the most important as affecting industrial conditions, were those of coal miners on Vancouver Island and sawmill hands at St. John, N.B. These two disputes, together, accounted for a loss of upwards of 130,000 working days.

# THE COAL DEPOSITS AT NANAIMO, VANCOUVER ISLAND, B.C.*

By Charles H. Clapp.

There are at present three productive coal seams in the Nanaimo district lying in the following succession from the bottom upwards: the Wellington, the Newcastle, sometimes called the lower Douglas; and the Douglas. The lowest seam, the Wellington, occurs about 700 feet above the base of the Nanaimo series, overlying 600 feet of marine sandy shale, the Haslam formation. The Newcastle and Douglas seams, are only from 25 to 100 feet apart, and overlie the Wellington seam by about 1,000 feet, separated from it chiefly by a thick bedded conglomerate, the Extension formation. A fourth and small seam, called the little Wellington, locally overlies the Wellington at a distance of 20 to 50 feet. It has been mined in a small way.

The coals of the various seams are as a whole much alike, and furnish a bituminous coal of fair grade. The amount of fixed carbon in the best quality ranges from 45 to 60 per cent., and the ash from 5 to 10 per cent.

The most striking feature of the seams is their great variability in thickness and quality. The thickness varies from nothing to over 30 feet, sometimes within a lateral distance of less than 100 feet. This variation is caused by irregularities in either the roof or floor, and occasionally in both. In quality the seams vary from where they are entirely composed of clean, bright coal ,with about 5 per cent. ash, to where they are entirely composed of a dirty slickensided coal, locally called "rash," with over 50 per cent. ash. The following is a proximate analysis of the rash from the Wellington seam.

**Proximate Analysis by Fast Coking.**

| | |
|---|---|
| Water | 1.59 |
| Vol. combust | 24.15 |
| Fixed carbon | 19.29 |
| Ash | 54.97 |
| Sulphur | undet. |
| | 100. |

**The Wellington Seam** rests on a firm sandstone floor, which is fairly regular although a few sharp rolls do occur in it. The roof, however, varies greatly in character from sandy shale to conglomerate, with many irregularities, especially in the sandy shale. The average thickness of the seam is from 4 to 7 feet, but it occasionally pinches to virtually nothing, and then suddenly thickens to 10 or 12 feet. The floor may be nearly smooth, but the roof in passing from the thin to the thick portion of the seam rolls upward sharply and often irregularly. Occasionally the roof is overturned forming in one instance an overlap in the seam of at least 25 feet. These sharp rolls are locally called "faults." Invariably at the thin places or "pinches" the coal is dirty and slickensided, while in the thick places or "swells" it is clean, black in colour with a sub-brilliant lustre, and broken only by a few irregular joints. Rash is usually found near the top and bottom of the swells and rarely in thin partings near the centre. Even in the swells some bone is present as small lenses seldom more than a quarter of an inch thick. In some instances the coal is clean and unfractured against the upturned roof, but more commonly it is somewhat slickensided and even contorted. The roof at the rolls is always contorted and slickensided.

The strike of the rolls corresponds with the strike of the measures, that is, northwest to west, and the pinches occur in the northeast and north side of the rolls with the corresponding swells on the opposite side. Where the seam is overlapped, the overlap is to the northeast or north.

It appears from the evidence given above as if the variation was due in large part to a folding which affected the coal seams when the clean coal was in a fairly plastic condition. This conclusion is especially well substantiated in another part of the Wellington seam, where it is composed of several sub-seams separated by dirty slickensided coal or rash. During the deposition of the seam, conditions in which fairly clean carbonaceous matter was deposited must have alternated with those during which the carbonaceous matter was deposited with a large amount of silt. When the seam was folded, the clean coal was apparently forced away from the tight bends, where the folding caused an increase in the vertical pressure, and left the seam at these places composed almost entirely of rash. The clean coal flowed to where there was a corresponding relief of vertical pressure forming a swell where the seam, except for the rash at the top and bottom, consists chiefly of clean bright coal.

Besides the barren places or wants due to folding subsequent to the deposition of the same, there are large wants due solely to silting, for in some instances the silting must have persisted throughout the period of coal formation. Also large and persistent partings of shale occur between the sub-seams.

**The Douglas Seam.**—Both types of variation occur in the Douglas seam. The seam varies from nothing to 30 feet in thickness, and averages about five feet, although over large areas the average thickness of the mineable coal is between three and four feet. The floor of the Douglas seam is usually a rather weak sandy shale, and the roof, although stronger, is very variable, ranging from a sandy shale to a fine grained conglomerate, the principal type being a shaly sandstone with sandstone layers and lenses of fine grained

*Extracts from Guide Book, No. 9, prepared by the Geological Survey of Canada, for Twelfth Session International Geological Congress, August, 1913.

conglomerate. Unlike the conditions in the Wellington seam the pinches and swells are caused chiefly by irregularities in the floor, the roof being fairly smooth. At the pinches the seam is composed almost entirely of rash, like that of the Wellington seam, although as a rule it is harder. The coal occurring in the swell has a compact texture, but rather dull lustre. It is irregularly broken into large blocks. Near the pinches some of the coal is slickensided and contorted, but where these features are shown the coal contains a higher percentage of ash. The coal seam is displaced also by small faults, although an actual break seldom occurs, the coal having been forced along the plane or zone of dislocation. Rarely the entire seam folds or wrinkles without any appreciable variation in thickness.

**The Newcastle seam** is more regular than the Wellington or Douglas seams, but is thinner, varying, as far as known, from 20 to 45 inches where mined, and contains more numerous and more regular partings. It is also less extensive in area than the other two seams.

**Production.**—The coal has been the source of a flourishing industry for over 50 years. The Wellington seam has been mined at Wellington, Northfield, East Wellington, Harewood Plains, and Extension, and is at present mined by the Vancouver-Nanaimo Coal Mining Company at East Wellington and by the Canadian Collieries (Dunsmuir) Company near Extension. The Newcastle and Douglas seams, which are usually worked together, have been mined extensively in the vicinity of Nanaimo. The mines here are operated by the Western Fuel Company. There has also been a large production from the Douglas seam south of Nanaimo, notably at Chase River, Southfield, and South Wellington. In these localities the Newcastle seam, although readily located, is of doubtful value. There is only one mine producing at present in this district, the South Wellington mine, operated by the Pacific Coast Coal Mines. Both the Western Fuel Company and the Pacific Coast Coal Mines are sinking new shafts along the lower part of the Nanaimo river to open up the Douglas seam in depth. The present coal production is over 1,000,000 tons per year, and the importance of the Nanaimo district in the coal industry may be more readily comprehended when it is realized that it produces over one third of the entire coal output of British Columbia.

## HEDLEY GOLD MINING CO.'S PRODUCTION.

The Hedley Gazette states that there seems to be a persistent misconception on the outside as to the output of the Nickel Plate mine, in Camp Hedley, Similkameen district, British Columbia. In particular it complains that the Daily News of Nelson, B.C., placed the value of the output to the end of 1911 at $2,500,000 to $2,700,000, as compared with figures given in some detail by the Gazette, which total, to 1911, inclusive, $3,810,910; further, that an official guide book compiled in Ottawa for the use of members of the International Geological Congress shows a value to the beginning of 1913 of $3,250,000, while the Gazette claims a total to that time of $4,599,625. Adding the value of the production for seven months, to August 1, 1913, an aggregate value of $5,104,373 to that date is claimed by the Gazette. Now, while the detailed figures printed by the Gazette are higher for each of three years—1910, 1911 and 1912—than those published by the Hedley Gold Mining Co. as the value of the precious metal recovered in those years (the company's figures for other years are not at the time of writing available to the present writer), there is no doubt that the Gazette has good grounds for its protest against the persistent publication of misinformation concerning the value of the output of the Nickel Plate group of gold mines. There is just a possibility that the Nelson newspaper mentioned will now admit its error, made in an account of the Hedley Gold Mining Company's property published in the Daily News of July 15, 1913, but it is probably too late for a change to be made in the official publication which the Gazette states was prepared for the International Geological Congress. No information is given as to who was responsible for the mistake to which the Gazette has taken exception, but since Mr. Chas. Camsell gave, in his Memoir on the Hedley Mining District, the recovered value of 153,000 tons mined and treated from 1904 to the end of 1908 as approximately $2,142,000, there surely should not have been any difficulty in ascertaining the value recovered during the four years, 1909-1912. It would appear that the official statement, if as quoted by the Gazette, was about $1,250,000, or more than 25 per cent. short of the amount actually produced. Such serious inacuracy in a supposedly reliable publication is much to be deplored.

The detailed statement printed on August 28 by the Hedley Gazette is as follows:

| | |
|---|---|
| Value of production to end of 1907....... | $1,617,229 49 |
| " for 1908, 44,068 tons at $13.35 per ton. | 588,507 80 |
| " for 1909, 31,100 tons at $11.58 per ton. | 360,138 00 |
| " for 1910, 44,828 tons at $12.31 per ton. | 551,832 68 |
| " for 1911, 57,815 tons at $11.99 per ton. | 693,201 85 |
| " for 1912, 70,455 tons as per statem't.. | 788,715 05 |
| " for seven months of 1913, to July 31.. | 504,748 00 |
| | $5,104,372 87 |

An excerpt from the Hedley Gazette's review of the Hedley Gold Mining Co.'s progress in the year 1912 may prove of interest at this time. In the course of its comments on the year's work the Gazette observed: "As might be expected from the fact that the dividends have been greater during the year last past than in any previous year, 1912 has been a year of breaking records and all former achievements have had to take second place. The quantity of ore mined and milled has been greater; the bullion produced has been greater; the mill has accomplished a higher duty per stamp; the extraction has been higher, and, more important than all of them, the development done during the year has shown up foot for foot a vastly greater amount of ore than ever before with the result that the ore reserves have reached a point which puts the whole enterprise on 'easy street' for years to come, so far as the necessity for looking for new ore bodies is concerned. No wonder the ore reserves have increased so enormously, when it is known that every bit of the development done in the Nickel Plate during the year has been all in ore."

In the published report for 1912 of the Hedley Gold Mining Co., the following statement is made by the general superintendent: "We have no hesitation in stating that the minimum quantity of reserve ore, as shown by development and diamond drill, in the Nickel Plate and Iron Duke claims, is 413,000 tons, and that this ore will average at least $11.35 a ton."

The president of the company reported: "We acquired, in 1912, the adjoining claims, known as the Windfall group, lying to the northwest of our property. Our exploration work demonstrated that the ores pass into this acquired territory, which promises well for a long life to our mines.

# SHUSHANNA GOLD FIELD, ALASKA

When in Vancouver, British Columbia, at the end of August, Dr. D. D. Cairnes, of the Geological Survey of Canada, gave a meeting of business men of that city his impressions of the Shushanna district, Alaska, from which he had just returned. Dr. Cairnes has done much geological investigation work in the North country, chiefly in Yukon Territory, latterly in studying and mapping the geology along part of the 141st meridian (the Yukon-Alaska boundary), in accordance with an understanding arrived at between the United States and Canadian Geological Survey workers engaged in delimiting the International Boundary between Alaska and the Canadian Yukon. A published report of what Dr. Cairnes said in Vancouver, states that he spoke in a very cautious manner, and did not give the impression that the Shushanna is an exceptional field. He was careful to lay stress on the fact that the area in which gold had been found in that part of Alaska is small, and that all the ground had already been taken up. He was quoted as follows:

"It would be very foolish to go in there without a good outfit and prepared to spend the winter. It is absolute foolhardiness to stampede in there with the idea of getting out quickly. By this time there must be between one and two thousand men on the ground, and all the good ground was staked by the first 200 to get in.

"As to the strike itself—Mr. James told men that he first found gold on May 3. There is a story current that an Indian showed James where he could get gold, but I believe James found it himself. On July 4 they started sluicing and took out $300 a day per man. The diggings are shallow and gravel is not frozen. The creek bottoms are typical prospectors' diggings, and with a shovel and pan it is easy to establish the nature of the ground in an hour or two.

With the exception of that recovered by James, no great amount of gold has been taken out by any one as far as I am aware. The ground is staked for ten square miles, and this includes mountain tops. Practically everything between Johnson and Wilson Creeks has been taken up. Men going in after August 1 will find everything taken up around the strike, but there is a large country left to prospect. There are not many benches and the creeks are narrow. There is very little gravel on the benches, with the exception of the old channel of the Bonanza Creek."

Describing the geological conditions, Dr. Cairnes said that similar bedrock conditions prevail 25 miles away, on the Canadian side of the International Boundary ,and it is quite probable gold will also be found in the Canadian Yukon part of the district. He adds:

"The stampede has been greatly overdone. Undoubtedly it is the greatest stampede since that to the Klondike, but kindly note that I do not say it is the greatest strike since the Klondike. The trails are bad, with wet ground and a great amount of "niggerhead," but new trails are being constructed along the higher ground. We met many men who had very little idea of their position; one man was 15 miles from where he thought he was. Several parties were overdue when I left."

Dr. Cairnes states that the ground is at a high elevation and the creeks are practically all above timber line, but one gets the impression that it is low flat country, despite the fact that the average elevation is above 5,000 ft.

There are five routes into Shushanna—two from Alaska and three from the Canadian Yukon. The first Alaska trail is from McCarthy, but this is available only for eight to ten weeks in summer and is dangerous for pack animals. The other Alaskan route is from Fairbanks up Tanana River, and it is possible to get to the mouth of Johnson Creek by water, but it is very dangerous. Rivermen think that light-draft steamers can get to within 50 miles of Johnson creek.

Of the Canadian routes, there is one from Skagway to White Horse 110 miles, thence by wagon road to Kluane Lake 145 miles, then trail to Canyon City 130 miles; from that point to where Beaver Creek crosses the line and then into the diggings. Another route is by way of White Horse to Coflee Creek and thence to Canyon City or by way of Snag Creek. The latter is the shorter route and a new trail is being constructed, while road houses are being built at suitable places. Freight rate from Dawson City, Yukon, is $50 a ton, which Dr. Cairnes says is very reasonable.

Dr. R. W. Brock, director of the Geological Survey of Canada, who happened to be in Vancouver at the time, on his way to Dawson with an International Geological Congress excursion party, said that the whole country around Sushanna is favourable for prepecting, and added that he will not be surprised if some important discoveries are made in Yukon Territory and northern British Columbia within the next year or two. He also made reference to the proposed railway through Alaska, and stated that one of the few available routes is by way of Kluane Lake, White River and Tanana River.

A press despatch from Dawson is to the effect that the Canadian Customs Department has waived the restrictions on American goods crossing the Canadian Yukon to the diggings. Such goods in transit will be allowed to pass without the usual deposit, and where supervision shall be necessary to see that the goods are taken into United States territory the expense of convoy will be borne by the Canadian Customs. This arrangement has ben made by the Canadian Government on the recommendation of Yukon Commissioner Black and Dr. Alfred Thompson, member for Yukon in the Dominion House of Commons. No customs duty is being charged on Canadian goods being taken across the boundary line to the diggings.

## GRANBY CONSOLIDATED M. S. AND P. CO.

Mr. Geo. L. Walker included the following information concerning the Granby Consolidated Mining, Smelting and Power Co., Ltd., operating in British Columbia, in his "Weekly Copper Letter," published in the Bostoh Commercial last month:

"Granby completed, on June 30, a most successful fiscal year. Figures at hand indicate that it produced approximately 27,000,000 pounds of copper at a cost of 10½ to 10¾ cents a pound. If it was sold at an average of 15½ cents a pound the company must have earned between $7.50 and $8 a share on its outstanding 150,000 shares.

"The ores of Granby's original mines at Phoenix, B.C., from which all its production now comes, yield an average of only 17 to 18 pounds of copper and about 90 cents of gold and silver per ton. On a 15 cent metal market, therefore, these ores have a gross recoverable value of only $3.50 to $3.60 a ton. Economical and highly efficient management make it possible for Granby to treat this very low grade ore profitably.

It is a direct smelting, self-fluxing ore, and the total values recovered from a ton of it do not greatly exceed the single cost of smelting a ton of ore in some other districts. Granby mines its ore, pays 25 cents a ton freight on it to the smelter, smelts it, ships the copper to the Atlantic seabord, pays for refining and selling, and the cost of the whole operation is only about $2.70 per ton of ore handled during the year.

"It is the same management that is developing for the Granby Company its new mine the Hidden Creek, and building the smelter at Granby Bay, B.C. This mine and smelter are located together at tidewater, eliminating the 25 cent freight charge and some other expenses; but more important is the fact that Hidden Creek ore will yield approximately $6 a ton, or $2.50 in excess of that now being handled with good profit at Phoenix. The Hidden Creek property, therefore, promises to yield very large profits."

**THOS. W. GIBSON**

**Deputy Minister of Mines, Ontario**

## MINERAL PRODUCTION OF ONTARIO.

Returns made to the Ontario Bureau of Mines show that the production of the metalliferous mines and works of the province for the first six months of 1913 was as follows.

| | Quantity. | Value. |
|---|---|---|
| Gold, ounces | 106,091 | $2,171,147.00 |
| Silver, ounces | 13,890,692 | 7,693,713.00 |
| Copper, tons | 5,873 | 832,645.00 |
| Nickel, tons | 12,104 | 2,514,414.00 |
| Iron ore, tons | 62,627 | 141,324.00 |
| Pig iron, tons | 369,450 | 5,051,840.00 |
| Cobalt ore, tons | 79 | 7,374.00 |
| Cobalt oxide and Nickel oxide | 404,060 | 186,347.00 |

Compared with the first six months of 1912 these figures show the following increases:

| | |
|---|---|
| Gold | $1,935,949 |
| Copper | 96,176 |
| Nickel | 347,519 |
| Iron ore | 108,264 |
| Pig iron | 1,109,202 |

and the following decreases:

| | |
|---|---|
| Silver | $ 242,887 |
| Cobalt and nickel oxides | 5,726 |

**Gold.**—Most of the gold came from Porcupine, the chief producers being the Hollinger and Dome mines, both of which have been steadily at work. Porcupine Crown and McIntyre Porcupine also contributed. The other gold camps yielded about $150,000, including Swastika and Lucky Cross at Swastika, Cordova in Hastings County, Canadian Exploration at Long Lake, Northern Gold Reefs at Sturgeon Lake, Goldfields, Limited, at Larder Lake, and Tough-Oakes at Kirkland Lake. The narrow veins in the last named camp are proving to contain rich ore.

**Silver.**—The most productive mines for the half year were the Nipissing, Coniagas, La Rose, Kerr Lake, McKinley-Darragh-Savage, Buffalo and Crown Reserve, all mines which have held a leading place for years. Cobalt Townsite, Casey-Cobalt and Seneca Superior are coming into prominence as producers, while some properties, formerly in the first rank, are falling off in their yield. Shipments of ore were 3,216 tons, of concentrates 8,253 tons and of bullion produced at the mines 2,792,311 ounces. The corresponding figures for the first six months of 1912 were: Ore, 6,860 tons; concentrates, 4,806 tons, and bullion, 2,448,689 ounces, showing the progress being made towards complete treatment of the ore on the spot. Three mines in Gowganda and South Lorrain yielded 407,103 ounces.

**Nickel and Copper.**—The mines of the Sudbury District continue to increase their output, and the outlook is for still further production. The Canadian Copper Company and the Mond Company remain the sole producers of matte. Recent drilling operations have proven the existence of very large ore reserves. The Alexo mine, on the Porcupine branch of the T. and N. O. Railway is interesting, as being separated about 140 miles in a direct line from the Sudbury mines, and so proving the existence of ore quite outside the older field. The shipments are made to the Mond Company's new smelting plant at Coniston, which came into operation during the half year.

**Pig Iron.**—The production of pig iron in Ontario is growing rapidly. In 1902 it amounted to 112,687 tons; in 1907, 286,216 tons; in 1912 to 589,583 tons, and at the present rate of production, if maintained for the remainder of the present year, the output will be 738,900 tons. All the blast furnaces, except the one at Port Arthur, were in blast during the six months.

# PERSONAL AND GENERAL

Mr. C. F. Caldwell, manager of the company operating the Utica Silver Lead mine, in Ainsworth mining division, has returned to his headquarters at Kaslo, B.C., after having spent several weeks in the United States.

Mr. Wm. Fleet Robertson, of Victoria, provincial mineralogist for British Columbia, accompanied the International Geological Congress excursionists to Prince Rupert last month.

Mr. W. M. Brewer, who at the time was traveling in Lillooet district, investigating mining conditions for the British Columbia Department of Mines, lost his horse, which slipped off a trail and fell down a steep mountain side, fully one thousand feet. Fortunately Mr. Brewer was not riding the horse when the accident happened.

Mr. Bruce White has returned to Nelson, B.C., from a prospecting trip down the Athabaska river to Lake Athabaska and thence east into northwestern Saskatchewan. He told the Daily News of asphaltum, lime, salt, and natural gas resources of parts of the country passed through, and that there are as well lode metals—gold, copper, lead and nickel.

Mr. Jas. Buchanan, superintendent of the Consolidated Mining and Smelting Co.'s smelting works, has returned to Trail, B.C., from a holiday trip to Scotland.

Mr. W. L. Coulson, of Victoria, B.C., general manager of the Canadian Collieries (Dunsmuir), Limited, operating collieries on Vancouver Island, has been in Toronto. The Canadian Collieries Company is a Mackenzie & Mann enterprise.

Dr. D. D. Cairnes, of the Geological Survey of Canada, came down to Vancouver, B.C., from Yukon Territory last month to meet a north-bound party of International Geological Congress excursionists and accompany them to Dawson. Mr. R. G. McConnell, also of the Survey, was down from Rainy Hollow, in the extreme northwestern part of British Columbia, to take charge, as leader of the excursion to Prince Rupert, Skenna River, Malaspina and Yukon.

Mr. C. H. Macnutt left London on August 29th to take charge of the Burma Mines, Ltd., at Nantu, Burma.

Mr. A. A. Hassan has completed a report on the Moose-Head Gold Mine in Halifax County, Nova Scotia.

Mr. H. H. Lavery has joined the staff of the Mond Nickel Company at Worthington Mine.

Prof. A. P. Coleman injured his ankle as the result of slipping on a stone on a mountain trail while with the geological excursion in British Columbia in August. He has gone on to Alaska, however, with another excursion.

Mr. Reginald E. Hore has returned to Toronto after visiting mining districts of Alberta and British Columbia with the C2 excurison of the Geological Congress.

Mr. Neil Cochrane, an old-time mine superintendent in Rossland camp, recently visited Rossland after an absence of ten years. He is now superintendent of the Jumper Californian Gold Mines, Tuloumne County, California.

Mr. H. Hyman Claudet, for years representative in British Columbia of the Elmore Oil Process interests, was in London lately, after having completed the installation of an Elmore plant in Switzerland.

Mr. J. D. Galloway has been appointed acting assistant to the Provincial Mineralogist of British Columbia, and will do field work for the British Columbia Department of Mines during the remainder of the present year's field season.

Mr. Thos. Graham, chief inspector of mines for British Columbia, last month had a narrow escape from serious accident. Accompanied by Mr. James McGregor, district inspector, he was returning to Nelson after having visited the Silver King Mine, on Toad Mountain, when their horse bolted down the wagon road. Both men jumped from the buggy; Mr. Graham was not hurt, but Mr. McGregor had one ankle badly sprained. Shortly afterward the buggy was smashed and one horse was so badly injured that he had to be destroyed.

Mr. J. H. Cunningham, superintendent of the Canadian Collieries Co.'s colliery at Extension, Vancouver Island, had a somewhat strenuous time last month, having taken to the woods to escape the wrath of the strikers, who were indulging in the diversion of shooting and burning in and about the Extension mining camp. Mr. Cunningham's house and contents were utterly destroyed by fire. After a rough experience he found a place of safety in Victoria.

Mr. W. W. Leach, of the Geological Survey of Canada, who was to have been one of the guides in Western Canada, of an International Geological Congress excursion party, was prevented from doing so by an attack of typhoid fever.

Mr. Horace G. Nichols, who was for some time manager of Ymir gold mine, in British Columbia, and since then has had his headquarters in London, England, was expected to leave that city in July on a business trip to the United States and Canada. Lately he joined the firm of Bainbridge, Seymour & Co.

Mr. W. W. Mein, of New York, consulting engineer for the Canadian Mining and Exploration Company, was in Hedley camp, Similkameen, B.C., in the early part of August. He was accompanied by his assistant, Mr. Ralph S. G. Stokes, formerly mining editor of the Rand Daily Mail, Johannesburg, South Africa.

Dr. Heinrich Ries, professor of geology at Cornell University, Ithaca, New York, is in the West, continuing his investigations into the clay resources of Canada, which work he is doing for the Geological Survey of Canada.

Mr. Wm. Thomlinson, of New Denver, B.C., has been engaged for a couple of months in getting together specimens of the ores of Slocan district, for use in representative collections of the ores and minerals of British Columbia the Provincial Department of Mines is having prepared for permanent exhibition in suitable places.

Mr. E. E. Ward has retired from the office of superintendent of the Silver Hoard mine, in Ainsworth camp, B.C.

Mr. Ed. Dedolph, for some time engaged in the metallurgical laboratory at McGill University in connection with zinc ore reduction experiments, that have been conducted there under the direction of the Mines Branch of the Canada Department of Mines, is now in British Columbia, Dr. Haanel having arranged to continue the experiments at the electro-thermic works at Nelson, for some time operated experimentally by the Canada Zinc Company.

# SPECIAL CORRESPONDENCE

## BRITISH COLUMBIA

Metal mining is being continued in the province with very little interruption. Hydraulicking in the placer-gold districts has been practicable to a later date than is usual in ordinary seasons, so a proportionately large increase in the quantity of placer gold recovered this year is looked for. Generally speaking, lode mining is being carried on in the older mining camps. The only serious decrease in mineral production looked for is in connection with coal mining, and this on Vancouver Island, where labor troubles have occasioned much bitterness, and unfortunately with no present prospect of a settlement.

**Ainsworth.**—The following information concerning the Silver Hoard mine, in Ainsworth camp, has been given to the Kaslo Kootenaian by Mr. W. S. Hawley, managing director of the company owning and operating that mine: "As a result of having found a larger and better orebody at the 100-ft. level than we had at the 50-foot, and the encouraging outlook generally, the company has decided to sink a double-compartment shaft on the Silver Hoard to a depth of 500 ft., which will be 400 ft. deeper than the lowest present level on the property. With this end in view surveys are being ing made and preliminary work is to be commenced at once. A compressor, to be driven by water from the north fork of Cedar Creek, is to be installed, and this will supply all the power that will be required for drilling and hoisting. This compressor, by the way, will be of a somewhat new design and principle; it was designed by Prof. Francis A. Thompson, head of the mining engineering department of the State College of Washington, Pullman, Washington.

**Kaslo.**—The Lardo correspondent of the "Kootenaian" says: "The mining outlook along the Lardo branch is steadily improving and prospects have not been so encouraging for a long time. Prospectors and claim owners are active and the indications are that capital will soon be more readily available with which to develop the many promising locations."

Grading on the Kaslo & Slocan railway line, which is being changed from narrow to standard gauge, is likely to be completed by November 1, according to the contractor for the work. Most attention has been given during the summer to completion of the work from Whitewater, a few miles down toward Kaslo, for the altitude of that part being higher snow falls earlier than nearer Kaslo. It is hoped steel will be laid part of the way between Whitewater and South Fork before the snow shall commence to fall, for it will then be practicable to haul freight in and out between Three Forks and South Fork pending completion of the line through to Kaslo.

**Sandon.**—Several Slocan mines that had not shipped ore for a number of years lately commenced to send ore to Sandon for shipment by railway and steamer to the smelting works at Trail. The Last Chance aerial tramway having been put in running order, after a long period of non-use, is being utilized for conveyance of ore from the Surprise mine down to the lower terminal below Cody, whence hauling is done by teams. The outlet for the Surprise is now through one of the old Last Chance adits, connection having been made by a long extension of the adit and then a raise of more than 800 feet. Ore is also being received at the Sandon railway depot from the Wonderful mine, at which years ago much galena was recovered by ground-sluicing. Underground work has resulted in the vein on the Wonderful being found and now ore is being mined from it.

**New Denver.**—The Slocan Record states that the work of driving No. 8 adit on the Standard, near Silverton, Slocan Lake, has been commenced. This adit is on one of the old Emily Edith group of mineral claims, now owned by the Standard Silver-Lead Mining Co., No. 7 adit, on the same property will have to be driven about 400 feet more before it will be under the big orebody occurring on levels Nos. 6 and 5. Ore is being mined in a stope that has been opened from No. 5 level, which stope has been advanced about 50 feet, and still has 6 feet of shipping ore in the face. The ore contains about 80 per cent. lead, and some zinc, and averages 156 oz. silver to the ton. Other stopes, both above and below No. 5, are also yielding shipping ore.

**Silverton.**—The Van-Roi mine report for the month of July shows that little more was concentrated in that month, milling operations having been temporarily suspended on July 9. Only 143 tons of ore was milled; its average assay was 3.7 oz. silver per ton, 0.1 per cent lead, and 3.5 per cent. zinc. The metals recovered were half a ton of lead concentrate and two tons of zinc concentrate; the former contained 117 oz. silver per ton, 54.6 per cent. lead, and 10.3 per cent. zinc; the latter contained 35.3 oz. silver per ton, 3.4 per cent. lead and 38.2 per cent. zinc. The west drifts on levels Nos. 7 and 9 were extended and the raise from level No. 9 was advanced 22 ft. Diamond drilling was continued from No. 9 level and holes from both 1,250 and 1,510 feet from portal reached the vein.

**Rossland.**—Le Roi No. 2, Ltd., has published the following report for July from its Josie mine: Shipped 1.570 tons of ore and 103 tons of concentrate. The receipts from the smelter were $23,530, being payment for 1,695 tons of ore shipper, and $1,138 for 145 tons of concentrate; total receipts, $24,668. Estimated costs for corresponding period were: Development $7,-700, ore production $8,300, milling $1,500, total $17,-500. Summarized, the development work done was 173 ft. on the 500-ft. level, 40 ft. on the 700-ft. level, and 199 ft. on the 900-ft. level. The highest grade ore opened was that on the 700-ft. level where the average for a width of 16 in. along 30 ft. was 16 dwt. gold per ton, and 6.25 per cent. copper.

Arrangements have been made under which Mr. W. R. Foley, of Denver, Colorado, and associates will operate the Blue Bird mine, in the South Belt of Rossland camp. This mine was worked for some time by Mr. Lyman Carter, but under unfavourable conditions financially. Some 20 cars of ore was shipped to Trail. As depth was gained copper largely replaced silver and lead in the ore.

**Boundary.**—The Granby Consolidated Co., has declared a dividend of $1.50 per share, payable on September 2.

The Ledger says there are 40 men working at the Jewel gold mine and stamp mill, and the production of ore is about 50 tons a day.

A commencement has been made to haul ore from the Union claim, in Franklin camp, North Fork of Kettle river, to the railway terminus at Lynch creek, where 12 tons of gold-silver ore was lately delivered. This is the first ore shipped in commercial quantity from Franklin camp.

The Granby Consolidated Co. is reported to have bonded the Big Copper property, situated about five miles west of Greenwood, and to intend to do some diamond drilling on it.

A. E. Watts, a well-known lumber mill man of East Kootenay, and F. N. Knight, both connected with the management of the Boundary Mining and Exploration Co., were recently charged with five infractions of the Coal Mines Regulation Act. For failing to report to the Department of Mines that a man had been burned by gas in the company's coal prospect workings near Midway. Watts was fined $75 and Knight $25, both with costs. Watts has appealed against the infliction of this penalty. On four other charges Watts was fined $1 each, without costs. Similar charges against the others were withdrawn. Watts at first disregarded a summons to appear at Midway to answer the charges but after a bench warrant had been issued for his arrest thought it best to put in an appearance. A minority of the shareholders are much dissatisfied with the present condition of the company's affairs.

Advices from New York state that the preliminary report of the Granby Consolidated M. S. and P. Co., for the fiscal year ended June 30, 1913, shows that the profits from the company's Phoenix mines and Grand Forks smeltery amounted to $1,207,661, of which the sum of $449,955 was distributed among shareholders since dividend payments were resumed recently. These figures are subject to minor corrections by the final statement to be submitted at the annual meeting of shareholders to be held in New York on October 7, proximo. The earnings for July and August will show some shrinkage, due to low copper prices and somewhat small recoveries, but the total for the year will reach approximately $1,250,000, it is believed, as compared with $1,600,000 for the previous twelve month period.

In a circular letter to the shareholders, which will be mailed with the dividend cheques for the second quarterly disbursement on September 2, President W. D. Nichols has included the greater part of the engineer's reports on the company's Hidden Creek property, compiled recently, that shareholders may be kept in touch with the progress of the work there.

"Construction work is progressing with remarkable rapidity," says President Nichols. "Inspection from August 3 to August 10 shows that the ground for the buildings at Hidden Creek is all cleared; steel frame for main smeltery building erected; foundations for the flue chamber completed; the machine shop finished and being used; and smeltery warehouse being erected. The mine development is in advance of the demand and ore shipments can be begun at any time. Our engineers estimate that 7,000,000 tons of ore is now in sight within the developed area."

**Vancouver.**—Preparations are being made for as large a display of specimens of minerals as it shall be found practicable to get together. Many mining camps have sent in collections of ores, and the Provincial Department of Mines is making a comprehensive exhibit.

Mining is in progress on several properties in the mountains near Howe Sound, but only the Britannia is making a production of ore of any importance, the work on other properties being either prospecting or development.

**Nanaimo.**—Owing to the destruction of property at the Extension coal mines of the Canadian Collieries (Dunsmuir) Limited, and the violence of striking miners and their sympathizers, the whole of the Nanaimo-Extension coal mining district has for two weeks been guarded by militia men, whose presence has been made necessary by the excesses of those who for several days committed many unlawful acts. About 150 men have been arrested and charged with various breaches of the law—assault, unlawful assembly, possession of stolen property, or other offences. It is probable the Extension mines will shortly be worked again, only surface buildings and plant having been destroyed by fire, and all danger of a repetition of the recent disorders having passed. The Western Fuel Company is flooding, from the sea, the southern and most important part of its No. 1 mine, at Nanaimo, to either extinguish underground fire that has gained much headway since the miners ceased work at the end of April, or seal off that large and hitherto productive section of the mine workings of that mine. Local newspapers state that serious effects of the strike will be felt by business men of both of the coal-mine towns, Nanaimo and Ladysmith, for a long while.

**Granby Bay.**—Much machinery, plant and material is being received for use in construction and equipment of the smelting works of the Granby Consolidated Mining, Smelting and Power Co., Ltd., is establishing at this place, and in providing for mining ore on a large scale, also for shipping accommodation. The company is hastening construction and equipment work as much as possible while the weather continues favourable, so as to get well forward toward completion before the winter shall set in, and outdoor work be done only under difficulty.

**New Hazelton.**—Smelter returns from 282 tons of ore shipped from the Silver Standard mine, situated a few miles from Hazelton, to the Consolidated Mining and Smelting Co.'s smelting works at Trail, B.C., give the fololwing metal recoveries: Gold, 63.323 oz.; silver, 40.883.28 oz.; lead, 149.525 lbs. The net value of the whole was $30,000.61, or $106.42 a ton after payment of freight and treatment charges. Other properties are making small shipments of ore, but generally for test purposes. In most cases development work only is being done, facilities for transportation of ore from mines to railway not yet having been provided By next year the present temporary freight tariff will have been replaced by a regular, and it is expected a lower tariff, after which production and shipment of ore will be undertaken by a number of mine-owners not yet ready to make an output.

## PORCUPINE, WEST SHINING TREE AND SWASTIKA

**Enlarging Dome Mill.**—Work has been started on the excavations for the 40 stamp addition to the Dome mill. The new addition to the mill is being erected at the west end of the present building, where the forty stamps are now treating over 400 tons daily. The new building will be 130 feet by 75 feet. With the addition to the mill the practice will be slightly altered, so that it will approximate even closer to the Home-stake. The new plant will consist of 40 stamps, Dorr classifiers, 3 Dorr thickeners, 4 sets of Merrill cones, 4 sets of plates, a couple of storage tanks, 3 pumps, 3 Merrill presses and 6 40 by 10 leaching tanks. The whole building will be of steel. The force of men has been increased. All the machinery has been ordered, as it is expected that the building will be roofed in before the snow flies. The addition should be in operation early in 1914.

**The Kerr Lake Mining Company** has examined the Hollinger Reserve property in Porcupine and thoroughly sampled the same. But no purchase or option has yet been negotiated, though it is quite possible that it may be.

**Rea Mine.**—So satisfactory was the mill run at the Rea mine that the directors of the Leasing and Exploration Company have decided to add another five stamps at once. During the 19 days in July that the five stamp mill was in operation treating dump ore, a return of $3,000 was made, and for the experimental run the directors were quite pleased. The Leasing and Exploration Company has an option on a royalty basis, on the Rea.

**West Shining Tree.**—Largely owing to the systematic work on claims owned by Mr. R. J. Denison and his associates there is quite a rush into the West Shining Tree district. The best claims all lie round Wasabika Lake, and it is estimated that about 300 men are encamped on its shores or near it. There is not much free gold found on the claims worked by the Denison syndicate, but the assays from the devitrified quartz are very encouraging and quite uniform. The district was first staked in the months of July and August, 1911, largely by Gowganda prospectors. But that was before Porcupine had demonstrated the possibilities of gold in Northern Ontario, and the original stakers did little work and received very poor backing. Many claims were allowed to lapse and nothing or little was heard of the district for years. The prospectors now have to pack in their supplies from Ruel, on the Canadian Northern, but a wagon road is now being cut by the Government and should be available this winter. If the camp demonstrates its importance, it will be easy for the Canadian Northern to run a spur into the new gold camp.

**Alexo Nickel Mine.**—The shipments from the Alexo nickel mine for the month of August will be about 800 tons. This has all gone to the Mond Nickel Company at Coniston. The open cut is down 60 feet and is about 40 feet long. At the bottom of the working there is four feet of massive ore, which will run about 8 per cent. The disseminated ore on one side of the vein is as high as 3 per cent. for the width of the open cut. There is little or no nickel in the other wall.

**Dixon Mine.**—The Timmins, McMartin and Dunlop syndicate has commenced work in earnest on the Dixon property at Porcupine. The shaft is now 200 feet, and it will be carried to 500 feet without cross-cutting at intervening levels. The Hollinger Mining Company has been granted a contract for the work on the Dixon. The Dixon will be explored from the Hollinger. Wherever the Hollinger veins are found to continue into Dixon property they will be followed and developed.

**Pearl Lake.**—A shoot of high grade ore has been struck on the Pearl Lake twenty feet above the 400 foot level in a raise.

**McEnaney.**—Owing to the stoping of some remarkable ore at the 100 foot level, the little stamp mill at the McEnaney mine produced about $50,000 in the month of August. The ten stamp mill has therefore already produced $165,000. The block of ground which enables the little mill to show such good returns in August was at the 100 foot level. For 23 feet in the drift the ore was taken out for a width of six and a half feet, and over this width it ran $130 to the ton. This helped the general average of the mine very materially.

**Kirkland Lake.**—A good discovery has been made on the Bagshaw claims at Kirkland Lake. These claims lie between Mud and Gull Lakes. They are owned jointly by Robertson and T. Montgomery. The vein is about twelve inches wide and has been stripped for sixty feet.

**Hollinger Mine.**—At the 400 foot level ten feet of good ore has been cut at the Hollinger mine. The vein was cut from the winze sunk from the 300 foot level. The drift will be continued from the point where the ore body was struck, to a point under the main, and a rise put through to the 300 foot level. Then sinking operations will be resumed. By the end of the year it is expected to have the main vein at a depth of 550 feet.

**Burnside.**—On the Burnside property at Kirkland Lake the vein dipped from the shaft at 50 feet. A cross-cut has been started at the 100 foot level to pick up the vein. It is estimated that from its dip it should be cut at not much more than fifteen feet. Camps are now being built for the winter campaign on the Burnside. Five thousand feet of surface work has been done this summer.

Two hundred feet north of the southern boundary a twelve inch vein has been cut which shows free gold.

## COBALT, GOWGANDA, AND SOUTH LORRAIN

**McKinley-Darragh-Savage.**—Another of the regular Cobalt dividend payers has cut its regular rate of payment. After paying 176 per cent. the McKinley-Darragh-Savage has cut its bonus from 7 per cent. to 3 per cent. The company is still paying at the rate of 6 per cent., or 3 per cent. regular and 3 per cent. bonus. The McKinley-Darragh, with its October payment, has distributed $4,097,832. There should be no great surprise among shareholders at the announcement. For the last two annual meetings the president of the company has given notice that unless some unexpected good fortune arrived the company would soon have to cut their high rate. The company has now merely arrived at a point where exploration will be higher in comparison with silver production, as it is fast becoming all over the camp. In making the announcement of the cut the treasurer said: "Owing to extensive explorations, which have resulted in the discovery of valuable deposits in the McKinley mine, and indications of a considerable addition to reserves in the Savage mine, and to the cost of a large addition to the concentrating plant, the accumulated surplus, as shown by the statement of January, 1913, has been considerably reduced, in order to maintain the standard of credit and efficiency of the company, the directors have decided to restore and maintain the usual substantial surplus, and therefore reduced the rate of bonus to be divided, as present conditions indicate a continuation of this rate of distribution for a considerable period." As a commentary upon this statement, it is significant to state that the McKinley production jumped from 185,182 ounces in June to 224,628 ounces in July. Several good shoots of high grade ore were discovered and worked.

**Buffalo.**—As an offset to this cut in dividend rate the Buffalo mines have increased their bonus. The directors added 15 per cent. to the regular five per cent. due on October 1st, with 4 per cent. more added to the usual 3 per cent. dividend in November, making a total of 27 per cent. declared at one time. The Buffalo has been on a 32 per cent. per annum basis, but from time to time have added a bonus to the regular dividends. This year has surpassed all others, as the Buffalo had a remarkable surplus, and 57 per cent. has been added to the regular dividend. On January 1st an 18 per cent. bonus was added to the regular 5 per cent., giving a total dividend of 23 per cent. For the second quarter of the year a 15 per cent. bonus was added, making a 20 per cent. dividend, falling due on April 1st, with the 3 per cent. in May. The Buffalo's total for the year is brought to 89 per cent., or a total of $890,913.

**Nipissing.**—During the month of August the Nipissing mined ore of an estimated net value of $222,260 and shipped bullion of an estimated net value of $330,-526. During the month the high grade mill treated 171 tons of ore, and the refinery shipped 553,698 ounces of bullion. The low grade mill yielded 7,824 tons, an average of over 260 tons per day.

While no new veins were found either on the surface or underground, the development of known ore bodies continues to be quite satisfactory. Most of the month's production continued to come from shafts 73, 80 and 63. At all other places most of the work consisted of exploration. The hydraulic was working to the east of shafts 27 and 19. Several seams were uncovered, but these contained no ore at the surface. The diamond drill is working in the diabase on R. L. 408, near the Nova Scotia mine. One hole has a depth of 613 feet. Nothing favourable was encountered. The drill is now on the second hole endeavouring to cut a small vein assaying 150 ounces in silver, found on the surface several years ago by trenching.

**Geological Congress Visitors.**—The last of the geologists have seen the North and departed. There can be no doubt of the impression the silver camp made upon them. One German scientist, belonging to Party C6, said at the reception given in their honour, that the chief difference between Cobalt and Saxony was that Cobalt had the ore and Saxony the rock and the tenor of all the speeches of the Teutons was that Cobalt was yet in its infancy. They, too, they declared, had had high grade ore, but it had been mined out generations ago.

The last party contained the Minister of Mines, the Hon. Louis Coderre. Mr. Coderre made a good impression upon all the mining men he met by his evident interest in all he saw, and his sincerity in intending to make the portfolio of Minister of Mines a more important one that it has been heretofore. He frankly admitted that he knew nothing whatever about mining; but was quite willing to learn.

**Crown Reserve.**—A new ore shoot has been discovered on the north vein of the Crown Reserve. It is two and a half to three inches of high grade ore, and it was developed at the 50 and 140 foot levels. On August 29th the big turbine pumps on the raft near the Kerr Lake No. 7 shaft began to work, and good progress has already been made with the big project of draining the lake.

**Hudson Bay Mine.**—The production of the Hudson Bay mine for the month of July was 36,484 ounces, practically the same as the preceding month. The greater part of this production came from the mill. The mill ran 24 days and treated 1,784 tons, the daily average being 74.30 tons. The heads ran 22.2 ounces and tails ran 2.9 ounces. The extraction was 87.30 per cent. The buildings to replace those destroyed by fire have been completed. At camp No.2 the long drift connecting No. 1 and 2 shafts has broken through. This cross-cut is 780 feet in length and cuts the Cobalt Lake fault. It was started from the 100 foot level of the No. 1 shaft. The vein on the fault did not hold any very encouraging values.

**Nipissing Bullion.**—A bullion shipment, which is claimed as a world's record, was made last month by the Nipissing. It contained 212 bars of bullion, 257,-425 ounces, $152,524. On the same day the Buffalo also made a large consignment of bullion, the total for the two mines being 397,827 ounces, $235,361.

**O'Brien.**—By adding another tube mill the O'Brien mill has raised its capacity from 100 to 150 tons. No change is being made in the treatment.

**Earlton.**—A calcite vein showing native silver has been made in Cain township, between Earlton, on the T. and N. O. main line and Elk Lake. The outcrop of rock above the clay is meagre. No work has been done on the narrow calcite vein, which shows native and cobalt bloom. Quite a number of claims have been staked wherever it was possible to find rock.

**Elk Lake.**—In the Elk Lake camp some fine high grade ore is being taken off the Curry claim. The Forest City Mining syndicate struck good high grade ore at a depth of 30 feet sinking on a strong niccolite vein.

# STATISTICS AND RETURNS

## B. C. ORE SHIPMENTS.

Shipments of ore from Kootenay and Boundary mines to Trail smelter for the week ending Aug. 30 totaled 6,454 tons, making a total for the year to date of 241,527 tons.

In the Slocan district the foremost shippers were the Standard, 74 tons; the Utica, 30 tons, and the Eastmount, 29 tons. The No. 1 at Ainsworth shipped 141 tons and the Silver Hoard in the same camp sent out a shipment of 48 tons. In the Nelson district the heaviest producer was the Yankee Girl at Ymir, which shipped 131 tons. Production in detail was:

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

## ENGINEERS, METALLURGISTS AND GEOLOGISTS.

## ASSAYERS, CHEMISTS AND ORE TESTERS.

# BUYERS AND SELLERS OF METALS

# PROVINCE OF QUEBEC

## Department of Colonization, Mines, and Fisheries

***The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, Etc.***

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

**MINERS' CERTIFICATES.** First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is $10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

**WORKING CONDITIONS.** During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

**SIX MONTHS AFTER STAKING.** At the expiration of six months from the date of the staking, the prospector, to retain his rights, must take out a mining license.

**MINING LICENSE.** The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of $10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

**MINING CONCESSION.** Notwithstanding the above, a mining concession may be acquired at any time at the rate of $10 an acre for SUPERIOR METALS when more than 20 miles distant from a railway and $20 an acre when less than 20 miles.

For INFERIOR METALS the prices are $2.00 and $4.00 an acre respectively.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

**PROVINCIAL LABORATORY.** Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

**THE HONORABLE THE MINISTER OF COLONIZATION, MINES, AND FISHERIES, QUEBEC.**

# The Minerals of Nova Scotia

The extensive area of mineral lands in Nova Scotia offers strong inducement for investment.

The principal minerals are:—Coal, iron, copper, gold, lead, silver, manganese, gypsum, barytes, tungsten, antimony, graphite, arsenic, mineral pigments, diatomaceous earth.

Enormous beds of gypsum of a very pure quality and frequently 100 feet in thickness are situated at the water's edge.

The Province contains numerous districts in which occur various varieties of iron ore practically at tide water and in touch with vast bodies of fluxes.

The Gold Fields of the Province cover an area of approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Deposits of particularly high grade manganese ore occur at a number of different localities.

Tungsten-bearing ores of good quality have lately been discovered at several places and one mine has recently been opened up.

High-grade cement-making materials have been discovered in favorable situations for shipping.

Fuel is abundant, owing to the presence of 960 square miles of bituminous coal and 7,000,000 acres of woodland.

The available streams of Nova Scotia can supply at least 500,000 H. P., for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

**Copies of the Mining Law, Mines Reports, Maps and Other Literature may be had free upon application to**

**HON. E. H. ARMSTRONG,**
**Commissioner of Public Works and Mines,**
**HALIFAX, N. S.**

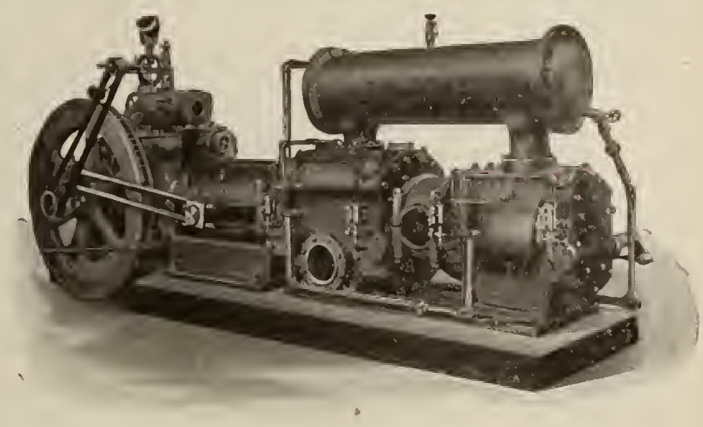
# Air Compressors

Designed by engineers of wide experience. Built in new and especially equipped shops by skilled mechanics. Standard sizes up to 6000 cu. ft. per minute.



Type SS2

# Rock Drills

We build these for every service,—a full line to choose from. Rugged in construction, efficient in operation, they accomplish maximum work at minimum cost.

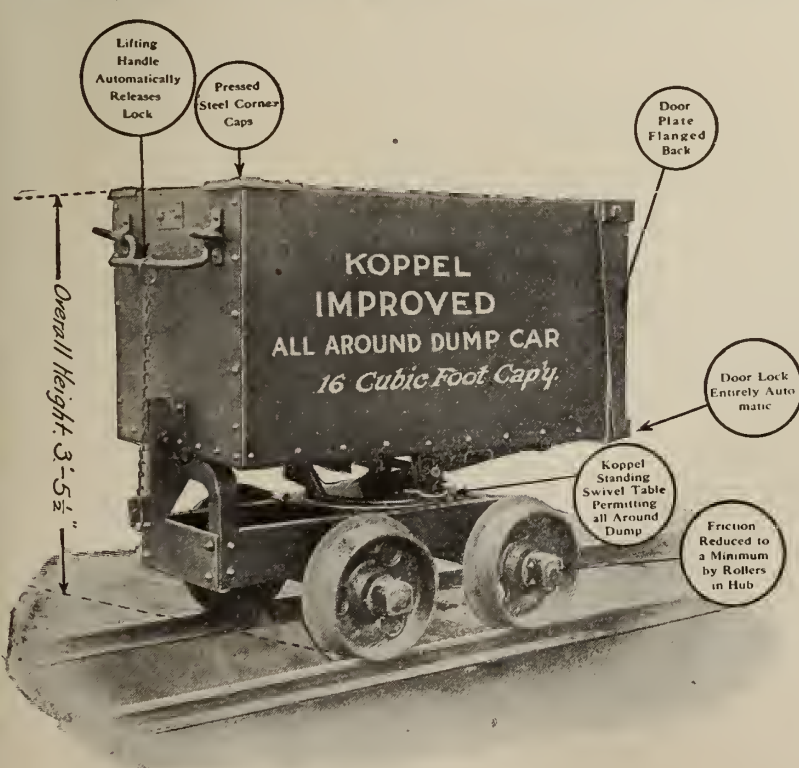
Do you want further particulars?

Write our nearest office about it.

## The Jenckes Machine Co., Limited

SHERBROOKE, MONTREAL, TORONTO, ST. CATHARINES, SOUTH PORCUPINE, COBALT, NELSON, VANCOUVER.

# Koppel Improved Type of All Around Dump Car



This type of car is especially adapted for mine service.

The swivel table permits all around dumping. It is a very easy running car as the friction is reduced to a minimum by rollers in the hubs of the wheels.

We construct these cars for 12 and 16 cu. ft. capacity and for 18 or 24 inches gauge. They are carried in stock at Koppel, Pa.

Our catalogue on "Koppel Railways in Mines" will be of interest to you.

# Amatite ROOFING

## For Mine Buildings

IT'S the one ready roofing that is not affected in the slightest by coal smoke or acid fumes. It is made of the same waterproofing materials as are used in Barrett Specification Roofs which are so popular on railroad round houses, where the coal smoke and condensing steam cause even more severe exposure than on mine buildings.

Amatite Roofs can be laid without skilled labor, and once laid they require no painting or similar attention.

The wearing surface is practically a pitch concrete and naturally immune from rain, snow, sun or frost.

Amatite is sold in handy rolls. Nails and liquid cement supplied free.

*Send for free sample and booklet to our nearest office.*

## ECONOMIC MINERALS AND MINING INDUSTRIES OF CANADA

The Mines Branch of the Department of Mines has recently published a very useful pamphlet presenting interesting information on minerals and mining in Canada. This has been compiled under the direction of Mr. J. McLeish, Chief of the Division of Mineral Resources and Statistics, who has had the co-operation of several officers of the Mines Branch staff; more particularly Messrs. C. T. Cartwright, L. H. Cole, H. Frechette, H. S. de Schmid and A. W. G. Wilson. The publication is remarkable for its concise, clear statements. Seldom has so much information on such subjects been given in so few pages.

## QUEBEC IN 1912

Mr. Denis' report on Mining Operations in Quebec during 1912 shows an output valued at $11,187,110. In the previous year the value of the product of mines and quarries was $8,679,786. The increase is a very satisfactory one. The chief products are asbestos, cement, limestone, brick, copper and sulphur ore, lime, granite and marble.

The volume contains in addition to the resumé for 1912, a report by J. Austen Bancroft on the Geology and Natural Resources of the drainage basins of the Harricanaw and Nottaway river, to the north of the Transcontinental Railway, in northwestern Quebec.

Mr. Denis is to be congratulated on the early appearance of the volume.

## MICHIGAN COPPER MINERS' STRIKE

The strike called by the Western Federation of Miners in Michigan on July 23 has not yet been settled. Many of the mines have resumed operation. Some have a large percentage of their former employees again at work, but others are still idle and none are producing at a normal rate.

The financial loss to operators and miners continues very large. Aside from the loss to all merchants and others who depend on the mines and miners for their business, there is a large expense to the counties and to the state in providing soldiers and deputies to enforce the laws.

The strikers are being reduced to pitiable circumstances. Many already are dependent for their daily bread on the funds supplied by the union. A few dollars a week is given to those who prove to the satisfaction of the union officers that they are in urgent need. Others get nothing. Appeals are being made in several mining districts for contributions to the union treasury.

It is a notable feature of the strike that the men who quit work have, according to the mine managers, never made any request for change in working conditions or wages. It is generally reported that the men want an eight-hour day and a minimum wage; but they have not yet asked for it.

The reason for the remarkable condition of affairs is that the men are on strike at the order of officers of the Western Federation. These officers asked that the mine managers recognize them as representatives of the miners. The mine managers refused to do so, giving as reasons the past record of the Federation and the fact that the officers of the Federation do not properly represent the miners; but only such miners as they have induced to join the union. The officers claim that a large percentage of the employees are members of the union. The operators claim that a large majority are not members, and have no desire to be considered such or to be represented by the union officers.

Believing this to be the case, the managers have reopened the mines and taken back such employees as wish to work. There has as yet been no attempt to bring in large numbers of new men, though a few are now at work.

As is usual, the men going to work have been subjected to much abuse from the strikers. For weeks attempts were made every morning to prevent the miners from going to work. Encounters were frequent and serious riots were prevented only by the activity of the soldiers and deputies. On September 20 the companies applied for and were granted an injunction intended to stop such practices.

In order to settle the strike, investigations are being carried on by both State and Federal Governments. Numerous plans have been proposed; but none yet found acceptable. The union men state that what they want is recognition as representatives of the employees. The mine managers say that they will never recognize them as such. Hence they say that proposals of arbitration are not to be considered, for there is nothing to arbitrate.

In order to break the deadlock, if possible, the Copper Country Commercial Club, an organization of business men of the district, has appointed a committee of three members to offer its services to both employer and employee with a view toward the resumption of work at all of the mines.

At present it seems unlikely that there will be any settlement of the dispute between the Western Federation and the mine managers. It is possible, however, that the strikers and their former employers may come to terms if they can be brought together.

## CANADIAN NICKEL CORPORATION'S SMELTER

It is understood that the nickel company organized by Dr. F. S. Pearson and associates has taken over the property of the Dominion Nickel Company in the Sudbury district. For some time the work at these properties was carried on vigorously by the former owners; but lately there has been less activity. A smelting plant has been designed, but it is not yet erected. The financial stringency is supposedly the reason for the postponement.

In Mr. Gray's article, part of which appears in this issue, he quotes from a memorandum prepared by the promoters, in which the smelting plant is spoken of as though already in existence. There w[illegible]o signs of it two weeks ago, and we doubt whether [illegible] been erected since that time.

## CONDITIONS IN BRITISH COLUMBIA

As the third quarter of the year draws to a close, the condition of the metal mining industry of the province continues generally satisfactory. While few, if any, new mines have this year added substantially to the total of ore production, there has not been a decrease in output of the mining districts from which the chief supplies of ore are obtained. In a general way this is true of all parts of the province that have in recent years contributed to the total quantity of ore produced. Several individual instances of a reduction of output are known, but these do not include mines that have made a large production; on the other hand, there are other cases where there has already been an increase or where ore will shortly be mined to an amount that will more than offset decreases. With lode mining generally productive, and placer mining giving promise of larger results than were obtained during any of the last three or four years, there appears to exist good reason for satisfaction. Indeed, it is hoped that metal mining will show a sufficiently large increase to, in considerable measure, compensate for the loss in total production that labour troubles at coal mines have caused.

## ASBESTOS MINING IN QUEBEC

The world's chief source of asbestos is the district known as the Eastern Townships in the Province of Quebec. This district shipped in 1912 111,175 tons of asbestos, valued at $3,059,084, an average of $27.52 per ton. There was mined during the year 1,870,608 tons of rock. Wages amounting to $1,377,444 were paid to the 2,910 men employed.

During 1912 the shipments exceeded the production of the mills, and the stock on hand was reduced from 33,751 to 24,176 tons. During the present year business has been very good, and the industry is generally reported to be in better condition than it has been for some time. A few years ago the industry received a setback as the result of overcapitalization and questionable dealings in stock. The mines and mills were pushed and a large production made at a time when the market would not absorb the mineral. Soon the buyers become aware that stocks were accumulating. The price fell, and many of the mines and mills were forced to close. Conditions have now happily changed for the better. Elsewhere in this issue will be found the report of Theo. Denis, Superintendent of mines of Quebec, on Asbestos in 1912.

# ORE DEPOSITS OF THE KIRKLAND LAKE DISTRICT

By Charles Spearman.

That part of Teck and Lebel Townships, in the neighbourhood of Kirkland and Gull Lakes, is usually spoken of as the Kirkland Lake district. The centre of the district is about five miles east of Swastika Station, which is at mileage 164 on the Timiskaming and Northern Ontario Railway.

The history of the district has been more or less fully covered by papers published at various times, and therefore no space need now be devoted to it.*

The rocks of the district are for the most part sedimentaries, which have been correlated with the Timiskaming series of the Algonkian. Intrusive into the sedimentaries are lamprophyres and porphyries. Outside of the immediate neighbourhood of the district are some patches of Keewatin, upon which the above sedimentaries lie unconformably.

The relative ages of the above rocks are clearly shown at different exposures in the district, for instance, on the McKane claim, near Kirkland Lake, lamprophyre dikes cut the sedimentary series, which are in turn cut by porphyry dikes.

The conglomerate is in places rather coarse, the boulders being from two feet to three feet in diameter, but on the whole it cannot be called coarse, for the average pebble is not much larger than egg size. Practically all of the conglomerate shows evidence of great strain, for most of the pebbles are highly fractured. Thin sections also show this fragmental nature, together with abundant decomposition products, such as kaolin, chlorite, serpentine, epidote and sericite. The greywacke also shows much of the same secondary minerals of decomposition as the conglomerate, under the microscope. There is every evidence of a great thickness of the sedimentaries.

The lamprophyre is very near the camptonite porphyrite variety, the predominating feldspar being plagioclase and the phenocrysts being augite and hornblende. Some of these lamprophyre exposures are very large, covering several acres. From observation in the field, so far, there is no evidence that the lamprophyre played any important part in the introduction of the ore.

The porphyry, of which there are many different varieties, is probably the most widespread igneous rock of the district. The common variety is a reddish alkali porphyry, with predominating orthoclase phenocrysts. Some of these phenocrysts are over half an inch long, and display wonderful zonal structure, while still other gradations show a fine grained hypidiomorphic structure.

* For description of some of the deposits see July 15 issue of this journal.

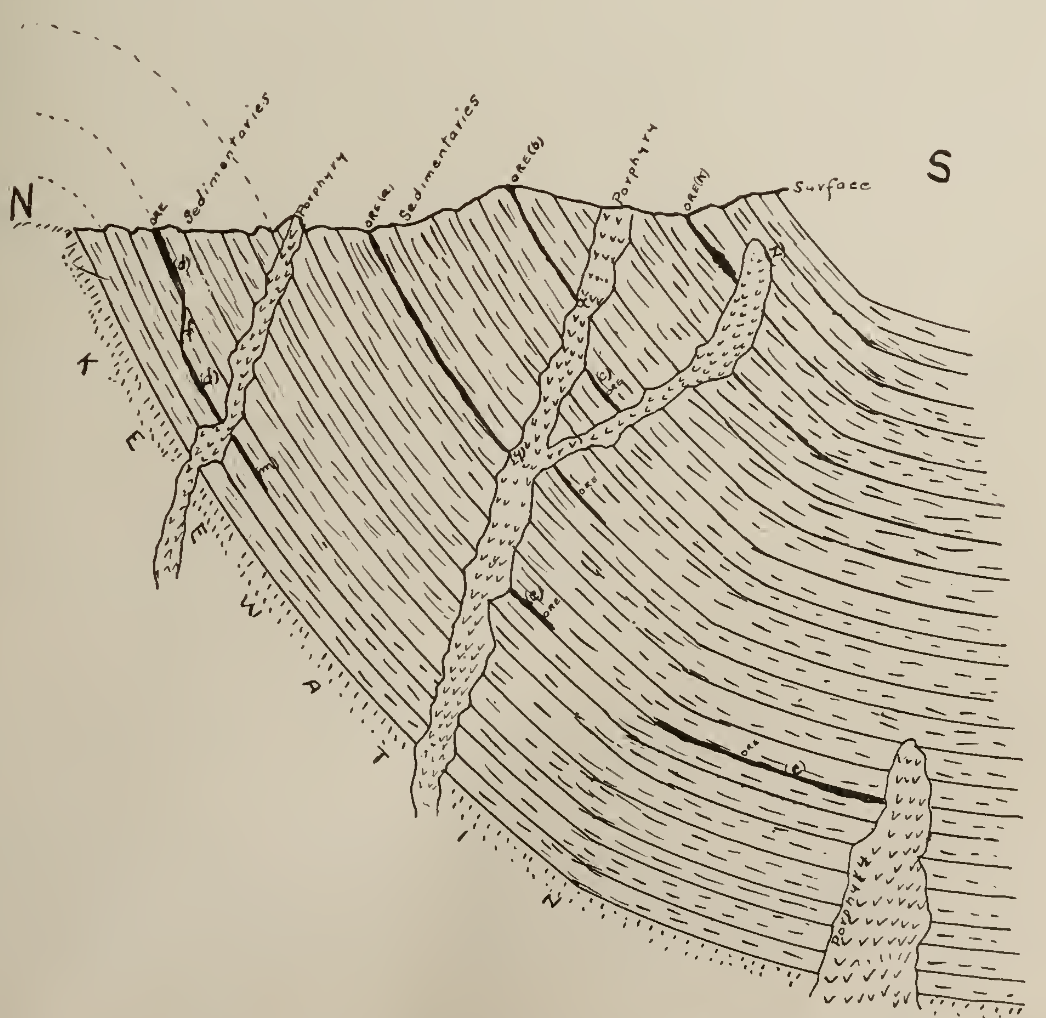

**Fig. No. 1.—Showing the relation between the porphyry and the ore bodies in the sedimentaries.**

Another variety shows the acid plagioclase albite as the predominating phenocryst, while still other varieties of the more basic type show amphibole and pyroxene phenocrysts. All the porphyries are much altered, the thin sections showing the common decomposition products.

From field observations and from exploration work already done in the district it is safe to conclude that the acid porphyries were instrumental in introducing the ore in the present deposits. The line of reasoning is as follows:

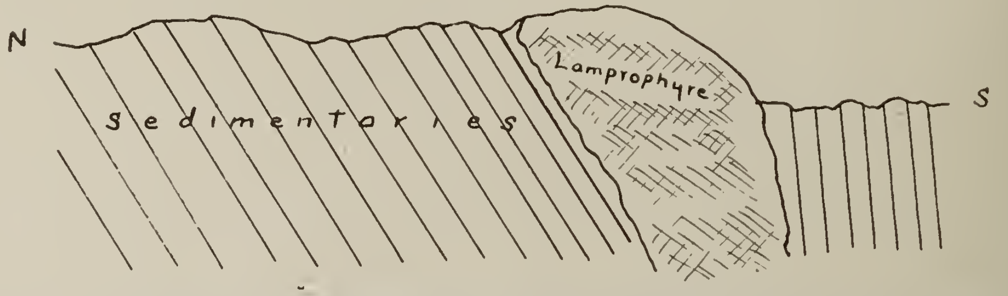

**Fig. No. 2.—Showing vertical position of strata on north part of Burnside property, due to a large lamprophyre intrusion.**

After the sedimentaries were laid down and prior to the advent of the intrusives, there appears to have been great crustal movement, which folded the sedimentaries, such that the axis of the fold was about N. 75° E., and the dip about east 75° S. This fold may have been synclinal or monoclinal, judging from what evidence is left in the field. (For the present it will be called monoclinal, as the writer has not found any evidence of northerly dips in the strata to correspond to the opposite leg of the synclinal trough.) During this process of folding many lines of weakness were created in the sedimentaries, such as fracturing across the bedding planes and faulting along the bedding planes, as shown by the slickensides. This faulting or gliding of one stratum over the other in the process of folding probably afforded the "main channels" for the mineralization solutions.

After these lines of weakness in the crust had been formed by some tectonic movement, the intrusives began to find their way to the surface through these fractures. For reasons outlined above, the porphyry only will be considered in this discussion. This porphyry crossing the bedding planes of the sedimentaries imported minerals to the lines of weakness on either side, viz., the gliding planes between the strata referred to above as "main channels." See Fig. 1.

The mineralized solutions from the porphyry following along these channels deposited minerals in every available void within the zone of its permeability. This mineralization may be seen in the "mashed" conglomerate pebbles and stringers along the channel. This method of mineralization, along such a uniformly crushed zone, accounts for the uniform value of the ore as well as its high content.

In general, under such conditions of mineralization as above, many peculiarities may arise. Glacial erosion removed the higher part of the fold, exposing some of the ore deposits as at (a) and (b), striking N. 45° E., still others may exist as at (c), yet not exposed. Conditions might also exist as at (d), where the deposit follows the bedding plane and follows a fracture as at (f), across the bedding plane. Conditions being equal, consider the deposits (a) and (b), at (b) the ore shoot is much shorter than at (a), for at (b) the length is bx, and at (a) the length is ay. The length of the ore shoot would be proportional to the distance north from the porphyry outcrop. Then again other ore bodies, such as (k), may emanate from an intrusive as (z), which is not exposed; ore as at (m) might also be found.

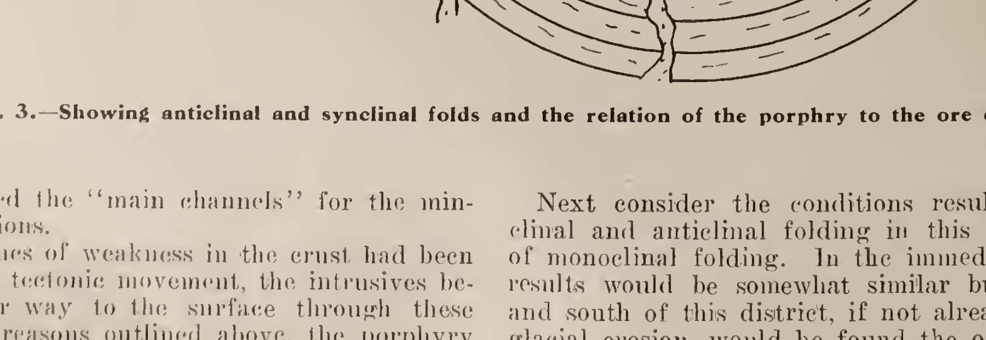

**Fig. No. 3.—Showing anticlinal and synclinal folds and the relation of the porphry to the ore deposits.**

Next consider the conditions resulting from synclinal and anticlinal folding in this district, instead of monoclinal folding. In the immediate district the results would be somewhat similar but to the north and south of this district, if not already removed by glacial erosion, would be found the other legs of the folds, and possibly the outcropping ore bodies of the bedding planes of the sedimentaries, providing there exists the porphyry intrusives to introduce the ore.

See Fig. 3. Conditions beneath the eroded surface resembling saddle reefs (a) might also occur.

In prospecting the area it is a good rule to first locate the alkali porphyry, then run the trenches north from it. This is evident from the ideal section, Fig. 1.

This type of deposit is very irregular as to width, from the fact that the width is governed by the different degrees of permeability of the sedimentaries through whose slickensided bedding plane channels the mineralized solutions flowed.

In places the strata do not preserve their regular average dip, but stand quite steeply. This may be regarded as strictly local and effecting but a small area. An example of almost vertical strata is seen in the Burnside shafts, but this may be accounted for as follows: About 200 feet north of the shaft is a great lamprophyre intrusion, which by squeezing in between the strata, turned up in almost vertical position all strata to the south of it. See Fig. 2.

The ore deposits, i.e., the economic deposits of the camp to date are not true veins, but impregnations of the sedimentaries introduced by mineralized solutions along the slickensided bedding planes. This is quite evident from the nature of the ore on either side of the slickensided surface, which preserves its lithological character throughout, many places showing the conglomerate pebbles in the very midst of the ore. This impregnation extends back into the formation for several feet on either side of the "main channels," and at times much further by following small fractures across the bedding plane. The mineralization consists of quartz, molybdenite, graphite, pyrite, gold and tellurides of lead, silver and gold. The quartz for the most part fills small fractures along the channels, and is dark coloured, having many wavy bonds of dark metallic-looking mineral running through it. As a rule a small percentage of the gold content is found in the quartz. For the most part the gold and tellurides are associated with the "impregnated" portion of the country near the slickensides. The gold content here is very high, ranging about 50 ounces per ton. The molybdenite and a small quantity of graphite give the ore a bluish black lustre, and this in conjunction with the millions of minute pyrite crystals give the ore a very rich appearance. Much free gold is disseminated throughout this mass, as well as are the tellurides. The common telluride is altaite, and to a much less degree the silver and silver-gold tellurides. There is every evidence that after the deposition of the ore the whole was subjected to slight movements at various times, which shattered the deposit. These cracks, which are very numerous and some large, but as a rule nearly microscopic are filled with secondary quartz and sometimes with calcite. At times this calcite filling encloses the pieces of native gold, which happened to be located on the fracture plane.

### Deposits Within the Porphyry.

Another class of deposit is the deposit within the porphyry itself. Of this class there are two types so far seen in the field. Firstly a fissure caused by movement of the solidified porphyry and filled with quartz and brecciated porphyry. This type seldom exceeds 8 inches, and is usually two or three inches wide. The other type suggests the flow structure, while the porphyry magma was in semi-plastic state, where the strain of the flow is almost sufficiently severe to shear, thus leaving a weakened drawn out zone, which was subsequently filled with quartz emanating from the porphyry itself, thus mineralizing the weak zone. This type is often over 18 inches wide, with much quartz filling throughout, alternated by long drawn out bands of porphyry. Again, where certain flow strains within the porphyry have not been so severe as to suggest flow structure, but nevertheless to cause lines of weakness, quartz again derived from the flow is deposited with mineralization in the strained zone. These deposits resemble very much differentiations from the porphyry, as they have no definite delineation, grading apparently insensibly into the porphyry. Deposits of this kind are usually narrow and short. Both types often carry spectacular gold.

The outcropping ore deposit in the sedimentaries is usually covered by more or less of a gossan, due to oxidation of the sulphides in the impregnated outcrop, and this often helps to locate the ore body, especially in trenching operations. The outcrop in the trench may be but a fraction of an inch in width, yet the rusty gossan will serve to locate it. Work may then be continued on the deposit along the strike or dip.

From Fig. 1, which is of course an ideal section, the conditions are such that it is not at all improbable that the mineralization extends also into the underlying Archean in the neighbourhood of the porphyry intrusives.

As development work progresses in the district, no doubt many new conditions will arise which will throw more light on the nature of the different deposits. This article is based practically on surface observations and is merely a summary of such observations.

## ASIATICS IN VANCOUVER ISLAND COAL MINES.

Our British Columbia correspondent writes: Reference has frequently been made, especially by those advocating the cause of the coal miners who stopped work and declared a strike at coal mines on Vancouver Island, British Columbia, to the number of Asiatics employed at those mines, and there have been attempts made to give the impression that very many of the non-union miners who have worked at the mines of the Canadian Collieries (Dunsmuir), Limited, are Asiatics. If reference be made to the "Annual Report of the Minister of Mines for British Columbia," 1912, p. K. 246, there will be found a table showing the "number of hands employed" at the Coast collieries for the year, namely, 4,720, of which 4,090 were employed at Vancouver Island coal mines, including: Japanese—miners 55, labourers, 62, total 117; Chinese—miners 85, labourers 537, total 622; total Orientals or Asiatics, 739, as compared with 3,351 whites, the latter including all white employees of the coal mining companies. It should be noted that 416 of the Orientals were employed above ground and but 323 underground, and of the latter number 183 were labourers. Prior to the strike, white (union) miners employed Oriental labourers underground. Five years ago—in 1908—there were employed at Vancouver Island collieries 864 Orientals out of a total of 3,460 hands; ten years ago—in 1903—there were 865 Orientals out of a total of 2,993 employed; twenty years ago —in 1893—there were 442 hands employed at the Comox (now Cumberland) coal mines, and of them 150 were Orientals. It will be seen, then, that the employment of Orientals at Vancouver Island coal mines is by no means a new departure. It is true that there are now both Chinese and Japanese certificated miners (there were shown to be 140 in 1912), but there is no law in British Columbia, nor has there been, debarring Orientals from mining coal underground after they have passed the examination prescribed by law. No official figures are available for the current year, but I have unequivocal assurance that the number of Oriental miners—that is those who do work that only certificated men may do—is this year not much, if any, larger proportionately than in 1912.

# A VISIT TO MINES OF ALBERTA AND BRITISH COLUMBIA

By Reginald E. Hore.

The C2 transcontinental excursion of the Twelfth International Geological Congress left Toronto by special train on Thursday, August 14th, a few hours after the conclusion of the session in Toronto. Hon. Louis Coderre, Secretary of State and Minister of Mines, accompanied the party, which was in charge of R. W. Brock, director of the Geological Survey, and J. McEvoy, mining engineer and geologist. H. E. T. Haultain, professor of mining at Toronto University, was secretary, and H. Frechette of the Department of Mines, Ottawa, assistant secretary. At several points along the route geologists and mining men joined the party and guided the members in the areas which they have studied.

The excursion afforded an excellent opportunity to visit western mines, especially the coal mines of Alberta and the coal, gold and copper mines of British Columbia. The large smelting plants at Grand Forks, Greenwood and Trail were also visited. On the return trip the gold mines at Porcupine and the silver mines at Cobalt gave the visitors some idea of the possibilities of Northern Ontario.

**The Landslide at Frank, Alberta.**

The excellent arrangement of the excursion gave a remarkable opportunity for study of the western mountains. The Rockies were crossed at all three passes, in going west on the Canadian Pacific Crow's Nest Pass branch, east on the Canadian Pacific main line through Kicking Horse Pass and west and east again on the recently constructed Grand Trunk Pacific line through the Yellowhead Pass. The several trips to the mines in the mountains and the steamer trips on the long lakes gave several sections across and along the ranges. In all the places visited the geologists received warm receptions from the citizens. The large cities and the small camps in the mountains in every instance extended hearty welcome to the visitors. The members have learned much of the geological structure and the mineral resources of the districts visited, and on these counts alone feel well repaid for the time and expense which the excursion demanded, but all, I am sure, will value highly also the general information gained en route. The vast extent of the grain-producing prairies, the evidence of remarkable growth of the centres of population, the splendid transportation facilities and the activity in improving and extending them, the magnificence of the mountains with their glaciers and beautiful lakes, the great rivers and their power-producing possibilities, the forests, the salmon-producing streams, the fruit ranches in the mountain valleys, have made lasting impressions. Not the least highly treasured memento of the trip is the remembrance of the kindly hospitality of the western people.

### At Winnipeg, Stony Mountain and the Stampede.

The first scheduled stop was at the capital city of Manitoba. Arriving here at noon, the party was received by a number of municipal officials and taken out on electric cars to the City Park, on the Assiniboine River. Luncheon was served in the pavilion and an address of welcome was given by Mayor Deacon. Several members of the party replied on behalf of the countries which they represent. After the luncheon a trip was made to Stony Mountain to examine the exposure of fossiliferous rocks there. Many of the party went out to the Exhibition Grounds to see the "Stampede," the great exhibition of cowboy sports, which had been running all week and which the excursionists fortunately visited on the closing afternoon, when the finals for the championships were being run off. The remarkable ability of the cowboys and cowgirls held the attention of the spectators for several hours and proved especially interesting to those unfamiliar with the romantic features of life on the plains. The roping of steers, riding wild horses and the exhibitions of fancy roping proved more attractive than the possibility of finding fossils in Stony Mountain. It is reported, however, that some of the party, not realizing the attractive nature of the "Stampede," did actually spend the afternoon in a very industrious attack on the fossiliferous limestones.

### Medicine Hat Gas Field.

From Winnipeg the party travelled westward through the great grain fields to Medicine Hat, Alberta. Here a stop was made to visit the gas wells and the manufacturing plants which have recently grown up as the result of the use of cheap fuel furnished by the city. Near Medicine Hat there are two important producing wells, from which gas is piped 178 miles to Calgary. The city has within its limits a large area of gas-producing horizons and has drilled several wells. To manufacturing industries gas is supplied free for five years and after that period is supplied at a low figure—about five cents per thousand.

### The Great Landslide at Frank, Alberta.

From Medicine Hat the Crow's Nest Pass route was followed. At Hillcrest the party left the train to view the results of the disastrous landslide which occurred at Frank in 1903, and which is believed to be one of the greatest which has ever occurred. As a result of the openings made in the process of mining coal the whole side of Turtle Mountain broke away on extensive joint planes and piled up a mass of rock at a great distance away and high up the opposite side of the valley. It seems almost a physical impossibility that the sliding of rock down the mountain side would of itself produce enough energy to send the material so far and so high. It is nevertheless believed by Mr. Brock and others who made special study of the phenomenon soon after its occurrence that such was the case. Mr. Brock, in pointing out features of the extraordinary slide stated that eye witnesses saw the great mass rebound as it struck the bottom of the valley and actually leap up the opposite slope. This account is borne out by the fact that there is actually a decided valley in the debris, such as might have been thus formed. It has been utilized in rebuilding the railroad across the area covered by fallen rock, and is a marked depression which greatly facilitated construction.

The actual position of the fallen rock suggests what might have been expected if a gigantic blast had been fired along the joint plane. Sudden relief of horizontal tension may have been partly responsible for the extraordinary distribution of the broken rock.

There are numerous large open joints parallel to the face along which the slide took place and another large portion of the mountain is believed by Mr. Brock to be in a very precarious condition and liable to slide. A danger zone has been established and warning given to the public by a commission appointed by the Government to examine and report on the condition of the mountain. The most dangerous period of the year is when freezing and melting of water is occurring in the joint planes. The action of frost is liable to set off the trigger, as Mr. Brock puts it.

### Coal Mines at Hillcrest, Frank and Blairmore.

After examining the Frank landslide several coal mines and structural sections were visited. At Blairmore the party were taken into the International Mine, where a very extensive bed of coal is being mined. The tunnel level runs for nearly three miles into the mountain, and from it rooms have been driven several hundred feet to the surface.

### The Corbin Coal Seams.

To visit the Corbin mine the excursion train was taken sixteen miles south from McGillivray on the Eastern British Columbia Railway, which follows the south fork of Michel creek. At Corbin the mining company had made excellent arrangements for taking the visitors up to the great exposures of coal over 1,000 feet above the town and 6,100 feet above sea level. A standard guage railway has been recently constructed up the hill and, for the convenience of the geologists, a gondola was fitted up as an observation car and pushed ahead of the locomotive up the grade. General Manager Roberts and Superintendent Graham accompanied the party.

**Air locomotive and train load of geologists ready to enter International coal mine at Blairmore.**

Part of the ascent is made directly and is intended to be later used as a section of the railroad which will be continued south up the valley. The upper part is made by a series of switchbacks.

The outcrop of coal is a very remarkable one. The seam is usually thick and forms the surface rock for a large area on the slope of the hill. Bore holes driven to determine the thickness show that there is a large area which carries from 50 to 100 feet in thickness. Below this there is a slate bed 10 to 20 feet in thickness, and then a second bed of coal about as thick as the slate. At the mine the coal seam dips at a gentle angle to the west. Further down the slope the beds flatten and then turn up, the shale coming to surface. Higher up the hill there are outcrops of the beds which underlie the coal seam and then another thick bed of coal. The structure

Geologists on way to Corbin coal mine, B.C.

of the rocks indicates that the two outcrops of coal are in reality parts of the same bed. A bed of sandstone stratigraphically below the coal shows distinct anticlinal structure, is succeeded by coal, slate and coal beds which are quite similar to those lower down the hill.

While the party was at the mine the manager showed them an operation unique in coal mining. A steam shovel working in the thick seam loaded a standard freight car in a few minutes. It would be possible to make an enormous output in this way at a low cost, but without selection the product is not of good grade, and it is not thought that the steam shovel will be in regular operation, though it may be used on occasion. In any case it will be possible to mine a large quantity very cheaply.

After viewing the thick seams, the party was led by Mr. Clapp, guide for the day, to the older workings and then down the hill to Corbin. The old workings are on much thinner seams. The thick seam has only recently been explored and is not yet making a large production.

### Coal Creek.

From Corbin the C2 special was taken down Michel creek to the Crow's Nest line, and then on to Fernie. From Fernie a special local train took the visitors to the mines and plant at Coal creek. There are several seams lying rather flat and cut by the valley. The tipple is located in the valley and ore is drawn from either side. The main seam at this mine is said to be about 30 feet thick and one of the best in the district. The other seams are considerably smaller, but some are very good coal. Besides the seams being worked there are others which are very high in hydrocarbons and which, when heated, melt and run on the grate. General Manager Wilson pointed out some of the peculiar features of the coal seams of the district. Notable ones are unusual crumpling or rolling of the seams making it difficult to

Mining coal with steam shovel. Corbin mine, B.C.

keep the openings straight and the great quantity of gas encountered in crushed portions of the beds.

After visiting the plant and watching the methods of handling the coal, the party returned to Fernie. In the evening a smoker was given by the city. The Mayor welcomed the members of the Congress and called upon Mr. Brock to preside and ask the visitors to do the talking. Mr. Schofield gave a very instructive talk on the structure of the Cordilleras. This was much appreciated, as the following day included a section across the ranges. The members then entertained one another by several impromptu speeches, songs and dances contributed by men of various nationalities. Local singers also contributed, and after luncheon had been served the party became a very merry one. Mr. Ashworth of Manchester and Piper Ferguson and the Scotch dancers, and the German chorus contributed largely to the success of the smoker.

### Reception at Frank.

After visiting the coal mines at Blairmore and Coleman, the train was run back to Frank, where the members were entertained at a supper in the Sanitorium Hotel. The members were welcomed by the citizens, and several replied in kindred spirit and thanked the people for their hospitality. Among those who spoke on behalf of the visitors were Hon. Louis Coderre, Minister of Mines; Mr. Bedford McNeill, president of the Institution of Mining and Metallurgy; Mr. Dahlblom, Inspector of Mines, Sweden; Mr. Boggild of Denmark, Mr. Kukuk of Germany and Director R. W. Brock of the Geological Survey of Canada.

(To be Continued.)

# CROWSNEST PASS COAL FIELDS*

By W. W. Leach.

The territory lying between Burmis, Alberta and Elko, British Columbia, includes all the coal fields, containing high-grade bituminous coal of Kootenay age in the Crowsnest Pass, which are traversed by the Crowsnest branch of the Canadian Pacific Railway.

These fields may be broadly divided into two groups, the most easterly lying in the Province of Alberta and separated from the westerly or British Columbia group by the main range of the Rocky Mountains. Each of these groups consists of a number of separate areas of coal-bearing beds.

On the Alberta side of the mountains the various coal areas are divided by a series of great faults, following closely the strike of the strata, while the individual areas have been subjected to severe folding and some minor faulting. On the other hand, the British Columbia group is composed of a number of more or less regular basins, the most important of which has a length of some 35 miles with a maximum width of 11 miles.

The coal is contained in rocks of Kootenay age (Lower Cretaceous) consisting of hard, grey sandstones, grey black, and carbonaceous shales with, towards the top, some hard siliceous conglomerate holding many chert pebbles. In the Alberta group the Kootenay rocks have a total thickness of not more than 700 feet containing from 5 to 6 seams of coal with an aggregate thickness of about 50 feet, while a section measured near Morrissey, on the British Columbia side of the Pass, showed 3,200 feet of Kootenay rocks with 216 feet of coal contained in seams of over 1 foot in thickness. Similarly the Fernie shales, of Jurassic age, underlying the Kootenay are very much thinner in Alberta than in British Columbia, in the former having a thickness of about 650 feet, while near Fernie, B.C., they attain a thickness of over 3,000 feet.

The coals throughout this district are all of a very similar nature, with the exception of a number of small seams found near Fernie, overlying the main coal measures, which contain coal of a semi-cannel character.

Nearly everywhere the coal cokes readily and is utilized to a large extent in the manufacture of that product; it is generally rather friable, and often contains a somewhat large amount of ash, but it has been found to be eminently adapted for steam raising purposes and is in much demand by the railways for locomotive use. The following proximate analyses, from air-dried samples, give a general idea of the quality of the coal:—

| Locality. | Moisture. | Vol. Comb. | Fixed Carbon. | Ash. | Remarks. |
|---|---|---|---|---|---|
| (1) Bellevue—No. 1 seam.............. | 0.2 | 27.5 | 56.8 | 15.5 | Run of mine coal. |
| (2) Coleman—No. 4 seam ............. | 0.6 | 23.8 | 59.5 | 16.1 | do. do. |
| (3) Michel—No. 8 seam ............... | 1.1 | 23.8 | 65.0 | 10.1 | Coal, screened and picked at mine. |
| (4) Hosmer—No. 8 seam ............... | 1.3 | 27.6 | 63.7 | 7.4 | Coal hand-picked at testing palnt. |
| (5) Coal Creek—No. 2 seam ........... | 1.3 | 26.0 | 63.8 | 8.9 | Coal screened and picked at mine. |
| (6) Marten Creek .................... | 2.10 | 57.71 | 30.33 | 9.86 | Camel coal, surface sample. |

In the year 1910, a total of 3,137,138 tons (2,000 lbs.) of coal was produced in the district, of which amount Alberta contributed 1,608,205 tons, and British Columbia 1,528,933 tons, from which 121,578 tons of coke were made in the former Province, and 241,579 in the latter. In 1911, the output was very much less, due to the fact that for eight months nearly all the mines were idle on account of a miners' strike.

**The Davenport Coal Company** has developed six coal seams, the several thicknesses of which are 3.4 feet, 5

*Extracts from Guide Book, No. 9, prepared by the Geological Survey of Canada, for Twelfth Session International Geological Congress, August, 1913.

feet, 4.6 feet, 5 feet, 6 feet, and 6 feet. The coal is mined by pillar and stall method and hauled to the tipple by endless rope; the steel tipple is equipped with Marcus screens, built at Newcastle-on-Tyne, and is capable of handling 120 tons per hour.

**Police Flat Siding.**—At Police Flat is situated one of the Leitch Collieries' plants. This point is on the axis of a sharp anticline and is underlaid by Dakota rocks, but about half a mile to the north, where the mine is situated, erosion has uncovered the underlying Kootenay beds. Here five seams of coal have been proven, 2 feet, 6 feet, 5 feet, 4 feet, and 10 feet, respectively, in thickness. The mine is worked by pillar and stall system, and on account of the steep dip (60°) the rooms are driven diagonally up the pitch. The coal is hauled in the main gangway and to the tipple by gasoline motor. The tipple is of the Phillips cross-over type and is equipped with shaking screens and picking tables, and has a capacity of 1,000 tons in two shifts. From the tipple the slack coal is elevated to the washing plant, of Luhrig jig type, with a capacity of 500 tons washed coal in ten hours. After washing, the coal passes to bins holding 1,000 tons and thence by electric lorries to the coke ovens, 101 in number; these ovens are a modified bee-hive, rectangular in shape and are mechanically levelled and pushed. They take a charge of 10 tons of coal.

**Bellevue Siding.**—At Bellevue, the West Canadian Collieries, Ltd., are operating an important mine. Four seams intersected by a cross-cut tunnel are 9 feet, 17 feet, 4¾ feet, and 15 feet, respectively, in width, in a total thickness of 450 feet of measures. Two other seams, one 4 feet, the other 3½ feet in thickness, are known to occur below these. The coal is worked by pillar and stall system, the rooms being driven directly up the pitch. In driving a crosscut from No. 1 seam to intersect the lower seams from a point some two miles from the entry, a notable double fold was met with, No. 2 seam having been cut in three places while No. 1 and 3 seams were entirely missed; the accompanying sketch will make this clear.

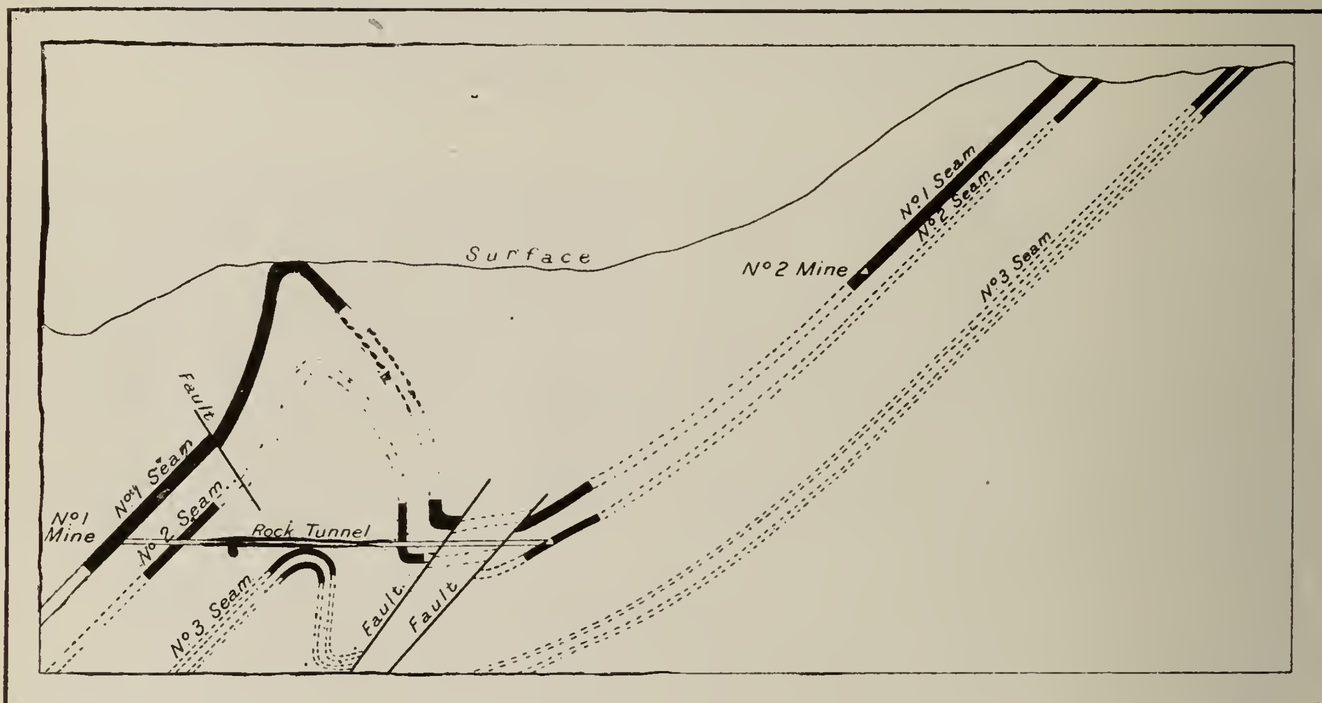
About one-half mile to the east of Bellevue, the Maple Leaf mine is situated. The folding mentioned above is well seen here, the coal seams being repeated four times in a distance of about one-half mile.

**Hillcrest.**—At this station a short spur turns off to the south to Hillcrest town and mine. The mine is located on the western limb of a broad undulating syncline, on the eastern limb of which the Bellevue mine is situated. Three seams, 14 feet, 8 feet, and 9 feet in thickness, have been developed at this point.

**The Canadian Coal Consolidated** is operating two mines at Frank; the first is opened by a drift parallel to the face of Turtle Mountain and driven in a southerly direction. Three seams have been proved but one only, the highest, is being worked; this seam is from 12 to 15 feet thick. The coal is hauled along the main level and to the tipple by means of gasoline locomotives.

No. 2 mine is situated about one-half mile north of No. 1, and is being operated by means of a shaft 330 feet in depth. The main level, driven from the bottom of the shaft, runs in a northerly direction towards Bluff Mountain. From this mine the daily output is about 450 tons.

**Lille Coal Mine.**—From Frank, the Frank and Grassy Mountain Railway branches off to the north and follows the valley of Gold Creek for about 7 miles. About 5 miles up this line the town of Lille is situated, where the West Canadian Collieries are operating their Lille mine. A coal seam 4 to 5 feet in thickness has been worked here quite extensively. The mine is



Geological Survey, Canada

*Section in **Bellevue Mine** showing folding of coal seams*

operated on the pillar and stall system with compressed air haulage on the main levels, the tipple capacity being about 1,200 tons in two shifts. The company has a coking plant at this point consisting of a washery for treating the slack coal and a battery of 50 Belgian ovens of the Bernard type.

**Blairmore.**—At this point the West Canadian Collieries are operating a mine on the south side of the railway, with an output from 700 to 1,000 tons a day. The coal seams have also been prospected for some distance north of the track.

**Coleman.**—At Coleman two companies are operating coal mines, one on each side of the valley. The plant and mines of the International Coal and Coke Company (Dennison Colliery), are situated to the south of the railway where five coal seams have been proved, of which No. 2, 15 feet, and No. 4, 6 feet are at present being worked. Both seams are opened by means of levels driven on the strike, the coal being won by pillar and stall method, and the rooms driven up the pitch, which is here about 32 degrees.

The capacity of the mine and plant is about 3,000 tons daily.

The coke plant consists of a Bradford breaker and 216 beehive ovens, the coal being delivered to the ovens by electric lorry.

The McGillivray Creek Coal and Coke Company's mine is situated on the north side of the valley, about one-half mile from the railway. One seam, from 10 to 12 feet in thickness, the No. 2 of the series, has been developed by means of a slope with levels driven from its foot, the coal being worked by pillar and stall system. From the top of the slope the mine cars are hauled by electric motor along a surface tram to the tipple, a distance of one and one-half miles. The tipple, of steel construction, is equipped with screens and picking belts, and is capable of handling about 2,000 tons in two shifts daily.

**Corbin.**—At Corbin a similar outlying remnant of the coal-measures is being exploited by the Corbin Coal and Coke Company. This company is operating two mines; No. 1 being opened near the valley level by means of a tunnel along the strike of the seam, while No. 2 mine is situated nearly 1,000 feet above the floor of the valley. The geological relationship of these two openings has not as yet been worked out, and it is possible that the same seam is represented at both places. At No. 1 mine the seam is nearly vertical and varies greatly in size, from a minimum thickness of 10 feet to a maximum of nearly 250 feet; this great difference may be due to compressed monoclinal folding. At the upper mine the coal has been stripped near the top of the hill, and shows the coal in a synclinal basin about 370 feet in width; the thickness of the coal near the centre of the syncline having been proved by drilling to be over 100 feet.

The upper mine is reached from the valley by means of a switch-back railway and the coal is worked in open cuts with a steam shovel. The output in 1910 from No. 1 mine alone amounted to about 142,000 tons.

**McGillivray.**—McGillivray station is situated near the eastern edge of the main Crowsnest coal basin, the rocks having general westerly dips. From the station to the junction of the North Fork with the main Michel Creek, where the coal measures proper are entered, the railway follows closely the strike of the Fernie shales.

The Crowsnest basin has a total length along its major axis of about 35 miles, with a maximum width of 11 miles, and is estimated to cover an area of about 230 square miles. In a sec. sey, 22 coal seams, of one fo were noted, containing in the ag coal in a total thickness of measures of feet. The greater part of the coal, however, of 198 feet, occurs in a thickness of strata feet. Assuming the extent of the basin to square miles, and the average thickness of w coal at 100 feet, the total available supply of coa would be about 23,000,000,000 tons.

The coal measures are overlain by a great series of conglomerates, sandstones and shales containing, towards the base, thin seams of coal of a semi-cannel nature and reaching a maximum thickness of from 4,000 to 5,000 feet. It is over comparatively limited areas only, however, that such great thicknesses of the overlying beds are to be found, denudation having removed them to a large extent over the greater part of the basin.

Where crossed by the railway in the valley of Michel Creek, the basin has narrowed to about four miles in width and the beds overlying the coal measures have been entirely removed by erosion.

**Michel.**—At Michel, near the centre of the trough, the Crowsnest Pass Coal Company is operating an extensive colliery and coke-making plant. The company has developed seven seams in all, four on the south side of the valley and three on the north side; of the former the seams designated upper No. 3, No. 3. No. 4 and No. 5, have the following respective widths: 10 to 12 feet, 4½ to 5½ feet, 6 to 8 feet, and 6 to 8 feet, while on the north side, No. 7 seam is about 11½ feet thick with a 2½ foot parting; No. 8 is from 8 to 14 and No. 9 is about 10 feet thick. No. 9 seam has not been worked for some years. All the mines at Michel, with the exception of No. 3, are worked by the pillar and stall method: in No. 3 the longwall system is in use. A total of 486 beehive coke ovens have been built at Michel.

**Hosmer.**—At Hosmer the colliery of the Department of Natural Resources of the Canadian Pacific Railway is situated. A rock tunnel, across the measures, has been driven at a point 600 feet above the railway for a distance of 4,931 feet, which has cut ten coal seams of the following dimensions:—

| | |
|---|---|
| No. 1 seam, | 18 feet (5.4 m.). |
| No. 2 " | 12 feet (3.6 m.). |
| No. 3 " | 22 feet (6.7 m.). |
| No. 4 " | 4 feet (1.2 m.). |
| | 5 feet coal, (1.5 m.). |
| No. 5 " | 10 inch parting, (25.4 cm.). |
| | 13 feet coal, (3.9 m.). |
| No. 6 " | 8 feet 8 ins. (2.6 m.). |
| No. 7 " | 4 feet (1.2 m.). |
| No. 8 " | 5 feet (1.5 m.). |
| No. 9 " | 8 feet (2.4 m.). |
| No. 10 " | large seam. |

Of these seams Nos. 2, 9 and 10 are at present being worked, and it is probable that Nos. 9 and 10 correspond to seams Nos. 2 and 1, respectively, of the Coal Creek Colliery. The lowest seams, first cut in the tunnel, have easterly dips of 63 degrees, the dip flattening from three on the minimum of about 25 degrees. In addition to the tunnel seams, the company is operating a mine on the outcrop of the coal, where No. 2 seam is being worked by means of a slope; this point being several hundred feet higher than the tunnel entry.

oal is lowered to the tipple ed, double-track incline, and upple by air locomotives. The onstruction, is equipped with screens lts, and has storage bins with a capa- tons of coal and 2,400 tons of slack. The treated in a Robinson washer of 400 tons acity, the washed product being utilized in e manufacture of coke in a battery of 240 beehive ovens.

**Fernie.**—Altitude 3,302 feet (1,006.4 m.). Fernie, a town of about 5,000 population, is the British Columbia headquarters of the Crowsnest Pass Coal Company; from here the Morrissey, Fernie and Michel railway branches off and follows the valley of Coal Creek up for a distance of five miles (8 km.) to the Coal Creek colliery.

**Coal Creek** is a tributary of the Elk River from the east, which occupies a comparatively deep valley cut through the Cretaceous rocks, thus affording a suitable railway grade to the point where the valley floor rises to meet the easterly dipping coal measures. Here the mines are situated. The coal seams strike approximately at right angles to the valley, thus enabling tunnels to be driven on the seams on each side of the creek, while, as this point is approaching the centre of the basin, the seams dip at much lower angles (12 to 18 degrees) than at their outcrop along Elk River escarpment. The company is working five seams here while several others have been prospected to some extent. The seams being worked with their several thicknesses, are as follows:—

| | | |
|---|---|---|
| No. 1, | Average thickness | 10 feet. |
| No. 2 | " " | 4½ feet. |
| No. 5 | " " | 12-14 feet. |
| A | " " | 8 feet. |
| B | " " | 3½ feet. |

Seams Nos. 1, 2 and 5 are the ones most extensively worked; Nos. 1 and 5 being opened on the north side of the valley, while three mines are being operated on No. 2 seam, viz.—No. 9 mine on the north side and Nos. 2 and 3 on the south side of the valley. The coal from all the seams except No. 2 is mined by the pillar and stall method, whereas, in the mines on No. 2 seam, the longwall system is in use. Inside the mines, haulage is by horses and air locomotives, while all the coal from the various mines is hauled to the same tipple from the several entries by steam or electric motors. The tipple, a steel structure 840 feet in length, which bridges the valley, is of the Heyl and Patterson revolving side dump pattern, and is capable of handling 4,000 tons daily. It is electrically driven and equipped with the necessary screening and picking appliances. The slack coal is stored in large bins at Fernie and is utilized there in making coke, 452 beehive ovens being in operation.

**Morrissey.**—At Morrissey another branch of the Morrissey, Fernie and Michel Creek Railway leads up the north side of Morrissey Creek to the Carbonado colliery of the Crowsnest Pass Coal Company. The Carbonado mines have been idle for some years, although at least nine seams have been worked at different times, and a large plant, including 240 coke ovens, installed. The extremely gaseous nature of the coal at this point, resulting in a number of serious outbursts of gas, has caused it to be considered expedient to abandon this colliery for the present.

On the south side of Morrissey Creek and extending to the south branch of Michel Creek on the eastern edge of the coal basin, the Dominion Government holds in reserve a block of 45,000 acres of coal land, being part of a total reserve of 50,000 acres, the remaining 5,000 acres being situated to the northeast of Hosmer.

## COST OF LAKE SUPERIOR STRIKE.

The Boston News Bureau of Sept. 20 says that the strike at the Lake Superior copper mines, which is now on its ninth week—but gradually breaking up—has cost the miners thus far about $2,400,000 in lost wages, while dividend reductions ordered to date have amounted to $625,000. Figuring probable reductions by Wolverine, Mohawk and Osceola at next declarations, the loss to stockholders will approximate $1,000,000.

There were between 16,000 and 18,000 miners involved in the strike, with an average daily wage of $3.50, making the daily pay roll over $50,000.

Four Lake Superior companies have declared dividends since the strike started late in July. In the following table we present a comparison of the quarterly dividend rates of these companies, prevailing before the strike, with present rates and total losses to stockholders:

| Companies | Shares. | Prev. Rate. | Pres. Rate. | Losses. |
|---|---|---|---|---|
| Calumet & Hecla .. | 100,000 | $10.00 | $6.00 | $400,000 |
| Ahmeek .......... | 50,000 | 5.00 | 3.00 | 100,000 |
| Copper Range ..... | 393,712 | .75 | .50 | 98,428 |
| Quincy ........... | 110,000 | 1.25 | 1.00 | 27,500 |
| Total.......... | .... | .... | .... | 625,928 |

## KERR LAKE.

Kerr Lake Mining Company reports for year ended August 31:

| | 1913. | 1912. | 1911. |
|---|---|---|---|
| Ore sales ........ | $1,182,493 | $1,044,417 | $1,231,246 |
| Expense .......... | 345,178 | 275,242 | 293,870 |
| Net profit ...... | 837,315 | 769,175 | 937,379 |

|---|---|---|
| Profit and loss account Aug. 31 | 716,992 | 709,817 |
| Net profit year ended Aug. 31. | 837,315 | 769,175 |
| Total .................... | 1,554,307 | 1,478,992 |
| Dividends payable during year | 600,000 | 762,000 |
| Profit and loss Aug. 31 ....... | 954,307 | 716,992 |

Kerr Lake Mining Company, of New York, the holding company, reports for year ended Aug. 31, 1913:

| | 1913. | 1912. | 1911. |
|---|---|---|---|
| Dividends from Kerr Lake Mining Co. ....... | $600,000 | $762,000 | $1,338,000 |
| Dividends from Wettlaufer, Lorrain, etc. ...... | 652 | 679 | 6,545 |
| Total ......... | 600,652 | 762,679 | 1,344,545 |
| Exp. & taxes .... | 19,137 | 21,645 | 33,056 |
| Divs. pay ....... | 600,000 | 690,000 | 1,200,000 |
| Written off ...... | 15,000 | 45,000 | 45,000 |
| Surplus......... | *33,484 | 6,033 | 111,488 |

*Deficit.

Production amounted to 2,109,975 ounces of silver, at a cost of 21.39 cents per ounce, which compares with production of 1,855,495 ounces at a cost of 18.30 cents per ounce in the previous year. Ore reserves at the end of the year were 6,019,300 ounces, against 6,660,091 ounces at close of previous year.

Balance sheet of the operating company shows cash, short term bonds and notes, ore, etc., on hand amounting to $868,692, with taxes and accounts payable, etc., amounting to $47,600, leaving excess of quick assets $821,092.

# ASBESTOS MINING IN QUEBEC IN 1

By Theo C. Denis, Superintendent of Mines.

Asbestos in 1912 heads the list of mineral products of the province. After passing through a rather critical period the asbestos industry is now regaining its balance, and the outlook for the future is bright. The following table gives details of the asbestos in the Province of Quebec durin 1912:

**Production of Asbestos for the Year 1912.**

| Qualities. | No. of Men. Employed. | Wages Paid. | Shipments. Tons. | Shipments. Value. | Aver. value per ton. | Stock on Hand. Tons. | Stock on Hand. Value. |
|---|---|---|---|---|---|---|---|
| Crude No. 1 | .... | ........ | 1,941 | 510,785 | 263.16 | 867 | 221,215 |
| Crude No. 2 | .... | ........ | 3,766 | 379,445 | 100.76 | 2,867 | 310,596 |
| Mill stock No. 1 | .... | ........ | 3,682 | 237,203 | 64.42 | 2,370 | 137,106 |
| Mill stock No. 2 | .... | ........ | 32.689 | 1,018,960 | 31.17 | 8,234 | 301,774 |
| Mill stock No. 3 | .... | ........ | 69,097 | 912,691 | 13.21 | 6,838 | 131,515 |
| Totals | 2,910 | 1,377,444 | 111,175 | $3,059,084 | 27.52 | 24,176 | 1,102,206 |

Quantity of rock mined, 1,870,608 tons.

For the two previous years, 1911 and 1910, the figures are given in the tables below:

**Production of Asbestos for Year 1911.**

| | Shipments. Tons. | Shipments. Value. | A. value per ton. | Stock on Hand. on Dec. 31st, 1910. Tons. | Stock on Hand. on Dec. 31st, 1910. Value. |
|---|---|---|---|---|---|
| Crude No. 1 | 1,400 | $ 388,224 | $277.30 | 1,358 | $ 360,304 |
| Crude No. 2 | 3,382 | 382,980 | 113.68 | 3,368 | 431,548 |
| Mill Stock No. 1 | 6,340 | 415,559 | 65.54 | 3,794 | 207,403 |
| Mill Stock No. 2 | 35,991 | 1,091,684 | 30.33 | 12,272 | 379,523 |

| Totals | 80,605 | $2,667,829 | $33.10 | 41,159 | $1,921,923 |

Quantity of rock mined during year 1910, tons, 2,035,705.

The classification adopted by the Quebec Mines Branch is an arbitrary one. Each mine has its own grading, and there is no uniformity between the products of the different mines. In the tables above given the values of the various grades have been grouped as follows:

Crude No. 1—Hand-cobbed asbestos valued at $200 a ton and over.

Crude No. 2—Hand-cobbed asbestos valued at less than $200 a ton.

Mill Stock No. 1—Products of mechanical separation valued at $45 and over.

Mill Stock No. 3—Valued at less than $20.

Mill Stock No. 3—Valued at less than $20.

It is interesting to note that in 1911 and 1912, the shipments exceeded the output of the mining and milling operations for each respective year. This shows a steady evacuation of the stock on hand which had accumulated during 1910, when an abnormal production had caused a congestion of the market.

Therefore the balance between the output and shipments is gradually readjusting itself, and as the consumption is steadily increasing, the future of the industry is hopeful.

The following table shows the growth of the asbestos industry since the year 1900:

| Year. | Tons. | Value. |
|---|---|---|
| 1900 | 21,408 | $ 719,416 |
| 1901 | 33,466 | 1,274,315 |
| 1902 | 30,634 | 1,161,970 |
| 1903 | 29,261 | 916,970 |
| 1904 | 35,479 | 1,186,970 |
| 1905 | 48,960 | 1,476,450 |
| 1906 | 61,675 | 2,143,653 |
| 1907 | 61,985 | 2,455,919 |
| 1908 | 65,157 | 2,551,596 |
| 1909 | 63,965 | 2,296,584 |
| 1910 | 80,605 | 2,667,829 |
| 1911 | 102,224 | 3,026,306 |
| 1912 | 111,175 | 3,059,084 |

**AT BLACK LAKE, P.Q.**

**Geologists looking for new minerals in the asbestos bearing rocks.**

The year 1912 therefore shows a new high record for both tonnage and total value. However, it must be pointed out that although the tonnage in 1912 increased 8.75 per cent. as compared with 1911, the total value only increased 1.07 per cent.

There is an increase in the demand for long fibre asbestos and a corresponding decrease for the lower grades. Spinning stock and shingle stock, which must be of clear and fibrous asbestos, find a much readier market than paper and mill-board stock, which are now much more difficult to get rid of. For this reason only the mines which are able to produce an appreciable quantity of the better stocks were operated this year. As a consequence of this state of things all the mines of the Broughton district were shut down during the whole of 1912. The serpentine rock in this district contains as a rule a high percentage of asbestos; this, however, is not in veins, but in the shape of short fibre disseminated throughout the rock. In the Robertson district, where the asbestos rock is of an intermediate nature between that of Thetford and that of Broughton, two mines were worked part of the time.

In Thetford and Black Lake, there was a serious shortage of labour which somewhat hampered operations.

One of the important features of the year in the asbestos industry has been the reorganization of two of the large operating companies. In both cases, the principle adopted in the reorganization has been the reduction of the bonds by converting part of these into common stock, thereby reducing the fixed charges. In these reorganizations, the names of two companies, the Amalgamated Asbestos Company and the Black Lake Asbestos Corporation, have been changed respectively to Asbestos Corporation of Canada, Ltd., and the Black Lake Asbestos and Chrome Company, Ltd.

**At BLACK LAKE, P.Q.**

**Dr. J. A. Dresser describing the occurrence of asbestos to members of geological congress.**

Returns of shipments of asbestos were received from mine producers as follows:

Asbestos and Asbestic Co., Ltd., Danville, P.Q.

Asbestos Corporation of Canada, Ltd., Thetford Mines and Black Lake, P.Q.

B. and A. Asbestos Co., Robertson, P.Q.

Bell Asbestos Mines, Thetford Mines, P.Q.

Berlin Asbestos Co., Rumpelville, P.Q.

Black Lake Asbestos and Chrome, Black Lake, P.Q.

Jacobs Asbestos Mining Co., Thetford Mines, P.Q.

Johnson Co., Thetford Mines, P.Q.

Martin, Bennett Asbestos Mines, Ltd., Thetford Mines, P.Q.

The Asbestos Corporation of Canada operated four of their mines, the Kings and Beaver mines at Thetford, and the British Canadian and the Standard mines at Black Lake. The fifth mine, the Dominion at Black Lake, was not re-opened.

The Black Lake Asbestos and Chrome Co., Ltd., have actively worked the Union and the Southwark mines. Their large mill has a capacity to treat 1,000 tons of rock per 10 hours. The motive power is electricity.

The Bell mines are the only ones in the district who have done much underground development by means of tunnels. These aggregate in the vicinity of 20,000 lineal feet, which have developed a large reserve of asbestos-bearing rock.

The mill has a capacity of 900 tons of rock per 10 hour shift. In their mining and milling operations the Bell mines use 1,200 h.p., of which about one-half is electric power, and one-half is furnished by steam boilers.

The Asbestos and Asbestic Company, Ltd., are the only ones working in the Danville district. They operate the Jeffrey mine at Asbestos. This company was in continuous operation during 1912. There are two

**AT BLACK LAKE, P.Q.**

**Examining crystals of white garnets found in the asbestos bearing rock.**

**Robert Harvie, Ottawa; Dr. Charles Palache, Harvard; Dr. A. C. Lawson, California.**

well equipped mills, of a capacity of 1,000 tons of rock each per 10 hours. Provision is made for about 2,000 h.p., partly steam and partly electricity.

The Johnson Company operate two mines, at Thetford and Black Lake respectively. Each mine has its own mill, and both were in continuous operation during the year.

At both mines and mills steam power is used exclusively. The capacity of the Thetford and Black Lake mills of the Johnson Company aggregate 750 tons of rock per 10 hours.

The Jacobs Asbestos Mining Company operate on lot 28 in the sixth (VI.) range of Thetford. Their well equipped mill has a capacity of 600 tons of rock per 10 hours. Electric power is used exclusively in operating both the mines and the mill. The horse power used is about 700.

The Martin-Bennett Asbestos Mines, Ltd., is the latest addition to the Thetford mines. This company acquired the Ward-Ross property, situated near the Johnson mine. It had been lying idle for a great many years owing to litigation. The new mill, which is very complete and efficient, was put in operation in the spring of 1912. It has a capacity of 900 tons of rock per 10 hours. In their mines and milling operations steam power is used exclusively.

The B. and A. Asbestos Company operate on lot 9 in the fifth (V.) range of Thetford, at Robertsonville. The mill has a capacity of 450 tons per 10 hours. Electric power, 600 h.p., is used exclusively in both mining and milling operations.

The Berlin Asbestos Company have their mine and mill on lot 2 in the fifth (V.) range of Thetford. The mill has a capacity of 450 tons per 10 hours. The mining and milling operations require 400 h.p. The two last mines were only operated during a part of the year.

The electric power is distributed in the asbestos districts by two electric power companies, the Continental Light and Power Company and the St. Francis Hydraulic Company. The first of these obtain the power from Shawenegan Falls, on the north side of the St. Lawrence River. Two lines of 80 miles deliver 9,000 h.p. in Thetford, Black Lake, Robertson, East Broughton and Danville.

The second company has its plant at the falls of the St. Francis River, two miles above Disraeli. They develop 3,000 h.p. and have an auxiliary steam plant of 2,000 h.p.

The price of electric power in these districts averages $25 per h.p. for eight month to during the year, as generally during the winter months mining operations are considerably reduced.

It is noteworthy that there is now a growing tendency towards using steam power in mining and milling operations. The contention is that although electric power at the rate at which it is delivered would be cheaper for continuous operations, as there sometimes occur long interruptions in the work owing to various causes, such as shortage of labour, sluggishness in the asbestos market, unfavourable weather to work in the asbestos pits, etc., it is more profitable to install a boiler plant and produce steam power. The price of good steam coal on the cars at Thetford or Black Lake during 1912 was $5 per gross ton.

**Cobbing Asbestos, Black Lake, P.Q.**

## THE OUTPUT OF COPPER IN AUGUST.

The Boston News Bureau states that the copper production for August by 26 producers approximated 81,413,124 pounds, compared with 99,540,194 pounds last year, a decrease of 18,127,070 pounds. This sharp drop was directly due to the suspension of operations in the Lake Superior district. The last half of the month witnessed resumption on a small scale at Calumet and Hecla, Copper Range and Quincy, but it is very improbable that the combined output from these properties exceeded 4,000,000 pounds, which would compare with a normal monthly production of the camp of from 18,000,000 to 20,000,000 pounds.

The porphyries—Utah, Chino, Nevada Consolidated, Ray Consolidated and Miami—outputted last month 30,019,348 pounds, an increase of 1,854,320 pounds over August, 1912.

## NIPISSING.

Nipissing Mining Company report as of September 20, shows: Cash on hand, $1,192,297; ore and bullion in transit, $24,245; ore on hand, $182,980; total, $1,399,522.

# CANADA'S NICKEL INDUSTRY*

By Alexander Gray.

The nickel industry of Canada, centred in Ontario, was pre-natally endowed with the mineral-bearing rocks essential to it, and unparalleled in their extent and characteristically contained worth.

That much is conceded by those who have scientifically investigated the norite of the Sudbury District and by those who tediously nurtured the industry with capital and all the metallurgical, mining and metal market sciences afforded.

Nickel and copper in intricate association confounded the issues and caused pioneer capitalists and their metallurgists ruefully to confess they would be happier "with either were t'other dear charmer away." Moreover, the metallurgy of the ores had been economically solved, nickel had to await its adaptation to multifarious uses—and abuses, in the estimation of those who frown upon naval armaments.

It took so many millions to separate and popularize nickel, so many years to introduce it into the manufacture of armour plate and innumerable art—those familiar with the inner details of that paroxysmal period cannot begrudge honours and emoluments to those who made nectar with a "lemon," so to speak. Nor is it surprising in the circumstances, that most of those who jauntily undertook to engage in or participate in the nickel industry, usually came to grief.

Notwithstanding the undisputed magnitude of the natural resources of the Sudbury District in respect to these ores, the difficulties attending the refining of nickel—and marketing of the metal in large and continuous quantities sufficient to bring adequate return upon capital invested—were painfully prolonged and deterred others than those who had to furnish money in bulk to the International Nickel Company and the Mond Nickel Company. Repeated attempts by ill-equipped concerns, ended in ignominious failure, emphasizing the futility of mere promoters entertaining what exacted the unceasingly expensive energies of wealthy and skilled technical chiefs, who had devoted so much time and money to their problems they could not abandon the field.

Opportunity for competitive enterprise and a somewhat envious environment could not induce other than the Mond Company and the International Nickel Company to do little more than acquire nickel-copper-bearing areas. Occasionally mining has been pursued. The Dominion Nickel-Copper Company organized by influential Canadians; the Lake Superior Corporation; the Montreal owners of the Worthington property, all knew they had ore and devoted themselves to explorations by diamond drilling. Plants and a railroad to what is defined as the North Nickel Range, sustained by representations as to the feasibility of certain separating and refining processes, did not get beyond the contemplative. Speculators holding properties of real or problematic merit could not enthuse financiers and steel-makers into the erection of smelters. Repeatedly inquiry for properties failed to get beyond preliminaries.

Not until quite recently when expansion brought to the two producing companies named, the profits they had earned as their reward for constructive capital outlays, has it appeared at all possible to enlist anyone competent to effect the economical separation of the metals and market the same. Even now—and in spite of the support given by noted personalities—there is a halt in the programme of those who took over the holdings of the Dominion Nickel-Copper properties, along with the Murray Mine and other areas amalgamated as the Canadian Nickel Corporation with a nominal capital of $30,000,000. Whatever the inducement presented in these outstanding nickel properties—and, however, ambitious individuals may be to contest nickel markets with the International and Mond Companies—those best informed appreciate what the rivalry will entail.

Had the Messrs. Guggenheim, with their metallurgical staffs and mastery of metals markets, succeeded in obtaining the properties massed under the aegis of the Canadian Nickel Corporation, a battle royal might have ensued. The Guggenheims were willing. Somehow there was a misdeal. While certain of the Canadian owners favoured the American Mining and Smelting Masters, Messrs. J. R. Booth and Clifford Sifton closed with Dr. F. S. Pearson, E. R. Wood, Z. A. Lash, Sir William Mackenzie and others, for a round four or five million dollars in cash and script. Mr. J. E. McAllister, managing director of the Canadian Nickel Corporation, and adviser in the matter to Dr. Pearson, was alert. He took the trick—and it remains to get the $10,000,000 as proposed by a debenture issue and a bonus of 125 per cent. of common stock, leaving $7,500,000 of the $20,000,000 of common stock to be otherwise disposed of. When that is accomplished, possibly there will be a third formidable nickel corporation, bringing the capitalization of the entire Ontario nickel country to over $80,000,000, exclusive of what is in the Micawber class of holders and including the Alexo Company, operating near Kelso and shipping their ore to the Mond smelter.

Yet it is almost thirty years since Dr. Howie discovered the pyrrhotite and chalcopyrite on the surveyed line of the Canadian Pacific Railway, on the site of the Murray Mine which the Vivians subsequently operated and abandoned twenty years ago, now said to contain more ore of higher grade than those original nickel refiners at Swansea dreamed of. Had the Vivians retained the Murray and proved its worth, they would have become larger factors in nickel markets. It bespeaks the perplexity permeating Nickeldom that the very property which the Vivians declined to longer operate in 1894, was the 1913 basis of the transaction now in process of consummation with the Pearson interest. It would add to the ironies if the Mond English Company contracted for a considerable tonnage of newly discovered Murray ore.

Ordinarily a mineral industry requiring a quarter of a century to mature to the profit-distribution stage, would be regarded as a glorified "wild cat." Assuredly the nickel industry had a career that was precarious and vicarious simultaneously. Most of the "mystery" attached to it was due to the fact, for years, that nickel-making was unspeakably hazardous. There were no beplumed Chanticleers around Copper Cliff and Sudbury; because those preoccupied with their work had to strut softly so as not to arouse those who subscribed their millions and existed on a slim diet of hope deferred.

That the fixed capital of Ontario's Nickel Company is approaching the $100,000,000 mark, does not warrant the assumption that the production of the metal is to be accomplished any easier, further than that there are

*From Journal of Commerce, Sept. 13 and Sept. 20, 1913.

multiplying uses for it when competitors can supply it upon terms relatively as satisfactory as those companies now dominating nickel markets. How formidable these latter have become, in that they contribute about 80 per cent. of the world's nickel, is illustrated by the following progressive Bureau of Mines tables giving the Ontario output and value by years, since the organization of the International Nickel Company in 1902:

companies is not repeated as a disastrous experiment with mining industrial matters exacting thorough organization and sane finance. Necessarily the output of the producing nickel mines has conformed to demand. Supply never was at issue since the Sudbury District ores and the solution of their treatment. Were the world prepared to take more nickel—at a price that would yield a satisfactory profit—the world could have it, and the turn over

## NICKEL AND COPPER PRODUCTION OF ONTARIO MINES

| | 1902. | 1903. | 1904. | 1905. |

| | Number | Number | Number |
| Men employed | 2,156 | 2,439 | 2,850 |

**Recapitulation.**

| | |
|---|---|
| Tons raised | $4,469,688 |
| Tons smelted | 4,301,365 |
| F.O.B., Sudbury value of nickel | 28,722,414 |
| F.O.B., Sudbury value of copper | 14,453,331 |
| Wages | 13,789,802 |

Obviously 31.9 per cent. of the Sudbury valuation of the nickel-copper contents of the practically four-and-a-half-million tons raised was paid out to employees of the Canadian Copper Company, which is the producing organization of the International Nickel Company; the Mond Company—and latterly, in a mall way, the Alexo Company. As obvious is it that the nickel industry is at its best—a best that will be more superlatively so if markets for the metal are conserved and the demoralization due to random promotion of asbestos

on capital would compensate somewhat for any reduction in the market price of the metal. But the world shied at more than so much—consequently the companies engaged in supplying it had to modulate their output and conform to the momentary requirements.

Inspection of the foregoing tables will convince economists that financial depression—periodic depressions—automatically influenced the nickel output. Had the situation been what the Englishman describes as "all beer and skittles"—otherwise defined as "all jam" —the International Nickel Company sooner might have begun to "get back some of its money." Just as the nickel industry was beginning to benefit from enlarged markets, the 1907 panic occurred. It will be observed that the 1907 aggregate was but a trifle in excess of that of 1902, the year in which the International Company went into the business; also it is clear that the 1908 output was below that of 1902 or of 1907.

Since then the output has almost doubled—and the ore reserves have multiplied so enormously that the leading companies are safeguarded. Concurrently there have been necessary enlargements of plants and properties, more capital has been forthcoming—and the markets secured by long-term contracts or by demonstrated ability to furnish metal markets with "the goods."

The International Nickel Company raised 618,294 of the 737,656 tons of ore smelted in 1912. The Mond Company raised 117,568 tons and took 1,792 tons of ore from the Alexo Company. In other words, the International Company produced over 80 per cent. of the Canadian tonnage. This is about the usual proportion. Doubtless the International Company's contribution of nickel was in greater ratio, for 518,417 tons was high-grade ore from the unexcelled Creighton Mine—a mine that was a saving clause during those unprofitable years when the International Company was in what aviationists speak of as the "upper air currents." At any rate the International and Mond Companies accounted for 99.75 per cent. of all the nickel ore mined in Ontario in 1902—and they are prepared to beat that record, if markets will take the metals. The Alexo tonnage was bought by the Mond for its high nickel content, the low copper content being no deterrent; because Mond matte shipped to Wales contains more nickel than what is many craves a freer market in nickel, but its manufacturers side-step all proposals that they engage in mining and refining the metal. Meanwhile the International Company possesses sufficient ore reserves proved to maintain the current output for about 75 years and has funds on hand for extensions to plant. Not only will the No. 3 Mine be equipped upon an unprecedented scale, but another hydro-electric plant will be constructed next year on the Spanish River, thus doubling the power capacity. Power, tonnage, plants, cash and markets, bespeak the achievements of those who brought the International Company to the point where those who would measure swords with it must have greater dexterity, a better eye—and the essential sinews. How potential are International and Mond Companies may be determined by these figures:

**World's Production of Nickel.**

| Years. | Metric Tons. | Ontario Output Tons. |
|---|---|---|
| 1906 | 14,300 | 10,776 |
| 1907 | 14,100 | 10,602 |
| 1908 | 14,600 | 9,563 |
| 1909 | 17,300 | 13,141 |
| 1910 | 20,100 | 18,636 |
| 1911 | 24,500 | 17,049 |
| 1912 | 26,500* | 22,421 |

*Estimated.

## INCOME ACCOUNT OF THE INTERNATIONAL NICKEL COMPANY

sent by the Canadian Copper Company to the Orford Company in New Jersey in behalf of the International Company. So strongly entrenched are the two producing companies, even a fraction of their trade at other than sacrifice prices will be difficult to dislodge. They have prospered despite adversities which would have discouraged the less capable, however fiscally equipped.

Copper Cliff and Coniston Smelters as perfected and trebled have the economies long sought by the technical experts of the International and Mond Companies. Cheaper processes—and as efficient—there may be. Canadians interested in their material resources cherish the desire for a still greater nickel industry—but those who plan nickel enterprises will have to make more than a sporting bet. As yet Canadian consumption of nickel is a negligible factor. The bounty awaiting nickel refined in Canada has not enticed capitalists to provide metallurgical works in Canada for that special purpose. Ger-

While the Ontario industry has advanced 110.8 per cent. in those eight years the world's supply has increased 85.3 per cent. Having in view the Ontario Mines Department detailed data as to the output and spending power in wages of the Ontario nickel industry, it is pertinent to present the consolidated income account of the International Nickel Company in recent years:

The entrenched position of the International Nickel Company and the war chest to provide ammunition and the commissariat, and enable it to withstand a siege. On March 31st, the end of its last fiscal year, it had a cash surplus of $4,442,664, as compared with $3,854,177 in 1912; $2,852,102 in 1911, and $1,455,836 in 1910. What is more significant is the recent financing by which all the bonds of the company were retired, thereby eliminating fixed charges and putting more millions into plants and the treasury. Over $8,000,000 in bonds were redeemed in furthering the company's purposes, greatly enlarged facilities are to be a feature—and this while meeting dividends on the increased common. The dividend record by years and the annual surplus disclosed were as follows, despite heavy capital expenditure by which earnings were reinvested:

**Dividend Record International Nickel Co.**

| Year. | Per cent. on common. | Year's Surplus. |
|---|---|---|
| 1912-1913 | **11.7 | $994,501 |
| 1911-1912 | 26.3 | 903,798 |
| 1910-1911 | 17.9 | 2,432,074 |
| 1909-1910 | 17.2 | 1,044,805 |
| 1908-1909 | 5.3 | 470,671 |
| 1907-1908 | 8.9 | 790,009 |
| 1906-1907 | 14.2 | 1,254,769 |
| 1905-1906 | 8.6 | 754,760 |
| 1904-1905 | 7.8 | 668,093 |
| 1903-1904 | *3.8 | 341,102 |
| 1902-1903 | *6.4 | 559,149 |

*Earned on the Preferred Stock.

**Common Stock increased from $11,582,626 to $38,031,500.

International Company shareholders had to exercise patience. There was no dividend on the preferred shares for four years following the organization of the company. It was eight years before the common issue brought any return, owing to the necessity for re-investing surplus in plants. However, of late years, dividends have been as follows:

| | Preferred Dividends. | Common Dividends. |
|---|---|---|
| 1913 | $534,754 | $3,491,048 |
| 1912 | 534,749 | 2,143,411 |
| 1911 | 534,748 | 3,126,859 |
| 1910 | 534,745 | 487,977 |
| 1909 | 534,733 | ...... |
| 1908 | 534,733 | ...... |
| 1907 | 534,730 | ...... |
| 1906 | 267,360 | ...... |
| | $4,010,552 | $9,149.295 |

In 1912-13 the sum of $1,051,920 was written off for depreciation to plants and exhaustion of ore—notwithstanding the millions of tons added to the ore reserves. It is conservative administration policies, such as this, which made the International Company a model in Canadian mining, reinforced as they are by what was intimated in the most recent annual report:

"We are continuing to keep our plant up to date in every respect, increasing its efficiency wherever possible, and enlarging its capacity."

So close is the nickel organization to-day it rests with the dominant companies to meet the market conditions at the moment, or over contract periods. A trifle less than 13 per cent. of the 44,221,860 pounds of nickel contained in the matte exported, went to Great Britain in 1912. The actual exports were:

| | Lbs. |
|---|---|
| To Great Britain | 5,072,867 |
| To United States | 39,148,993 |

Whereas the total as applied to Great Britain reflects a gain of 9 per cent., that for the United States represents a gain of 41.9 per cent. Therefore the importance of the American market, and a tariff which permits unrefined metal to enter the States as such, requires little emphasis. America takes the business—and caters for it, otherwise it could easily alienate a goodly portion of it. Canada has a very substantial first profit—not anywhere near to being measured by the wage items from year to year. For this we have the authoritative pronouncement by Dr. A. P. Coleman in his most complete monograph on the nickel industry published by the Dominion Department of Mines. He says:

"The whole nickel basin includes an area of 550 square miles, divided among twenty-four townships of the regular size and shape. Mining has taken place in eight of these ten townships, while important ore deposits are known to exist in several others.

"Omitting the villages connected with the farming region of the interior basin, the nickel mining industry supports two towns, Sudbury and Copper Cliff, and four villages, with a total population of perhaps 10,000 people."

We have the authority of the Ontario Mines Department for the statement that 4,459,688 tons were raised since 1902, and to the end of 1912. Throughout the operations, and dating back to the 80's, we have the authority of Dr. Coleman for the assertion that "the total amount of ore mined in the region up to the present (1912) is roughly 5,500,000 tons, of which probably 4,000,000 were actually sulphides, containing perhaps 2,400,000 tons of iron and its associated metals, nickel itself amounting to about 133,000 tons. . . . . More than half the total has come from the few hundred feet of margin at the Creighton Mine, so that things are very unequally distributed."

Substantiating this Dr. Coleman also says "the Creighton has of late years been by far the most productive nickel mine in the world, with its annual output of more than 200,000 tons of ore containing on the average 4.68 per cent. of nickel and 1.65 of copper. The total production up to the end of 1910 was 2,088,531 tons, and mining at the regular rate has gone on steadily since that time. The annual production of nickel from this mine has probably surpassed that of all the other nickel mines in the world."

The same gentleman, who has devoted years to the study of the nickel country, states that "the Creighton ore up to September, 1910, contained on the average 5.08 per cent. of nickel and 1.63 of copper with a total for the two metals of 6.71 per cent., making it the richest of the large mines with the exception of Copper Cliff. Crean Hill ore approaches it, but with the proportion of the two metals reversed. It is also the richest in the sulphides of all the large mines, or in other words, contains less rock matter than the others, 75 or 80 per cent. of the ore being sulphides. It has shown slight falling off in grade since the earlier years, since more rock is now included with the ore, but the sulphides seem to be very uniform in their average contents of nickel and copper."

Without intending to make comparisons which might be deemed invidious, the metallic contents of the basic Creighton ore saved the day for the International Nickel Company when duly supported by that from the Crean Hill and Copper Cliff mines. Such high grade ore made it easier for metallurgists and those in charge of metal markets in behalf of the International Company to make dividends and equip the properties. Combined with all of this is the proved ore reserves in the numerous areas owned by the International Company. Whether those reserves actually total 50,000,000 or 60,000,000 with—more to come—they are ample for all emergencies. Presently the Frood, or No. 3 Mine, will place the International Company in a very strong position. Some idea of this Frood section will be conveyed to the laity by this extract from Dr. Coleman's monograph:

"The widest part of the band of norite and gossan is 900 feet across, a little to the South of the Frood Mine; and the whole gossan-covered area far surpasses any other in the nickel region, being probably four times as large as the gossan surface at Creighton or Whistle mines, which come next to it. It was an axiom of the early prospectors that a large area of gossan meant an important ore body, and in this case at least their belief was justified. . . Though No. 3 mine was found early in the history of the region, it was not worked, beyond some stripping and the sinking of pits, until 1899. In the following year a railway switch from the Stobie mine gave an outlet for ore from the mine, but four years later, in 1903, the mine was closed down after 107,942 tons of ore had been sent to the Copper Cliff smelter. The ore ran 2.66 per cent. of nickel and 1.39 per cent. copper, the two metals making up 4.05 per cent., so that it was considerably richer than its neighbour the Stobie mine.

"The results of systematic diamond drilling across the ore deposit by the Canadian Copper Company (the operating end of the International Nickel Company) have since proved the amount of ore of a similar grade to be enormous, certainly 35,000,000. . . . . The Canadian Copper Company also is sinking three compartment shaft to a depth of 500 feet and building a direct railway to Copper Cliff, giving a much shorter connection than the former roundabout route past Stobie and Sudbury. It may be expected that this greatest of known nickel deposits will soon be sending ore to the smelters of the two producing companies, and adding greatly to the available supply of the region."

(To be continued.)

# GRANBY CONSOLIDATED COMPANY'S MINE AT PHOENIX, BRITISH COLUMBIA

By O. E. Leroy.

The production of the Boundary district (including the Osoyoos Mining Division) from 1896 to the end of 1912 amounts to 13,744,338 tons of ore, containing 938,125 ounces of gold, 5,035,953 ounces of silver, and 334,874,378 pounds of copper, having a gross value of $73,312,913. Approximately 60 per cent. of the tonnage was furnished by the mines at Phoenix.

The copper-bearing portion of the Boundary district occupies an area of about 25 square miles, and includes the important centres of Phoenix, Greenwood (Deadwood) and Summit. It was in 1891, following the discoveries at Rossland, that prospecting was actively carried on in the three above named camps. In that year most of the ground subsequently proved to be productive was staked. The low grade character of the ore proved a great disappointment which was partially offset by the discovery that the ore was almost self-fluxing. The field, however, was open only to large companies with financial resources beyond those of the average individual. The two companies at present operating were early in the field; the Granby Consolidated Mining, Smelting and Power Company confining its attention to Phoenix, and the British Columbia Copper Company operating at Deadwood and Summit. The smelter of the former was built at Grand Forks and the first furnace blown in in 1900. Its capacity has been increased from 1,200 tons to between 4,000 and 4,500 tons per day. The latter company commenced smelting at Greenwood in 1901. The present capacity of its furnaces is about 2,600 tons per day.

**Ore Deposits.**—The copper deposits occur at intervals along the edges of zones of contact metamorphism and also at the base of the zones or in some non-outcropping intermediate position.

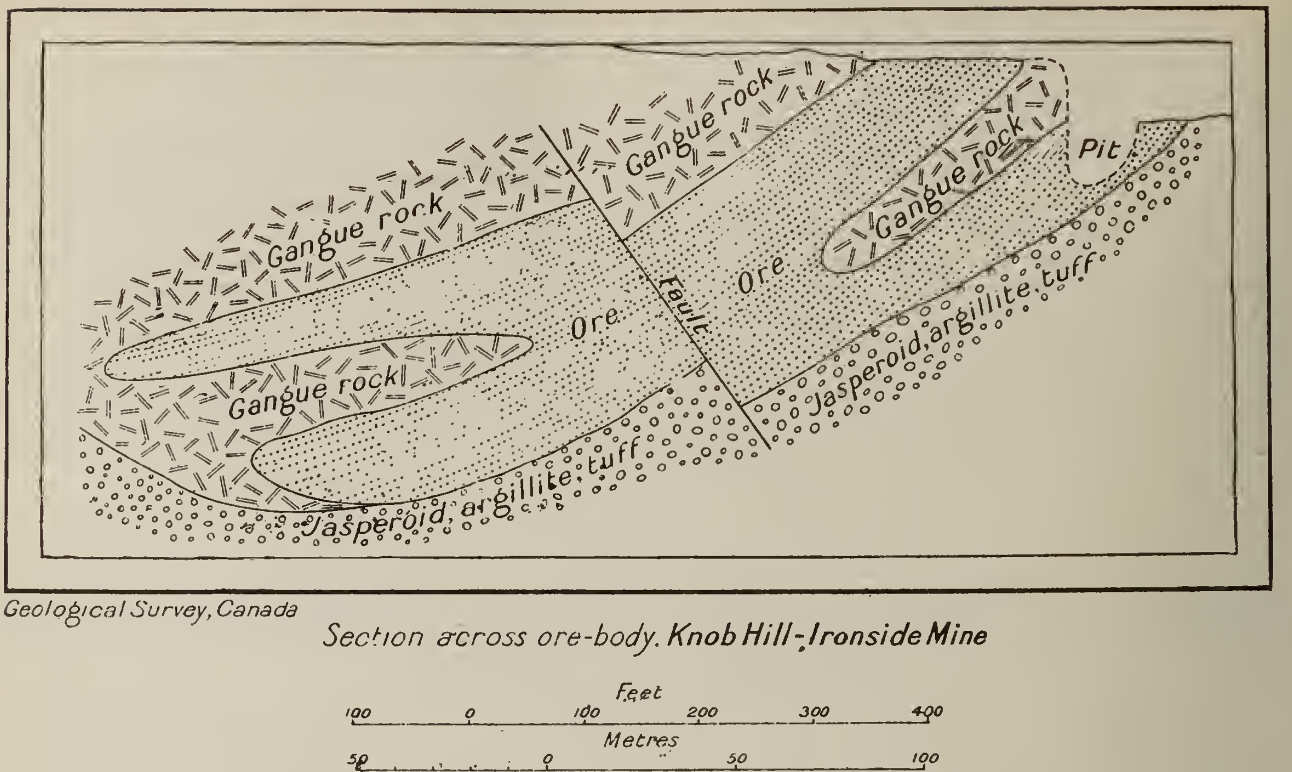
The zone in which the principal deposits occur is horseshoe-shaped. The west limb is 3,200 feet long and 1,000 feet wide, while the east limb is 2,250 feet long and from 350 to 1,000 feet wide. The thickness varies from one foot or so to 350. The floor is jasperoid or in places the siliceous rocks of the Knob Hill group.

**Knob Hill Ironsides Mine.**—The ore body of this mine owned by the Granby Consolidated, is the largest and most typical of the camp. The ore body is composite in character and consists of two lenses which coalesce about their central portions. Along the outcrop these appear as distinct ore bodies separated by a varying thickness of the lime-silicate gangue rock. The western lens is at least 2,500 feet long, from 370 to over 900 feet wide, and from 40 to 125 feet thick. The eastern lens is apparently shorter, but approaches the magnitude of the other in width and thickness. The general strike along the outcrop is about N. 10° E. with dips to the east ranging from 45 to 60 degrees. The dip flattens with depth and on the lower levels averages from 15 to 30 degrees. The general pitch of the ore bodies is about 18 degrees to the northeast. The vertical range from the south end of the main "glory hole" to the lowest working levels is 675 feet. The structural footwall is the jasperoid zone of the Brooklyn formation, and in places, the siliceous rocks of the Knob Hill group. The hanging wall is a purely commercial one and the ore either grades insensibly into barren gangue or terminates sharply against a gouge-filled fissure. The ore bodies and adjacent rocks are traversed by an intricate system of fissures which run in all directions and dip at all angles. They have had a most important influence on ore deposition as they formed channels for the ore-bearing solutions which permitted a uniform distribution of their metallic contents. In many cases the ore adjacent to these fissures is of noticeably higher grade. Some of the fissures have been subsequently filled with banded quartz, calcite and chalcopyrite.

The only displacement noted is along one of the major fissures which faulted the ore body with a throw varying from zero to 120 feet along a dip of 55 degrees to the west.

The ore is mainly massive with local banded areas. It consists of chalcopyrite, which with pyrite and hematite is finely and uniformly distributed through a gangue composed almost exclusively of garnet, epidote, quartz, calcite and chlorite. The pyrite occurs

*Extracts from Guide Book, No. 9, prepared by the Geological Survey of Canada, for Twelfth Session International Geological Congress, August, 1913.



Geological Survey, Canada

*Section across ore-body. Knob Hill-Ironside Mine*

in grains, crystals and streaks, while the hematite (specularite) occurs in platy aggregates. Magnetite occurs in masses and irregular lenses at intervals through the ore bodies, but it is relatively unimportant. The average content of the ore is: copper 1.25 per cent.; gold 0.04 ounces, and silver 0.3 ounce per ton. Along the outcrop the ore has been leached out in part but has produced no noticeable secondary enrichment at lower levels.

The zone of contact metamorphism and the development of lime-silicates is believed to have been the result of metasomatic replacement of limestone by solutions above the critical temperature carrying ferric iron, alumina and silica and consisting mainly of water gas strongly ionized. Epidote and garnet, etc., were formed, and the magnetite was probably formed contemporaneously with them. When the formation of the above was well advanced the character of the solution changed somewhat and chalcopyrite, pyrite and hematite were deposited in and along the numerous minute fissures and cavities in the lime-silicates. Calcite and quartz were the last to deposit and completely filled the remaining minute spaces. In the absence of any direct evidence, as there are no large bodies of igenous plutonic rock in contact with or adjacent to the zone of contact metamorphism at present, it is suggested that these zones were overlain by more or less irregular and thick sheets of granitic rock, and that these were the cause of the metamorphism of the limestone and the source of the mineral bearing solutions. The circulation would thus be descending and lateral and would account for the ore bodies terminating abruptly at comparatively shallow depths either against jasperoid or crystalline limestone. The age of the deposit is referred to as post-Jurassic or the period immediately following the intrusions of the granodiorite batholith of the Boundary district. The ore bodies suffered from erosion in the early Tertiary and are overlain unconformably by Oligocene sediments.

**Method of Mining.**—The ore bodies are mined along their outcrops by large open quarries or "glory holes" and underground by a system of tunnels and shafts. Stoping by the pillar and room method is used entirely below the level of the "glory holes." The development work is based on the information gained by extensive prospecting with diamond drills.

## MICHIGAN MINE MANAGERS REFUSE TO RECOGNIZE WESTERN FEDERATION.

Following a meeting of the mine managers, Saturday, Sept. 20, a reply was delivered to John H. Moffit, federal emissary at Houghton, to offer the good offices of the United States Government in effecting a settlement of the Michigan copper miners' strike. Mr. Moffit made a proposal to the mine managers last Wednesday. The text of his proposal was not made known, but the reply yesterday was to the effect that the mine managers and companies are inflexible in their purposes not to treat in any way with the Western Federation of Miners, not to consider that organization as a party to any proposed arbitration of the present labour trouble.

The text of the reply, signed by every mine manager in the district says:

"Honourable John A. Moffit, special representative U. S. Department of Labour. Dear Sir: The undersigned, being managers of the copper mines of the counties of Houghton and Keweenaw, in the State of Michigan, desire to express to you their most sincere appreciation of your offer of the good offices of the department in bringing about an adjustment of the existing strike, involving part of the mine workers of our companies, submitted to us in yours of Sept. 16.

"The first offer submitted by you begins with the proposition, 'That all of the issues involved in the strike shall be settled by arbitration.'

"The real issue involved in the strike is recognition of the Western Federation of Miners as an organization entitled to represent through its officials, the mine workers of the district. This has been publicly announced in speeches and in print by the officials of that organization themselves.

"In like offers of mediation made by the Governor of Michigan personally and through personal representatives appointed by him and acting by his authority, we have heretofore definitely declined to treat with the Western Federation of Miners, either directly or indirectly. This conclusion was arrived at in the first instance because of the past history of the federation in its operations throughout the mining districts of the west; because it was and is our firm conviction that the domination of the employees of the mining companies by that federation would not be to the best interests of our employees themselves; and because the federation was entirely unjustified in attempting to speak as the representatives of our employees for the reason that, according to our best information at the time of the inception of the strike, confirmed by all the information which we have obtained since then, their number did not exceed twenty-five per cent. of the employees of the companies (and in many instances a much smaller percentage) were members of the organization and the large majority of our employees were not willing to be dominated by that organization.

"It should also be recognized that because of the attitude of the officers, leaders and organizers of the Western Federation towards the mining companies and their officials and employees, there could not be a resumption of mutual relations and good will and confidence between employers and employees so long as the employers or any part of them are under the influence or domination of the federation. This should be apparent from the nature of the teachings and utterances of the officers, leaders and organizers of the Federation, as set forth in their published speeches and in their official publications.

"**Large Force at Work.**—All of the larger mines of the district have resumed operations with a large portion of the normal forces of their employees, who are entirely satisfied with conditions. In the case of the Calumet and Hecla, after deducting from the normal force those who are known to have removed from the district by reason of strike conditions or for other reasons, from 80 to 85 per cent. of its employees have returned to work and are now engaged in their several occupations. Similar conditions (with varying percentages) exist at the other larger mines of the district which are now in operation.

"Under these circumstances it is our judgment that we would be remiss in our duties towards the great majority of our employees if we should take any action which in any manner would recognize the Western Federation of Miners as the representatives of the mine workers or as dictating or dominating the actions of our employees, even to the extent of an arbitration as to their right to recognition or as to any other difference, real or fancied, which the federation may urge.

"For these reasons, among many others which might be mentioned, we must adhere to our position that we will in no manner deal with the Western Federation of Miners, either directly, through mediation, arbitration or in any other way.

"**The Only Demand was for a Conference.**—The only issue involved at the time the strike was called by the Western Federation of Miners was our refusal to enter into any conference with a committee of representatives of the federation. The only demand that was made was for such a conference, with a statement that if we were not willing to meet the officials of the Western Federation of Miners it would be taken as proof that the situation could not be settled peaceably.

"**No Grievances Submitted.**—We have had no other grievances submitted to us in any way, either officially or otherwise. This was not a grievance of our employees, but was a grievance of the federation represented by their officials and organizers from other states, who are entirely unjustified in making any claims to a right to represent the employees of the mines of this district.

"Both of your propositions as submitted by you, involve arbitration or discussion by or with committees, a part of them to be chosen 'By the mine workers now on strike.'

"The mine workers now on strike are those only who are members of the Western Federation of Miners. As above stated, they constitute but a small part of our employees. No method of choosing or appointing arbitrators or committees by 'the mine workers now on strike' could be devised in which such choice will not be the direct choice of the Western Federation of Miners, as such, and with that federation we will have no dealings of any kind.

"It cannot be too definitely understood with relation to the present situation that the mining companies cannot and will not in any manner recognize or deal with the Western Federation of Miners. They do not represent our employees, but, on the contrary, under present conditions, they stand between the employers and the employees as the only bar to a satisfactory and amicable adjustment of all existing differences.

"Because of this situation and without any lack of full appreciation of the efforts of yourself and the Department of Labour, we feel that it is necessary to say to you that we cannot accept any plan of mediation or arbitration between the mine employers and 'The mine workers on strike,' which is but another designation for the Western Federation of Miners.

"But we suggest to you, in view of the situation as above stated, and as it exists in the counties of Houghton and Keweenaw at this date, that if you should use your personal influence and the influence of the Department of Labour to induce the officials, organizers and leaders of the Western Federation of Miners to come to a full realization of the futility of any attempt to secure recognition in this district or retain a standing therein which would permit them to remain as a factor of influence among our employees or any portion thereof, and to withdraw themselves and their influence from the present situation and from the district, there would be nothing in the way of an early adjustment of any differences or grievances, if they exist, between the employers and their employees. In this way and in this way only can the present deplorable condition be remedied or adjusted.

"Since the inception of the strike it has been stated in published speeches of the officials of the Western Federation of Miners that they demanded an eight-hour day, abolition of the one-man drill, and a minimum wage of three dollars per day for all employees. No grievances of that kind were stated or submitted to the companies in any form.

"**As to the working hours**, it may be stated to you, as was stated to Judge Murphy, who was here on a similar mission in behalf of the Governor of Michigan, that for some time prior to the inception of the strike there had been under consideration by the several companies the institution of an eight-hour day for underground employees, so far as that rule could be made practicable. The present strike situation does not alter the intention of the companies in that regard. It is known to the companies that a large number of their underground employees do not want the eight-hour day, and are opposed to it, but we will state to you that if the eight-hour day for our underground employees is desired by them, or a sufficient majority of them, it will continue to be given favourable consideration.

"**The One-man Drill Question** is purely and simply a manufactured grievance. We know it to be the fact that those who operate these drills do not want them abolished. The continuation of mining industry in this district requires the use and application of every modern appliance for the reduction of cost. It is made necessary by the low copper contents of the rock and the expense of deep mining, as compared with higher production of other competing districts. The one-man drill is an economic necessity which has come to stay. The conditions of its use have been prescribed by the Legislature, and the question of its abolition is one which could not be submitted to arbitrators.

"**As to the Minimum Wage Question**, the conditions at the different mines vary to such a large extent that no scale can be adopted applicable to all the different conditions. This has been impossible in the past and will continue impossible in the future, and would be as unfair to the labourers themselves as to the companies.

"We greatly regret that the situation is such as to render the plan of arbitration or of conference with a committee or with representatives of the Western Federation of Miners an impossibility to us. With the elimination of that organization, arbitration or mediation would become wholly unnecessary, as we are convinced that there would be no difficulty in adjusting satisfactorily all questions that might arise between our employees and the respective companies by whom they are employed. Dated at Houghton, Michigan, Sept. 20, 1913."—Mining Gazette.

## PHILADELPHIA MEETING OF MINING CONGRESS.

Manufacturers of mining machinery, rescue and first-aid apparatus and safety appliances, are to be given an opportunity to display their wares before the mining men of the country at a great industrial exposition, to be held under the auspices of the American Mining Congress, in Philadelphia, Pa., the week of October 20th.

This exposition, the first of its kind in America, will be held in conjunction with the annual convention of Mining Congress, and the double attraction is expected to attract thousands of interested men. There is a tentative plan to have a gold mining camp in full operation, with a mill crushing the ore. Horticultural Hall, the biggest place of its kind in Philadelphia, situated in the heart of the city, has been engaged for the occasion.

While the plans are still in embryo, a number of the leading manufacturers have already been approached and have shown sufficient enthusiasm to lead to the belief that all of the space will be taken in a short time and that there may not be enough to take care of all who apply.

A number of the big coal companies that have developed the "Safety First" movement at their mines, are now negotiating for large amounts of space, to show the mining men and the public what they are doing in behalf of their men. These companies will send rescue and first-aid crews, and there is talk of exhibition drills between the various crews. The United States Bureau of Mines will be represented by one of its safety cars and a picked crew of helmet men. The State of Illinois and a number of the big anthracite companies, may send rescue cars for exhibition purposes.

"This exposition will not only be of untold value to the mining men of the country," said James F. Callbreath, Secretary of the Congress, "but it will also show the magnitude of the industry to the entire country. We know that it is a gigantic industry, second only to agriculture, employing directly more than a million and a half men, and with a yearly output of two billion dollars, but the public has never given it the recognition it deserves. The convention which will be held at the same time as the exposition will be the most important body of mining men ever gathered together. The industry has been making great strides in the last few years, and a number of problems have arisen that are to be discussed straight from the shoulder."

The Convention is to be the first get-together affair of all the mining interests of the country, and an attempt is to be made to show the need of a stronger national organization, that will represent all phases of the industry and lead to the placing of the industry in the important place it belongs. Perhaps the leading topic of the Convention will be the new system of mine taxation recently put in operation in some States and being discussed in others at the present time. The West can unite with the East upon this proposition, for Colorado and Arizona have new taxation laws for the mines, and so have Pennsylvania and Michigan. Colorado mining men are claiming that they are doubly taxed, and that their industry will suffer. Arizona is making similar claims, and it is understood that Michigan is very much dissatisfied. An increase in the price of Pennsylvania coal is threatened by reason of the new tax law in that State.

Altogether, the exposition and the convention promise to bring together a great gathering of mining men, and much good is expected from its deliberations.

## RAMBLER-CARIBOO.

A meeting of directors of the Rambler-Cariboo Mines, Limited, was held in Spokane, Washington, U. S.A., on September 10, when reports that had quite lately come from the company's mine manager were submitted. The president of the company, Mr. A. F. McLaine, has been quoted as authority for the statement that the company's net profits are now more than $10,000 a month, with prospects of still better results shortly. The company's silver-lead mine and concentrating mill are in the Slocan district, British Columbia. The mine has been opened to a depth of about 1,425 feet below the apex of the vein, and ore is being stoped on four or five levels down to and including that depth.

## ALBERTA COAL.

The first session of the third Alberta Legislature was opened at Edmonton, Alberta, on September 16. It is noteworthy that in the "speech from the throne," as printed in the newspapers, there was not a single word of reference to the mining industry of the province. Yet, according to statistics supplied to the Canada Department of Mines by Mr. John T. Stirling, Provincial Inspector of Mines, Alberta in 1912 produced 3,446,349 tons of coal, valued at $8,471,126.

# BOOK REVIEWS

**Introduction to the Study of Igneous Rocks**—By George Irving Finlay, Ph.D., Assistant Professor of Geology, New York University—McGraw-Hill Book Co., N.Y.—Price, $2.00, net.

The author aims in this book to select from the large body of observed facts bearing on the identification of rocks with the microscope those which it is desirable for the beginner to get command of in the course of his early studies. The work is intended as an introduction to the exhaustive treatises on the subject.

The title is somewhat misleading. The book contains no description of the mode of occurrence of igneous rocks, no discussion of their origin. Such phenomena as differentiation are not even mentioned. There is no discussion of alterations. The book might better have been designated as an introduction to the study of the microscopical characters of rocks and a quantitative classification.

The determination of the igneous rocks in hand specimens—the means actually in use by nearly all those who study rocks in the field, is dismissed in a rather cursory manner. A careful examination with the hand lens should be recommended as the most readily available means of determination of rocks, and the student should study large collections of properly labelled specimens in order to be able to make comparisons before resorting to the use of the microscope. That the author is overanxious to use thin sections for determinations is indicated by such statements in regard to lavas as this: "If we see laucite we conclude safely that the rock should be put with the phonolites, but otherwise we have no good reason for such a determination."

The chapter on movement of light in crystals is similar to that in several other texts already available.

Chapter IV., The identification of the essential minerals of igneous rocks; Chapter V., Description of the Accessory Minerals; and Chapter VI., The Igneous Rock Types, form the most interesting and original portion of the text. The distinctive characters of the rock minerals are well pointed out and helpful. Brief statements of the composition of the common rocks are given.

The last half of the book contains little material not readily available in other works, being largely a synopsis of chapters from Idding's Igneous Rocks and the Quantitative System of Classification advanced by Messrs. Cross, Iddings, Pirsson and Washington, together with methods of calculating the chemical analyses of rocks.—R. E. H.

---

**General Metallurgy**—By H. O. Hofman, E.M. Met. E., Ph.D., Professor of Metallurgy in the Massachusetts Institute of Technology—McGraw-Hill Book Co.—Price, $6.00, net.

In this work the author has endeavoured to give a general introduction to the study of metallurgy. It is not a treatise on the metallurgy of copper or of iron or of lead; but a discussion of the properties of metals, alloys, metallic compounds, fuels and refractory materials, of metallurgical processes and apparatus of mechanical metallurgical operations and of metallurgical products. It has a place by itself in the literature. There is no other modern text which covers the same field.

The subject is treated from the standpoint of the metallurgist who has a leaning towards physical chemistry. The theory of solutions developed by physical chemists is applied to the study of the metals and alloys. Elementary statements of the theories are given; but the text is not greatly overloaded with information that the student may already have gathered in his study of general chemistry and physics.

Following the shorter introductory chapters on properties of metals, alloys, metallic compounds and ores is a long chapter—236 pages—on fuels. This contains a very instructive discussion of the properties of fuels and methods of determining them. The numerous types of coals and their uses, the methods of coking and of saving the by-products, liquid fuels, gases, gas production and apparatus for burning the fuels are among the numerous subjects dealt with.

Chapter VII. is devoted to refractory materials. Properties and uses of fire-clay, fire-brick, silica, barite, lime, etc., are described.

Chapters VIII., IX. and X. are devoted to pyrometallurgical, hydrometallurgical and electrometallurgical processes and apparatus. The treatment of these subjects is excellent, as an endeavour is made to elucidate principles rather than to describe special methods.

Chapter XI.—350 pages—is devoted to mechanical metallurgical operations. In view of the existence of Prof. Richards' excellent text book on this subject, there seems to be unnecessary duplication here, though recognition of the fact that mechanical methods are of constantly increasing importance to the metallurgist is obtained by treating ore dressing in the same text rather than in a separate one.

Two short chapters are devoted to metallurgical products and economic considerations.

The volume will prove a very useful one and will doubtless be adopted by many teachers who have been looking for a work which deals with metallurgical principles.—R. E. H.

---

## HEDLEY GOLD.

The Hedley Gold Mining Company, operating the Nickel Plate group of mines, Similkameen district, British Columbia, recently declared its customary quarterly dividend and bonus, together 5 per cent., on the issued capital of the company, which is $1,200,000. This distribution of $60,000 makes the total of profits divided in 1913 $180,000. Last year the final distribution of the year was at the rate of 15 per cent., making a total of 30 per cent. for 1912; for December, 1911, it was 10 per cent., and the total for that year was 25 per cent. The 1913 profits are understood to have thus far been higher than in either 1912 or 1911.

---

## GOLD REPORTED NEAR TELKWA, B.C.

Western papers report a new gold strike at Sibola Creek, a tributary of the Tahtsa River, 100 miles southeast of Telkwa, B.C. No official news is yet available. Telkwa is on the line of the G.T.P., and a rush of men engaged in construction work is regarded as not unlikely.

## PERSONAL AND GENERAL

Mr. H. C. Meek, general superintendent of the Dome mine, has returned to Porcupine after an absence of several months.

Mr. E. L. Bruce, who had been assisting Dr. C. W. Drysdale in local geological investigation, left Rossland, B.C., on Sept. 6 for New York City, to resume duty as an instructor in mineralogy at Columbia University.

Mr. Howard W. Du Bois, of Du Bois, Mixer & Armas, Philadelphia, Pa., was at Barkerville, Cariboo district, B.C., at the end of August.

Mr. John L. Retallack has been visiting Similkameen and Tulameen districts, British Columbia.

Mr. C. J. Seymour Baker has returned from London, England, to the Cariboo district of British Columbia, to continue experiments in extracting gold from black sand, on which problem he has been working for several years.

Mr. George L. Fraser has retired from the management of the Columbia Coal and Coke Company, which for several years has been developing a coal property near the lower Tulameen River, British Columbia.

Mr. Desaix B. Meyers, of Los Angeles, California, has been examining the Emerald lead mine, in the vicinity of Salmo, Nelson mining division, B.C.

Mr. Chas. H. Clapp, who for five or six years has done geological work on Vancouver Island, British Columbia, for the Geological Survey of Canada, has gone to Arizona to commence his new duties as Professor of Geology at the University of Arizona.

Mr. Lionel Hill, assistant to the manager for the Le Roi No. 2, Ltd., has returned to Rossland, B.C., from a visit to England.

Mr. Frederick K. Brunton, assistant superintendent at the British Columbia Copper Company's smelting works, has returned to Greenwood, Boundary district, B.C., from Butte, Montana, where he attended the meeting of the American Institute of Mining Engineers.

Mr. Donald G. Forbes, who has been investigating mining conditions in Portland Canal, Queen Charlotte Islands, and other coast districts for the British Columbia Department of Mines, is now giving attention to Valdes Island, which is one of a number of islands lying between Vancouver Island and the mainland of British Columbia.

Mr. E. R. Davidson, of Spokane, Washington, manager for the Eagle Lode Mining Company, recently let a contract for driving about 1,000 feet of tunnel on the company's Eureka group, in Ainsworth mining division, B.C.

H. W. Johns-Manville Co. has opened a new branch at Galveston, Texas. This concern owns asbestos mines at Danville, Quebec.

Prof. Francis A. Thomson, head of the mining engineering department of the State College of Washington, Pullman, Washington, last month made a long trip to the head waters of Crawford Creek, a stream emptying into Kootenay Lake, British Columbia, to examine some copper claims.

Mr. Hamlin B. Hatch has returned to South Porcupine after spending five months exploring and prospecting in the district of Patricia, Northern Ontario.

Mr. W. J. Watson, manager for the Tyee Copper Company, has returned to Ladysmith, Vancouver Island, B.C., from several months' travel in Europe and elsewhere.

Mr. Jas. Ross, president of the Dominion Coal Company, died on September 20, after an illness of two weeks.

Mr. Robt. B. Stewart has returned to Toronto from Alberta.

Dr. Waldemar Lindgren's work on Mineral Deposits is now ready.

Mr. Peter MacLaren, formerly manager of the Scottish Ontario mine, Porcupine, has returned to Tisdale Township to take charge of the property of the Success Gold Mining Company.

Mr. C. W. Wright, manager of the mining interests of Lord Brassey in Italy, who was recently in Western Canada mining districts with the Geological excursion, has returned to Italy.

Mr. Reginald E. Hore has returned from a visit to the Michigan copper mining district.

Dr. Willet G. Miller was given the honorary degree of LL.D. at a special convocation of the University of Toronto, August 14. Friends of Dr. Miller are arranging to present him with an oil portrait of himself as a mark of esteem from the mining fraternity.

The American Mining Congress meets in Philadelphia October 20 to 24.

### JAPANESE COAL BOGEY.

On September 6 "Coal Age," New York, printed as an item of news the following: "Vancouver, B.C.—Public indignation over the forced importation of Japanese coal, as the result of the refusal of the operators to arbitrate the strikes in mines near here, is liable to effect, it is said, the opening of Government mines in Alaska. The mine operators declare that they will import Japanese coal until the strikers return to work, and the owners are being bitterly denounced as responsible for this situation." Occasionally "Coal Age" is unfortunate in its selection of news items relating to British Columbia. Under the circumstances that there are not at any British Columbia port facilities for unloading coal from any sea-going vessel, nor accessible bunkers to store it in if it were unloaded, the alleged "public indignation" is somewhat superfluous. It is probable the freight rate on coal from Rocky Mountain coal fields in Canada would be less than the cost of unloading and storing Japanese coal, so the statement that mine operators threaten to import Japanese coal is only one of the wild allegations of agitators. The Western Fuel Company has arranged to get Japanese and Australian coal shipped to San Francisco to supply its customers there, but that is "a horse of another colour." In this connection it may be mentioned that the Canadian Collieries (Dunsmuir) Limited, which ever since the strike was called last September, has been working its Cumberland mines with non-union men, during the last few days of August and on toward the middle of September had got its output of coal from that colliery up to an average of fully 2,000 long tons a day. On September 8 2,290 tons was produced, and on September 10 2,287 tons, while the daily average for six working days to September 10, inclusive, was 2,014 tons. The general average when conditions were normal, before the strike, was only about 2,100 tons. Then non-union men have gone back to work in the same company's mines at Extension, where production is being resumed, although the electric locomotives having been destroyed by the strikers, the output will necessarily be comparatively small until power haulage facilities shall be restored. It is understood that the Pacific Coast Coal Mines Company intends to resume coal mining without delay at its South Wellington colliery. The Japanese coal bogey, therefore, will soon pass out of the limelight.—E. J., Victoria, B.C.

# SPECIAL CORRESPONDENCE

## COBALT, GOWGANDA, ELK LAKE AND SOUTH LORRAIN

**Draining Kerr Lake.**—Already the draining of Kerr Lake has revealed veins of ore which appear from their surface indications to be likely to reimburse the Crown Reserve Mining Company and the Kerr Lake Mining Company for their trouble. The pumps have lowered the lake more quickly than was anticipated.

Six new veins, which the underground plans do not show below, have been picked up. All these veins show some native silver. The largest of the new veins was found on a point of rock about 150 feet straight north of the old No. 1 shaft. The vein has been traced for 50 feet and runs from two to four inches of two thousand ounce ore. This strike is almost due east and west, and is supposed to be one of the Fleming series. Another series of small veins, three in number, were found just west of the pipe line. The largest of these, nearest the shore, is two inches, and can be traced for several hundred feet in places, showing as a mere crack in the rock. Fifteen feet south is another vein, quite narrow, but traced for some distance, while eight feet further is the third of the series. These veins are immediately north of No. 9 shaft. Further to the west are two other veins, running from mere cracks to two inches in width. Plans will immediately be made to cross-cut these veins from levels that are already being worked under the lake. Until these new ore bodies are more carefully surveyed, it cannot be said with certainty that they are not being worked below, but with the data at present available it does not appear probable. All these leads have excellent possibilities.

It has been found necessary already to move the scow upon which the pumps are placed further into the lake, as the waters are receding much more rapidly than it was at first thought would be the case. The water level has been already lowered sixteen feet, and, as a result, the bay at the Crown Reserve end of the sheet of water is bare. Now one pump has been laid off in order that hydraulicking operations in sluieing off the mud at the bottom may be commenced. The Crown Reserve will sluice off the thick covering of mud which overlays the conglomerate formation, but will not trouble to lay bare the diabase for some time.

**Beaver.**—The quarterly report of the Beaver Consolidated mine shows that the net balance on Aug. 31 was $127,910. A vein, which has been worked with advantage on the 450 foot level, has recently been cut at the 500 foot level, and shows there four or five inches of high grade ore. On the 530 foot level, 52 feet from the No. 3 vein, a new vein was cut two inches wide, of 1,900 ounce ore, and on a branch of the same level is also yielding good ore. On the 460 foot level there is a shoot of ore on the main vein for 400 feet in the drift, and it is holding good in both faces. Other developments are satisfactory. But the main development for the Beaver Company is at the Beaver Auxiliary at Elk Lake, the property they took up under option last year. In the south drift on the vein some remarkably high grade ore is now showing. When the vein was first cut 60 feet east from the new shaft the values were not at all promising, running only a few hundred ounces. But now a rich ore shoot is being worked in the south face, the values running five or six thousand ounces over the width of two and a half to three inches. There is no pay ore in the north face yet. Another interesting vein was cut; but it has not been drifted upon yet. There are still three payments of $5,000 to be made on the property.

**The Lumsden Mining Company**, South Coleman, announces the interesting fact that at the 250 foot level the vein they were drifting upon in the Keewatin also holds good across the contact in the diabase. There have been some very rich but quite short shoots of ore on this vein, but the ore in the diabase runs higher than any previously encountered.

**Bullion Shipments.**—An announced rise of $2.50 per hundred pounds express on silver bullion shipped to London has induced the Nipissing to consign their shipments to New York. The steamship companies state that they have been getting little or nothing out of the freight and intend to raise the price of oversea shipment at the end of the month. If no compromise is arrived at, nearly all the bullion will go to New York, as the slightly better rate allowed by the London brokers will not counterbalance the increase in the express rate. The Nipissing at first did ship all their bullion to New York, as did the Buffalo mine, but they afterwards found it to their advantage to make London their market.

**South Lorrain.**—While the shutting down of the Wettlaufer in a month or six weeks deprives South Lorrain of its only consistent shipper, the good luck experienced at the old Keeley and the Curry has caused a little revival of interest in that outlying silver section. In the Wettlaufer mine the fifth and lower levels are already flooded, and in a month's time the water will be allowed to rise to the 200 foot. Before the winter actually sets in the mine will be closed down tight. While recent reports have been quite pessimistic as to this property, there is a feeling among mining engineers acquainted with the property that the possibilities of the mine have not yet been exhausted.

On the other hand, forty feet of high grade has been opened up on the new strike at the Keeley mine, now being worked by the Associated Gold Mines of Western Australia, of which Dr. Bell is the representative in Canada. This is their first entry into the Northern Ontario field.

The Curry claim, which is being worked by the Pittsburg syndicate, is mining good ore on two levels. Other properties working are the Maidens and the Proudfoot fraction, upon which the late Dr. Beattie Nesbitt once had an option. This latter property is being diamond drilled. The Bellellen has just closed down.

**McKinley-Darragh-Savage.**—The production from the McKinley-Darragh-Savage for the month of August amounted to 212,098 ounces, which is a slight decrease in comparison with the month of July. But the quarter ending in August has been so productive that the McKinley could easily have maintained the old rate of dividend. However, the management does not count on a recurrence of the good fortune in the striking of unexpected high grade ore shoots.

## PORCUPINE, SWASTIKA AND KIRKLAND LAKE

**Hollinger Gold Mines, Ltd.**, is adding twenty more stamps to the mill, making sixty in all. Ground has already been broken. It is understood that the addition is in part intended to accommodate ore from the Dixon property, which the Hollinger Gold Mines is now working.

The gross output for the four weeks ending August 12 amounted to $141,732, and the surplus to $625,202, after paying all dividends, which have just passed the million dollar mark. The approximate average value of all ore hoisted was $18.37 per ton. Based upon the total tonnage of ore and waste hoisted the cost per ton was $2,398.

The principal development underground was the cutting of the main vein at the 425 foot level. It there shows a width of ten feet and a value of $18 a ton. Mr. P. A. Robbins, general manager, reports: "We now have a total of 16 headings advancing in ore, four upon the 100 foot level, seven upon the 200 foot level, 3 upon the 300 foot level, and two upon the 425 foot level. Besides this we are doing a considerable amount of cross-cutting, and during the week have picked up No. 5 vein at the 100 foot level; No. 8 vein on the 200 foot level, and No. 34 vein on the 300 foot level. Thirty-seven drills are working double shift."

**Hughes Porcupine.**—A change is announced in the management of the Hughes Porcupine property in Whitney township. Mr. York has left that company to take charge of the Mine d' Or Huronia in Gauthier township, near Larder Lake. This company has a plant working and a small ten stamp mill on the ground. It will be set up and be operating before the snow flies.

**Bureau of Mines Survey.**—Mr. A. G. Burrows, of the Ontario Geological Survey, and his assistant, Mr. Percy Hopkins, are again in the field studying the country in the vicinity of Sesikinik Lake. This is an extension of the Kirkland Lake field, of which Mr. Burrows made an exhaustive study this summer. The map which is to be issued by the department of the Kirkland Lake area is eagerly awaited.

**The Swastika Mine** has closed down. After doing pioneer work in this particular section of the country for years, the Swastika blossomed out as a full grown mine about two years ago. Mr. Frank Armstrong took an option upon a considerable block of the stock and spent considerable money in developing the mine. There was a good ore shoot on the 200 foot level and above, but below that level exploration has failed to disclose pay ore. The ten stamp mill has not been in operation more than a year. The grade of ore being put through, together with the low extraction possible with simple amalgamation, did not pay current expenses, and so the premier mine of the Swastika section is closed down. The Lucky Cross mine and mill are also both silent. Swastika is now devoid of all activity. Kirkland Lake is, however, quite active.

**Teck-Hughes.**—The Teck-Hughes is doing extensive work at Kirkland Lake, both in sinking and drifting. The No. 1 shaft is now down 226 feet, the veing being in porphyry. From the No. 2 vein, at the 100 foot level, a vein has been cut showing some free gold.

**Wright-Hargraves.** — On the Wright-Hargraves, which is under option to Mr. Cartwright and his associates, ore is being sacked. Sixty bags have been taken off and will be shipped when a full carload is obtained. Most of this has been obtained from the No. 1 vein, which is 350 feet east of the old discovery. An incline shaft is now being sunk and is down about forty feet and a steam plant is in operation.

**Power for the Kirkland Lake Mines.**—Power is one of the prime needs of the Kirkland Lake camp. Tentative offers have been made to the Gold Fields, Limited, for the purchase of their power at Raven Falls, and there is a scheme afoot to increase the capacity of the plant owned by Mr. Pete Farah at Charlton and to run a transmission line from that point.

**Kert.**—The Hon. David Mitford, of London, has taken up the other half interest in the Kert claim in Teck township. Extensive trenching and stripping has been carried out on the property.

**Tough-Oakes.**—It is probable that for the present the Foster-Tough-Oakes Company will be content to mine with their present mill equipment. Good results are being obtained in the drift on the vein at the 100 foot level. The high grade streak is 25 inches wide and ore which will be hand picked for shipment to the smelter is being broken for a width of two feet. Ore is already being bagged for the next carload shipment. The ten stamp mill is only making an extraction of about 57 per cent. of the ore from the dump; but it is paying current expenses at the mine.

**General View of Plant, Swastika Mine, Ont.**

## BRITISH COLUMBIA

### CARIBOO.

**Barkerville.**—Drilling, to test the gold-bearing gravel, has been commenced at the Meadows, below the old Kurtz and Lane shaft, on Williams Creek, Cariboo, by a New York syndicate, the object being to ascertain the suitability or otherwise of the ground for gold-dredging. A Keystone drill, steam-driven, is being used in making the tests.

**Quesnel.**—Announcement has been received of the intention of the Provincial Labour Commission to hold sittings in Cariboo district during September. The dates are: Tete Jaune Cache, 9th; Fort George, 12th, and between 13th and 25th Barkerville, Quesnel, 150-Mile House, Clinton, Lillooet and Ashcroft.

Mr. A. Stewart, resident engineer at Quesnel for the Public Works Department, has arranged to make a tour of inspection of the route of the proposed wagon road between Barkerville and Fraser River—from Bear Lake through to Fraser River, via Goat River.

## EAST KOOTENAY.

**Fernie.**—On August 17 a train consisting of 101 cars of coal and hauled by one locomotive (a Mallet compound), left the Great Northern Railway Company's yards at Fernie, Crow's Nest Pass.

On August 19 the members of the International Geological Congress Excursion C2 were entertained at a smoker at Fernie. In the course of a short address made by Mr. W. R. Wilson, general manager for the Crow's Nest Pass Coal Company, by request of the visitors, that gentleman said that in no mining region where he had been was the science of geology more necessary to the successful prosecution of coal mining than right there in the Crow's Nest Pass, where conditions of the most extraordinary character made the mining of coal from the earth a business on which must be brought to bear every aid that science, skill and experience could afford.

## SLOCAN.

**Silverton.**—Shipments of silver-lead ore and concentrate to Trail by the Standard Silver-Lead Mining Company during August totalled about 1,100 tons. This included some 200 tons of crude ore and 900 tons of concentrate. The zinc concentrate made at the company's mill has been stored latterly; of this product from 500 to 600 tons is made monthly, with the mill running only one shift. This is in addition to the silver-lead concentrate, which is shipped regularly, as far as transportation arrangements conveniently admit. The output of ore from the Standard mine is chiefly from stopes between levels Nos. 6 and 5 and Nos. 5 and 4. The ore body being mined in the latter gives from 7 to 8 feet of clean ore, beside much mill feed ore. The lower stopes, between 6 and 5, also yield considerable ore. No. 7 adit, being driven at a vertical depth of about 300 feet below No. 6, is now in more than 1,400 feet, with 400 feet more to be driven before the face will be under the portal of No. 6. One shoot of ore has been cut by No. 7—lead ore with some zinc—but this working will have to be advanced to about 3,800 feet from the portal before it will be vertically under the ore body being mined between 6 and 5. Preparations are being made to extend No. 8, which is 750 feet vertically below No. 6; the old adit is being retimbered before resuming driving.

## TRAIL CREEK DIVISION.

**Trail.**—Ore receipts at the Consolidated Mining and Smelting Sompany's works at Trail during four weeks ended August 28 were as under.

## BOUNDARY.

**Grand Forks.**—Figures published locally show the Granby Consolidated Company's production of blister copper in 1913, to the end of August, to have been 14,492,997 pounds from 829,979 tons of ore, of which 820,240 tons was from the company's own mines at Phoenix and 8,830 tons custom ore. Largest monthly quantities were those of March, when the quantity of blister copper produced was shown as 2,020,000 pounds, and of ore treated 108,871 tons—107,931 tons from Granby Company's mines and 940 tons of custom ore. August figures are: Blister copper produced, 1,827,300, from 101,722 tons of ore—99,641 tons from Granby Company's mines and 2,081 tons of custom ore.

Shipment of ore from the Union group of mineral claims in Franklin camp, north fork of Kettle River, has been commenced. It is stated that more than 100 tons of ore of shipping grade is on the dump and being sacked for hauling to the present terminus of the Kettle Valley Railway, about 18 miles from Grand Forks. The ore has to be hauled in wagons 28 miles to the railway, whence it is taken to the Granby Company's smelting works. Cost of hauling to railway is given as $15 a ton, and railway freight and treatment charges as $6. Value is in silver and gold. No ore had been sent out in bulk previously, from Franklin camp claims.

### YALE.

**Hope.**—The size of the ore body lately opened in the Aufeas mine, on Wardle Creek, has not yet been determined. So far a width of 26 feet of ore has been proved, but no wall has yet been found. The ore is arsenopyrite, with a little chalcopyrite, and gold is the principal valuable metal it contains.

The old Murphy property, situated on the north side of Fraser River, about one mile above Hope Railway station, has been bonded by A. Beamer and A. E. Raab, of Hope. The original mineral claim was located and development was done on it in the early sixties; later several other claims were located, and now the whole group is under bond. An 800 foot adit, driven long ago, has been cleaned out, and is being extended to connect with an old shaft. The ore is gold-copper of good grade.

### COAST DISTRICT.

**Vancouver.**—A news item published in the Vancouver Daily Province read as follows: "Compromise has been successful in ending the strike at Britannia mines, Howe Sound, which has been in progress since February last, and which affected some 600 men. As a result of negotiations, which have extended over some weeks, notice is given that at a meeting of the local members of Britannia Miners' Union, held on August 27, the strike has been declared off. Notice of this action has been sent to all parties interested."

Shortly afterward the vice-president and general manager of the Britannia Mining and Smelting Company caused the following to be published in Vancouver: "There has appeared in the various papers published in Vancouver a notice that the strike at Britannia mines had been declared off, a compromise having been arranged with this company. So far as this company is concerned, we desire to state that no compromise of the strike has been arranged by nor on behalf of the company, and so far as the company is concerned the conditions are the same as they were in February of this year."

It may be added that in February less than one-half of the 700 men then employed by the company (that being the full number then on the company's pay roll and including Japanese and Chinese labourers employed in railway grading and other surface work, and some 50 white carpenters engaged in erection of buildings), went out on strike at the behest of the local officials of the Western Federation of Miners. Within six weeks the places of miners, shovellers, trammers and other underground men who had struck, were filled, and ever since Easter the company has been turning away men seeking work at its property. Not one of those who struck work has been re-employed, all having been warned when they responded to the call of the Union that it would be useless for them to seek work at the Britannia again, since it would not be given them. The management emphatically denies having made any compromise with or concession to the strikers, nor does it intend to. Its mines are now operated by non-union labour entirely. It is noteworthy that the output of ore for eight months of 1913, to September 1, was approximately 132,000 tons, that quantity having been 11,300 tons greater than for the corresponding period of 1912. The local Union officials blundered badly in calling a strike, and the Britannia members have had to pay the penalty. They were employed by a company financially strong, with years of work ahead of it; they were being paid at the highest rate of wages obtaining at the copper mines of the province; the food supplied to them was the best obtainable, and the bunkhouse accommodation generally better than at most mines; while in provision for recreation, in hospital accommodation and medical attention, and in other matters, the company had done all that reasonable men could expect of it. The chief result of the attempt of Union officials (who over-rated their power to deal as they pleased with the Britannia Company to coerce the company) has been to bring about the establishment of a strong non-union camp at the largest productive metal mine in the Coast district, and this the men who responded to the strike call now realize.

**Nanaimo.**—The Western Fuel Company and the Pacific Coast Coal Mines Company have not conceded the demands of the officials of the United Mine Workers of America, nor have they yet resumed work. A number of fire bosses and others are keeping things in shape at the Western Fuel Company's mines, but the company's headquarters at San Francisco having made arrangements to get from Australia and Japan all the coal it will require to supply its customers in that city, and having as well chartered two vessels to take coal from Puget Sound, Washington, to San Francisco if needed, there is no immediate need for it to attempt to operate its mines here. It is understood the Pacific Coast Coal Mines Company will shortly endeavour to operate its mines at South Wellington. The Canadian Collieries (Dunsmuir), Limited, is resuming work at its Extension colliery; the output of the mines at its Cumberland colliery has latterly averaged more than 2,000 tons of coal a day, which is within one or two hundred tons of the average when things were normal before the labour trouble arose.

### PORTLAND CANAL.

**Stewart.**—By the middle of September the low level adit being driven by the Portland Canal Tunnels, Ltd., within four miles of the town of Stewart, at the head of Portland Canal, had reached a distance from its portal of about 2,000 feet. Assuming that what appears to be the main vein of the fissure zone of the Portland Canal Mining Company's group of mineral claims continues to depth, the calculation made before the work of driving the adit was undertaken was that a distance of 2,300 feet would have to be driven to reach the vein, on its dip, at 620 feet below the surface working known as the Richard cut. On August 25 a 5-inch veinlet of quartz was cut by the adit; the quartz contained a fair proportion of pyrite and a very little galena. On August 28 the face of the adit was in a larger vein of white quartz containing pyrite, and crossing the adit diagonally. This vein has since been proved to be 11 feet 6 inches wide and to be fairly well mineralized with pyrrhotite. The manager reports that while he does not expect the ore from this vein to assay more than a dollar or two, the really interesting question is what will be found at the junction of this vein with the main vein to cut which the adit is being driven. The point of junction is calculated to be about 150 feet south of where, assuming projections to be correct, the adit will enter the main vein.

# STATISTICS AND RETURNS

## COBALT ORE SHIPMENTS.

The ore shipments for the week ending Sept. 20 were:

| | High. | Low. | Tons. |
|---|---|---|---|

# "The simplest, most economical, and efficient screening equipment I have ever seen."

This is the way Mr. Wm. B. Crawford, the chief engineer of the "Carter Coal Company," begins his description of the "MARCUS PATENT-PICKING TABLE SCREEN," which his company has had installed at their Thelma Mine, Coalwood, W. Va. He continues to say :—

"It screens and sizes the coal better than any other type of picker can possibly do it and coal can be picked cleaner and easier than on any other type of conveyor I have ever seen.

"The screens will handle a greater capacity than Standard shakers of equal size, delivering the coal to railroad cars in much better condition. It is well balanced, does its work smoothly, without strain and with about 35% of the power required for Standard shakers. So far we have not been able to locate any weak points in the equipment."

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

# DEPARTMENT OF MINES GEOLOGICAL SURVEY.

## PUBLICATIONS

**The Geological Survey has published maps and reports dealing with a large part of Canada, with many local areas and special subjects.**

A catalogue of publications will be sent free to any applicant. A single copy of a map or report that is specially desired will be sent to a Canadian applicant free of cost and to others at a nominal price. The applicant should state definitely the precise area concerning which information is desired, and it is often of assistance in filling an order for a map or report if he states the use for which it is required.

Most of the older reports are out of print, but they may usually be found in public libraries, libraries of the Canadian Mining Institute, etc.

### REPORTS RECENTLY ISSUED:

CANADA

1085. Descriptive Sketch of the Geology and Economic Minerals of Canada. Accompanied by a geological and mineral map of Canada, by G. A. Young and R. W. Brock.

NEW BRUNSWICK and NOVA SCOTIA

1165. Memoir No. 18. Bathurst District, New Brunswick, by G. A. Young. Maps not yet published.

QUEBEC

1186. Memoir No. 35. Reconnaissance along the National Transcontinental Railway in Southern Quebec, by John A. Dresser.

ONTARIO

1160. Memoir No. 17. Larder Lake District, Ont., and Adjoining Portions of Pontiac County, Quebec, by Morley E. Wilson.
1242. Memoir 33. Geology of Gowganda Mining Division, by W. H. Collins.

NORTH WEST PROVINCES

1204. Memoir No. 24. Preliminary Report on the Clay and Shale Deposits of the Western Provinces, by Heinrich Ries and Joseph Keele.
1220. Memoir 29. Oil and gas prospects of the Northwest Provinces of Canada, by Wyatt Malcolm. Map not yet published.

BRITISH COLUMBIA

1175. Memoir No. 21. The Geology and Ore Deposits of Phoenix, Boundary District, B.C., by O. E. LeRoy.

YUKON AND NORTH WEST TERRITORIES

1228. Memoir No. 31. Wheaton District, Yukon Territory, by D. D. Cairnes. Maps not yet published.

### MAPS RECENTLY ISSUED:

CANADA

1042. Mineral Map of Canada. Scale 100 miles to 1 inch.
1277. Map 91A. Geological map of the Dominion of Canada and Newfoundland. Scale 100 miles to 1 inch.

NOVA SCOTIA

1133. Map 13A. Kingsport sheet, Nova Scotia, No. 84. Scale 1 mile to 1 inch.
1208. Map 53A. Southeast Nova Scotia. Scale 4 miles to 1 inch.

NEW BRUNSWICK

1181. Map 35A. Reconnaissance Map of Parts of Albert and Westmoreland Counties, N.B. Geology and topography. Scale 1 mile 1 inch.

QUEBEC

1178. Map 32A. Larder Lake and Opasatika Lake, Nipissing, Abitibi and Pontiac, Ontario and Quebec. Geological. Scale 2 miles to 1 inch.

ONTARIO

1177 Map 31A. Larder Lake, Nipissing District, Ontario. Geology. Scale 1 mile to 1 inch.
1244. Map 64A. Advance geological copy of map of Gowganda Mining Division and vicinity. Scale 1 mile to 1 inch.

ALBERTA

1132. Map No. 7A. Bighorn Coal Area, Alberta, by G. Malloch. Scale 2 miles to 1 inch.

BRITISH COLUMBIA

1260-1276. Maps 74A-90A. Geology of the Forty-ninth Parallel. Geology and topography of the International Boundary between British Columbia and the United States. Scale 1 mile to 1 inch, contour interval 100 feet.
1237. Map 62A. Nelson and vicinity, British Columbia. Geology and topography. Scale 1 mile to 1 inch. feet

YUKON and NORTH WEST TERRITORIES

1089. Map 9A. Explored Routes on parts of the Albany, Severn and Winisk Rivers. Scale 8 miles to 1 inch.

NOTE.—Maps published within the last two years may be had, printed on linen, for field use. A charge of ten cents is made for maps on linen.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon. Letters and samples that are of a Departmental nature, addressed to the Director, may be mailed O.H.M.S. free of postage.

***Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.***

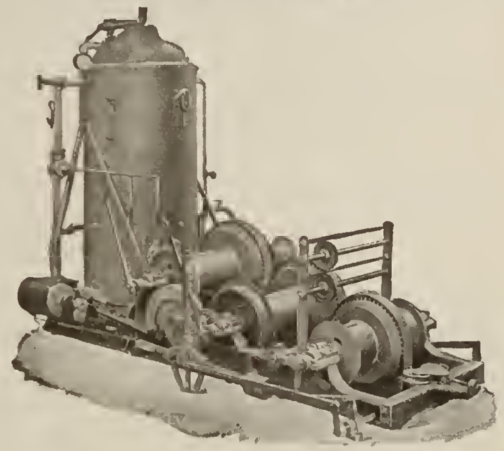
# "BEATTY HOISTS"

**STEAM OR ELECTRIC.**



**Standard Two-Drum Hoist with Swinger.**

This represents one of many types we are prepared to furnish on short notice. Proof of their being built right and giving satisfaction, lies in the fact that a large portion of our business is made up of repeat orders.

If interested in a Hoist, Williams Faivrette Clamshell, Steel Derrick, or Centrifugal Pump, drop us a line—we'll send full particulars.

# Amatite ROOFING

## For Mine Buildings

IT'S the one ready roofing that is not affected in the slightest by coal smoke or acid fumes. It is made of the same waterproofing materials as are used in Barrett Specification Roofs which are so popular on railroad round houses, where the coal smoke and condensing steam cause even more severe exposure than on mine buildings.

Amatite Roofs can be laid without skilled labor, and once laid they require no painting or similar attention.

The wearing surface is practically a pitch concrete and naturally immune from rain, snow, sun or frost.

Amatite is sold in handy rolls. Nails and liquid cement supplied free.

*Send for free sample and booklet to our nearest office.*

## ONTARIO MINERAL OUTPUT INCREASING

The report of production of Ontario mines and works for the first half of the year, prepared by Mr. T. W. Gibson, Deputy Minister of Mines, shows notable increase in total output of metals. There was a slight decrease in silver from Cobalt district; but a large increase in gold from the Porcupine mines. The satisfactory condition of the nickel industry is told by the substantial increase in output of Sudbury mines.

For several years Ontario's total output has shown an increase, and 1913 bids fair to set a new record.

The Cobalt district may be expected to yield less silver than in 1912, and unless some remarkable discoveries are made, there will be a further falling off next year. The very rich ore forms a smaller and smaller percentage of the production of the district It is to be expected, however, that Cobalt will be a very large producer of silver for many years to come.

The Porcupine district is by far the most important producer of gold that has yet been found in Ontario. 1913 will go on record as the first in which Ontario has produced a very large amount of the precious metal. Next year there will probably be a considerably larger production, provided, of course, that labour troubles are avoided.

There is also good reason to expect an increase in output of nickel and copper, as the operating companies are finding a satisfactory market and are preparing to enlarge their plants.

The output of iron is still small, but has increased greatly during the past few years.

## THE GEOLOGICAL CONGRESS EXCURSIONS

It was expected from the announcements describing the excursions to be taken during the summer, that these trips would prove of extraordinary interest to both visiting geologists and to Canadians. Such proved to be the case. Places of special geological and mining interest all across the continent were visited under unusually advantageous conditions. The Dominion and Provincial Governments aided liberally and the transportation companies did their part in a way which won for them much praise.

To the Department of Mines of Canada and to the mining departments of the governments of Ontario, British Columbia, and Quebec belongs most of the credit. The numerous members of these several departments all assisted. Mr. W. S. Lecky, secretary of the Congress, did an enormous amount of work, and did it well. President F. D. Adams, Dr. A. E. Barlow, Dr. A. P. Coleman, H. E. T. Haultain, G. G. S. Lindsey, J. McEvoy, Dr. W. A. Parks, J. B. Tyrrell, T. L. Walker and several others shared the work with the government officials.

The members who visited Canada for the first time were apparently much surprised to find our country so large and our resources so great. Those who have been here before were amazed at the wonderful growth of the past few years. These men will return to their several countries to tell what they have seen and Canada will be better known to the large number of men reached by the reports of our distinguished visitors.

To the Canadian geologists the comments of the visitors on what they saw, the descriptions of similar phenomena in other places and the theories advanced to explain them proved very interesting and useful. Large numbers of specimens were gathered and carried home to laboratories in several parts of the world. The study of these and of the literature and the new interest which the visitors now have in Canadian geology will all help us to interpret the geology of our country. The guide books and maps prepared for the excursions are in themselves a very important contribution to the literature, and will long be useful to those who visit the chief points of interest along the main lines of the railroads and in the mining camps.

## WESTERN FEDERATION STRIKE IN MICHIGAN

The Michigan copper mines are again in operation; but with reduced forces. A few of the mines which were having considerable difficulty in making receipts equal expenditures are still idle, and will probably not be worked for some months. The members of the Western Federation of Miners still refuse to go to work, and the miners at work are all non-union men.

The output of copper is as yet far from normal, but the production shows a gradual though slow increase. The Calumet and Hecla Mining Company has a large number of men at work. The other companies have a comparatively small percentage of their usual working force, and some mines are only able to make a very small daily output.

It is evident that the mines can be operated without the union members and, if the law is enforced, they will be. Since the laws do not compel the operators to recognize the officers of the union as representatives of their employees, the strikers are endeavouring to gain their ends by ignoring the laws. In this they have received considerable encouragement from the actions of the civil authorities.

Every day strikers have endeavoured to prevent miners from going to work. Sometimes they do so by peaceable means, by arguments and by parades made for the purpose of impressing the public with the number of men on strike. To such methods there can be little objection, as everyone recognizes that the strikers should be permitted to use any reasonable means of adding to their numbers.

Frequently, however, and almost daily, the strikers resort to violence and to intimidation by threats. Day after day the workmen have been subjected to insults. Serious conflicts have been time and again averted only by the activity of the soldiers and deputies. Scores of arrests have been made; but, in spite of the fact that the men were taken in the act, nearly all have been freed without punishment. Every such case encourages the strikers to commit further disorders and they are apparently beginning to believe that the laws will not be enforced against them. Recognizing that the local authorities were unable to cope with the situation, Judge O'Brien issued an injunction prohibiting interference with the workmen. A few days later, however, he dissolved it on a technicality and then refused to grant a restraining order to prevent violence and intimidation by threats.

The strikers during the period that the injunction was in force, were comparatively quiet and the workmen were not seriously annoyed. Within a few hours of the dissolution of the injunction, however, the disorder broke out again. The strikers were apparently under the impression that the dissolving of the injunction meant also that the common law was suspended. The workmen were again subjected to forcible interference. Men unconnected with either party were fired on while passing on the public highway. A party of mine guards was met by a fusilade of shots. Finally, last week, one of the deputies was murdered.

Fortunately at this stage the Supreme Court of Michigan ordered Judge O'Brien to show why an injunction should not be issued and in the meantime to put it into force. It is hoped that this action will prevent serious bloodshed.

Throughout the strike there has been practically no discussion of grievances. It is merely a struggle between the owners of the properties and the officers of the Western Federation of Miners. Naturally the owners wish to run their own properties.

The strikers have grievances. They want higher wages, shorter hours, and improved conditions. Some do not want to use the one-man drills.

The average wage paid in Michigan copper mines is comparatively low. A common wage is from \$70 to \$80 per month. There are, of course, many miners making higher wages. Many of those using one-man drills make over \$4, and some over \$5 per day. It is rather peculiar that a demand for higher wages should be made along with one for the abolition of the one-man drill.

Many of the men employed in the copper mines have had very little or no previous experience as miners. Considering their lack of experience it is not surprising that they do not receive high wages. Men of this class are chiefly employed as trammers and earn about \$65 per month. The work is hard; but rests are frequent. Industrious trammers of good physique after a little experience receive much higher wages. Some average \$90 per month.

In a recent statement, President Agassiz says that the pay rolls of the last full month of the Calumet and Hecla show that the miners were receiving an average wage of

$3.66, and the trammers $2.89 net after deductions for medical assessment, etc.

While the wages are lower than in many mining districts, there are advantages which offset this to a considerable degree. The mines are worked regularly, even in periods when the price of copper is very low. The mines are dry and well ventilated. The companies provide houses at low rentals, good schools, hospitals and libraries. Some men do not place a high value on these things, however, and in making comparisons neglect them altogether. They want to make a lot of money by working hard and are willing to live under less favourable conditions in order to attain their end. To such men especially do the wages seem low.

As a matter of fact, men who are willing to work hard are able to earn very high wages by using a one-man machine and working on contract. If they are given two-man machines and less industrious or less experienced partners they cannot make as good wages. Neither man works as hard and the one heavy machine cannot do nearly as much work as two light machines in the character of rock that is being mined in Michigan.

The contention of the strikers, or rather of the officers of the Western Federation, is that there should be a minimum wage, and that the one-man drill be abolished. This is equivalent to asking the managers to ignore the differences in ability of the workers and to pay wages according to number of men employed rather than to amount of work done. Such practice would evidently soon lead to financial ruin, and the mine managers are not likely to make any such agreement with the Federation or with anyone.

The wages paid must depend largely on the profits from mining. The profit depends on the price of copper and on good management. To keep down the costs the managers are constantly endeavouring to find better machines and better methods. The adoption of these results in larger profits and, therefore, in the possibility of increasing wages. It is the desire of all managers to reduce the hours of labour and increase the wages. To do this in the face of a low price for the product means that there must be increase in efficiency. When the strikers realize, as the men at work realize, that the interests of employer and employee are the same, they will have made a real step forward in their campaign for a larger return for their labour.

## IRON DEPOSITS OF QUEBEC

The Bureau of Mines of the Province of Quebec has in preparation a work by Mr. E. Dulieux describing the iron ore deposits of the province and their possible utilization. In the reports on mining operations for the years 1911 and 1912, Mr. Dulieux describes most of the deposits and this work will furnish the basis for the more elaborate report.

The iron production of Quebec in recent years has been very small. A little bog iron ore has been mined and used in local furnaces; but the report for the year 1912 shows no production whatever.

It is to be hoped that the publication of Mr. Dulieux's monograph will direct more attention to the ore deposits.

## WESTERN OIL AND GAS FIELDS

A memoir is being prepared by Wyatt Malcolm, of the Geological Survey, to lay before the public what is known regarding the oil and gas possibilities of the northwestern provinces of Canada.

There are large areas of formations in which oil and gas may be reasonably expected to exist. Comparatively little has yet been done to test the possibilities.

There are a few areas already proven. At Medicine Hat and Bow Island gas has been found in paying quantities. Prospecting for oil has as yet met with little success.

The development of the West is creating a splendid market for oil and gas. The gathering together of all the available knowledge will aid exploration and will be much appreciated by those who are searching for commercial deposits.

## MINE TAXATION

One of the leading topics for discussion at the meeting of the American Mining Congress at Philadelphia during the week of October 20 will be taxation laws for mines. Colorado, Arizona, Pennsylvania, and Michigan have new systems of taxation. Many mining men claim that they are overtaxed under the new systems and considerable airing of views is expected.

The system of taxation introduced by J. R. Finlay in his appraisal of the mines of Michigan resulted in much criticism; but in a re-appraisal of the mines in 1913, Mr. R. C. Allen, Director of the Michigan Geological Survey, has shown that the system, modified somewhat, is reasonably fair to the mine owners if the appraiser has time to acquire an intimate knowledge of the character of the ore bodies and the costs of mining and marketing the ore.

Mr. Finlay bases his calculation on three factors: average cost, present prices, and an estimate of future life. The third factor is determined partly by developed ore and partly by assumption of continuance of known ore bodies beyond the bottom levels of the mines. The assumption for continuance is based mainly upon the extent to which the continuity of the deposits has been proven for the district and for the type to which the mine belongs.

The third factor to be properly applied must be used only after careful study of the structural features of the ore bodies. The Michigan Tax Commission has consequently asked the Director of the State Geological Survey to make the estimates. During the past summer this has been done in the Michigan iron districts and the results are regarded as very satisfactory.

It is intended that the Geological Survey shall annually revise the estimates. The revision, compared with the first estimate, will be comparatively simple, and a more accurate record will be obtained than is possible by the more costly special commissions.

## HOLLINGER DIVIDENDS

Hollinger Gold Mines, Limited, in the period January 1 to September 9, of this year, made a profit of $1,139,267. Shareholders have during the past year received $1,170,000. The mine is reported to be in good condition and the cost per ton has been lowered.

The good record of the Hollinger is all the more noteworthy because of the fact that operations were seriously interfered with for some months by a strike ordered by officers of the Western Federation. The strike was quite unsuccessful; but the industry suffered considerably from the activities of the agitators.

## MINING WORLD INDEX

The publishers of the Mining and Engineering World, Chicago, have issued the third volume of an index which has proven very useful to those who have occasion to refer to the literature on mining subjects. This third volume covers the half-year period, January to July, 1913. The compilation of such an index means a great amount of work, and the editors are to be congratulated on its comprehensive character, simplicity of arrangement and early appearance. For ready reference to the current literature it is invaluable.

# COPPER ORE IN ALBERNI DISTRICT, B.C.

Copper ore in Alberni district is to receive attention, the Ptarmigan Mines Co. having been organized to prospect and develop mineral claims in the vicinity of Great Central Lake. Seven years ago Mr. Herbert Carmichael, Provincial Assayer and Assistant Provincial Mineralogist, visited that part of the island and made a report which was printed in the Annual Report of the Minister of Mines for 1906. The following was his introductory account of what he saw there: "Considerable bodies of ore having been reported to exist at the head of Great Central Lake, Alberni district, it was decided to make a preliminary examination of that region, which was done toward the end of August, 1906. Great Central Lake can now be reached with ease from the town of Alberni, a distance of 12 miles, by wagon road, the elevation of the lake being 200 ft. above the sea. This inland sheet of water presents the same physical features as do the inlets which indent the west coast of Vancouver Island, the mountains rising abruptly from the water, with here and there a valley extending back for a considerable distance, the most important valley being that extending to Ash Lake on the northeast. The general length of the lake is east and west, and it is about 25 miles long by a mile or so wide. At its western end two creeks flow in, heading from mountains still farther to the west. A trail from the lake follows the more northerly of these creeks on a gradual ascent for a distance of ten miles until it ends in a basin, shut in by high mountains, the basin having here an elevation of 1,500 ft. above the Great Central Lake and 1,700 ft. above the sea. To the south a precipitous bluff rises 2,075 ft. high, from which pours a considerable stream of water that barely touches the rocks until it reaches the bottom, breaking into a mass of spray in its descent. The ascent of the bluff requires stout muscles and the aid of the small bushes which cling so tenaciously to the clefts in the rock. On the top there is a small rocky plateau or basin enclosing a lake about half a mile long by a quarter wide, the elevation of the lake being 3,350 ft. above the sea. This mountain lake, situated in the heart of Vancouver Island, with snow-clad mountains rising 2,000 ft. above it, and the blue crevassed glacier of the 'Nine Peaks' showing up to the south in the morning sun, forms a beautiful scene."

After having given some particulars of the Big Interior group of seven mineral claims, Mr. Carmichael summarized as follows: "The mineralized zone, showing in the face of the cliff to the north of the basin and forming the great mass of low-grade mineral on the property, is so large, so inaccessible, and the mineralization so scattered, that it would be impossible to obtain anything approximating an average general sample of the exposure without the expenditure of time and money not justifiable under the circumstances. However, at the foot of the cliff, there is a talus extending the whole length or width of the mineralized zone, made up of material broken away from the whole face of the zone in question. While this talus may to a certain extent have been affected by weathering, it still may be considered a very approximate sample of the inaccessible cliff. Samples were taken from this talus, from which it is judged that approximately the central portion of the mineralized zone will assay from 0.5 to 1 per cent. copper, with from 1.5 to 2 ozs. of silver per ton, and a trace of gold. This value extends over a width of about 1,500 ft., while to the right the mineralization gradually fades off into the country rock. To the left of the mineralized zone is what has been called, for purposes of designation, the 'brecciated zone,' and which is merely a continuation, to the left, of the mineralized zone which has here been subjected to a crushing due to movement, and in which the interstices between the fragments of the rock have been filled with secondary minerals, chiefly calcite, with some carbonate of copper forming a secondary enrichment. This secondary enrichment has taken place, as would be expected, along defined channels, producing streaks of higher-grade mineralization often forming commercial ore. Here, again, no general sampling was possible, although a tunnel has been driven for some 31 ft. into the bluff it was found impossible to examine the face of the cliff for ten feet on either side of the tunnel mouth. The mineralization just described, and which forms the great bulk of visible mineralization on the property, is admittedly very much diffused through the rock, and is, consequently, so low-grade as to be of value only if found to be amenable to some form of concentration, and of which there seems to be a fair probability."

# ASBESTOS MINING IN QUEBEC

By Reginald E. Hore.

**Asbestos veins in peridotite, Black Lake, P.Q.**

Quebec is the world's chief source of asbestos. This material, being the best fireproofing material known, is in constantly increasing demand, and the industry has in recent years become a very important one. During 1912 the asbestos mining companies in Quebec employed 2,910 workmen, paid wages amounting to $1,377,444, and produced asbestos valued at $3,059,084.

The production from other countries is comparatively small. Russia is the chief producer outside of Canada. Most of the Russian asbestos is used locally or exported to Germany. A little reaches the United States and enters into competition with the Canadian product. The United States is the chief manufacturer of asbestos products and depends on Canada for the raw material. The Canadian exports of asbestos during the year 1912 were reported by the Dominion Customs Department as 88,008 short tons valued at $2,349,353. Of this quantity 71,426 tons was shipped to the United States, the remainder going chiefly to England, Germany and France.

The following table from a report by Mr. J. S. Diller, of the U.S.G.S. shows Canada's pre-eminent position as producer of asbestos:

**Asbestos vein in peridotite, Black Lake, P.Q.**

**The asbestos is the thin central portion only. It is enclosed by serpentine.**

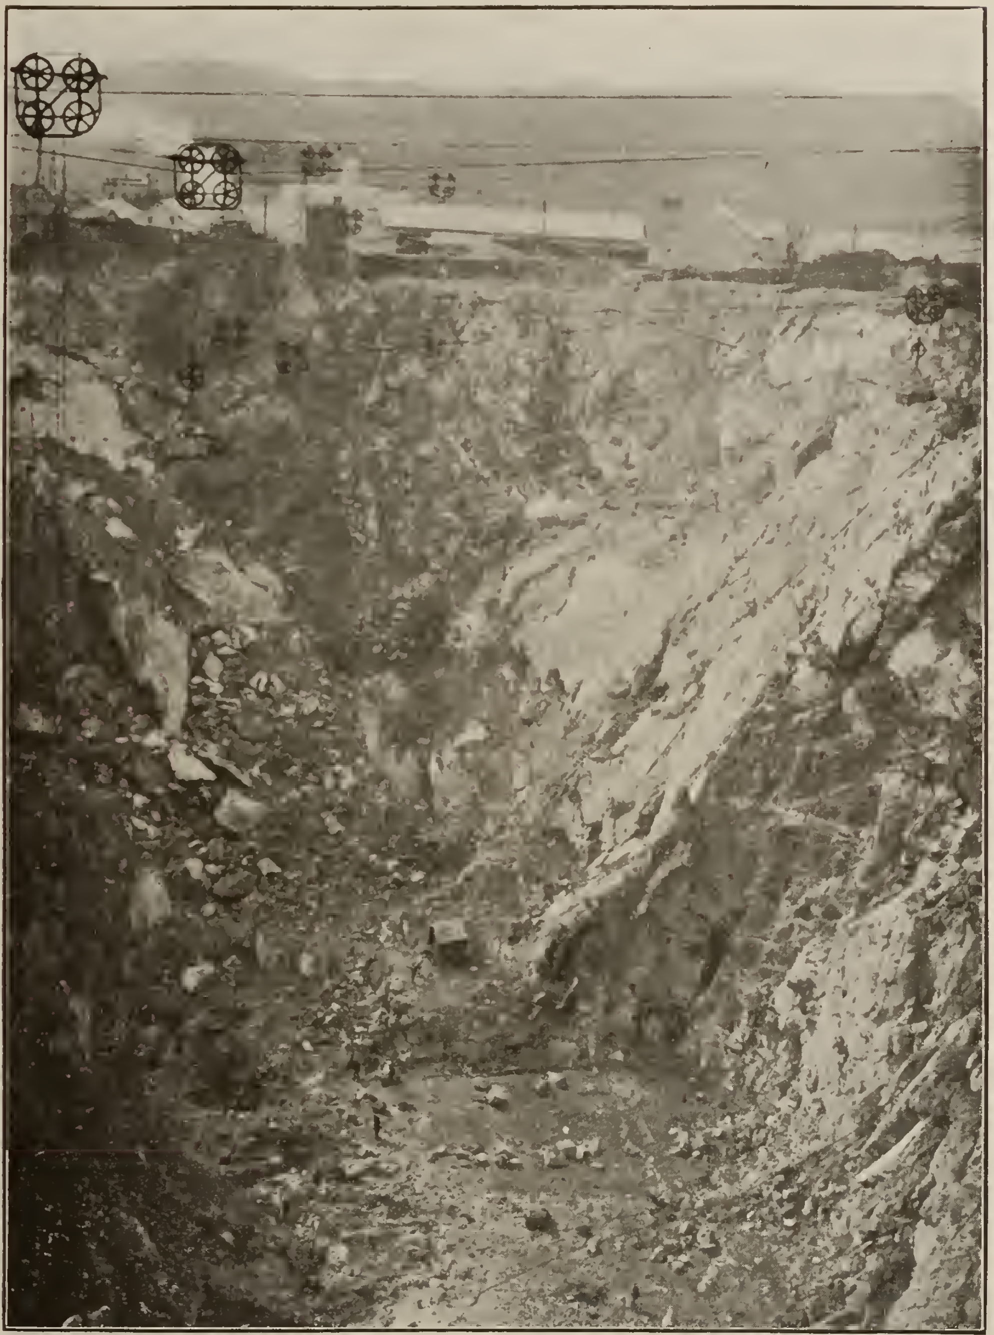
**Asbestos mining at Thetford, P.Q.**

**Showing method of raising asbestos from open pits. Mill at left under characteristic dust cloud.**

Canada's asbestos mines are located in the Eastern Townships, Province of Quebec. The chief producers are at Thetford, Black Lake, Danville, and East Broughton.

The asbestos occurs in thin irregular veins traversing masses of serpentine rock. The veins are seldom more than two or three inches thick, though occasionally they are five or six inches thick for short distances. The asbestos is of a variety known as chrysotile. It is finely fibrous and has a silk-like lustre. The fibres are arranged transverse to the walls of the vein and are hence very short. Frequently the fibres extend from wall to wall and hence have a length equal to the thickness of the vein—a few inches. Commonly, however, there is a parting in the thin vein and then the fibres are even shorter—extending from the parting to either wall.



**Asbestos Mining at Thetford, P.Q.**

## Method of Mining Asbestos.

As the thin veins traverse the rocks in all directions and do not continue for great distances it has not been found possible to mine the veins individually. The practice is to break the rock containing veins and then sort out the asbestos from the waste rock. Usually the veins are not confined to a narrow zone; but extend in all directions through masses of serpentine. Hence the openings made in mining are very large and it has been found advisable to do most of the mining, or quarrying, as open cuts. At one property some underground work has been done; but most of the production is from open cuts such as those illustrated in the accompanying photographs. It will, therefore, be evident that the production varies with the weather. In winter, comparatively little work is done.

Lying on the asbestos bearing rock there is a deposit of soil varying in thickness. At Thetford it is about 15 ft. thick. It is removed either by steam shovels or by hand shovels, loaded into cars and drawn away.

When the overburden has been removed the rock is broken down in a series of benches by the use of dynamite. Machine drills are used in most of the mines, but hand drilling is the practice at some of the smaller properties.

The broken rock is sorted and the best quality of asbestos, known as long fibre, is picked out by hand. Rock containing short fibre and all the fine material is sent to the mill. The remaining rock is piled on the waste dumps.

To hoist the ore from the pits cable derricks are used. A rope is stretched across the pit and a carrier is sus-

pended from the rope along which it travels by a system of pulleys as may be seen in the accompanying photograph.

**Hand-Cobbing.**

At the mills the higher grade mine product is broken up by hand. Heavy hammers are used to break the rock. The fibre thus separated from the rock is cleaned by girls using smaller hammers. The product from hand-cobbing is the asbestos known as 'crude' and is ready for the market.

**Mill Treatment.**

The discards from the cobbing sheds and the rock sent directly from the mine to the mill are treated mechanically. The material is first dried by exposure to the air, by steam pipes or in rotary dryers. The rock is then first crushed in jaw or gyratory rock-breakers, and then by rolls or in machines known as fiberizers and cyclones.

The material from these machines falls on a screen and the fibre is picked up by the suction produced by a fan. The fibre is then classified by treatment on grading screens into long and short fibre.

## DUTY ON LEAD AND ZINC

A press despatch from Washington, D.C., states that in connection with the United States Tariff Bill, representatives of the Senate and House in conference have agreed to an adjustment of differences in regard to duties on lead and zinc, as follows: House representatives receded from their position requiring a rate of one and a half cents a pound duty on lead and accepted the Senate's rate of three-fourths of one cent a pound. Senate representatives yielded to the decision of the House that the rate on zinc ore be ten per cent. instead of twelve and a one-half per cent., as asked by the Senate.

# DEVELOPMENT OF THE ASBESTOS MINING INDUSTRY IN QUEBEC*

By Fritz Cirkel.

The use of asbestos can be traced back to ancient times. The Romans drew their supplies from the Italian Alps, and even from the Ural. They imagined it to be of vegetable origin; the highly silky appearance and unctuous feel giving them the impression that it was an organic substance.

It is said that cremation cloth, in which dead bodies were enwrapped to be consumed by fire, was made of asbestos. It appears, however, that the high cost of making this asbestos cloth militated against its general use. Pliny refers to it as a rare and costly cloth—"linum vivum—the funeral dress of kings" he calls it; evidently assuming that it was of vegetable origin. The fibre used came from the Italian Alps and was called "amianthus." It was apparently very difficult to spin, on account of its shortness; but judging from a piece of asbestos cloth on exhibition in the Vatican, and which is said to have originated in the days of ancient Rome, it is certain that vegetable fibre was intermixed with the real asbestos fibre in the making of so-called asbestos cloths. There is, moreover, according to Sir E. J. Smith, in the library of the Vatican, a winding sheet of Italian asbestos, which, although very coarsely made, is of a very soft and silky texture. This piece of cloth—perfectly preserved—was, together with some ashes, found in a sarcophagus in the Via Praenestina in 1702. It was subsequently placed in the Vatican Library by order of Clement XI. It appears that some vegetable fibre was used with real asbestos fibre in the making of the cloth; because it is reported that, when fire was applied at one end of the cloth, it burned with brightness, but leaving the real mineral fibre intact.

When Marco Polo was travelling in the thirteenth century through Siberia—at that time known as the Great Empire of Tartary—he was shown some cloth that withstood the action of fire. Marco found that it was made of a fibrous mineral called "amianthus," which resembled the Italian asbestos. Upon further investigation he found that the ore from which this fibre was extracted was first dried and then pounded in a mortar. After the impurities had been eliminated, the pure silky fibre left was used in a spinning process, the modus operandi of which is unknown. The fibre referred to in Marco Polo's travels, was long, beautifully white and silky; and probably belonged to the variety known to-day as "hornblende asbestos." This same variety is found in Corsica. Before its real value became known, it was used as a packing tow, and Dana reports that Dolomiea when packing up minerals for his collection on that island, used it in tying the boxes.

That asbestos was used in ancient times as lamp wicks is recorded by Plutarch, who called them "perpetual"; for the reason that the wicks never seemed to wear out. These lamps were principally used by the Vestal Virgins. The wicks, made of delicate asbestos fibre, formed small tubes through which the oil passed, while the wick itself remained intact. Pausanian mentions a lamp that was filled with oil only once a year; he evidently attributes to the oil what should have been credited to the wick—which was not consumed at all. He notes that the wick was made of "Carpasian" linen, referring to a mineral fibre obtained from Carpasius in Cyprus. It is said that Kirchner, the German philosopher, used in his library a lamp which had a wick made of "amianthus." Whatever the uses of asbestos may have been in days of old, it is certain that its peculiar non-combustible and spinning qualities were recognized and taken advantage of from the first; but it remained for modern times to make the mineral of commercial utility and an important factor in the industrial market of the world.

Although the discovery of this mineral is attributed to the Romans, who, as already related, mined it in a small way in the Alps, the knowledge of its existence—which may not have been more than local—apparently lapsed. Only in a few instances is it mentioned, or its utilization referred to in the literature of the middle ages. It appears that in the year 1720, asbestos was discovered in the Ural Mountains; and forty years later—under the reign of Peter I.—a factory for the manufacture of asbestos articles was established near the Naviansky works. But the known uses were so few, and the demand so limited, that the industry subsequently disappeared; and it was not until some forty years ago that technical interest in the mineral was revived in Europe. In the domain of applied mechanics its non-combustible properties were no sooner realized, than investigation of its nature and utility was begun in earnest—with a view to its application on a commercial scale. Since 1860, the search for asbestos has been incessant; the exploitation and development of the deposits discovered remarkable; and the progress made in the invention of mechanical methods of refining and preparing the mineral for utilization in the industrial world simply marvellous.

The first modern attempt to exploit asbestos deposits was made in the Aosta valley of the Italian Alps by a London syndicate, for the purpose of experimenting on a large scale; and almost simultaneously with the exploitation in Italy asbestos was discovered in the Des Plantes River region, between St. Joseph and St. Francis villages, Province of Quebec. At the exhibition in London, in 1862, a specimen of fine, silky-fibred asbestos from the above locality was exhibited.

The extension of the belt of serpentine rocks in which the mineral was known to occur had been traced with some care from the Vermont boundary in the township of Potton, to and beyond the Chaudiere River; but the deposits of asbestos discovered were comparatively limited. All attempts to work them profitably failed, and during the next fifteen years nothing was done in the way of exploration or exploitation.

In 1877, however, asbestos was found in another district in Quebec; this time in the serpentine hills of Thetford and Coleraine. The credit of this discovery is claimed by Mr. Robert Ward; although by others it is stated that the first find was made by a French-Canadian named Fecteau. Following closely upon this discovery several parties secured areas both at Thetford and Black Lake in Coleraine Township, close to the line of the Quebec Central Railway, which, for some miles, runs through a belt of serpentine. Large fires having swept over the country, destroying all forests, the discovery of veins was facilitated by the weathering of the mineral on the surface.

Mining operations on a small scale commenced in 1878, and in this year fifty tons were produced; but it was difficult to find a market. The quality of the fibre mined was excellent, and the width of the veins every-

*Extract from monograph published by Department of Mines, Canada thing that could be desired, being from ½ inch up to 2 inches, 3 inches, and sometimes 4 inches. This justified the expectation that large deposits of the mineral might exist in that locality, though their true importance and value were not ascertained for several years later. Shipments of the better grades to London created quite a sensation in the British market; hence extensive tests and investigations were made, with the result that, on account of its exceptional spinning qualities, high prices were soon established, and the race for the acquisition of additional areas likely to contain the valuable mineral began. The land upon which the asbestos was found was considered of very little practical value, either for agricultural or any other purposes, and mining operations were rapidly extended. The principal areas in which the asbestos-bearing serpentine was found to occur were lots 26, 27 and 28, near the line between ranges V. and VI. of Thetford, and in the township of Coleraine near Black Lake station, four miles southwest of Thetford station, in an area previously unsurveyed; but adjoining, on the south-west, range B, also on lots 27 and 28, range B; and on lot 32, range C. All these areas were speedily secured, as well as most of the serpentine-bearing ground extending south-eastward from the Quebec Central Railway towards Caribou Lake and for several miles along the Poudrier road.

During the next twelve years a rapid development of the asbestos industry was witnessed. The mines were operated on a large scale; while prospectors were busy exploring the hills of the surrounding country for new deposits of the mineral. Villages sprang up in the vicinity of the mines as if by magic, although the country—physically speaking—was sterile and very rough. Prior to the beginning of mining operations, the population consisted of only a few scattered families, but now increased to several thousands, and the whole country showed all the marks of industrial activity and prosperity.

In 1885, it was reported that seven quarries were in operation, which produced during the same season an aggregate of about 1,400 tons of asbestos. The prices obtained for the different grades were: First quality, $80 per ton at the mines; second quality, $60; third quality, $40, and the lower grade—suitable only for pulp—$10. The total number of men employed by the various operating companies was 350; distributed as follows: King Bros., 40; Boston Asbestos Packing Company, 100; the Johnson Company, 100; Ward Bros., 20; Lionais and Company, 40, and Irwin & Hopper, 50.

Dating from 1885, a gradual increase in the prices took place; especially for the first and second qualities. In 1900, about $300 was realized for the first quality. This and other economic features in connection with the industry, served to give a powerful impetus to the development of the existing asbestos resources; additional mines were opened; the demand for the mineral continued brisk for a time; and properties were sold at a high figure. At a meeting of the Bell Asbestos Co., Ltd., held January 30, 1889, at the Cannon Street Hotel, London, England, the chairman, Mr. John Bell, announced a dividend of 22½ per cent. on the capital stock of the company for the year 1888, and said that the large growth of the asbestos business in general promised even better prospects for the current year.

But this state of affairs did not continue long; prices began to drop gradually, the demand slackened, and it was discovered that the prevailing methods of hand extraction were faulty, inadequate and expensive, especially with regard to the lower grades. As a matter of fact, under prevailing price conditions, only those quarries which were working on rich ground, and had a large percentage of crude asbestos, had a chance to live, and carry on operations with a profit. The natural outcome of these adverse conditions was obvious; many quarries producing only a very small percentage of the higher grades were forced to shut down; and this, together with serious difficulties accentuated by overproduction and a consequent fall in prices, caused the industry to receive a severe set back in the middle of the nineties. For some years the industry languished, and this had a depressing effect on all except those who would not be discouraged, or who were naturally optimistic.

Those engaged in the quarries and those having the development of the industry at heart perceived that only one thing could save the industry, namely, a more economic production; hence they began to exercise their inventive powers; the result being that mechanical treatment of the lower grades of asbestos gradually displaced hand-cobbing; and this method, in the course of years, was applied with such conspicuous success that, to-day, every quarry in the district is equipped with a complete milling and fiberizing plant. By means of this improved process, all the smaller fibre—which in the earlier years was left in the rock and thrown into the dump—was saved; and as new demands for this short material sprang up, the life of a quarry was prolonged, and its operations performed with greater ease and economy.

The quarrying and production of asbestos in the Eastern Townships of Quebec is, to-day, one of the most prosperous industries in the Dominion of Canada. Previous to the discovery of this mineral, the district was but sparsely populated—being in a like condition to the famous Cobalt region prior to the discovery of silver—but continued success in exploitation and development has attracted thither a large mining and trading class, hence the population has rapidly increased during the last ten years. This result was brought about by the excellent quality of the product of the quarries; the practically unlimited supply of the mineral; the untiring efforts which were made by the proprietors and managers to effect mechanical separation and last, but not least, by the opening out of the Quebec Central Railway, which runs through the region. Indeed, it is doubtful whether the Canadian asbestos industry would have attained its present prominence and prosperity had it not been for the transportation facilities afforded from the beginning by that railway. The author knows of no mining camp in Canada where transportation facilities are as convenient as in the asbestos region of Quebec. The productive asbestos area—as determined by the author—now extends over twenty-two miles. In all this stretch not one productive quarry is located farther than one mile from the railway track; and as the latter runs generally parallel to the asbestos range, and since there is still room along the belt for the opening up of more quarries, every new establishment will participate in these special transportation facilities. Unless foreign asbestos fields yet unknown, having equal ease of access, produce the same quality and quantity of the mineral as the serpentine region of Quebec, the Canadian asbestos industry will continue to be the chief source of the world's supply.

During the last twelve years, new fields have been discovered in various parts of the globe; but as a matter of fact, none of the deposits so far discovered produce asbestos which compares favourably with the Canadian article, either in quality or quantity.

# KERR LAKE MINING COMPANY ANNUAL REPORT

### Report of President.

In his report to the shareholders of the Kerr Lake Mining Company for the year ending August 31st 1913, President William G. Nickerson said, on September 16th:

This year we have produced 2,109,975 ozs. of silver, and have reduced the reserves by only 600,000 ozs., leaving still approximately 6,000,000 ozs. of actual ore in reserve. This gain in silver is due to some important additions to reserves and to the excess of production in milling and high-grade ore over estimate, and to a much more liberal estimate of value of milling ores, justified by the year's production of same.

The total cost per ounce of silver is slightly higher, owing to a much larger production of low-grade ores with proportionately higher treatment charges. We also have charged to cost many improvements at the mine.

I visited the mine on the 12th of September, and found that Kerr lake had been lowered approximately fifteen feet. The ultimate success of the draining of the lake seems assured, and its importance has been already demonstrated by the discovery of several small, but very rich veins, formerly under water and not hitherto discovered by our underground explorations.

Much to my regret Mr. Susmann resigned his duties as your Secretary and Treasurer, but your company still retains the privilege of his valuable advice.

Your company is most fortunate in securing the services of Mr. Westlake as Secretary and Treasurer.

I wish to congratulate Mr. Livermore, General Manager, on the efficiency which he has shown in managing your mine and his success thus far in draining the lake.

### Report of Manager.

The report of the Manager, Robert Livermore, is, in part, as follows:

**Production.**—The gross production from all ores, for the year ending August 31st, 1913, amounts to 2,109,975 ozs. of silver. This figure includes 34,289 ozs. of silver on hand, August 31st, 1913, according to inventory. Of the total, 1,575,334 ozs. were produced from shipping ore, and 534,641 ozs. from low-grade ore milled by the Dominion Reduction Co., Ltd., at Cobalt.

**Development.**—Most of the known veins having been well blocked out, development work was reduced from the amount maintained last year to between four and five hundred feet a month, a rate more in proportion to the other work of the mine. In all, 4,984 linear feet were done, including drifting, sinking and raising, as against 8,481 feet last year.

Exploratory work in the more unprospected parts of the property was conducted by long crosscuts in the central and east central portions. That in the central part did not disclose any veins of value, the conglomerate formation being found shallow, and soon changing to the more unfavourable Keewatin formation. In the east central part, a crosscut driven north from Little No. 3 shaft cut several veins, which were generally small and irregular, but in some of which a fair amount of second-grade ore, with some mill rock in the walls, was found. The conglomerate here, too, is shallow, but should be found to deepen as the work is carried to the north. In this work Nos. 23, 24, 25 and 27 veins were discovered, and No. 4 vein, formerly opened by an isolated shaft, was further explored by drift. Of these veins, Nos. 23, 24 and 25 contained the only profitable ore. Nos. 4 and 22, the latter discovered last year, and No. 27 had only low values. In the three first mentioned veins assays from 50 to 2,000 ozs. were obtained, and a little production of high grade was made in development. Further work must be done upon these veins before it will be known of how much importance they are as reserves.

In No. 3 vein the main work consisted of sinking the winze below the sixth level. From this winze, two drifts, Nos. 7 and 8 levels, were driven. All of this work opened only ore of too low grade to be called an addition to the reserves. Sinking on the vein was finally discontinued at a depth of 487 feet below the collar of the main shaft. At this depth the formation has changed from diabase to Keewatin, and the vein, although still fairly strong, is barren of value.

In No. 7 shaft, connection was made between the 225 ft. level and the main shaft. The Fleming vein was also connected by crosscut to this shaft at the same level. By means of this work pumping and hoisting through separate winzes has been abandoned, and all water and rock is handled through the main shaft.

New developments above the 225 ft. level were not of great importance, although two new veins were found on the 140 ft. level, called Nos. 26 and 20A. Both of these veins are narrow, and contain only second-grade ore. Development and stoping on No. 7 vein proved the ore to exist a greater distance south of the shaft than was supposed, and several very rich shoots were taken out above the 90 ft. level. On the 140 ft. level, an extension to No. 8 vein was found which assayed over 2,000 ozs. over a width of 1½ inches for sixty feet.

The most important development of the year was upon the Fleming vein. As mentioned above, a crosscut was driven on the 225 ft. level, which opened the vein at this depth, and a drift was run on the vein nearly to the east boundary. This drift opened ore of much the same

**Ore Production for the Year Ending August 31st, 1913.**

| Grade of Ore. | Net Weight, Pounds. | Silver Contents, Ounces. | Average Silver Content per ton. Ounces. |
|---|---|---|---|
| 1st Class | 768,988 | 1,287,035 | 3,347.00 |
| 2nd Class | 323,030 | 72,783 | 450.60 |
| Jig and Table Concentrates | 383,020 | 183,682 | 959.10 |
| Bullion from Metallics | ...... | 31,834 | ...... |
| Mill Ore | 18,252.3 tons | 534,641 | 29.29 |
| | | 2,109,975 | |

August estimated in part.

grade and appearance as that had on the level above. The general run of ore may be said to be good second grade and mill rock, but there are occasional shoots of very high-grade ore. Beside the drift, a raise was driven to connect with the upper level, and a winze sunk to explore at fifty feet deeper, on the 275 ft. level. An interesting fact is that most of the ore shoot on the 225 ft. level is in Keewatin formation, while it was in conglomerate on the upper level. It has been found in most of the explorations in the district that the veins lose their value and strength with the change of formation from conglomerate to Keewatin, and this would seem to be an exception, but it is probably only one to the extent that it carries its value a little further into the Keewatin than usual, and at greater distance away from the contact the same conditions will apply as with other veins. Nevertheless, the developments to date have added a very fair amount of ore to the reserves in this vein, and as some good ore has been recently found on the 275 ft. level, also in Keewatin, it is reasonable to expect that the greatest depth of the ore shoot has not yet been reached. No stoping has been done on the Fleming vein.

Developments for the coming year will continue the work in the still unprospected parts of the property, notably the conglomerate in the northeastern and central sections, and at depth on the Fleming and No. 10 vein systems. A crosscut will be driven from the sixth level of No. 3 shaft to connect with No. 2 vein. This is a strong calcite vein in diabase from which some very good ore was taken near surface, but which has been little explored at depth. Other work will be in following up the veins soon to be opened for exploration by the draining of the lake, mentioned hereafter.

**Stoping.**—During the year stoping was distributed over most of the reserves, with the exception of the Fleming, where production was entirely from development. In general it may be said that the reserves produced more silver than was expected for the ground removed, and less of the available reserves were stoped than was anticipated.

The Big Chamber above the 140 ft. level was most largely drawn upon for the production, but still has a large amount of ore left in place. No. 7 vein furnished nearly as much silver mostly from the blocks south of the shaft, above the 90 ft. level. The best part of this vein is still in reserve. No. 10 vein produced well from the block under the fourth level. None of the stopes on the vein above this level have been drawn upon during the year. The main east vein was stoped for a short distance above the 140 ft. level, but the greater part was left intact. The McDonald production was drawn mostly from broken reserves made last year, and little new stoping was done. In No. 3 vein, all known ore was removed, as it lay in small pillars which were rapidly becoming inaccessible from caving ground.

In consequence of the growing importance of ore of milling grade, it was found necessary to carry the stopes much wider than formerly to mine the ore of this class occurring as veinlets and leaf silver in the wall rock next to the high grade veins. Because of these wide stopes, which in places are twenty feet in width, in order to support the ground and mine the ore efficiently the square-set method of timbering has been adopted and carried through a large portion of the mine.

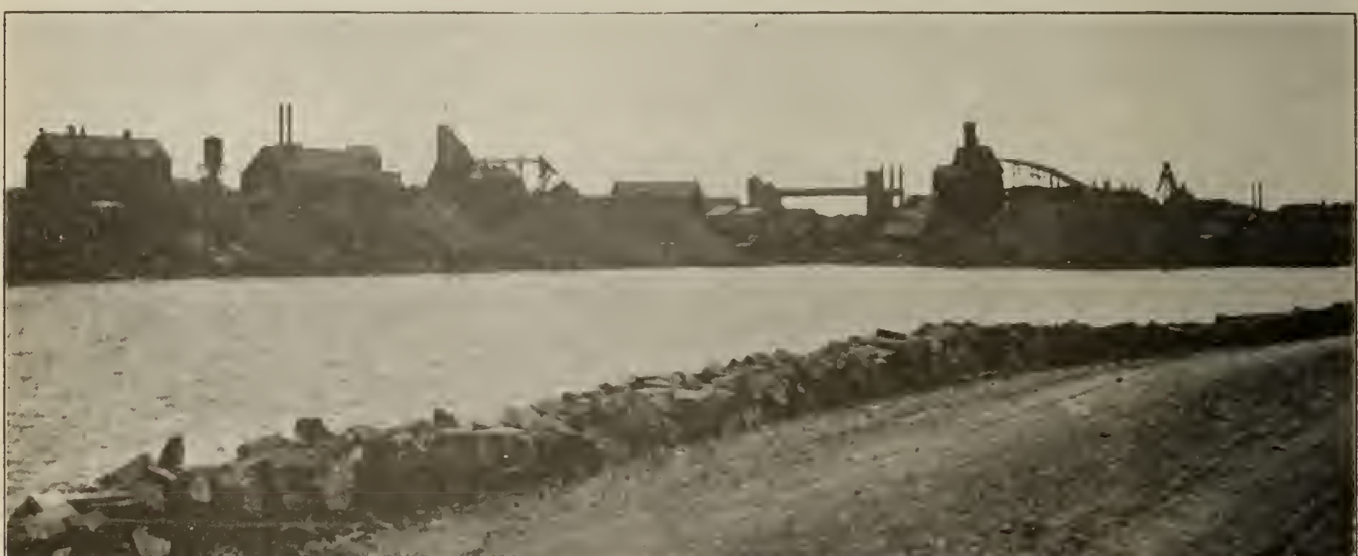
**Ore Sorting and Jigging Plant.**—No changes have been made here, the present plant being ample to treat the product for which it was designed. The total production for the year amounts to 383,020 lbs., assaying 959.1 ozs. per ton, a total of 183,682 ozs. of silver.

**Mill Ore.**—The production from this source was greatly increased, owing to the fact that a larger tonnage of payable ore existed in conjunction with the high-grade veins than was at first thought, and that better facilities for handling the tonnage were made, both underground and by the addition of bin capacity above. A small hoist and incline were installed for handling dump material. Of the 18,252 tons sent to the mill, 3,389 tons were taken from No. 7 dump.

The 18,252.3 tons milled averaged 29.29 ounces per ton, a total of 534,640.87 ounces silver.

**Classes of Ore.**—There was hoisted 33,738 tons of ore, classed as follows:

| | Tons |
|---|---|
| **Sacking Ore—** | |
| 1st Grade | 379 |
| 2nd Grade | 161 |
| Jig Conc. | 192 |
| Total | 732 |
| Mill Ore | 16,625 |
| Waste from bumping tables | 16,381 |
| Total | 33,738 |



**Kerr lake and Crown Reserve mines, Kerr lake, Ont.**

**Costs—**

The following were the costs:

43,134 tons rock hoisted at a mining cost of $5.07 per ton.

2,109,975 silver ounces at a mining cost of 10 38/100c. per oz.

**Draining Kerr Lake.**—During the year all preparations were completed towards dewatering the lake, in order to develop and stope the ore-bodies lying beneath it. This work was undertaken jointly with the Crown Reserve Mining Company, Limited. Hitherto, the workings have been stopped at a safe distance away from the bottom of the lake, as established by careful soundings, and, consequently, many good veins have not been developed to their full extent.

Surveys were started as early as the summer of 1912, and the full plans were worked out during the following winter. The application to dewater having been granted by the Government in the spring of this year, machinery was ordered, and the work of construction finished in August. The pumps were started on August 28th, and at the present writing the lake has been lowered several feet. At the rate the work is proceeding, it is safe to say that the bulk of the water will be out of the lake before the cold weather.

The plant in operation consists, briefly, of two pumping units of two centrifugal pumps each, the two units each driven by a 250 h.p. motor. The pumps and motors are mounted on a barge of some sixty tons capacity. The water is pumped against a head varying from 60 to 125 feet, through a twenty-inch pipe to Giroux lake, 2,700 feet distant. The rate of flow will average for the entire operation some 6,000 gallons a minute. The overflow from Giroux lake runs to the Montreal river. As the water in Kerr lake recedes, the barge is moved further out from the old shore line and new lengths of pipe connected.

It was originally calculated that between three and four hundred million gallons of liquid must be handled. As there are no inlets of importance in Kerr lake, it will be a simple matter, once the water is out, to keep it drained, and there will be no difficulty in recovering all of the ore hitherto considered unavailable, and of developing the undoubtedly valuable territory under the lake to its full extent.

As the Kerr Lake, Crown Reserve, and Cobalt Comet (Drummond) mines are dependent for their water supply on Kerr lake, a pumping plant has been installed on Giroux lake to supply them with water for all purposes. This plant consists of two motor-driven turbine pumps, each with a capacity of 500 gallons a minute, taking water from a well sunk in rock at the lake side, and connected to it by a blasted out passage. The water is pumped through an eight-inch pipe against 125 feet head to a 46,000-gallon receiving tank, whence it is piped to the different mines.

**Drummond Purchase**—Lots J. B. 9 and 10, containing about six acres under Kerr lake, together with 33 feet of the shore, recently purchased from the Drummond mine, jointly by this company and the Crown Reserve Mining Co., adds to the territory to be explored when the lake is drained, and offers very fair prospects of finding new ore. Part of this ground is in conglomerate formation, and there is one vein showing native silver, on the present lake shore.

**Ore Reserves.**—Estimates of this year are largely based on production figures as before, except that the Fleming vein, whose greater width and regularity makes such method feasible, has been carefully sampled, and the total value calculated from widths and assays in the usual manner. In this case no distinction is made between high-grade ore and mill rock. This year, no separation is made between available and unavailable ore since the latter will soon be available by the draining of the lake.

All ore estimated may be called positive.

The situation regarding possible ore is a little improved over last year, as prospects are very favourable for finding extensions of vein systems thrown open to development under the lake. Also there are very good indications that some ore will be found in the Fleming vein at least as deep as our present deepest level, the 275 ft. No attempt, however, is made to estimate possible ore.

Ore reserves have been decreased, but not to the extent that was expected, owing to better results from stoping, a more liberal allowance for mill ore in reserve, due to better recognition of its value and quantity from data gained during the year, and additions to the reserves in the Fleming and No. 23 vein systems.

Production for the year showed that the estimates of September 1st, 1912, were conservative, as the actual silver produced from high-grade ore exceeded by over 300,000 ozs. the estimated silver content of the ground

**View of Crown Reserve mine from Kerr lake mine**

removed. Of this excess, one-half has been allowed as an increase to the remaining reserves, and the other half used as a further factor of safety.

From lack of data, last year, mill ore reserves were given a very low value, which has been more than doubled from the year's production alone.

**Estimate of Ore Reserves, Kerr Lake Mine, Sept. 1st, 1913.**

| Big Chamber Vein System. | Estimated ozs. silver. |
|---|---|
| Big Chamber, Cross No. 11, Little McDonald | 567,700 |
| McDonald Vein | 753,900 |
| No. 7 Vein | 885,400 |
| No. 8 Vein | 66,000 |
| Main East Vein | 242,700 |
| Xmas Vein | 49,900 |
| No. 10 Vein | 1,073,300 |
| No. 15 Vein | 140,200 |
| Little No. 7 | 16,800 |
| Fleming Vein | 600,000 |
| Little No. 3 | 7,000 |
| Nos. 2, 21, 18, 20a | 6,400 |
| Nos. 23, 24, 25 | 25,000 |
| Total | 4,434,300 |
| Gain over estimated reserve 31st Aug., 1912 | 150,000 |
| Mill Ore | 700,000 |
| Dump Ore | 735,000 |
| Grand Total | *6,019,300 |

TREASURER'S REPORT.

The Treasurer, E. H. Westlake, says, in part:

**The shipments for the year** amounted to 2,160,878 ozs. The smelter settlements aggregate 1,977,870 ozs. The difference is accounted for by the deductions made by the smelting works for losses and in the way of treatment charges.

**The costs of production per ounce** are as follows:

| | Cents. |
|---|---|
| Mining and development cost | 10.38 |
| Shipment and treatment charges | 10.45 |
| Administration and general | 0.56 |
| Total | 21.39 |

The item "Mine Property" which at the beginning of the fiscal year stood at $55,000, has been increased to $130,000. The difference represents the purchase by the company of an undivided one-half interest in the 7-acre Drummond tract, which carried with it certain rights in connection with draining the lake.

All construction expenditures during the year have been charged to operating expense.

**Dividends Paid.**

The following is a statement of the dividends paid by the company to August 31st, 1913:

| | |
|---|---|
| In 1906 | $90,000.00 |
| 1907 | 210,000.00 |
| 1908 | 360,000.00 |
| 1909 | 480,000.00 |
| 1910 | 990,000.00 |
| 1911 | 1,200,000.00 |
| 1912 | 690,000.00 |
| 1913 | 600,000.00 |
| Total | $4,620,000.00 |

**Expenditures for the Fiscal Year 1912-1913.**

| | | |
|---|---|---|
| Cost of production and development: | | |
| Stoping | $18,710.10 | |
| Development | 29,036.81 | |
| Power, Light and Heat | 27,569.25 | |
| Ore Sorting and Jigging | 15,346.55 | |
| Tramming | 28,963.53 | |
| Hoisting | 8,060.02 | |
| Timbering | 17,011.79 | |
| Pumping | 760.33 | |
| Drills and Steel | 9,316.17 | |
| Mine Expense | 11,217.22 | |
| Repairs to Plant and Buildings | 5,950.31 | |
| Stable Expenses | 5,206.12 | |
| Office Expenses | 4,165.06 | |
| Surface Maintenance | 11,130.29 | |
| General Expenses | 989.55 | |
| Taxes | 24,780.00 | |
| Boarding House | 779.93 | |
| | | $218,993.03 |
| Shipment, treatment and other charges: | | |
| Shipment Expense | $1,349.24 | |
| Milling | 2,643.49 | |
| Freight | 9,323.65 | |
| Ore Treatment Expense | 92,632.61 | |
| Assaying | 4,891.22 | |
| Insurance | 3,608.95 | |
| | | 114,449.16 |
| Administration and general expenses | | 11,736.23 |
| | | $345,178.42 |
| Balance being profit carried to balance sheet | | 837,315.44 |
| | | $1,182,493.86 |

**Receipts for the Fiscal Year, 1912-1913.**

| | | |
|---|---|---|
| Proceeds of ore sales | $1,176,399.48 | |
| *Less—* | | |
| Ore on hand, at Smelter and in Transit 31st August, 1912, at estimated value | 205,262.18 | |
| | $971,137.30 | |
| *Plus—* | | |
| Ore on hand at, Smelter and in Transit 31st August, 1913, at estimated value | 192,989.09 | |
| | | $1,164,126.39 |
| Interest | | 18,367.47 |
| | | $1,182,493.86 |

## NORTH AMERICAN SMELTING CO.

A press despatch from Ottawa states that a case involving a charge of discrimination by the railways against eastern ore smelters in favour of those of British Columbia, was recently heard by the Dominion Railway Board. It is said to have arisen out of an application by the North American Smelting Co., of Kingston, Ont., for a reduction in the rates on lead and silver-lead ores from British Columbia to Ontario. It was stated on behalf of the Kingston works that the Canadian Pacific Railway, by charging a lower rate on refined lead and silver from the West, makes it impossible for owners of reduction works in the East to compete with the lead smelting and refining works at Trail, B.C. The Board will not give a decision in the matter until after owners of works in the West shall have had an opportunity to state their side of the case.

# COPPER MINING IN MICHIGAN

By Reginald E. Hore.

Michigan has long been known as an important producer of copper. The mines of the Lake Superior district are among the oldest regularly worked mines in America. One of them, the Tamarack, is the deepest in the world. Another, the Calumet and Hecla, is one of the largest in the world and has the distinction of having returned to shareholders over $120,000,000 in dividends. The Quincy mine from much leaner ore has yielded profits of over $20,000,000, and has a remarkable record for regularity in dividends.

Other well known Michigan copper mines which are or have been profitable, are the Ahmeek, Atlantic, Baltic, Central, Champion, Cliff, Copper Falls, Franklin, Kearsarge, Minesota, Mohawk, Osceola, Trimountain and Wolverine. Of these Atlantic, Central, Cliff, Copper Falls and Minesota have been worked out and abandoned. The old Franklin was nearly worked out, and then purchased by the Quincy Mining Company, which property it adjoined.

Taking the place of these idle mines and contributing largely to Michigan's production are the Allouez, Centennial, Superior, Franklin Junior, Isle Royale, Victoria, Mass and Lake mines. With the exception of the Superior and Lake these are all old mines, but have never paid dividends. The Allouez, Superior and Isle Royale are very likely to be the first to join the list of dividend payers. The costs at the others are comparatively high and their success or failure depends on very small fluctuations in the price of copper.

Besides the producing mines there are numerous properties on which exploratory or development work is being done. Few explorations prove profitable; but the prize being a large one, fortunes are spent in the endeavour to find another profitable deposit. It is noteworthy that of the forty properties on which work was being done in 1912, when the price of copper was unusually high, only 18 were in position to make large outputs, 13 operated during the year at a profit; but only nine were able to declare dividends. In the preceding four years copper averaged only 13.25 cents per pound, and only eight companies were able to declare dividends during that period.

Two two-man (Rand) machines Photo by O. Gardner

62nd level. Calumet conglomerate lode. Calumet and Hecla mine, Calumet, Mich.

The total dividends paid by these eight companies in 1911, when copper averaged 12.5 cents per pound, amounted to $5,351,125, and thirteen other companies were forced to levy assessments amounting to $2,086,-299 in order to continue operations.

In 1912, when copper averaged 16.5 cents per pound, nine companies paid $9,901,875, and the assessments levied totalled only $986,000.

The record of the producing companies is shown by the following table which, with other data given below, accompanied reports on the copper industry made by the writer for the Michigan Geological Survey:

**SUMMARY OF RESULTS OBTAINED IN 1908, 1909, 1910 AND 1911 BY THE 18 COPPER MINES WHICH PRODUCED OVER 90 PER CENT OF THE TOTAL OUTPUT OF MICHIGAN.**

| | | Tons ore stamped. | Cost of mining, transportation, stamping and taxes, per ton. | Pounds refined copper produced. | Pounds refined copper per ton of ore stamped. | Cost per pound at mine excluding construction. | Cost per pound smelting, freight, commission, eastern office. | Total cost per pound, copper. | Price received for copper sold. |

**5th level. Osceola amygdaloid lode. Calumet and Hecla mine.**

**Recent Progress.**—The year 1912 was an unusually profitable one for Michigan copper mining companies and the companies made larger profits while paying higher wages than in previous years. The dividend-paying companies made larger disbursements than in 1911 and increased their surplus of assets. Large amounts were spent for construction and development work at the producing mines and more vigorous examination made of several properties that are not yet productive. Two new companies and one reorganized company began diamond drilling investigations that are expected to be continued over large acreages.

An unfortunate circumstance, and one most keenly felt by companies whose property is not centrally located, has been the scarcity of suitable labour. In spite of the increased wage offered, many of the companies, during the summer months especially, were unable to secure enough men to permit of very economical operation. This inability to run the mines at capacity prevented the owners from taking full advantage of good copper prices and increased the cost per ton produced. The increase in cost due to labour scarcity has been partially, but not wholly, offset by improvements in methods. Recently there has been more than ordinary attention paid to the improving of efficiency of all departments. New methods and machines and less waste of labour and supplies have materially decreased the cost of breaking and handling the ore underground. Labour saving devices have cut down the rock-house costs. New machinery installed at the mills gives a better recovery from the ore treated. Use of larger furnaces and more mechanical appliances to handle charge and furnace products has lowered the cost of smelting. In spite of the many improvements, the year 1912 showed higher costs per pound of copper produced. This, in most cases, at least, is due to higher wages paid, and means simply that the mine owners shared with the miners the profits of a successful year.

**Dividends.**—During 1912 the dividend-paying mining companies paid to shareholders $9,901,875, and added considerable amounts to surplus account. Ahmeek, Baltic, Calumet & Hecla, Champion, Mohawk, Osceola, Quincy, Trimountain and Wolverine all paid larger dividends than in 1911. Dividends paid for the past five years and to date have been as follows:

## PORTFOLIO OF MINES

On June 1 The Canadian Mining Journal expressed the opinion that a British Columbia mining association had acted unwisely in beclouding the issue of a separate Portfolio of Mines at Ottawa by submitting the name of the member for Kootenay in the House of Commons for appointment as such Minister. A correspondent draws attention to a change in the attitude of the Nelson Daily News, a publication that for a while gave prominence to Mr. R. F. Green's name in connection with the proposed separate portfolio. Some weeks ago the Daily News said editorially: "The Daily News wants to be distinctly taken as advocating no special man for the position (of Minister of Mines). It believes Premier Borden can be trusted to make a suitable selection if such an appointment is decided on."

# CANADA'S NICKEL INDUSTRY

By Alex. Gray

(Continued from October 1st issue.)

### THE MOND COMPANY.

So much for the genesis and evolution of the nickel fields and the predominant partner in the nickel industry. Analysis of the data submitted in relation to the industry as a whole and the International Company in particular, invites the conclusion that both have attained to maturity. The industry certainly had no adolescent youth. It was at once an "ugly duckling." It was long in acquiring aplomb and in becoming a source of pride to its proprietors. If it was the despair of its earliest sponsors, it is ripe for the admiration of those who have a permanent interest in Canada's special mineral resources. That it was cradled in adversity, almost disowned by those whose natural heritage it is, practically discarded by domestic capitalists as unworthy of their serious considerations, rather emphasizes what has been achieved, accentuated as that success was by the recent increased capitalization of the respective producing companies and of other concerns in process of formation.

An insular view obtained, now and again, that an export duty on nickel large enough to be prohibitive almost—would be an effective method of averting war—more so than Peace preachments. As well might the constituents contained in ordinary explosives be made contraband. By adding to the armour of the God of Battle, by substituting a larger measure of immunity during naval conflicts, by increasing efficiency in the steel and allied arts, nickel—the nickel of Ontario—became indispensable. Local prejudice, because those who solved the metallurgy of these complex ores and created a world-wide demand for the refined metal without confiding in everybody, bulks small alongside of the avidity with which latter-day promoters seek to benefit from the research of the pioneer companies.

Within a year or two the law of national self-preservation, and the serenity with which the International and Mond Companies have expanded, pursued broader markets while perfecting plans to more fully supply those markets, resulted in the proving and pre-emption of nickel-bearing areas to an extent establishing Ontario as the future source of a metal the nations must have and the household arts will not be without. Whether or not the dream of the millennium, when warfare will become a matter for diplomatic or judicial arbitrament, is to be a reality, nickel will be more and more a utility removed from corrosive influences, essentially superior of itself or in alloy. Enough competition is extant and pending to preserve the equities in behalf of consumers.

It was the appreciation of all this that induced the Mond Nickel Company—properly to be designated as the junior partner to date in the nickel industry, to branch out with a new and modern smelter at Coniston near Sudbury, to acquire more properties in the Sudbury District, and to enlarge its metallurgical works at Clydach in Wales. Like the Canadian Copper Company, before it was merged into the International Nickel Company, and as the latter's shareholders experienced, the Mond Company can measure its success by contrast with its initial years of adversity.

The Mond carbon monoxide process in practice, differs from that of the International Company. Dr. Carl Langer and Dr. Ludwig Mond devised it and worked it out to a profitable fruition. In 1899 they sought the Sudbury fields and located there, at what was named the Victoria Mine. The year following the Mond Nickel Company was organized by Dr. Mond, the capital being £600,000. This company took over the Victoria Mine and smelter. In 1901 bessemer matte was produced, but delays ensued there and at the Clydach refining works. Several years elapsed before shareholders had a "look in." Of those years the writer of this review has this to say: "The first profit and loss statement was made up in 1903. Dr. Mond retained all of the deferred shares and many of the ordinary shares as part of the vendor consideration. Not only that, but for the first few years he met the dividend on the preferred shares; rather he made good all deficiencies. That his reward was worth waiting and working for, is evidenced by the fact that the deferred shares have drawn almost 200 per cent. in the five years ended April 30, 1910, the rate for each of the latter three years being 48 per cent. per annum. Yet Dr. Mond was no different from other scientists and capitalists who enlisted in the nickel business. 'It took longer'; as the Financial News of London remarked, 'to reach the dividend-paying stage than Dr. Mond had anticipated when the works were put up.' "

The Mond Company now is capitalized at £850,000, with £500,000 in 7 per cent. cumulative preference shares of £1 each; £300,000 in ordinary shares of £1, and £50,000 in deferred shares of £1 each. In the repayment of capital, the preferred shares, besides being entitled to the cumulative dividend of 7 per cent., have a priority of £7 10s. 0d. per share in the event of the distribution of assets. The ordinary shares have the right to a non-cumulative dividend of 7 per cent. per annum and one-half of the surplus profits, the deferred taking the other half.

After four years, in 1904-5, the ordinary shareholders received 6 per cent. In 1905-6 the ordinary shares paid 10 per cent. and the deferred shares 18. In 1906-7 the ordinary shares paid 12½ per cent. and the deferred shares 33. In 1907-8-9-10, the ordinary shares carried 15 per cent. and the deferred shares 48 per cent. In 1911 the ordinary rate was 16¼ per cent. and the deferred rate 55½ per cent. Otherwise arranged, the years 1909-11, inclusive, enabled the company to make this showing:

| | 1909. | 1910. | 1911. |
|---|---|---|---|
| Net profit | £111,320 | £114,107 | £140,803 |
| Balance after dividends | 23,053 | 22,763 | 42,399 |
| Brought in | 29,923 | 32,976 | 20,741 |
| For reserve, etc. | 52,976 | 55,741 | 63,140 |
| To reserve | 20,000 | 35,000 | 35,000 |
| Carried forward | 32,976 | 20,741 | 28,140 |

Having those figures, it remains to quote the remarks of Sir Alfred Mond, Bart., M.P., chairman of the company, at the annual meeting a year ago, when he dealt with the 1911-12 doings, that is, for the year ended April 30, 1912. He said:

> "I will deal with the balance-sheet first. If you look at the credit side there is an addition of £13,649 to the first item, namely, mines in Ontario (Canada), and freehold and leasehold land and houses in On-

tario and Clydach (South Wales). The bulk of this money has been spent on development in Canada and on some cottages at Clydach. In the next item, that is the smelting and refining works in Ontario and Clydach, the additions for the year amounted to £53,578. We are at present constructing new smelting works at Coniston, in Ontario, and this money has been spent on the construction of those works. The balance represents additions to our works at Clydach. The suspense account is always a fluctuating one, and has diminished by the sum of £5,000. Stocks on hand are some £14,000 up, while ore, raw material, and intermediate and finished products have increased by some £75,000. As our business increases we have to have larger amounts locked up in those items. Sundry debtors have increased by £19,000. The cash in hand shows an increase of £31,000, which is due to an instalment on the debenture stock paid in advance. As regards the debtor side of the balance-sheet, there is no alteration in the capital account. The first mortgage debenture stock, which we issued in the course of the last financial year, figures for the first time in our balance-sheet. The reserve fund, with the sum you voted last year, now stands at £185,000. The reserve suspense stands at £20,000, and your sundry creditors have increased by some £3,000.

"I will now deal with the profit and loss account. There was brought forward from last year £28,000, while the balance at credit for the financial year to April 30, 1912, is £154,364, which compares with £148,000, an increase of £6,000. The net outcome, in comparison with a year ago, is that the amount we have to deal with as profit is £13,200 more. I have very little to say about the balance-sheet. All the increases are in the ordinary course of our business, and the satisfactory item in it is the increase in the profit and loss account.

"Turning to the report of the directors, although the profits are somewhat higher the board have decided—and we have no doubt that the shareholders will agree—not to make an alteration in the amount of the distribution, but to leave the dividend at the same rate to which we raised it last year. Of the balance, we propose to place £15,000 to the ordinary reserve bringing the amount to £200,000, and to place £20,000 to the reserve suspense account, bringing its total amount to £40,000. We propose to carry forward the balance, namely, £41,381. This, I think, leaves our company, in a very sound position, and provides well for contingencies in the future. The progress of the operations of the company, both in Canada and in England, in spite of difficulties not due to internal causes, has been very satisfactory indeed.

"In consequence of the continuously-increasing demand for the metal we manufacture we have decided to enlarge our works in Wales. So far as our new smelting works, in Ontario are concerned, I am glad to be able to tell you, that, in spite of a winter of such exceptional severity that I believe nothing like it has been known in Canada for more than sixty years, the programme that was planned for the making of the railway tracks, laying of the concrete foundation, and of all the preliminary works, was carried out practically without a hitch. It was kept well up to time, and I think that the greatest credit is due to our Canadian staff, who succeeded in spite of temperatures which would alarm anyone in this country. The work is proceeding very well, and the latest reports are that the steel work of the different buildings is going up, and that there is every prospect of the new plant—which will be a very fine and entirely up-to-date smelter—being completed in the time contemplated.

"Our accounts from the mines as to developments are extremely satisfactory, and I think our shareholders have every reason to be satisfied. We, of course, are dependent for our profits to some extent on the fluctuations of the copper market, as we are not only producers of nickel metal, but also large manufacturers of copper sulphate. I am glad to say that although prices last year were above the very low levels reached in previous years, they are steadily improving, and if the present prices of copper are maintained we ought to benefit considerably in the course of the current financial year."

In the calendar year 1912 the Mond Company did not handle so large a tonnage as in 1911. According to the Ontario Bureau of Mines, 163,352 tons were raised in the latter year; 116,932 from the Garson mine, and 46,370 from the Victoria mine, as against a total tonnage raised in 1912, of 117,568. This falling off may have been due to the concentration of work upon the completion of the new Coniston smelter, the acquisition of other properties, the development of the Garson mine, and the shortage of ore at the Victoria. At any rate, the Mond people have their greater smelter in operation at Coniston and are fortifying themselves in the matter of ore supplies, having purchased the Worthington mine from its Montreal owners, found more ore at the Victoria, advanced the development of the Cochrane-McVittie property where there is a portion of "the great Frood deposit," as Dr. Coleman describes it, and otherwise provided for emergencies by buying ore from the Alexo mine near Kelso. With ore supplies assured and increased smelting and refining capacities in Ontario and at Clydach, the Mond Company may also take a considerable tonnage from the Murray mine, owned by the Canadian Nickel Corporation.

Its chief source of supply at present, is the Garson mine, near which the new and complete smelter is situated. A shaft is being sunk on the Cochrane-McVittie fraction. It will be sunk to a depth of 600 feet or so in order to tap the ore intersected by the drill, which drilling was done to determine whether this particular ground had any of the mass of ore as notified by the International Company's Frood or No. 3 mine adjoining.

That is why Dr. Coleman, already quoted, expects soon—to see this section "sending ore to the smelters of the two producing companies, and adding greatly t the available supply of the region." Power for the Coniston plant is obtained from Wahnapitae river. With the company's recent territorial acquisitions, including the Levack, Kirkwood and Blezard, the Mond will be removed from the shortage of ore with which it was confronted for a while.

*Canadian Nickel Corporation.*

The Mond Company having a stronger hold upon th source of supply and having insured the retention of its share of markets for its special products, rivalry to the chief producer is impending. Within the past few months the Canadian Nickel Corporation, Limited, was organized under the auspices of Dr. F. S. Pearson, of New York and London, counselled by consulting engineers, J. E. McAllister and Benjamin B. Lawrence, the capital being:

| | Authorized. | Issued. |
|---|---|---|
| 6% Debenture Stock | $10,000,00 | $10,000,000 |
| Common Stock | 20,000,000 | 20,000,000 |

In this allocation of capital provision is made for the redemption of the debenture stock at or under 106 by means of an annual sinking fund, payable out of earnings, which, it is expected, will enable the entire issue to be redeemed in twelve years, a further safeguard being set out that "the interest and sinking fund payments must be made before any dividends are declared on the common stock."

Prior to the formation of the Canadian Nickel Corporation, nearly all of the areas held by it were acquired by those interested in the Dominion Nickel Copper Company, chiefly Messrs. J. R. Booth and M. J. O'Brien, along with Messrs. Fadyen and Chapin; their managers at different periods being Mr. J. N. Glidden and Mr. J. A. Holmes, the latter being largely instrumental in arranging the deal with Dr. Pearson and his colleagues, with the sanction and cooperation of Mr. Booth.

It is the understanding that Mr. O'Brien would rather have dealt with Kirby Thomas, M.E., in behalf of the Messrs. Guggenheim, but Mr. Booth, in concert with Sir William Mackenzie, closed with Mr. McAllister, who represented the Pearson interests. As a consequence the Messrs. Guggenheim after having bid for it, declined to take the Worthington mine, which went to the Mond Company. Following is the initial memorandum prepared by the promoters of the Canadian Nickel Coporation. Its contents have not been made public until now when the financing plans are subjected to delay on account of monetary stringency in the world's banking centres:

"PROPERTIES.

"These cover approximately 17,500 acres in the Sudbury region—the most important source of the world's nickel supply—and include the following:

Murray, Elsie and Lady Violet Group,
Gertrude Group,
Whistle and Wild Cat Group,
Victor and Blue Lake Group,
Falconbridge Group,
Nickel Lake Group.

"From present development and prospecting work to May 1st, 1913, 6,800,000 tons of ore have been blocked out, or sufficient to operate on the basis of 1,500 tons of ore daily for almost thirteen years, while the engineers estimate that the properties contain at least a further equal amount.

"POWER AND TRANSPORTATION.

"Hydro-electric power is obtainable at from $12 to $16 per horse power per annum from two companies generating power in the district. The Canadian Nickel Corporation, however, proposes to generate its own hydraulic power and to install two units of 5,000 kilowatts each, thereby reducing the cost below the above figures.

"Excellent transportation and shipping facilities are available as three railway lines serve the property, namely, Canadian Northern, Canadian Pacific, and Algoma Eastern Railway.

"REFINING.

"The rights to a refining process (which has been in successful operation in Norway for the past three years) for all nickel ore mined in North America, have been secured, after full and satisfactory investigation as to its merits by four different experts.

"The sheet nickel and copper produced under this method are ninety-nine per cent. fine and the form in which nickel is turned out by this process has in the past commanded a price of five cents per pound more than nickel not refined electrolytically.

"MANAGEMENT.

"The operations of the company will be in the hands of the managing director, Mr. J. E. McAllister, who for the past ten years has been in active charge of successful metallurgical enterprises of this type. His experience and record, not only as an engineer, but in the successful application of technical knowledge to industrial business, especially qualify him to fill this important position. The heads of departments have been selected from men who have either been associated with him in the past or who are specially fitted, by knowledge and experience, to conduct the work of each branch.

"ESTIMATED EARNINGS.

"The operating department of the corporation estimates a total cost per ton, of $6.60; this allowing for contingencies and including all expenditure from ore in place to the sale of the contained metals. Operations are to be conducted upon a basis of 540,000 tons of ore per annum, from which will be extracted an average of 30 pounds of nickel, 12 pounds of copper, and $1.00 in precious metals per ton.

"The American quotations for electrolytically refined nickel have ranged from 45 cents to 50 cents per pound for the past two years (see United States Government Reports, also 'Engineering and Mining Journal' quotations), but assuming a price of 30 cents per pound for nickel and 13 cents per pound for copper, the following earning basis will result:

| | | |
|---|---|---|
| Nickel, 30 lbs. at 30 cents | 9.00 | |
| Copper, 12 lbs. at 13 cents | 1.56 | |
| Precious metals | 1.00 | |
| | $11.56 | |
| Deduct operating costs | 6.60 | |
| Net profit per ton of ore | $4.96 | |
| Net profit per annum, 540,000 tons at $4.96 $2,678,400. | | |
| Deduct 6% interest on $10,000,000 Debenture Stock | $600,000 | |
| Annual Sinking Fund, say | 600,000 | |
| | | $1,200,000 |
| Balance available for $20,000,000 Common Stock (or about 7½%) | | 1,478,400 |

"DIRECTORS.

"Dr. F. S. Pearson, M.I.C.E., President, President of Brazilian Traction, Light & Power Co.; J. Frater Taylor, Vice-President, Managing Director Lake Superior Corporation; J. E. McAllister, Vice-President and Managing Director; Benjamin B. Lawrence, Consulting Engineer, New York; E. R. Wood, Director Canadian Bank of Commerce; Walter Gow, Director Brazilian Traction, Light & Power Co., Miller Lash, Director Mexican Light & Power Company."

The foregoing may be accepted as the general purpose of the influential promoters, who expect to market the metallic contents of 540,000 tons of lower grade ore than has been treated by other companies—and to do it at a handsome profit with the Hybinette process. Of course the item "precious metals" is something new in the per ton profit on these ores, but if the world will take all the nickel necessary to carry the capital of the three producing companies, Canada cannot complain and will welcome the momentum. Perhaps it should here be reiterated that the International Company has no fixed charges; nor are the debentures of the Canadian Nickel Corporation designed to be a burden in case of a struggle for markets. With the Canadian Nickel Corporation it becomes a matter of internal economics and ability to assert in the nickel trade. In this connection Dr. Coleman, who visited Norway in 1911, has this to say encouragingly with reference to what Messrs. Hybinette, Borthen and Henriksen are doing there with ores similar in character to those of the Sudbury District:

"Mr. Hybinette states that the cost of mining the Evje ore is $1.25 per ton, and that the smelting to low grade matte amounts to about as much; but that the second smelting costs about $20 per ton of high grade matte. One hundred men are employed at the mine and as many at the smelter.

"The little establishment at Evje is interesting as a contrast with the great smelting plants at Copper Cliff and Coniston; and it is rather surprising to find so modest a plant with such simple methods able to compete successfully with these large, costly and highly organized enterprises.

"The high grade matte is shipped by narrow gauge railway to Kristiansands, the seaport at the end of the valley, to the refining plant which is under the charge of Mr. V. Hybinette. The works, which are a little west of the city, have been in operation for over a year and have been so successful that plans are under way for a large increase in the plant. I am under obligations to Mr. Hybinette for taking me through the works and explaining the process, which is in accordance with United States patents No. 805,550 and No. 805,969, taken out in 1895, and first used in the plant in the Southern States (Missouri) and now owned by the Dominion Nickel Copper Company. As this electrolytic process is described in the patents, it will be unnecessary to refer to its features in detail at this point.

"At the time of my visit—June, 1911, about one ton of nickel was produced a day, having a composition as follows:

| | |
|---|---|
| Nickel | 98.70% |
| Copper | 0.07% |
| Iron | 0.63% |
| Sulphur | 0.02% |
| Arsenic | 0.05% |
| Cobalt | 0.90% |

"In a general way it may be said that the matte is roasted to convert the metals into oxides, then leached with weak sulphuric acid, which extracts principally the copper. The residue is heated with sulphuric acid in a temperature at which hydrous sulphates do not exist, and is again leached with weak sulphuric acid to extract copper. The residue is then heated with hydrochloric acid to a temperature sufficiently high for partial decomposition of the anhydrous chlorides and again leached with weak acid, the heatings being repeated, if necessary, in order to obtain a residue of nickel oxide suitable for further treatment."

These generalizations bearing on the Hybinette process are specially apt, since the process has been a controversial issue in the Canadian nickel country. They are more so now, in view of the advent of the Canadian Nickel Corporation, for which Mr. O'Brien bought the rights some years ago. The process has been employed at Norway for about three years and the promoters of the Canadian Nickel Corporation in their prospectus leave no room to doubt its feasibility in Sudbury District practice, notwithstanding the lower percentages, of the nickel-copper and copper, as compared with the grade of ore heretofore treated by the International and Mond Companies. On this point Mr. J. E. McAllister has reported:

"REFINING AND SEPARATION OF THE METALS.

"For this purpose the process which has been in use for more than two years past by A. S. Kristiansands, Nikel-raffineringsvork, at Kristiansands, Norway, has been adopted, the rights for its use having been purchased for all ore mined on the Continent of North America. By this process the nickel and copper are separated by electrolysis; the precious metals, chiefly platinum and gold, being recovered from the tank residues. The commercial success of the process has been fully demonstrated by the operations in Norway, and in the investigation of it the writer has had the assistance of Messrs. R. W. Deacon and C. S. Lomax, of New York, and W. A. Heywood, of London.

"The investigation of the technical and commercial work of the process has been exhaustive and satisfactory, the engineers referred to, as well as the writer, having spent some time at the Norwegian plant for this purpose.

"Its working costs have been considered over a period of two years, from which estimates have been compiled for the operation of the process in Canada under conditions which obtain there. The sheet nickel and copper are 99 per cent. fine, and the form in which the nickel is turned out has in the past commanded a price of 5 cents per pound more than the market quotations of nickel which is not refined electrolytically."

"OPERATING COSTS AND REVENUE.

"The ore blocked out by prospecting and development operations to May 1st, 1912, amounts to 6,800,000 tons, as follows:

| | |
|---|---|
| Whistle and Wild Cat mines | 1,400,000 tons. |
| Murray and Elsie mines | 4,665,000 tons. |
| Nickel Lake, Gertrude, etc. | 735,000 tons. |
| | 6,800,000 tons. |

"In addition, there is a large tonnage of lower-grade ore in the Whistle and Wild Cat property, and the company has also in the Falconbridge property 2,500,000 of lower-grade ore, but as this will not be available until suitable means of mechanical concentration is adopted, it is not taken account of in the figures which follow. Its possibilities, however, must not be lost sight of.

"The average contents of the 6,800,000 tons specified above will be 51.31 lbs. of combined nickel and copper and $1.15 precious metals (platinum, gold and silver) per ton of ore, from which will be extracted 30 lbs. of nickel, 12 lbs. of copper and $1 in precious metals. It is intended that operations shall be conducted upon a basis of the delivery of 45,000 tons of ore monthly to the reduction works, or 540,000 tons per annum, and at this capacity the total expenditure to cover all operations is estimated not to exceed $6.60 per ton of ore handled."

(To be continued.)

# SYDNEY COAL FIELD*

By G. A. Young.

The name, Sydney coal field, is applied to the area of Carboniferous strata fringing the north-eastern coast of Cape Breton for above 30 miles from Cape Dauphin on the west, to Mira Bay on the east. The area occupied by these measures amounts to about 300 square miles, of which total about 50 square miles is underlain by the Productive Coal Measures. In addition to the land area of the Productive Coal Measures, there is, by reason of the low seaward dip of the strata, a very considerable submarine area from which coal may be won.

The Sydney Carboniferous basin is notable for the splendid sections exposed along the coast and for the great thickness of the strata, which, in the vicinity of Sydney harbour, reaches approximately 12,600 feet. The section is characterized by the apparent absence of pronounced stratigraphical breaks. In general, the geological structure is simple in form, the angles of dip low, and although a few prominent faults occur, the greater part of the field is free from them.

By reason of a series of low folds and certain indentations of the coast, the coal field is naturally divisible into six coal basins or districts. All of these with but one exception contain, besides a number of minor seams, 5 to 8 seams of coal varying from 2 feet to 13 feet in thickness. The total thickness of coal in seams that may be workable varies in the five main basins from 23 feet up to 47 feet. The coal is of a bituminous variety and in 1911 the total production amounted to above 4,900,000 tons. The individual seams are traceable for miles along the strike, in fact many of them are believed to extend throughout the whole length of the field. The individual seams vary somewhat in quality along the strike, change in thickness in a rather remarkable manner, and in some cases what is one seam in one locality becomes two in another, because of the greatly increased thickness of an elsewhere relatively insignificant parting.

The fund of general geological information concerning the Sydney Carboniferous area is contained, almost entirely, in early reports by Charles Robb and Hugh Fletcher, published by the Geological Survey in the '70s, and in a series of maps by Fletcher which are, in part, revisions of earlier editions. Important contributions to the geology of the district were made by Richard Brown, at one time manager of a coal company operating in the field. The varied and striking palæobotanical material described by Bunbury and Dawson was mainly collected by Brown, chiefly from the North Sydney area and in no small part from one shale bed overlying the main seam. From this single horizon, it is stated by Brown, that over 90 plant species were obtained.

The Carboniferous strata of the district have been grouped and mapped under four divisions, of which the highest, the Productive Coal Measures, embraces the youngest consolidated rocks in the region. The different divisions, in a general way, are displayed over long areas trending east and west, parallel to the coast line—the highest divisions bordering the coast, the lower divisions developed inland towards the south and resting on Cambrian and Pre-Cambrian strata. The Pre-Cambrian comprises plutonic, volcanic, and highly metamorphosed sedimentary strata; the Cambrian is mainly of sediments which are in part fossiliferous.

The Carboniferous area, bordered on the north and east by the Atlantic, is essentially a low, rolling country, seldom rising higher than 350 feet above the sea, while the Pre Cambrian and Cambrian areas, situated to the south and west, are more broken, and in part consist of long ranges of high hills rising abruptly from partly encircling Carboniferous lowlands, to heights of from 500 to 1,000 feet above sea level. The coast line is broken by bays and channels of the sea running inland in a south-westerly direction. One of the larger of these indentations is that of Sydney harbour, situated towards the centre of the basin and forking towards its head into two arms, each of which is continued inland by a long valley. Farther west, cutting through the Carboniferous lowland, are two long channels leading south-westward into the salt water Bras d'Or Lake, which occupies so much of the central part of Cape Breton Island.

The general south-westerly trend of the depressions occupied by the sea, of the courses of the axes of folds in the Carboniferous, and of the high ranges of Pre-Cambrian and Cambrian strata, is a marked feature. The presence of the Carboniferous over the lowlands that border and penetrate the high hills of Pre-Cambrian and Cambrian rocks, the overlapping of various divisions of the Carboniferous on these ancient strata, the relatively undisturbed attitude and the comparatively coarse nature of the bulk of the thick series of Carboniferous measures are signs which point to the conclusion that the topography of the present day in some measure reflects that of early Carboniferous time.

The nearness to the old shore of the portion of the Carboniferous basin still preserved doubtless, in part at least, explains the great volume and general characters of the sediments. Possibly a considerable proportion of the supposed thickness may be explained as due to dip of deposition.

The general similarity of the Carboniferous measures as displayed in Cape Breton, to those on the mainland of Nova Scotia and over New Brunswick, along the southern and western edge of the Gulf of St. Lawrence; the resemblance of these beds to those developed in Newfoundland on the east side of the St. Lawrence Gulf; and the occurrence of Carboniferous strata on the Magdalen Islands, situated towards the centre of the hydrographic basin, have led various observers to believe that Sydney Carboniferous area represents a remnant of the southern border of a once continuous basin of Carboniferous strata that may have occupied the greater part of the area of the Gulf of St. Lawrence.

The Carboniferous section of the Sydney field is customarily divided into the following groups, tabulated in descending order with approximate thickness as developed in the vicinity of Sydney harbour.

| | |
|---|---|
| Productive Coal Measures ........ | 1,970 ft. |
| Millstone Grit .................. | 3,625 ft. |
| Limestone series ................ | 4,500 ft. |
| Conglomerate series ............. | 2,525 ft. |
| Total. ...................... | 12,620 ft. |

The Conglomerate series consists essentially of red conglomerates, sandstones and shales. The conglomerates predominate and their water-worn pebbles and boulders are often of large size. Calcareous material in

*Extracts from Guide Book No. 1, published by the Geological Survey for the Twelfth International Geological Congress, August, 1913.

places forms the matrix of the conglomerates and occasional impure beds of limestone occur.

The Limestone series includes a great thickness of sandstone and shales, red and grey or green in colour, also conglomerate horizons, and many beds of limestone that frequently are fossiliferous. Only one bed of gypsum is known to occur in this series in the neighbourhood of Sydney harbour, though a few miles to the west and in other areas of the Carboniferous, gypsum forms an important member of the series.

The Millstone Grit is largely composed of coarse and fine, grey or green sandstones in part conglomeratic, especially towards the base of the series, and shales usually dark in colour. In the eastern part of the field shales are relatively more abundant, are more largely red, and at least one important coal seam is present, whereas, to the west the shales are generally dark, are less abundant, the conglomeratic phases of the sandstone are more prominent and coal seams are absent or relatively unimportant.

The Productive Coal Measures are largely shales, commonly dark coloured, but also in part red or green, and light coloured sandstones. Thin, persistent beds of dark limestone form a characteristic feature of the lower portion of the division. In various measured sections there is, on an average, 24 coal seams, with a total average thickness of 46 feet of coal.

## ALLIS-CHALMERS MANUFACTURING COMPANY'S PULVERATOR.

The Allis-Chalmers Pulverator is a crushing and pulverizing machine designed on a new principle. It might be thought, at first glance, to resemble the ordinary hammer mill but differs essentially in its action, as will be seen from the explanation given below.

The Pulverator is small, compact and easily mounted on a light foundation on account of its being evenly balanced.

It is designed as a crusher for the reduction of material from 3 inches or finer to a size of which all will pass a 20-mesh screen if necessary. The materials which it handles to advantage include limestone for cement making, concrete, agricultural purposes, etc., coal shale, feldspar, phosphate rock, gypsum, bauxite, slag and similar substances.

The machine can be regulated so as to provide for a 1 inch product down to any size desired, as low as 20-mesh, and on materials not too abrasive a product even finer than 20-mesh may be obtained. When a machine is crushing 20-mesh material there is a large quantity of the output much finer than this size and tests made on ordinary limestones indicate that from 40 per cent. to 50 per cent. of the product passes 100-mesh.

The capacity is proportional to the size of the product and the character of the feed. It varies from 5 to 7 tons an hour up to 15 tons, with consumption of a corresponding amount of powers, ranging from 25 to 40 h.p. for the outputs mentioned.

The wear is entirely upon the hammers, the lining plates and the grate bars, all of which are easily renewable.

The material is fed into the machine by a feeder or feed spout located in one of the upper corners and is immediately struck upward by one of the swiftly revolving hammers. It is thrown against the involute surface of the liners, which are set at such an angle that the material re-bounds and is again struck by the hammers, this action being repeated until the material is finely pulverized. The fine material is carried forward by the air currents and passes out between the involute liners or grate bars in the bottom of the casing. The hammers revolve very rapidly and are sufficiently heavy to produce a very effective blow even on a large lump of material.

The top and sides of the casing are protected by involute liners made of hard cast iron and are held in place by means of countersunk head bolts. Involute grate bars, set concentric with the line of travel of the hammers, form the bottom of the crushing chamber. These bars or liners are placed from ⅝ inch to 1 inch apart, the distance depending upon the nature of the material to be crushed, and the finished material is thus permitted to pass out between them. The grate bars slip into grooves in the casing and rest against each other.

Where the material to be crushed is inclined to pack in the machine the ordinary grate bars, similar to those generally used on a hammer mill, are employed instead of the involute type.

The shaft is carried in heavy ring oiling dustproof bearings located on the outside of the casing. The driving pulley is placed on this shaft outside of one of the bearings, and the flywheel is similarly placed on the opposite side.

A solid cast steel centre, which has a circular flange or disc on each end, is mounted on the revolving shaft and the "U" shaped hammers are attached to these discs by means of suitable pins.

The hammers are made in three pieces. The two side pieces which are fastened to the disc by a heavy pin, as explained above, screw into the shoe or wearing part of the hammer, which is made of special tool steel. The side pieces of the hammers are made in pairs of three different lengths, hammers of equal length being placed diametrically opposite each other. The shoes or wearing parts are made in three different thicknesses so that as the hammers become worn the thinnest one may be removed and the two remaining sets moved up to the next longer side pieces and a new shoe placed upon the first set of side pieces. It will readily be seen that this arrangement will greatly increase the life of the hammers and consequently reduce the cost of repairs.

The feeder has been specially designed for this mill and incorporates the well-known principle of the Gates feeder. It is adjustable within a wide range by means of a slotted crank. The crank on the sprocket or pulley provides a rapid and convenient means of stopping for adjustment. The power to operate the feeder is taken from the shaft near the balance wheel. This feeder is so arranged that the operator can at all times see just what material is being fed to the pulverator.

## GRANBY CO.'S NEW SMELTER.

Mr. F. M. Sylvester, assistant to the general manager of the Granby Consolidated Mining, Smelting & Power Co., Ltd., returned to Spokane, Washington, on September 27 after having spent several weeks at Granby Bay, Observatory Inlet, B.C., where the company is putting in a 2,000-ton smelting plant. He said that although rain had fallen every day for three weeks, there had not been any serious interruption to construction or equipment work on the new smeltery and hydro-electric power system. The buildings for both smelter and power plant are nearing completion. Practically all the machinery and other equipment has been received at Granby Bay, and much of it put in place. Altogether, both construction and installation have been advanced to a stage that promises the early completion of the works, so that it is expected ore-production and smelting operations will be commenced early in 1914.

## MINING EXPOSITION AT PHILADELPHIA.

The First National Mining Exposition, to be given in Philadelphia, October 17 to 25, under the auspices of the American Mining Congress, has gone far beyond the expectation of its promoters. Conceived but three months ago, its artistic and business success were assured fully a month ago. Now it promises to be one of the greatest trade gatherings ever held in this country and will undoubtedly result in great good to the industry.

"The response made by the mining men of the United States to the call for this Exposition," said Richard L. Humphrey, director of the Exposition, "only serves to indicate what a real need there has been existing for such an Exposition. It was quickly realized that this would not be merely a show for the curious, with doubtful results to the exhibitors. The American Mining Congress, which is to hold its convention at the same time, will bring to Philadelphia more than 2,000 of the leading mining men of the country, and these will attend the Exposition in addition to the men who will come solely for the Exposition. Considering the short time that the Exposition has been under way, I believe that it will be a most remarkable show."

A number of the exhibitors and their exhibits are as follows: Westinghouse Electric & Mfg. Co., Pittsburg, and Baldwin Locomotive Company, Philadelphia, mine locomotives; Western Electric Company, New York, mine telephones; Milwaukee Locomotive Company, Milwaukee, Wis., gasoline mine locomotives; Universal Portland Cement Company, Chicago, Ill.; use of cement in mining; Streeter-Amet Weighing & Recording Company, Chicago, automatic weight recorder for mine tipple scales; the Lobdell Wheel Car Company, Wilmington, Del., car wheels and axles as applied to mining cars; J. S. McChesney & Company, Chicago, mine supplies; Williams Patent Crusher & Pulverizer Company, Chicago, a coal crusher; Atlantic Refining Company, Philadelphia, lubricating oils; Hirsch Electric Mine Lamp Company, Philadelphia, miner's cap and lamp; Henry Troemner, Philadelphia, assay and analytical balances; West Virginia Rail Company, Huntington, W. Va., steel rails; Keuffel & Esser Co., Hoboken, N.J., mathematical and surveying instruments; C. O. Bartlett & Snow Co., Cleveland, O., working model of a complete coal handling plant; American Tempering Company, Springfield, Ill., a system of welding; Hyatt Roller Bearing Company, Newark, N.J., mine car wheels with roller bearings; Roessler & Hasslacher Chemical Co., New York, the sodium compounds used in mining; Link Belt Company, Chicago, elevating, conveying and transmission machinery; Fairmont Mining Machinery Company, Fairmont, W. Va., portable electric mine pump, etc.; Draeger Oxygen Apparatus Company, Pittsburg, Pa., life saving apparatus; General Electric Company, Schenectady, N.Y., electric machinery and appliances; Jeffrey Manufacturing Company, Columbus, Ohio, storage battery locomotive, etc.; John A. Roebling's Sons Company, Trenton, N.J., wire ropes and cables; the Alexander Milburn Company, Baltimore, Md., carbide lamps, etc.; Main Belting Company, Philadelphia, belting; Electric Storage Battery Company, Philadelphia, storage batteries designed for mine locomotives; Goodman Manufacturing Co., coal mining machinery; John G. Scott, Girardsville, Pa., patented transmission rope clip; Edison Storage Battery Co., Orange, N.J., storage batteries and electric mine lamps.

In addition to the above, there are twenty or more representative mining concerns that are just closing up negotiations for space in the Exposition. This, it is expected, will make the First National Mining Exposition a wonderful success.

## HOLLINGER.

The report for the period of four weeks ending September 9, 1913, shows a gross profit of $145,866.79. Operating costs were $61,899.48, an average of $5.179 per ton of ore milled. The approximate average value of all ore hoisted was $17.94. 6,033 tons of the ore was from development work, and 6,363 tons from stopes.

The mill treated 12,264 tons of ore of which 311 tons were treated for Acme Gold Mines, Ltd. The average value of the ore treated was $17.80. The average milling cost was $1.376 per ton. Approximate extraction was 96.4 per cent.

Work upon No. 1 vein upon the 425 ft. level is demonstrating that values and widths are about the same as upon the upper levels, and preparations are being made to immediately start sinking to the 550 feet level.

A point of interest to be noted is that practically one-half of the ore milled came from development work.

The main shaft has been holed through from the 300 to the 200 ft. level and is being timbered.

Crosscutting upon the 100 feet level resulted in finding an ore body which shows the same characteristics and high values as does No. 1 vein. The crosscut caught the vein 250 feet north of the supposed northern extremity of No. 1 vein, and as the new ore body lies directly ahead of the old workings it is possible that No. 1 vein may have a greater length than had previously been supposed.

Upon the 300 ft. level an ore body has been picked up by crosscutting which would appear to be No. 8 vein.

The reduction of working cost to $5.18 per ton is the lowest figure yet reached.

## NEW ROTARY POWER PUMP.

A new type of rotary power pump has just been developed by the Goulds Ffg. Co., Seneca Falls, N.Y.. This pump differs from the rest of the line of pumps of the same capacity in that gear style cams have been substituted for the three-toed cams used in the remainder of the line, and the gears on the end of the cam shafts have been eliminated.

Two sizes are built: No. 1 has a capacity of 25 to 50 gallons per minute at 225 to 450 revolutions, and No. 2 has a capacity of 50 to 100 gallons per minute at 225 to 450 revolutions. Both pumps are suitable for pressures up to 100 pounds or 230 feet elevation.

They are mounted on a cast iron bed plate, fitted with an outboard, bearing and tight and loose pulleys for belt drive. The suction connection is made within the base directly beneath the case and is reached through hand holes in the base. No. 1 has two discharge openings, one tapped for pipe and the other threaded for hose couplings. No. 2 has three discharge openings, two fitted the same as No. 1, and the third fitted with an interchangeable blank flange.

The suction is 3-inch on No. 1 and 4-inch on No. 2. The discharges are for 1½ and 2-inch pipe or hose respectively.

The Goulds line of pumps are for sale in Canada by the Canadian Fairbanks-Morse Co., Limited.

# PERSONAL AND GENERAL

Mr. John P. Clarke, B.A., a graduate of Queen's, Kingston, while employed with a survey party in the Flathead country, Southeast Kootenay, British Columbia, was killed by a tree falling on him and crushing his skull.

Dr. Alfred W. G. Wilson, of the Mines Branch of the Canada Department of Mines, after his return to British Columbia from a trip to Yukon with Excursion C8 of the International Geological Congress, has been making investigations relative to the question of the appointment of a special commission asked for by some members of Kootenay Boards of Trade to enquire into matters connected with the lead and zinc mining industries.

Mr. Cosmo T. Cartwright, assistant engineer, Division of Mineral Resources and Statistics, Mines Branch of the Canada Department of Mines, has been in British Columbia lately, gathering additional information concerning the mining and metallurgical industries of that Province.

Mr. Wm. Watson, for some time manager for the Motherlode Sheep Creek Mining Co., operating a gold mine and stamp mill in Nelson mining division, B.C., has returned to Nelson from a visit to Chicago.

Mr. Jas. McEvoy, who was taken ill with pneumonia while travelling in British Columbia with the C2 Excursion of the International Geological Congress, and had to be placed in a hospital in Vancouver for a time, is now recovered and has returned to Toronto.

Mr. M. K. Rodgers, well-known in British Columbia in connection with the development of the Nickel Plate group of gold mines in Camp Hedley, Similkameen district, and the Hidden Creek copper mines near Observatory Inlet, has lately been revisiting those properties, the great value of which he was the first to recognize and demonstrate by development of large bodies of ore. He had been in Mexico for a year or more previous to his recent return north. As he still holds mining property in Mexico, he intends making Los Angeles, Southern California, his headquarters in the near future.

Mr. Desaix B. Myers, of Los Angeles, California, has been examining the Emerald lead mine, near Salmo, Nelson mining division, B.C.

Mr. Frederick P. Burrall, of New York City, has been investigating mining conditions in the White Bear country, Yukon Territory, and across the International Boundary line from that region, in the Shushanna gold field, Alaska.

M. Eriera de Castro, a Portugese mining engineer, recently accompanied Mr. W. E. Cory, of New York, formerly president of the United States Steel Corporation, now one of the largest shareholders in the Hedley Gold Mining Co., and Mr. J. B. Worden, of Philadelphia, on a visit to the Hedley Co.'s Nickel Plate group of gold mines and 40-stamp mill in Camp Hedley, Similkameen, B.C.

Mr. Chas. Camsell, of the Geological Survey of Canada, whose lengthy memoir on the "Geology and Ore Deposits of Hedley Mining District, British Columbia," was published in 1910 by the Canada Department of mines, lately paid another visit to the Nickel Plate mines to obtain additional geological and mineralogical data made available by the extensive underground development work done since his report on the district was prepared.

Mr. C. H. McDougall, superintendent of the Consolidated Mining & Smelting Co.'s St. Eugene and Sullivan Group lead-silver mines in East Kootenay, B.C., was ill in the hospital at Cranbrook during the latter part of September. Latest news was that he was recovering.

Mr. S. J. Schofield, of the Geological Survey of Canada, with his field party, last month went up Crawford Creek from Kootenay Lake to cross the mountain divide between West and East Kootenay, in which latter part of British Columbia he has done much geological work in recent years.

Mr. L. B. Reynolds has returned to Nelson, B.C., after having spent two or three months in the Eastern United States.

Mr. W. R. Wilson, of Fernie, B.C., general manager for the Crow's Nest Pass Coal Co., was a visitor to Spokane, Washington, U.S.A., during the "Inland Empire Fair" week in that city in the latter part of September.

Mr. J. L. Warner, who several years ago was instrumental in attracting public attention to promising gold mining properties in Sheep Creek camp, Nelson mining division, B.C., and of late has been giving his attention to the South Belt of Rossland camp, in the same Province, was married last month in Spokane, Washington, and now has his home in Rossland.

Mr. John Hopp, of Barkerville, who has for years been operating on a comparatively large scale, hydraulic placer-gold mines in Cariboo district, B.C., was in Victoria last month seeking an injunction to prevent interference with his Lowhee water ditch. Last summer the manager of the neighbouring mining property was sent to jail for having blown up part of the Lowhee ditch with dynamite; latterly gates have been surreptitiously opened on different occasions and the water run to waste, so as to prevent Mr. Hopp from using it in washing gold-bearing gravel.

Mr. E. S. Moore was in Toronto on October 1st on returning from a trip to the Yukon.

Mr. Roy Margeneau has joined the staff of the Tough-Oakes Mining Company at Kirkland Lake, Ont.

Messrs. Weigand, Schenk, Morel, Fermor, Luttman-Johnson, Mouye and Zoude Mrs. Fermor and Miss Raisin, members of the International Geological Congress, visited Porcupine and Cobalt last week. Mr. R. G. McConnell was in charge of the party. Mr. A. A. Cole and A. G. Burrows acted as guides.

The S. Flory Mfg. Co., Bangor, whose plant was destroyed by fire July 31st, have erected temporary buildings equipped with improved high grade machinery and are ready to take care of orders as in the past.

The Roberts and Schaefer Company, Chicago, have opened a laboratory for analyzing and testing fuels.

Mr. Chas. Watson has been appointed manager of the Cobalt Townsite Mining Company, to succeed Mr. Bailey.

Mr. Stanley Graham has been appointed Professor of Mining Engineering at the Nova Scotia Technical College at Halifax.

Mr. P. A. Robbins has made an examination of the Jupiter mine for the Timmins-McMartin-Dunlap syndicate.

Norman R. Fisher, of the Timiskaming mine, Cobalt, has been appointed general manager of the Pearl Lake mines, but this position will not interfere with his duties at his Cobalt property.

Mr. Harold Roche, who has been superintendent of the North Dome mines in Porcupine for the past three months, has been placed in a similar capacity at the Pearl Lake mines, following the resignation of the general manager, Col. Stevenson.

Mr. J. B. Tyrrell will leave shortly for London, England. His address while there will be 224 Salisbury House, E.C.

Mr. J. V. Culbert is now superintendent of the Wasabika mines, West Shiningtree, Ontario.

The Canadian Allis-Chalmers Company has issued a new catalogue of mechanical power transmission machinery. It is a cloth-bound book of 300 pages and contains many useful general data as well as descriptions and price lists of the company's machinery.

The Canadian General Electric Co. has issued a bulletin on fractional horse power motors and their application.

The Canadian Collieries (Dunsmuir) have decided to install an extensive electric driven pumping plant. There will be four separate units. Two will be driven by 75 h.p. a.c. motors, and a third by a 75 d.c. motor, each unit being capable of delivering 350 gallons per minute against a head of 370 feet. The fourth unit, consisting of two pumps working in series, will deliver 350 gallons per minute, against a head of 740 feet. The pumps will be built by Canadian Allis-Chalmers, Limited, and the motors by Canadian General Electric Co., Limited.

Mr. G. F. S. Anderson, formerly of the Buffalo mine, has taken charge of the Lucky Cross gold mine at Swastika, Ont.

Mr. C. H. Hitchcock, formerly in charge of exploration at Murray mine for the Dominion Nickel Co., has been appointed geologist for the Canadian Copper Co.

Mr. F. M. Sylvester, formerly assistant manager, has been appointed general manager of the Granby, Consolidated Mining, Smelting and Power Co., to succeed Mr. J. P. Graves.

Prof. J. C. Gwillim has returned to Kingston to resume his duties at the School of Mining, after spending several months in Western Canada mining districts.

# SPECIAL CORRESPONDENCE

## BRITISH COLUMBIA

There has been nothing unusual, other than labour troubles at some Vancouver Island coal mines, to interfere with the progress of mining in the province during the latter half of September. Weather conditions have been favourable in the metal mining districts; in the Crowsnest coal field there has been the customary occasional shortage of railway cars that is experienced every year at wheat harvest time, and the result has been that the miners have not been fully employed, losing time whenever there were not cars to take away the coal mined.

On Vancouver island there has been some advancement made toward a general resumption of operations at the mines at which a total suspension of work followed the August excesses of strikers. The Cumberland mines of the Canadian Collieries (Dunsmuir) Limited, have been worked throughout the troubled times, as is shown by their record of output of coal—47,800 tons in August, which was the month in which the rioting occurred, and approximately 52,000 tons in September. The company has resumed work at its Extension mines. At South Wellington, the Pacific Coast Coal Mines, Ltd., is working on a small scale, and expects to gradually increase its working force and its output of coal. The Western Fuel Co. has men keeping its mines in shape, as far as practicable, for a resumption of production whenever this shall be decided upon. The only company that has yet recognized the Union Mine Workers of America is the Vancouver-Nanaimo Coal Mining Co., operating the Jingle Pot mine, near Nanaimo; this company ordinarily employs fewer men and mines less coal than the others above-mentioned.

### EAST KOOTENAY.

**Windermere.**—Prospectors are again giving attention to the lower part of Findlay creek, which enters Kootenay river near the northern boundary of Fort Steele mining division. A new discovery of ore containing grey copper and galena is reported as havi[ng] been made on the south side of the creek, about six miles up from its mouth, and six mineral claims have been located there. Many years ago this creek was worked for gold by placer miners; later, in the nineties, numerous mineral locations were made on a series of quartz lodes. One of the best known of those properties was the Thunder Hill group, upon which, so i[t is] stated, $12,000 was expended, exclusive of the cost of a two-mile tramway to a mill site on Upper Columbia lake, and of a 50-ton lead concentrating mill. The latter has long been idle, the class of ore it was intended to treat not having been found in quantity. There is o[n] the creek what has been known as a copper belt, and it is to that prospectors are now going.

### SLOCAN.

**Silverton.**—The Van-Roi Mining Co.'s managers in British Columbia cabled to the company's office in London the following report for the month of August: "Estimated expenditure for August: Development, $2,550; capital expenditure, $174. Exploratory raise, main vein, level 9: Position 216 ft. west of stope 1, level 9. Height of back 80 ft. above level. Advance 50 ft., of which 36 ft. averaged 18 oz. silver, 1 per cent. lead, 13 per cent. zinc across an average width of 24 inches. Crosscut northwards, level 9—1,500 ft. west of portal: Advance 11 ft. Ore has been penetrated averaging 12 oz. silver, 11 per cent. lead, 11 per cent. zinc across an average width of 3 inches. Crosscut southwards, level 9—1,500 ft. west of portal: Advance 10 ft. Ore has been penetrated averaging 12 oz. silver, 11.5 per cent. lead, 16 per cent. zinc across an average width of 33 inches. Crosscut northwards, level 9—860 ft. west of portal: Advance 10 ft. Ore has been penetrated averaging 2 oz. 10 dwt. silver, nil lead, 16 per cent. zinc across an average width of 12 inches. Mill will be ready to start to-morrow."

### NELSON.

The resident county court judge has delivered a judgment of much interest to mining men of British Columbia. Some miners had obtained a lien under the Mechanics' Lien Act against the Kootenay Gold Mines, Ltd., operating the Granite-Poorman group of mines and a 20-stamp mill in Nelson mining division. Between \$5,000 and \$6,000 was the total of the claims against the company of 32 of its former employees. The property of the company had been mortgaged, and the mortgagees disputed the right of the employees to a prior claim on it. The judgment follows: "There is no doubt that the main object of the Mechanics' Lien Act was to give every person a lien for work and services upon or in a mine, building, etc., but where prior mortgages existed the provisions of the section dealing with mortgages are inadequate to give relief to lien-holders of the class before us, unless in the proceedings at the trial the increase in the value of the mortgaged premises can be estimated. It is not contended that the work done in this instance increased the value of the premises, and the section just referred to would have to be read out of the Act before judgment could be given as against the mortgagees' interests. A high judicial authority has decided that 'it is a serious matter to hold that where the main object of a statute is clear it shall be reduced to nullity by the draftsman's unskilfulness or ignorance of law.' I must, however, hold that insofar as work in taking out ore, unless in strictly development work, the miners and other employees at a mine cannot enforce their liens against the premises or property as against the interests of the mortgagees. I find that the lien-holders have proved their claims as appears in the evidence and direct that the same be paid by the defendant company forthwith. And in default of payment forthwith I direct that the lien-holders may proceed by sale or otherwise as may be further directed, as agreed upon by all parties interested, against the equity in the premises owned by the defendant company."

## TRAIL CREEK DIVISION.

Ore receipts at the Consolidated Mining & Smelting Co.'s works at Trail during four weeks ended Sept. 25, were as under:

| From | Tons. | Tons. |
|---|---|---|

| | | 1,892 |
| Total | | 29,373 |

**Rossland.**—The managers of the Le Roi No. 2, Ltd., cabled from Rossland to London the following report: "Josie mine report for August: Shipped 1,620 tons of ore and 55 tons of concentrates. The receipts from smelter are \$17,303, being payment for 1,327 tons of ore shipped, and \$1,007 for 105 tons of concentrates; in all, \$18,310. Estimated costs for corresponding period: Development, \$6,000; ore production, \$12,500; milling, \$1,300. Total \$19,800. North Annie Drift, 500-ft. level: Advance, 64 ft., of which 40 ft. averaged 15 dwt. gold, 8.5 per cent copper, across an average width of 9 inches. Poorman Drift, 900-ft. level: Advance 17 ft. Also sunk 4 ft. for the purpose of connecting for ventilation. Drift 44, 900-ft. level: Advance 15 ft., of which the whole averaged 2 oz. 18 dwt. gold, 0.875 per cent. copper, across an average width of 39 inches. Raise 728, 700-ft. level: Back is 83 ft. above level. Advance 18 ft. Crosscut and drift 538, 500-ft. level: To investigate ore found in Diamond Drill hole No. 340. Advance 23 ft. crosscut and 20 ft. driven, of which 20 ft. averaged 4 dwt. gold, and 3.5 per cent. copper across 31 inches."

## VANCOUVER ISLAND.

**Victoria.**—Since Mr. Chas. H. Clapp left Vancouver Island for Arizona, in the early part of September, geological investigations have been continued in Sooke district, west of Victoria, by other members of the staff of the Geological Survey of Canada. It is understood that occurrences of copper ore in that district are regarded as of sufficient promise to warrant much development work being done to explore them.

---

The Canadian Goldfields Syndicate, Ltd., has declared its dividend No. 17; amount with bonus one and one-half per cent., on the company's capital stock. This company has its head office in Montreal; its mining property is in British Columbia, but it is not now, nor has it been for a number of years, doing any mining. It derives its profits available for distribution among its shareholders from dividends it receives from the Consolidated Mining & Smelting Company of Canada, Ltd. Years ago it sold to the St. Eugene Mining Co. a group of mineral claims, now part of the St. Eugene mine group at Moyie, East Kootenay, for which it received shares in the St. Eugene Co., and, later shares in the Consolidated Co.

Shaft-House, Cobalt Townsite mine

# COBALT, GOWGANDA, AND SOUTH LORRAIN

**Cobalt Townsite—**

Following the meeting of the directors of the English syndicate which controls the Cobalt Townsite, the Casey Cobalt, the Cobalt Lake, the City of Cobalt, and the Townsite Extension, there have been several important developments. The purchase of the Northern Customs mill has been ratified and preparations are being made to rush the work necessary to connect the City of Cobalt with that plant, a long tramway being built from the shaft to the mill. To finance the purchase of the mill, or partly finance it, the capitalization of the City of Cobalt Mining Company is being raised from $1,500,000 to $2,100,000. The head office of the City of Cobalt is also being transferred from Cobalt, where it has always been, to Toronto. Another change is the placing of Mr. Chas. Watson as manager of the Cobalt Townsite. He is already in charge of the City of Cobalt for the same interests. Directly the Northern Customs mill is turned over to the English companies in November, the ore which has been piling up on the surface and also in the stopes underground will be treated as far as the capacity of the plant will allow.

The new plant of the Northern Customs concentrator is making excellent progress. All the concrete work is finished and framing has commenced. The switch into the property has been completed, and, when the machinery arrives, it can be taken in without any delay. The water will be piped from Sasaginaga Lake and will be a gravity flow.

**The Hudson Bay** output for the month of August was considerably higher than usual, this being due to the larger proportion of high grade ore in the shipments. The production for the month amounted to 73,150 ounces. The ore concentrated during the month amounted to 19.40 tons, the heads to the mill ran 21.50 ozs. to the ton. The extraction was 86.90 per cent. The stopes are being carried very wide at the Hudson Bay now.

The many friends of Mr. Stanley Graham will congratulate him on the appointment he has received as the professor of Mining Engineering at the Nova Scotia Technical College at Halifax. A graduate of Queen's, Mr. Graham had experience in Mexico before he came to Northern Ontario. His last appointment was superintendent of the Peterson Lake Mining Company.

**Kerr Lake—**

No great surprise is entertained in camp at the good showing of the Kerr Lake Mining Company in the annual report. It has been known for some time that Mr. Livermore's policy of bringing development work up to date has yielded excellent results. The report, too, was drafted before the finds were made under the drained portion of Kerr Lake.

**Cobalt Lake—**

It is stated by the management of the Cobalt Lake Mining Company that the basis of 100,000 ounces per month was maintained during September. A new development was experienced from the No. 2 crosscut when a two-inch vein carrying occasional patches of high grade ore was cut. The systematic exploration of the northern end of the lake is being proceeded with.

Northern Customs Concentrator, Cobalt

In place of Mr. Stanley Graham who has been appointed professor of Mining Engineering in the Nova Scotia Technical College, Mr. John Baker has been given the position of superintendent of the Peterson Lake Mining Company. Mr. Baker was formerly mill superintendent of the Cobalt Lake Mining Company.

**Seneca-Superior—**

While the statement that a new vein had been cut on the Seneca Superior is not true, it is accurate that the main vein has been found to carry its values 130 ft. below the 200-foot level in a winze which is now being sunk. It it still in conglomerate at that point. The contact has also been reached and some good ore has been found in the Keewatin, but no hopes are being founded on this.

**More Geologists—**

The very last party of geologists has been entertained and has gone. This small but distinguished party from the Yukon had not included Cobalt in their original itinerary, but so insistent was the demand to see Northern Ontario that about twelve of them saw the Porcupine and Cobalt camps.

**Marketing the Ore and Bullion—**

Owing to the restricted market for Cobalt ores, some difficulty is being experienced in disposing of the silver both as concentrates and crude ore. The situation has been aggravated by the determination of the two A. S. & R. smelters to refuse all ores that run higher than 7 per cent. in arsenic. As practically all high grade Cobalt ores contain considerably more arsenic than this, this virtually means the closing of the Perth Amboy and Denver smelters to the mine managers of the camp. The Coniagas smelter at Thorold can handle little more than the output of the Coniagas, and the Townshite and Deloro must give first choice to O'Brien and Miller Lake O'Brien at Gowganda. The Pennsylvania smelter at Carnegie has closed down. It is understood that the smelter at Orillia is to be rebuilt and there is a much better market for Cobalt ores abroad than formerly.

The steamship companies plying out of Canadian ports have decided to raise their rates for handling silver bullion, and it is therefore probable that the bulk of the Cobalt bullion which has been marketed in London will now go to New York. The express companies are, however, desirous of retaining the business and a way may yet be found for shipping direct to the London market.

## PORCUPINE, SWASTIKA AND KIRKLAND LAKE

**Revival of Activity—**

There has been quite a revival of mining activity in Porcupine within the past month, not in the stock market, but in the operations in the camp. One of the most interesting developments is on the old Preston East Dome claims which reverted to its former owners. Out of an open cut on the No. 7 vein to the west of the camp buildings twenty and a half tons of gold ore were taken. The open cut was 30 feet long by 12 feet deep. The high grade streak of ore was 25 inches wide, but the open cut was two to three feet wide. Out of this approximately 24 tons of ore were taken and a total recovery of 210 ounces of gold made. A shaft is now being sunk at one end of the open cut from which another level will be developed.

**Tough-Oakes—**

It is understood that the contact between the conglomerate and the porphyry has been reached at or about the 200-foot level of the Tough-Oakes property. Remarkable high grade ore is being mined at the 100-foot level, and this is being bagged and another shipment will be sent out soon. The small mill is being kept busy, but the extraction is not much better than 50 per cent.

**Jupiter—**

Mr. P. A. Robbins, manager of the Hollinger Gold mines, has made an examination of the Jupiter gold mine for the Timmins, McMartin and Dunlap syndicate. The Jupiter mine has been closed down for some months.

**McIntyre—**

What is believed to be the extension of the Dixon system of veins has been cut in the McIntyre shaft at a depth of 390 feet. It will be drifted upon at the 400-foot level. An assay gave $12 a ton. The main shaft of the McIntyre will be continued to the 600-foot level from the 400-foot level. A lengthy crosscut will be made under Pearl Lake from No. 1 shaft to No. 5.

**Dome—**

The concrete work for the 40-stamp addition to the Dome mill will be completed in a few days when the steel work for the structure will be commenced. It is expected that the enlarged mill will be running about next March. Mr. H. C. Meek has returned from his holiday and is again in charge of operations. Mr. Ambrose Monell and other directors of the Dome will visit the plant this month.

**Three Nations—**

The Three Nations mill in Whitney township is now running. The ten-stamps have been crushing between 49 and 50 tons daily. It is possible that an additional ten stamps will be installed next spring, and a cyanide plant.

**Acme—**

Driving from the 100-foot level of the Hollinger mine, crosscuts are now being made to cut ore bodies on the Acme Gold mines, better known as the Dixon claim. The shaft is being put down from 200 to 500 feet without delay. At the No. 10 shaft, near the McIntyre line, crosscuts are now being made at 150 feet, which is equivalent to the 200-foot level of the main shaft.

**Schumacher—**

A new working shaft for the Schumacher mine will soon be available for hoisting purposes. Four hundred feet south of the old shaft a raise has been started from the 100-foot level to the surface. The new shaft will be one of three compartments. The enlarged plant will be in good working order before the snow flies.

Mr. Edward Yorke, formerly manager of the Hughes Porcupine, is now in charge of the mine d'Or Huronia, in Gauthier township, in the Larder Lake district. Mr. Porteous, formerly mill superintendent of the Vipond, has taken his place.

**Miracle—**

A compressor plant for the Miracle mines is soon expected to arrive. It will be taken in from Connaught station, the claims being situated in Langmuir township. So far only test pits have been put down, but this winter a main working shaft will be started.

---

It is stated that a mine-rescue apparatus, made in England, which does away with the use of the helmet, weighs only 28 lbs., and it is claimed that a man using it can work in deadly gases more than five hours.

---

A report from Vancouver, B.C., is to the effect that the company operating the White Pass and Yukon route to Dawson intends to extend its line toward the Chisana or Shushanna gold field, in western Alaska, this extension to be in Canadian territory.

# STATISTICS AND RETURNS

### COBALT ORE SHIPMENTS.

Shipments from the Cobalt camp were exceptionally low during the week ending Oct. 11, both from a standpoint of tonnage and value. Of the seven cars of ore which left the camp, four were of low grade values. In addition to the ore shipments being below the average, the bullion shipments, while fairly high in figures, included but one shipment, that from the Nipissing mine.

The LaRose sent out four cars of low grade during the week, the heaviest low grade shipment in a week from the property since the contract with a local customs concentrator was signed several years ago. One hundred and seventy-five tons were despatched by the LaRose during the week, going to Newark, N.J.

The high grade shippers during the week were the Trethewey, McKinley-Darragh and O'Brien mines, the first named sending to Denver. Last week a shipment from the Cobalt Aladdin company, the new English concern, now working the Silver Queen, was omitted from the list. This car was of high grade ore and the first sent from the Silver Queen property since the balmy days of that company.

The bullion shipment of the week was from the Nipissing mines. The total value was nearly $75,000.

The ore shipments tabulated as to high and low grade were as follows:

| | High | Low | Totals |
|---|---|---|---|
| LaRose | 0 | 4 | 348,600 |
| O'Brien | 1 | 0 | 87,400 |
| McKinley-Darragh | 1 | 0 | 71,665 |
| Trethewey | 1 | 0 | 40,000 |
| | 3 | 4 | 547,665 |

The bullion shipments for the week ending Oct. 11, were:

| | Bars. | Ounces. | Value. |
|---|---|---|---|
| Nipissing | 100 | 118,924.91 | $73,138.82 |

The shipments for the year to date are:

| | Ounces. | Value. |
|---|---|---|
| Nipissing | 4,749,936.33 | $2,719,879.45 |
| Penn-Can | 14,141.60 | 8,456.90 |
| Buffalo | 1,240,607.90 | 772,301.57 |
| Crown Reserve | 364,056.00 | 222,877.25 |
| Dom. Red | 352,183.40 | 203,277.15 |
| Townsite | 36,818.40 | 30,364.04 |
| Miscellaneous | 3,920.00 | 1,623.00 |
| Timiskaming | 25,561.70 | 14,948.04 |
| O'Brien | 146,542.77 | 78,423.66 |
| Wettlaufer | 4,715.00 | 2,925.00 |
| Miller Lake | 3,710.20 | 2,053.01 |
| Colonial | 635.00 | 374.00 |

| Lumsden | 1,814.40 | 1,079.00 |
| Beaver | 1,837.00 | 1,138.94 |
| | 7,046,599.83 | $4,168,799.62 |

### GOLD PRODUCTION OF CANADA.

"United Empire," the journal of the Royal Colonial Institute published in England, included the following paragraph, under the subhead "Canada," in its "Round the Empire: Monthly Notes," in September number:

"Geological Congress—The twelfth International Congress is to be held this year in Canada, and special care is being taken to ensure that all branches of mining shall be represented. The advance in the value of industrial metals is remarkable. The gold output, which until recently overshadowed other forms of mining, is steadily declining. On the other hand, the value of copper, tin and wolfram has become notably high, while the rarer minerals are also coming to the front, so that the prospector of to-day has new possibilities to take into account."

It may be that the foregoing comments on industrial metals were intended to be general, but if they are supposed to be applicable to Canada only, then the writer is astray in some of his alleged facts. Tin and wolfram have no place in recently published Dominion mineral production tables. The value of the 1912 production of copper was certainly high—the highest yearly total on record. The statement as to gold is not correct as regards Canada's production of that metal during seven years, 1906-1912, as will be seen by examination of the following comparative table, compiled from statistics published by the Mines Branch of the Canada Department of Mines, although it is admitted that for the previous seven-year period, 1899-1905, the total was much larger. In order to show the chief sources of the gold production of Canada, that of Yukon and British Columbia appears separately:

| Year. | From Yukon. | From Brit. Columbia | From all other parts of Dominion. | Total. |
|---|---|---|---|---|
| 1906.. | $5,600,000 | $5,579,039 | $ 323,081 | $11,502,120 |
| 1907.. | 3,150,000 | 4,883,020 | 349,760 | 8,382,780 |
| 1908.. | 3,600,000 | 5,929,880 | 312,225 | 9,842,105 |
| 1909.. | 3,960,000 | 5,174,579 | 247,651 | 9,382,230 |
| 1910.. | 4,570,362 | 5,403,318 | 232,155 | 10,205,835 |
| 1911.. | 4,634,574 | 4,930,145 | 216,358 | 9,781,077 |
| 1912.. | 5,540,000 | 5,167,390 | 1,852,053 | 12,559,443 |

It is true there was a steady decrease in total value of the gold production of the Dominion as a whole from its maximum yearly output of $27,908,153 in 1900 to $8,382,780 in 1907, but far from the production, since the latter year, having "steadily declined," it will be seen that as compared with 1907 the estimated production of 1912 shows an increase of approximately 50 per cent., while there is good reason to expect that the revised figures for the latter year, when they shall be available, will make an even somewhat better showing. Further, having in mind that Yukon, British Columbia and Ontario have each produced more gold during the expired portion of 1913 than for the corresponding portion of 1912, there is ample warrant for expecting an appreciably large increase in 1913 over 1912 and, of course, a higher percentage of increase over 1907.

Should it be contended that "United Empire" referred to production of a larger field than Canada, the figures above quoted may not be used as evidence that that publication is in error. However, this good purpose will be served—they will show that Canada's production of gold was larger in 1912 than in any other year since 1905. It may be added that the great decrease from the maximum above shown was chiefly in the production of Yukon Territory—from its maximum of $22,275,000 in 1900 to $3,150,000 in 1907.

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

# BUYERS AND SELLERS OF METALS

# PROVINCE OF QUEBEC

## Department of Colonization, Mines, and Fisheries

*The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, Etc.*

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

**MINERS' CERTIFICATES.** First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is $10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

**WORKING CONDITIONS.** During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

**SIX MONTHS AFTER STAKING.** At the expiration of six months from the date of the staking, the prospector, to retain his rights, must take out a mining license.

**MINING LICENSE.** The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of $10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

**MINING CONCESSION.** Notwithstanding the above, a mining concession may be acquired at any time at the rate of $10 an acre for SUPERIOR METALS when more than 20 miles distant from a railway and $20 an acre when less than 20 miles.

For INFERIOR METALS the prices are $2.00 and $4.00 an acre respectively.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

**PROVINCIAL LABORATORY.** Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

**THE HONORABLE THE MINISTER OF COLONIZATION, MINES, AND FISHERIES, QUEBEC.**

# The Minerals of Nova Scotia

The extensive area of mineral lands in Nova Scotia offers strong inducement for investment.

The principal minerals are:—Coal, iron, copper, gold, lead, silver, manganese, gypsum, barytes, tungsten, antimony, graphite, arsenic, mineral pigments, diatomaceous earth.

Enormous beds of gypsum of a very pure quality and frequently 100 feet in thickness are situated at the water's edge.

The Province contains numerous districts in which occur various varieties of iron ore practically at tide water and in touch with vast bodies of fluxes.

The Gold Fields of the Province cover an area of approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Deposits of particularly high grade manganese ore occur at a number of different localities.

Tungsten-bearing ores of good quality have lately been discovered at several places and one mine has recently been opened up.

High-grade cement-making materials have been discovered in favorable situations for shipping.

Fuel is abundant, owing to the presence of 960 square miles of bituminous coal and 7,000,000 acres of woodland.

The available streams of Nova Scotia can supply at least 500,000 H. P., for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

**Copies of the Mining Law, Mines Reports, Maps and Other Literature may be had free upon application to**

**HON. E. H. ARMSTRONG,**
**Commissioner of Public Works and Mines,**
**HALIFAX, N. S.**

# Amatite

## ROOFING

**Mineral Surfaced—**

**Needs No Painting**

EVERYTHING about Amatite appeals to the man with common sense. He can see its superiority at once—the real mineral surface *which never needs painting;* the two layers of Pitch which is the greatest waterproofing material known; the two layers of heavy Tarred Felt—all these contribute to the popularity of Amatite.

We can make Amatite better and cheaper than anyone else on account of our greater facilities, and consequently we sell it at a surprisingly low figure.

Simply the fact that it needs no painting is enough to make a man sit up and take notice—especially the man who has spent time and money in painting and repainting smooth surfaced roofings.

Write to-day for further information.

CONTENTS.

## MINERAL PRODUCTION OF CANADA--1912

The annual report of Mr. John McLeish, Chief of the Division of Mineral Resources and Statistics, containing revised figures for the year 1912, has been published by the Mines Branch, Ottawa.

Mr. McLeish's report shows that the output has increased greatly over that of previous years. For 1912 the total value was $31,827,302, or 30.8 per cent. greater than that of 1911, amounting to $135,048,296. The value per capita has increased from $2.23 in 1886 to $18.27 in 1912.

Noteworthy features of the year, which was by far the most successful year in the history of the mineral industry in Canada, were the extensive development of ore reserves, particularly Sudbury nickel copper ores, Porcupine gold ores, and British Columbia copper and lead ores, extension of ore smelting and refining facilities, improvements in methods of treatment of the ores and good prices received for the metals.

The production of metalliferous products in 1912 was valued at $61,172,753, being 45.3 per cent. of the total mineral output. The value of non-metalliferous products was $45,080,674.

The Mines Branch has endeavoured to obtain from every mine operator in Canada an annual report with respect to the number of men employed and wages paid, the total tonnage of ores mined, the tonnage concentrated and the quantities of concentrates produced, the tonnage of ore or concentrates shipped, and the net value thereof, the quantities of metals as determined by settlement assays contained in the ores shipped, and the quantities of metals for which payment was made by the purchaser's smelter or recovered by the operator's smelter. This has been successfully done, and with the exception of two products, placer gold and petroleum, Mr. McLeish's report contains this very interesting information with respect to each of the products.

The total number of men employed in 1912 in metalliferous mines was 10,612. Wages paid amounted to $10,113,578. There was mined 4,194,517 tons of ore. Total net value of shipments from metalliferous mines was $46,018,233; in non-metalliferous mines, exclusive of stone quarries and clay pits, there were employed in 1912 an average of 33,954 men, earning in wages $23,-877,781. The tonnage mined, chiefly coal, was 17,165,-628, having a net value of $45,080,674.

The report contains also a statement of the production of the several smelting and refining companies operating in Canada, and is an admirable summary of the progress of the mineral industry for the year 1912.

## GOWGANDA

Gowganda progresses in spite of many difficulties. In our special correspondence this week will be found several items of interest concerning this silver district. For numerous reasons Gowganda has not had a fair chance to make good. Chief among these is lack of transportation facilities, and it is unfortunate that the Gowganda road is still in such bad condition in spite of the urgent necessity of improvement.

## LABOUR ORGANIZATION IN CANADA

Membership in the labour unions is growing. The annual report of the Department of Labour, recently issued, shows that there was an increase last year from 133,132 to 160,120. This is equivalent to about two per cent. of the population.

The Department estimates the number of wage-earners in Canada at 1,300,000. About one-eighth are members of unions.

Nearly the whole membership is in organizations, which have their headquarters in the United States, and most of which are in affiliation with the American Federation of Labour. The latter organization is the most important of its character in North America, and has a membership of about 2,000,000.

Organization has proven a great boon to wage-earners in Canada. At the annual Trades Congresses vital subjects are discussed. Deputations place the resolutions before the Dominion and Provincial Governments and urge action. The serious deliberations of the Trades Congresses command attention and respect and organized labour gains influence thereby.

The two miners' unions which are affiliated with the American Federation of Labour are the United Mine Workers of America, and the Western Federation of Miners. Both these organizations are now conducting strikes characterized by lawlessness, by violence and intimidation. The miners would do well to use other means to gain their ends. They could take a lesson from the workers in some of the other industries.

At the beginning of the year the United Mine Workers had a membership of 5,631 in Canada, and 381,334 elsewhere, and the Western Federation had a membership of 5,947 in Canada, and 55,000 elsewhere.

## THE GRIEVANCE PROBLEM

It is often contended by miners, as by those engaged in other industries, that adequate provision is seldom made for the airing of grievances. The complaint is made that an employee who goes to the manager to register a complaint, thereby incurs the ill-will of his employers and makes his position worse instead of better. Some employees state that as a result of going to the manager they become immediately subject to the displeasure of the under bosses and suffer accordingly.

There can be little doubt that an opportunity for easy access to those in authority would establish better relations. Grievances aired become less intolerable. Many are imaginary, being based upon incomplete knowledge of the facts and unfair comparisons. Some are real and can be removed only when fully understood by both parties.

In the recent investigation of the strike of miners in the Michigan copper district, the Copper Country Commercial Club found that most of the contentions of the strikers were ill-advised. The officers of the Western Federation showed much anxiety over recognition of themselves as representatives of the miners; but failed to present the investigating committee with any statement of the grievances of the copper miners. The committee, after investigation, however, came to the conclusion that the miners have no suitable means of lodging complaints, and they have recommended that each manager set aside a day or half-day of each week for the express purpose of hearing grievances of employees, that he investigate every complaint, and adjust every legitimate grievance with all possible speed, and see that no man is discriminated against because of presenting complaints.

It seems necessary to reassure the employees that they will be given a proper hearing and that everything reasonable will be done to adjust real or dispel imaginary grievances.

The companies will do well to consider the recommendations favourably.

## WESTERN FEDERATION METHODS

In an attempt to settle the strike of Michigan copper miners, the Copper Country Commercial Club appointed a committee to investigate the subject from all sides and make a report to Governor W. N. Ferris. The mining companies assisted this committee in every possible way and allowed free access to all the data bearing on the subject. From the investigation a voluminous report has been made.

The officers of the Western Federation were asked to present to the committee their side of the case. The vice-president of the Federation, who has been in Calumet in charge of the strike since its inception, was asked to present all the facts and grievances and demands upon which were based the calling of the strike. Later a second invitation was personally extended to Mr. Mahoney to furnish to the committee the above data and a statement of conditions in the copper country which the Western Federation of Miners was seeking to better. The committee reports that this information has not been furnished.

As the strikers have been now out of work for three months it is evident that they must soon find employment. The avowed purpose of the committee was to locate the trouble and endeavour to remove it. The action of the union officers has made this difficult. It has, however, made more clear the impression that the strike was not called so much for the benefit of copper country miners as for the organization which a number of them have been induced to join.

## THE NANAIMO STRIKE

Published accounts of the report of Mr. Samuel Price, K.C., on the U. M. W. A. coal miners' strike on Vancouver Island indicate that the trouble there is in some respects similar to that in the copper mines of Michigan.

The report points out that the real object of the strikers is to establish a branch of the U. M. W. A. and to compel recognition of it by the employers.

To obtain their end, the members of the U. M. W. A. have used the same violent methods as have the members of the Western Federation.

It seems little more than folly to expect desired results when such methods are used. To destroy property, libel the managers, and assault employees who wish to work, and then expect to be rewarded by concessions is ridiculous. The right of men to organize to improve conditions is well recognized; but the members of unions would do well to endeavour to gain their ends by lawful means.

## NANAIMO RIOTERS PUNISHED

Press despatches state that forty men have been found guilty of rioting in connection with the strike of coal miners at Nanaimo and sentenced. Three men and two boys will serve two years in the penitentiary, twenty-three will be imprisoned for one year and are subject also to a fine of $100 each. Eleven were sent to jail for three months and fined $50 each. Several union officers were sentenced. It is reported that the United Mine Workers are now ready to call the strike off.

The authorities are to be commended for making it clear that, no matter what dispute there may be between labourer and employer, violence will not be tolerated.

## OIL IN ALBERTA

Numerous reports are current concerning discoveries of oil near Calgary. Gas has been found in large quantity in Alberta; but there are as yet no producing oil wells. It is quite probable that oil exists, and it may be that really important discoveries have been made.

As yet, however, no large quantity of oil has been found and investors will do well to be wary.

At a recent meeting of the Calgary city officials and Board of Trade a warning was issued urging the public to exercise care in investments in oil leases or in the stocks of companies which have been or may be formed for oil exploitations.

This prompt action, taken to protect the public, will be much appreciated.

An Ottawa despatch states that Mr. D. B. Dowling has been sent by the Department of Mines to investigate the discoveries. Mr. Dowling is a mining geologist who is very familiar with the coal and gas fields and his report will be of much interest.

## BRITANNIA MINES

As Mr. Wm. Fleet Robertson has pointed out in his annual report for 1912, comparatively little is heard of the operations of the Britannia mines at Howe Sound, B.C. The owners have established an elaborate plant and are producing a large tonnage of ore. According to the report of Mr. Robertson the production in 1912 was between 14,000,000 and 15,000,000 pounds of copper and between 70,000 and 80,000 ounces of silver. A flotation process is used in concentrating the ore, and it is said to be proving very successful.

## COAL PRODUCTION ON VANCOUVER ISLAND, B. C.

The statement has been made repeatedly by leaders of the striking coal miners on Vancouver Island, British Columbia, that but little coal has been produced at the mines of the Canadian Collieries (Dunsmuir), Limited, since the union miners went on strike in September, 1912. The following figures show the production at that company's Cumberland and Extension mines, respectively, during eight months of the current year to September 1:

| 1913. Month. | Cumberland. Long Tons. | Extension. Long Tons. |
|---|---|---|
| January | 27,429 | 1,022 |
| February | 29,516 | 2,471 |
| March | 36,313 | 3,862 |
| April | 38,225 | 4,433 |
| May | 40,087 | 5,012 |
| June | 42,661 | 6,020 |
| July | 48,407 | 7,337 |
| August | 47,815 | 3,254 |
| Totals | 310,453 | 33,411 |

In the corresponding period of 1912 the output was 397,312; for 1911 it was 353,665. The output at Cumberland mines for last month (September) was 52,187 tons; for the last day of that month is was 2,337 tons. The average per day for 26 working days was 2,007 tons. Work was suspended at Extension during the first half of August, but it was resumed recently and coal is now being mined there.

## U. S. COAL PRODUCTION IN 1912.

The total production of coal in the United States in 1912 was 534,466,580 short tons; spot value, $695,606,071.

The total production of Pennsylvania anthracite in 1912 was 75,322,855 long tons (equivalent to 84,361,598 short tons); spot value, $177,622,626.

The total production of bituminous coal and lignite in 1912 was 450,104,982 short tons; spot value, $517,983,445.

In 1912 the production of coal in the United States not only surpassed all previous tonnage records, but the average value per ton exceeded that of any normal year in the 33 years for which statistics are available. In fact, with respect to the latter, there has been only one year in which coal prices generally were higher than in 1912. This was in 1903 when, because of the fuel famine produced by labour troubles in the anthracite region of Pennsylvania and in the organized bituminous States, prices were advanced above and figures reached in recent history. The higher values in 1903 were notably exhibited in the bituminous regions, anthracite companies as a rule holding to the circulars, which maintained the prices of the previous year plus the increased cost due to the advance in wages and the reduced working time granted in the strike settlement. The average value per ton for anthracite in 1912 was higher than in 1903, and was again due to further advances in wages.

# CORRESPONDENCE

## A FEDERAL MINING LAW.

Editor Canadian Mining Journal:

Sir,—A press despatch sent out from Ottawa in September included the following: "New mining regulations are provided in a bill to be introduced at the next session of Parliament by Hon. Louis Coderre, Secretary of State and Minister of Mines. It is expected that an entire new mining law will be placed on the statute book and that the system of mining regulations now governing the administration of mines will be abolished. . . . The difficulty encountered in framing a Dominion mining law is found in provincial rights. The mining laws at present in force in Nova Scotia, New Brunswick, Ontario, and British Columbia, were passed before Confederation, while Alberta only last year passed a new provincial mining law."

Passing over the misstatement that British Columbia's mining laws were passed before Confederation, I desire to remind those interested in the subject that much progress toward the enactment of a Federal mining law was made about three years ago, before the present Federal government displaced the Laurier administration, and that Hon. Wm. Templeman, then Dominion Minister of Mines, heartily co-operated with those who did the work relative to which some information is here given.

In passing, I will state that I have been prompted to write on this subject by what is, in my opinion, unjust and uncalled for editorial comment, made in a provincial newspaper, as follows: "A new mining law is to be enacted to afford better protection to the miner and the prospector. The late government was too busy caring for the big fellow, the man with the roll, to bother about the interests of the miner and the prospector."

The excerpts that follow have been made from the Journal of the Canadian Mining Institute for 1911 and 1912, respectively. They will serve to indicate what progress was made during the last years of office of the Laurier administration, and by whom. The only comment I have to make at this time is that I deprecate the making of statements that deny common justice to either political opponents or friends. While the present administration has my support, I do not hesitate to give credit to the Canada Department of Mines under the Laurier government for much useful work, and especially for much that resulted in very material benefit to mining in British Columbia, though, of course, we have to thank only our Provincial Legislature for the excellent mining laws of this province.

From the annual address of the President of the Canadian Mining Institute, at Quebec, March 1, 1911:

"Possibly in no direction have the activities of the Institute been engaged to better purpose than in publicly voicing the opinions of the mining communities with a view to influencing legislation. Thus in recent years representations have been repeatedly and successfully made to both the Federal and Provincial governments on questions affecting or likely to affect the industry; and special reference may be here appropriately made to a very important work of this nature undertaken during the past year by the Legislative Committee of the Institute. It has long been a matter of just complaint that the conditions in respect of the granting of title to mining lands subject to Federal control were aggravating and unsatisfactory, since they were fixed not by Statute, but by Order in Council, and, consequently, unstable and uncertain. Acting, then, under the direction of the Council, the Legislative Committee interviewed the Prime Minister and the Minister of Mines in April, 1910, and represented to those gentlemen the importance of placing a mining law on the statutes of the Dominion regulating the issue of title to mineral lands. The question was also debated by the committee before the Select Committee on Mines and Minerals of the House of Commons, and the government, having consented to introduce a bill, invited the Institute to suggest the principles on which it should be formulated. Certain recommendations were in consequence made by the Institute's committee and having been approved by the Council were duly submitted to the authorities; whereupon the Minister of Mines appointed Mr. J. M. Clark, K.C., of Toronto, to draft a bill on the lines suggested for early submission to parliament."

From the report of the Council for year 1910-1911:

"The most important work undertaken by the Institute during the year has been the endeavour to induce the Dominion government to act on the recommendations of the Select Standing Committee of the House of Commons on Mines and Mining. These recommendations were (1) that there be assigned to the Mines Department the administration of mines, including the issue of title thereto, and of all mining laws; and (2) that an act be passed consolidating all the laws relating to mines under Federal control. . . . " (Here follows a statement of the actions of the Institute Committee and of its recommendations after these had been endorsed by the Council of the Institute.)

From the President's address, Toronto, March 6, 1912:

"Among the more important undertakings in which the Institute has been engaged during the past year was drafting, at the request of the Federal government, of a code of mining laws for that portion of Canada in which the minerals are still under Federal control. A bill, embodying this code and based on the principles advocated by the Institute, is now ready for submission to parliament."

From the report of the Council for year 1911-12:

"Federal Mines Act.—As reported last year, the Institute was successful in inducing the late government to take preliminary action towards the adoption of a mining law for the Dominion, and in this regard the Council desires to place on record its appreciation of the services rendered by Mr. G. G. S. Lindsey, chairman of the committee, who presented the case to the Prime Minister on behalf of the Institute, and, in general, is responsible for advancing the business to its present stage. A draft of a bill, based on principles advocated by the Institute, was duly prepared. This draft was carefully revised by Mr. F. T. Congdon, M.P., and Mr. R. W. Brock, Director of the Geological Survey, and resubmitted to the Institute's committee for final approval. It was designed that the bill should be presented to parliament at last summer's session; but unfortunately other business deemed to be more pressing was given precedence. Meanwhile the attention of the present administration has been called to the requirements in this direction, and it is hoped that the bill will be made law during the present session of parliament."

It would seem that, two years having elapsed since the present government took office, much longer delay in this matter, which is of particular importance to those interested in mining lands under Federal control, will not be reasonable.

E. JACOBS.

Victoria, B.C., October 13, 1913.

# A VISIT TO MINES OF ALBERTA AND BRITISH COLUMBIA

By Reginald E. Hore.

(Continued from October 1st issue.)

From Fernie the party travelled down the Elk river valley, passing through a district which contains many coal seams. At Morrissey creek nine seams have been worked at the Carbonado mines of the Crowsnest Pass Coal Company; but owing to the great quantity of gas encountered no mining is being done here at present. South of Morrissey creek there is a block of 45,000 acres of coal land held in reserve by the Dominion Government.

South of Morrissey the valley of the Elk river becomes narrower and at Elko the stream enters a narrow canyon carved into the flat-lying Cambrian rocks. The party left the train here and walked to the canyon where Mr. Schofield described the geological features of the district.

"**The Rocky Mountain geosyncline,** which includes the greater part of the Selkirk, Purcell, and Rocky Mountain ranges, consists of pre-Cambrian, Paleozoic, and Mesozoic sediments. Their western border passes through Coeur d'Alene, Kootenay, and Shuswap lakes, along whose shores is exposed the old crystalline complex, from which part of the above sediments was derived.

"The Rocky mountains on the east are separated from the Purcell range on the west by the wide Kootenay-Columbia valley. This topographic feature, which is of first importance in the structure of the region, is called the Rocky Mountain trench. The rocks which form the greater part of the Purcell range are probably pre-Cambrian in age, and their structure is of an entirely different character to that of the Rockies. The Purcell sediments were first folded into a series of northerly plunging anticlines and synclines. Later these folds were truncated by normal faults which strike in a N.E.-S.W. direction and hence trend in a direction at right angles to those of the Rocky mountains. It is probable also that the fault system of the Rockies truncates that of the Purcells, for, in the Rocky Mountain trench, a block of Mississippian limestone is down-faulted in contact with the pre-Cambrian quartzites, and this block trends in a N.W.-S.E. direction. From the above facts it is probable that the Purcell range was built prior to the Rockies, and that the two ranges are structurally separated by the Rocky Mountain trench.

"On the hill to the north of Elko is exposed a section showing the transition from the Cambrian (?) quartzites at the base of the hill to the lower Paleozoic limestones at the summit. Elk river, which above this point had been flowing in a hanging valley, now swings to the southwest, and enters a narrow canyon carved into the flat-lying Cambrian, argillaceous quartzites, and joins Kootenay river at grade about 15 miles southwest of Elko."

**B party, Excursion C 2. International Geological Congress**
**At International Coal mine, Coleman, Alberta**

The accompanying photograph shows a view up the stream from the point visited.

The canyon is a truly beautiful one, and there was some difficulty in getting the passengers back to the train. This was possibly because of the fact that after having done so much walking before breakfast many had little desire to do any more. The activity of the guides, however, made it almost impossible for anyone to loiter, and the train pulled out, on time as usual, with all hands on board.

For some distance southwards down the valley of the Elk river the Canadian Pacific and Great Northern railroads run close together. At Elko the C. P. R. leaves the Elk, however, and runs north-westerly across the valley of Kootenay river, then southwards to Moyie Lakes and down the valley of the Moyie river. At Moyie is the St. Eugene silver-lead mine.

**St. Eugene Mine.**—The St. Eugene until recently has been a very large producer of silver-lead ore. On June 30, 1912, the date of the last annual report, it had produced 1,015,280 tons of ore and 190,121 tons of concentrates from which was recovered 5,319,150 ounces of

Elk River at Elko, B.C.

silver and 227,614,836 pounds of lead. The gross value of the production was $10,527,985. During the past two years the mine has been only a small producer. The Consolidated Mining and Smelting Company, of Canada, owns the property.

**Kootenay Lake.**—The C. P. R., or rather one branch, leaves the Moyie river at Curzon and crosses westward down Goat river to the Kootenay river and Kootenay Landing. Here the party left the train, which was taken by ferry up to Proctor, and boarded a steamer for the trip up the lake to Nelson.

This proved very delightful and a welcome change after several days' confinement in the sleepers.

Kootenay lake is a long narrow sheet of water hemmed in by mountain ranges. Here and there along the shore there are low places, gravel beaches at the mouths of entering streams; but almost continuously the shores rise steeply to lofty hills. To the west is a range of very rugged mountains. The snow-capped peaks backed by heavy clouds presented view after view which won the admiration of the party as the steamer carried us along on the quiet waters of the lake.

On the more gentle slopes which occur in places along the east shore there are a number of small clearings, fruit ranches, which in comparison with the great stretches of unbroken forest look wonderfully small from the middle of the lake.

Half way up the lake a stop was made to visit the Halcyon Springs Hotel and the hot springs which attract its guests.

From the hotel there is a splendid view of the snow-capped mountain peaks to the west. In fact the view was so pleasing that many of the party felt quite content to stay and look, while the others made the hot climb up to the springs. And then also there was a tame bear whose antics caused many distinguished scientists to forget their original object in climbing the hill.

**West Arm.**—The route continues north for some miles further and then at Proctor turns sharply to the west along a narrow arm of the lake to Nelson. This part of the trip was made in the early evening. The approach to the mining town is up a very narrow sheet of water enclosed by high hills. Along the south shore the C. P. railway has been built almost at the water's edge and some of the difficulties of construction that have been overcome in the mountains are here to be appreciated. Later on the trips to Rossland and Grand Forks it became more and more clear that the railway has been constructed and is operated under conditions which would have frightened many companies.

**Nelson.**—After a trip up the beautiful lake, walled in by mountains and presenting the appearance of a great river, the steamer reached Nelson early in the evening. A splendid reception was met with here. The Board of Trade and the mining men of the district did their utmost to entertain the visitors. A pleasant evening and much of the night was spent as the guests of the citizens. Mr. Coderre was prevailed upon to stay over the following day to talk with some of the men interested in the zinc problem. An account of this meeting has been already published in the Journal.

Of Nelson and vicinity, Mr. O. E. Leroy says: "The City of Nelson is situated on the delta of Cottonwood creek which flows into the west arm about 22 miles west of the main body of Kootenay lake. The city owes its existence primarily to the mining activity in the later 80's and for some years its growth depended wholly on the mining industry. At present, mining, lumbering, manufacturing and fruit ranching are the chief industries and the city is also the main distributing centre for the Kootenay and Boundary districts. The city is underlain by granitic rocks of the Nelson batholith near the northern edge of an area of the rocks of the Rossland group. The latter also appear in small isolated patches throughout the main area underlain by the batholith. The ore deposits are all later than the intrusion of the granodiorite batholith, and younger than the last evidences of igneous activity which form a system of lamprophyric dikes cutting and faulting the ore bodies. The country in the vicinity of Nelson is rather widely mineralized, the principal deposits being gold-silver, silver-copper, silver-lead, and copper-gold-silver. The chief mines working at present are the Granite-Poorman (gold), Silver King (silver-copper), Molly Gibson (silver-lead), and the Eureka and Queen Victoria (copper-gold-silver). The total production of the mining division to the end of 1911 amounts to rather more than $10,700,000 in value.

and the City of Nelson power plant developing 2,350 h.p. The former company supplies power and light to various points in West Kootenay and the Boundary districts, particularly to the mining and metallurgical centres at Trail, Rossland, Grand Forks, Phoenix and Greenwood.''

**Granby.**—From Nelson the geologists' special proceeded to Grand Forks where the smelter of the Granby Consolidated Smelting and Power Company is situated,

**Granby Consolidated Co's Knobhill-Ironsides mine at Phoenix, B.C.
Barring down loose in open stope**

''Four miles west of Nelson the railway crosses to the north side of Kootenay river. The Kootenay from Granite to Castlegar, 22 miles, where it joins the Columbia, has a fall of 335 feet, and is characterized by swift-flowing reaches, falls and rapids. The most important falls are at Bonnington, where it is estimated that under a 40-foot head 267,000 h.p. can be developed at low water. At present there are two plants, the West Kootenay Power and Light Company with 20,000 h.p. developed,

then to Phoenix and the Granby mine. After viewing the open workings the party went underground through some of the large stopes. The ore is low grade, but has been very cheaply mined and treated, so that Granby has been for several years one of America's large copper mines. A few years ago the manager reported serious falling off in reserves and for a time the company's prospects looked anything but bright. Another property, however, has been acquired at Hidden Creek. This is

The glory-hole, Granby Co's Knobhill-Ironsides mine, Phoenix, B.C.

proving up very satisfactorily, and is counted on to produce a large tonnage of higher grade ore than that at the old mine. A description, by Mr. O. E. Leroy, of the latter property, was given in the October 1 issue of the Journal. The new or Hidden Creek property is several hundred miles north of Phoenix, and was not visited by the party. A smelter is being built at Granby bay for this new mine.

**The Granby Mines.**—The properties of the Granby Consolidated Mining, Smelting and Power Co., at Phoenix have for years been large producers of copper ore. The mines operated are the Gold Drop and Ironsides. On June 30, 1913, the former had produced 1,091,598 tons and the latter 8,144,684 tons, making a total of 9,236,282 tons.

The shipments during the last fiscal year totalled 1,261,088 tons. The smelter treated 1,279,869 tons ore yielding 22,688,614 pounds copper, an average of 17.68 pounds per ton. The ore yielded also 324,336 ounces of silver and 47,266 ounces of gold. The receipts were $4,782,691.20. Expenditures for operations and for some ore purchased totalled $3,568,091.90, leaving a profit of $1,214,599.30.

Mr. C. M. Campbell, assistant superintendent, estimated the ore in sight on July 1, 1913, at 5,613,402 tons, 210,402 being credited to the Gold Drop, and 5,403,000 tons to the Ironsides mine.

**Granby Costs**—The costs of mining and treatment of the Phoenix ores are unusually low. The large ore bodies are very economically mined and the average cost for the last year was 75.4 cents per ton, which is the lowest yet reached. The average smelting cost for the year was $1.214 per ton.

The total cost of copper per pound, after deducting value of the gold and silver was 10.6 cents. The average selling price was 16.039 cents.

**Granby's Hidden Creek Property.**—The Hidden Creek mines at Anyox are being rapidly developed and a 2,000-ton smelter to treat the ore is nearing completion at Granby Bay, Observatory Inlet. The officials expect that the plant will be ready to begin operations by the first of the year.

Mr. O. B. Smith, superintendent of the company's mines, reports that there had been developed on July 1, 7,759,550 tons ore, containing an average of 2.2 per cent. copper. Gold and silver contents are estimated at 20 cents per ton of ore.

Victoria shaft, Granby mine, Phoenix, B.C.

There are two ore bodies. At No. 1 the ore developed is estimated at 3,328,400 tons, carrying 151,580,500 pounds copper, or 2.26 per cent. For No. 2 the estimate is 4,431,150 tons, carrying 188,935,600 pounds copper or 2.13 per cent. The bulk of the ore lies above the 385 ft. level only 394,100 tons below this level being included.

(To be continued.)

## BRITISH COLUMBIA COPPER CO.

Information relative to the operations of the British Columbia Copper Co. has been published lately in New York and in Western newspapers. The following is an excerpt from the Pioneer, Phoenix, B.C.:

The production of the British Columbia Copper Co., Ltd., for the month of August, 1913, amounted, it is estimated by the company's officials, to 700,000 lbs. of fine copper, 2,400 ozs. of gold, and about 12,500 ozs. of silver. Adding these to the final figures for the earlier months of the year, the company's output for 1913 to date has been as follows:

| | Lbs. Copper. | Fine Ozs. Gold. | Oz. Silver. |
|---|---|---|---|
| August | *700,000 | *2,400 | *12,500 |
| July | 618,379 | 2,413 | 10,262 |
| June | 634,238 | 2,245 | 11,827 |
| May | 618,076 | 1,762 | 8,479 |
| April | 786,624 | 2,210 | 10,955 |
| March | 844,735 | 2,139 | 10,299 |
| February | 668,312 | 1,446 | 8,082 |
| January | 720,260 | 1,488 | 8,621 |
| Eight months | 5,590,624 | 16,103 | 81,023 |
| Year. | | | |
| 1913 | 7,800,000 | *24,750 | 123,000 |
| 1912 | 11,146,811 | 25,863 | 142,025 |
| 1911 | 9,944,987 | ...... | ...... |
| 1910 | 7,143,456 | ...... | ...... |
| 1909 | 6,325,000 | ...... | ...... |

*Estimated.

During 1913, the plant has been operating at only two-thirds of its full capacity.

A conspicuously favourable feature of the figures is the unusually high gold-silver yield from the ores. It will be noted that while the copper production from the ores treated in 1913 is only about two-thirds of that of 1912, the gold and silver yield is very nearly equal to that of the whole twelve-month period a year ago. On the basis of $20 an ounce for gold, and 55 cents an ounce for silver, the monetary return from these sources in 1913 should amount to about $117,650. This sum will reduce the net cost of copper per pound by almost exactly 1.5 cents, representing one of the highest gold-silver yields on record for the British Columbia Copper Co.

The worst "drawback" of the company, and this a "drawback" which is more apparent than real, is its expenditures in taking up new properties under option. The officials realize that no mine lasts forever, and have wisely adopted the sound policy of looking for additional properties while these latter may be cheaply obtained, and while, too, the British Columbia Copper Co. is in a favourable position for bargaining for such properties. In 1912 there was spent $230,000 in taking up new options and exploring and developing them, and similar expenditures in 1913 for about the first six months of the year have amounted to nearly $120,000. It appears that the expenditures for the entire year in this direction will be about $240,000, which will add to the operating cost per pound of copper ore produced, approximately 3.08c. In the past years there have been charged against options and their development, and plant additions, etc., expenditures (based on per pound of copper produced) amounting to 3.08c. in 1912, 2.27c. in 1911, 2.96c. in 1910, and 1.80c. in 1909.

## GOLD ON SIBOLLA CREEK, B.C.

Mention was made in the Canadian Mining Journal of October 1 of a new gold strike on Sibolla creek, southwest of Telkwa, a small town on the Grand Trunk Pacific Railway, from Prince Rupert eastward through British Columbia, and at the junction of the Telkwa and Bulkley rivers. The information which follows was sent from Telkwa to the Vancouver Daily Province:

After ten days, spent on the Sibolla creek placer field, 120 miles southwest of Telkwa, your correspondent reports the following: Three days' sampling of the gravel about Discovery claim, on the creek, resulted in fly-speeks and colours in only one pan out of four. No coarse gold was shown. Below Discovery, for the first three claims, the result was the same, and after that to No. 19 below, the colours became more numerous and not more than one-quarter of the total pannings were barren.

A shaft was being sunk at the time by S. White, I. McCulley, Dave McKenzie, Billy George, and Louis Koltas, in an effort to reach bedrock, and after 12 ft. of a 6 by 6-ft. shaft had been sunk, windlass erected, and the shaft timbered, the water came in in too great a volume so work on all the creek claims ceased.

Attention was then given to the bench claim of Leo McLaughlin and partner, on the north limit of No. 3, below Discovery, but at the time your correspondent left, bedrock had not been reached. However, colours were consistently present all the way down the shaft, which was, at that time, 15 ft. deep, timbered and with windlass erected. Prior to leaving, most of the prospectors left all their spare supplies with this party and they now have provisions for two months. The only others on the ground properly equipped are George Barrett and Joseph Bussinger, who have provisions for four months, and a good outfit, including a rocker. They are staked on the bench and should reach bedrock in the big flat without being seriously impeded by water.

The bench north of Sibolla creek has all been staked, but as far as could be seen, no active development had been done, except an 8-ft. hole, sunk by your correspondent on the Newsboy claim, in which fly-specks and colours were present after the first 3 ft. The wash here is very deep, and at the bottom of the hole the conglomerate gravel, slightly cemented, is moist and full of air spaces, but pay dirt is not likely to be found until a strata more dense and less coarse has been reached.

On the bench due west of the camp some promising ground was seen marked with dry water courses and sedimentary in character. Here the gravel at 3 ft. deep is very fine and heavily cemented, but no pay was discovered, though colours were fairly plentiful, with a large proportion of white iron and some black sand. A dozen claims have been staked on this ground.

Contrary to the first report, no contact of a slate and porphyry was seen, but a shale or coarse slate runs parallel with the porphyry along the range and dips into it at an acute angle. The large rounded boulders so plentiful in the wash are mainly grey and blue granite, and rose quartz is plentiful in the gravel with an occasional small specimen of native gold in some of the larger pieces. The field shows no sign of having been an ocean beach, but rather resembles the bed of a lake, or what is more probable, glacial detritus, and the characteristic surface boulders stretch for a distance of more than 12 miles, intersected with swamps, mainly with a gravelly bottom. The three beaver dams which have to be crossed in reaching Sibolla creek show considerable signs of wear, and horses with packs will not be able to reach the field should rain fall this month. The water at present above the dams is low and the frost has been very severe the past week.

Andy Goodwill and partner, one of the original locators, were met with on our way out, and had with them four packhorses and expect to put in the winter on No. 1, below Discovery, where the first coarse gold was taken out, and C. P. Price, also one of the original locators, is now outfitting here for the same purpose. Price states that coming out by a new trail from the Sibolla country he discovered on the same range about 12 miles north a similar creek to the Sibolla, fairly plentiful with colours, bearing out our own observations.

More than 300 claims have been staked, but with one exception no party of prospectors have been outfitted properly to reach bedrock in what is, to all surface appearances, a most promising field. If the men at present on the ground fail the value in the field in all probability will not be ascertained until next year.

The actual time occupied in going in from Telkwa was six and one-half days and time in coming out, travelling light, five days.

# OIL AND GAS OF THE NORTHWEST PROVINCES*

By Wyatt Malcolm

The plains of Western Canada are underlain by a great body of sediments, nearly horizontal in attitude, and resting on a Pre-Cambrian base. The eastern contact between the Pre-Cambrian rocks and the later formations runs in a generally northwest direction from Lake Manitoba past Athabaska, Great Slave, and Great Bear lakes. In the eastern part of the plains a great unconformity exists between the Paleozoic systems, consisting of limestones, dolomites and shales, and the Cretaceous system, consisting of shales and sandstones, so that we find the Dakota sandstones of the Cretaceous system resting directly upon limestones of the Devonian system. The paleozoic strata are exposed by faulting in the Rocky mountains and much of the later sediments has been eroded, only traces of the lower members being left. In the west, deposition during Carboniferous, Triassic, and Jurassic times has to a great extent bridged over the unconformity seen in the east. The geological column includes formations from in nearly all the great systems from the Cambrian to the Recent. In western Alberta and in some parts of south Saskatchewan the Cretaceous sediments are overlain by Tertiary deposits. Overlying all is a mantle of unconsolidated Pleistocene and Recent deposits.

Little has been done yet to test the gas and oil possibilities of the district. A few wells have been sunk, and in a number of these gas in commercial quantities has been struck. Prospecting for oil has been less successful.

Prospecting for oil has been carried on in two different areas in the Pincher Creek district, southwestern Alberta, one on the south branch of the south fork of Oldman river, and the other on Oil creek, which flows into Waterton lake. This has apparently resulted in no great measure of success. In northern Alberta the Dakota sandstone, where exposed along the Athabaska and its tributaries, is impregnated with a bituminous substance believed to be a petroleum product, and it is thought that liquid petroleum exists in this porous rock at some distance from the outcrop. To test the validity of this belief, wells were drilled during the nineties by the Dominion Government at Victoria on the Saskatchewan, at Athabaska Landing, and at the mouth of Pelican river. In the first two wells the Dakota sandstone was not reached, while in the last it was reached at a depth of 750 feet, penetrated about 87 feet, and found to carry maltha or heavy, tarry petroleum.

Prospecting for gas has been much more encouraging. The boring at the mouth of Pelican river, although disappointing so far as oil is concerned, proved the presence of a great reservoir of gas in the Dakota sandstones, and heavy flows were struck at 820 and 837 feet. In southern Alberta, also, gas is found in paying quantities. A good field exists at Medicine Hat, and flows have been obtained at several different points west of that city. At Bow island a flow of several million feet is obtained.

Thus, while the presence of oil in commercial quantities remains to be proved, boring operations have demonstrated beyond a doubt the existence of large reservoirs of natural gas, and it seems probable that further exploratory work throughout the wide area underlain by the Cretaceous rocks should lead to the discovery of other reservoirs.

It is believed that the Devonian limestone is the source of the gas and petroleum products of northern Alberta, while the porous Dakota sandstone forms the reservoir into which they have risen and in which they have been retained by the overlying shales. The Dakota sandstone is the productive formation at the mouth of Pelican river, and it is also believed to be the gas-bearing formation at Bow island in southern Alberta. As the Devonian limestone and Dakota sandstone are of wide distribution and probably underlie the western part of Manitoba and a great part of Saskatchewan and Alberta, the prospects for the discovery of other gas fields seem favourable. On account of the great thickness of sediments overlying these formations, the driller, however, must be prepared to go to a considerable depth.

*Extract from memoir No. 29-E., published by the Geological Survey of Canada, 1913.

## TREATMENT OF ZINC ORES.

The Daily News, Nelson, B.C., last month published the following: "Declaring that the problem of the treatment of complex zinc ores had been solved and that he was willing to demonstrate the process, F. B. Allan, of Toronto, has written to the Nelson Board of Trade. The process of which he writes will save all the metals in the ore, he declares in a letter read at a meeting of the Board, at a cost of about $2 a ton. He suggests that from $15,000 to $20,000 should be raised to erect a plant on a commercial basis. The secretary was instructed to take the matter up with the British Columbia Mining Association."

# COAL MINING IN BRITISH COLUMBIA*

By Wm. Fleet Robertson, Provincial Mineralogist.

The year 1912 proved to be, as far as statistics of production will show, one of the most successful in the history of coal mining in British Columbia. During this year the total gross production of coal made in the Province was 3,025,709 tons (2,240 lbs.) of coal, which is only some 113,526 tons short of that of 1910, which is still the "record year" in coal mining. Had it not been for the labour troubles, occurring in the later months of 1912, at the mines of the Canadian Collieries on Vancouver Island, whereby that company's output was reduced to a point 150,000 tons lower than the preceding year, there is little doubt but that 1912 would have been the record year to date, instead of occupying, as it does, only second place; yet, with the exception noted, it is greatly in advance of any other year.

The total sales of coal made in 1912 amounted to 2,230,565 tons (2,240 lbs.), of which 1,263,427 tons was sold in Canada, practically all in British Columbia; 858,981 tons was exported to the United States, including Alaska; while 108,157 tons was exported to other countries. The coke sales of the Province for the year amounted to 267,564 tons (2,240lb.), of which 217,307 tons was sold in British Columbia and 50,257 tons exported to the United States.

The following table shows, for the past six years, the output and the per capita production of the various districts:

better equipment, and greater volume of output. The figures given for 1911 are the actual statistics for that year, but they are in a way misleading for comparison with other years as regards the per capita production of the whole Province and of the East Kootenay field, since during that year the collieries of this latter field closed for eight months owing to labour troubles, while in the Coast District they represent a full year's work. In the Coast District the effectiveness of the employee, both total and underground, has not altered very materially in the last three years, and is considerably lower than in the East Kootenay District. In the East Kootenay field the effectiveness of the total employees has increased from 439 tons in 1910 to 523 tons in 1912, while the per capita output of the underground employee has similarly increased from 575 tons to 708 tons, a very remarkable and encouraging improvement.

**The Coalfields of the Province** which are at present producing may be divided into two main divisions—those of the East Kootenay District and those of the Coast District. These fields from their geographic positions—the one at the extreme eastern boundary of the Province, and the other at the extreme western edge—are in no way competitors in the market, their markets being quite separate and ruled by completely different conditions.

**The Market of the East Kootenay Field** is provided primarily by the railways of the south-eastern part of the Province and of the northern parts of the adjoining States of Montana and Washington, approximately two-thirds of the coal sold as such being exported to those States, while the other third went to supply the demands of the south-eastern part of the Province—its domestic needs, its railways, steamboats, mines, and smelters.

Coke, a product of the coal mines, is sold in the same markets, with the difference that the local consumption—chiefly by the smelters of Trail and the Boundary

**Local Production of British Columbia.**

| Year. | District | Gross tons of coal mined | Total No. of employees at colliery | Tons of coal mined per employee | No. of men employed underground | Tons of coal mined per underground employee |
|---|---|---|---|---|---|---|
| 1907 | East Kootenay District...... | 876,731 | 2,290 | 383 | 1,527 | 574 |
| | Coast District .............. | 1,342,877 | 2,769 | 356 | 2,862 | 469 |
| | Whole Province ............ | 2,219,608 | 2,959 | 366 | 4,389 | 506 |
| 1908 | East Kootenay District...... | 883,205 | 2,524 | 350 | 1,746 | 506 |
| | Coast District .............. | 1,226,182 | 3,549 | 345 | 2,686 | 456 |
| | Whole Province ............ | 2,109,387 | 6,073 | 347 | 4,432 | 476 |

| | Whole Province ............ | 2,297,718 | 6,873 | 334 | 5,212 | 440 |
| 1912 | East Kootenay District...... | 1,261,212 | 2,410 | 523 | 1,780 | 708 |
| | Coast District .............. | 1,764,497 | 4,720 | 374 | 3,495 | 504 |
| | Whole Province ............ | 3,025,709 | 7,130 | 424 | 5,275 | 574 |

**Per Capita Production**—While no figures can be given as to the actual cost of mining in the different fields, the per capita production of these fields is of interest, as having a bearing upon the working costs and as indicating the mining facilities existing and the improvement made in these conditions from year to year. It will be seen from the above table that the production per capita has steadily and materially increased during the past three years. This increased effectiveness of the labour employed is largely due to better methods,

*Extract from Annual Report of the Minister of Mines, 1912.

District—takes over 80 per cent. of the product, while 20 per cent. is exported to the States mentioned.

As regards the marketing conditions in this field, the East Kootenay collieries are, however, brought into direct competition with the collieries of Alberta just over the Provincial boundary-line, all these collieries being in the same coalfield, with practically the same grade of coal and working under similar conditions.

This competition has kept the price obtainable for coal at from $2.25 to $2.50 a ton, with little probability of any material increase in price, owing to the facility with which new collieries can be opened up and the very large reserve areas of coal limits in that district; a description of these reserves was given in the Report of this Bureau for the year 1909.

**The Coast District** may be subdivided into two fields —the Nicola-Princeton field and the Vancouver Island field—in which the markets differ considerably. In the former field the consumption is chiefly by the local railways, while a small amount finds its way to Vancouver, even under the handicap of what seems to be an excessively high freight charge.

**The Vancouver Island Coal Market** is provided by the domestic and manufacturing requirements of the coast cities, and of the ocean-going steamers calling at these ports. The demand for coal from the larger coasting steamers and from the railways has in the past couple of years diminished, as the Canadian Pacific Railway main line engines are nearly all burning California crude oil, and a large coasting steamer burning coal is now an exception. Notwithstanding the heavy consumption of crude oil, the coal sales have remained about constant, approximately 70 per cent. of the coal sold being for use in British Columbia, 20 per cent. exported to the United States, and 10 per cent. to other countries, chiefly Mexico. In the Coast District the demand for export coal has been so great and constant, particularly on the seaboard, and the prices obtainable so satisfactory to the shippers, that it has permitted of the domstic price being kept at a figure so high as to admit of the importation from California of fuel oil as a competitive fuel, where conditions permit of its use. It would appear, therefore, that the present price of coal on the seaboard, of from $4 to $4.50 a ton f.o.b., is not liable to decrease for some time.

**Producing Mines**—As in former years, the greater proportion of this product was made by three larger companies—the Crow's Nest Pass Coal Company, with two collieries in East Kootenay, and by the Western Fuel Company, of Nanaimo, and the Canadian Collieries, Limited, formerly the Wellington Colliery Company, these last two operating on Vancouver Island.

In addition to these larger shippers, very appreciable shipments have been made by the Hosmer Mines, Limited, and the Corbin Coal and Coke Company, in East Kootenay; by the Nicola Valley Coal and Coke Company, the Diamond Vale Collieries, and the Inland Coal and Coke Company, all of the Nicola Valley; by the Princeton Coal and Land Company, of Princeton; and by the Pacific Coast Coal Mines, Limited, and Vancouver & Nanaimo Coal Mining Company, both operating on Vancouver Island, near Nanaimo.

**Consumption.**—During the year 1912 about 56.65 per cent. of the coal, sold as such, by the collieries of the Province was consumed in British Columbia; about 38.51 per cent. was exported to the United States, including Alaska; and 4.84 per cent. was exported to other countries, chiefly to Mexico. Of the coke sold, about 81.23 per cent. was consumed in British Columbia, and the remaining 18.77 per cent. was exported to the United States.

## PLANT ORDERED FOR BRAZEAU COLLIERIES.

The Roberts and Schaefer Company, engineers and contractors, Chicago, U.S.A., through their president, Mr. Warren R. Roberts, secured a contract on October 7th for a complete coal mining plant for the Brazeau Collieries, Ltd., of Toronto, Canada, on the lump sum basis, aggregating approximately $185,000.00.

This modern mining plant will open up the recently acquired coal acreage of the Brazeau Collieries, Ltd., at Nordegg, Alberta, Canada.

This company is owned jointly by Mackenzie, Mann & Co., Ltd., who control the Canadian Northern Railway; Mr. Martin Nordegg, vice-president; and a firm of Belgian bankers who are represented by Mr. Ernest Gheur, consulting engineer of the Brazeau Collieries, Ltd., and Mr. H. Prudhomme, their Canadian representative, treasurer of the coal company.

The Canadian Northern Railway Company has practically completed a line 160 miles long to Nordegg, at the site of the mines.

The plant will be one of the most extensive in the Canadian field, and will consist of a modern mine tipple with box car loader; dump house from two slope coal mines with conveyor delivering coal to tipple; complete boiler plant, including boiler coal conveyor; combined generator house and repair shop, including electric transformers; combined carpenter and blacksmith shop; warehouse; two mine fans; mine office building; boarding house; miners' wash house; two railroad track scales; commissary building; complete steam and water piping for the entire equipment, and all electric wiring.

The Roberts and Schaefer Company has guaranteed to complete this entire installation in the fall of 1914, which will require the early ordering of material preparatory to starting the construction work in the spring.

## NIPISSING LOW-GRADE MILL

Mr. James J. Denny, writing in the Mining and Scientific Press, September 27, 1913, gives the following description of this mill:

The Nipissing low-grade mill is at Cobalt, Canada. The high-grade ores of this property have been treated for the last three years in the high-grade mill by an amalgamation and cyanidation process yielding the silver content directly as bullion.

The object of the new low-grade mill was to treat the low-grade wall rock by cyanidation and likewise recover the silver in the form of fine bullion. The mill was designed and constructed by James Johnston, of the Butters Engineering Co., and owes much of its success and smoothness of operation to his experience and foresight. Operations on a small scale were commenced on November 16, 1912, and after a short period of minor adjustment started at full capacity. Up to the present it has continued to run with gratifying success.

The rock is mainly the Cobalt series of conglomerate and is very hard and tough. The following is an analysis of the average run of mine ore:

| | Per cent. | | Per cent. |
|---|---|---|---|
| Ag | 0.106 | Pb | 0.064 |
| Cu | 0.270 | CaO | 9.020 |
| As | 1.880 | MgO | 4.330 |
| Fe | 1.920 | $Al_2O_3$ | 10.030 |
| S | 0.640 | $CO_2$ | 11.060 |
| Bi | 0.010 | Insolubles | 59.840 |
| Ni. and Co. | 0.73 | Hg | Trace |

**The washing plant,** where the ore is crushed in breakers and given a preliminary jigging treatment, is not a part of the mill proper, as the concentrate from this section is credited to the mine. The ore from the mine averages about 60 ozs. per ton, and the tailing from the washing plant as sent to the mill proper averages about 28 ozs. per ton.

**In the mill proper,** the ore is crushed by stamps in a 0.25 per cent. solution of caustic soda, lime being added to the extent of 5 lbs. per ton of ore. The lime is used merely for settling, to facilitate subsequent decantation of clear solution back to the battery storage tank, the alkalinity for cyanidation treatment being furnished by the caustic solution. The fine grinding is effected by a closed system of tube-mills and classifiers, two of the tube-mills being used to regrind the battery discharge, and the other two for the ultimate fine grinding. Of the final product, only 5 per cent. remains on a 200-mesh screen, 16 to 20 per cent. is a fine 200-mesh sand, and the remainder an impalpable slime. After settling and decanting the solution, the thickened slime passes on to the reducing treatment.

The pulp is given a preliminary desulphurizing treatment by being passed through a tube-mill which is charged with aluminum ingots. The final treatment is given by lining the filter stock tank with aluminum plates and agitating for about ten hours by mechanical means. From the stock tank the pulp is drawn off by the filters as required. After filtering, the cake carries 26 per cent. alkali solution as moisture, and is thence discharged without washing to the cyanide tanks.

**The cyanide treatment** consists of agitating the pulp for 48 hours in a 0.25 per cent. cyanide solution, dilution 2.5:1. The pulp is then settled, the excess solution decanted, and after being again agitated the pulp is pumped to the stock tank for filtering.

As already mentioned, the pregnant solution is precipitated with aluminum dust. The details of the mill practice, together with a statement of costs, are included in the article by E. M. Hamilton. The precipitate is then sent to the refinery of the high-grade mill, where it is melted in a reverberatory and refined, the bullion averaging 999 fine.

When the process was first put into operation, the mechanically agitated stock tanks were depended on for the desulphurizing treatment. Here the aluminum plates were soon found to form a coating which was thought to be a calcium aluminate, and the reducing action was seriously retarded. To overcome this difficulty, the tube-mill charged with aluminum ingots was added. This kept the aluminum clean and bright, but the aluminum consumption was increased as a result of the wear on the ingots. Lately, however, the trouble has been found to be due to impure aluminum containing iron and silica; sheets of pure aluminum are found to remain clean and to have no tendency to form a coating.

Crushing a neutral ore in an alkaline solution is unusual, though not unknown in cyanidation, and the 26 per cent. of the alkali solution passing over with the cake to the cyanidation tanks will be criticized as being contrary to general practice. However, instead of being detrimental as is ordinarily maintained, in this particular case, namely, with Cobalt ores where the native silver is associated with antimony, the addition of alkali to the cyaniding solution has proved to be a decided benefit. Daily tests, running the working mill solution against fresh cyanide solution, show in every case an increased solvent power of from 0.2 to 0.5 ozs. of silver per ton of ore in favour of the mill solution. In this connection, the behaviour of the mineral dyscrasite is interesting. As mentioned at the beginning of this article, the reducing treatment has no effect on this mineral, probably due to the fact that it is a complex of variable composition of the metals, silver and antimony, and does not contain sulphur. However, the results from treating this mineral by plain cyaniding, compared with the results of similar treatment, after the preliminary reducing treatment, show a decided advantage in favour of the latter, owing to the beneficial action of the caustic soda solution during cyanide treatment. A further advantage of the caustic in the cyanide solution is the fact that it is necessary to precipitation with aluminum dust and saves the addition of caustic at that point.

**The outstanding essential principles** of the practice followed at the Nipissing low-grade mill are, therefore: (1) The extremely fine grinding; (2) the preliminary reducing treatment before cyanidation; (3) the use of aluminum-dust precipitation. In July the mill treated 234 tons per day of 27-oz. ore, and below the stamps made an extraction of 93.16 per cent. actually recovered in bullion.

As the mill has been running less than a year, the compiling of representative figures showing costs is a matter of difficulty. In connection with the desulphurizing treatment, treating 7,268 tons per month, the following data are available:

**Collecting, Desulphurizing, and Transferring of Pulp.**

| | Per ton. |
|---|---|
| Labour | $0.050 |
| Supplies (aluminum, 0.81 lbs.; caustic soda, 1.46 lbs.; lime, 5 lbs.) | 0.347 |
| Power | 0.027 |
| Workshop | 0.008 |
| Total | $0.432 |

**Alkali Solution, Filtering and Transferring.**

| | Per ton. |
|---|---|
| Labour | $0.069 |
| Supplies | 0.006 |
| Power | 0.028 |
| Workshop | 0.002 |
| Total | $0.105 |

The desulphurizing treatment effects a saving of from one to four ounces per ton, depending on the amount of refractory minerals present, at a total cost of 54c. per ton.

## NIPISSING.

The following is a brief financial statement of the affairs of the Nipissing Mining Co., Ltd. (the Operating Company) as of October 1st, 1913:

| | |
|---|---|
| Cash in bank | $1,169,511.93 |
| Ore and bullion in transit | 55,464.64 |
| Ore on hand and in process and bullion ready for shipment | 158,491.00 |
| | $1,383,467.57 |

## DRUNK ON SHIFT.

Before Magistrate Brodie, James Bourtin, shift boss at the Murray mine was fined $15 and costs, and George Farrell, hoistman at the Murray mine, was fined $20 and costs for being drunk on shift the night of September 16th. Information was laid by Mr. T. F. Sutherland, inspector of mines for Ontario.

## THE MOFFAT-IRVING ELECTRIC STEEL FURNACE

Two years ago Messrs. James W. Moffat and Thomas C. Irving, Jr., erected in Toronto an electric smelting plant for the manufacture of steel castings. The smelter has now been in successful operation for some time and the company is supplying high grade castings to a number of customers in the city.

As the iron is largely derived from material which cannot be recovered in the ordinary blast furnace, the process has a special interest. Its successful application is a notable achievement. The raw material is flue dust and other furnace fines, containing about 42 per cent. iron. This is concentrated by treatment on a magnetic separator and then smelted in an electric furnace with limestone and coke. After being in the furnace for a period varying from 3 to 5 hours, the metal is drawn off into a ladle, and then poured into the moulds.

**The Charge**—With 1,000 pounds ore there is charged about 400 pounds limestone and 100 to 200 pounds coke. The coke and limestone are both first crushed to pass ⅛-inch screen. Coke breeze is used.

The crude ore contains about 42% iron. By magnetic separation a product containing 66 to 68% iron is obtained. This is then fed into the furnace. The sulphur content of the ore varies from .08 to .25% and the phosphorus from .15 to .3%.

**Method of Charging**.—Above the furnace are three bins for ore, coke and limestone respectively. From the ore bin the ore runs down by gravity to a hopper on the side of the furnace shaft. From this small hopper the ore is fed automatically into the furnace by a screw. An electric attachment records the number of turns of the screw. It has been found that by keeping the hopper full a very steady feed is obtained. The gravity feed from the large hopper gives the required regularity by keeping the small hopper full. The limestone is fed also near the top of the shaft in the same manner as the ore. The coke is introduced at the bottom of the shaft.

**Reduction of the Ore**.—There is an evolution of carbon monoxide at the bottom of the shaft. The ore coming down the shaft meets a strong current of reducing gas and reduction of the oxides takes place in the shaft.

Near the end of the run a determination is made of the amount of carbon in the steel. The coke feed is then regulated to give more or less carbon as desired.

The heat is produced by a current of 2,000 to 2,500 amperes passing through each of three graphite electrodes which are worked at a potential of 80 volts. The electrodes are set 120° apart and converge downwards. In the bath they are about 24 inches apart. The electrodes are controlled by hand. The current is delivered to the plant at 12,200 volts. This is stepped down to 80 volts by a Packard 300 k.w. transformer.

**The Steel**.—The remarkable control over the entire operation of steel making in the electric furnace makes it possible to produce steel of the highest grade. The usual analysis is: Carbon, 0.25 to 0.35; silicon, 0.27 to 0.32; manganese, 0.65 to 0.70; sulphur, 0.030 and lower; phosphorus, 0.040 and lower.. Under physical test this steel has shown an ultimate tensile strength of 80,000 to 100,000 lbs. per square inch, and an elastic limit of 45,000 to 60,000 lbs.

---

### INTERNATIONAL NICKEL CO.

N. Y.—Business of International Nickel Co. continues at a level sufficient to maintain earnings during current fiscal year at about the same high rate as obtained in 12 months ended March 31 last, when gross aggregated $6,800,000. A recession in business had been expected some months back, but the six months ending with September, being the first half of current fiscal year, have not been in accord with that forecast.

July was a quiet month, as is not unusually the case, but business in August was much better and bookings this month have been such as to indicate active operations for some time to come.

The feature of the company's business most pleasing to those interested is the enlarging demand for nickel for commercial purposes as against demand for use in munitions of war. Probably the latter use now absorbs only half of metal produced by International Nickel.

Should gross earnings of Nickel Co. during the current fiscal year equal those of last year surplus available for dividends should exceed that of the last year as result of retirement of the entire outstanding funded debt. Bond charges in the year ended March 31, 1912, amounted to $445,650; on that date bonds outstanding totalled $8,162,154. The sums formerly paid out in interest charges now go to swell surplus for dividends.

In the last fiscal year International Nickel's expenditures for new construction were very heavy, bringing total spent for new construction in 11 years to over $9,600,000. In the current year to date expenses of new construction have been much lighter, but if the outlook for business is as bright at the close of this year, the succeeding fiscal year will probably see a resumption of new construction on a heavy scale. Expenditures for this purpose since incorporation compare as follows:

| Year to March 31. | New construction: |
|---|---|
| 1913 | $1,323,276 |

The usual semi-annual inspection by directors of the company's properties will be made early in October.—Boston News Bureau.

---

### GYPSUM.

The Great Northern Mining & Railway Company, Eastern Harbour, C.B., has passed into the control of Montreal capitalists, headed by J. A. Davis & Co. The new owners have incorporated a company under the name of the Cheticamp Gypsum & Plaster Co., to operate the properties which include mill, railway, quarries, wharves, etc. The quarries are estimated to contain an enormous tonnage of gypsum.

---

The U. S. Bureau of Mines has issued a bulletin on First-Aid Instruction for Miners. The publication contains sections on: a simple description of the anatomy of the human body, common injuries and their treatment, bandages, dressings, and transportation of the injured. It is an excellent handbook for the first-aid man and can be read with profit by anyone.

# COPPER MINING IN MICHIGAN

By Reginald E. Hore.

(Continued from last issue.)

**Dividends.**—During 1912 the dividend-paying mining companies paid to shareholders $9,901,875, and added considerable amounts to surplus account. Ahmeek, Baltic, Calumet & Hecla, Champion, Mohawk, Osceola, Quincy, Trimountain and Wolverine all paid larger dividends than in 1911. Dividends paid for the past five years and to date have been as follows:

**Dividends Paid by Michigan Copper Companies.**

| | 1908. | 1909. | 1910. | 1911. | 1912. | All Years. |
|---|---|---|---|---|---|---|
| Ahmeek | ........ | ........ | ........ | 100,000 | 900,000 | 1,000,000 |

| Quincy | 495,000 | 440,000 | 412,500 | 440,000 | 550,000 | 20,430,000 |
| Tamarack | ........ | ........ | ........ | ........ | ........ | 9,420,000 |
| Trimountain | 500,000 | ........ | 150,000 | ........ | 300,000 | 1,250,000 |
| Wolverine | 600,000 | 600,000 | 600,000 | 540,000 | 600,000 | 7,440,000 |

In 1912, Copper Range Consolidated, from profits made by ownership of shares of Baltic, Trimountain and Champion mining companies, distributed $787,382. St. Mary's Canal Mineral Land Co., from profits made from half ownership of Champion Copper Co. and from sales of land, distributed $480,000 to shareholders.

**Increased Wages.**—Soon after the higher prices became established, the Michigan copper companies increased the wages of the miners. The increase, amounting to about 10 per cent. at most mines, was made voluntarily, and reflects a willingness on the part of the owners to share profits with employees. During the four lean years, wages were necessarily low, and yet plenty of men were available. In spite of the higher wage offered, there has been considerable difficulty in maintaining efficiency during 1912. Good men being not always obtainable, the companies have been compelled, in many cases, to keep on their rolls an unusually large percentage of poor and inexperienced workmen. Inability to secure suitable men has made it impossible to run some of the mines at their usual rate, and, as a result, there has been a natural increase in cost per ton due to lower production, as well as an increase due to the higher wage. Costs per pound of copper were from one-fourth to one-half cent higher than in 1911. This is largely to be charged to labour, though greater expenditure for construction has materially increased costs at some mines.

**One-Man Drilling Machines.**—The increased wage has in some cases not been reflected in higher costs, owing to many of the best miners having increased in efficiency. Using better machines and operating and caring for them more intelligently, the miners can earn larger wages while decreasing the cost per ton. The one-man drills, which have only recently been largely in use, have proved remarkably successful. The use of these drills has enabled the companies to pay higher wages than would otherwise be possible, as the saving in labour is larger than the increased cost of supplies and repairs. Good miners are, consequently, earning much higher wages than the companies could afford to pay under the old conditions.

**Efficiency Engineers.**—At several mines, graduates of the Michigan College of Mines and other colleges are employed as "efficiency" engineers. These men have themselves worked as miners and devote their attention to improving underground practice. They instruct the miners in use and care of the machines, study and compare costs of different methods of mining and handling the ore and guard against waste of air and supplies.

**Mining Methods.**—The methods of developing and mining the lodes were described in the January 1 issue of the Journal, in which was published some extracts from the writer's report on the copper industry made for the Michigan Geological Survey.

**The One-man Drill.**—One of the most noteworthy changes in mining practice in recent years has been the adoption of lightweight (150 pound) one-man drilling machines to replace the heavy (290-pound) two-man machines which were long in use.

Concerning these drills, the superintendent of one of the mines stated to an investigating committee recently:

"The necessity for further close economy in the operation of our mine forced us to go into the market for a more efficient drilling machine, and, if possible, a machine that could be operated with one man as compared with two, which was standard practice. After about eighteen months of experimenting we adopted our present machine. Our intention was to divide the benefits accruing to us from the use of the one-man machine with the men. This benefit to take the form of higher wages to machine operators (called miners), That we have carried out this plan is shown by the following table which shows the increase in wages to the men operating one-man drills over wages made when operating two-men drills: in case a man does not make what we call a fair rate he is paid off at a rate of not less than sixty-five dollars per month, but this ruling effects a very small portion of our employees. In fact, for the month of June this

**Comparative Statistics on One-man Drill and Two-man Drill Calumet & Hecla and Subsidiary Mines for Year Ending December 31, 1912.**

| | Shifts. | Labor Cost. | Supplies. | Total. | Average wage per shift. |
|---|---|---|---|---|---|
| Two-man drill ......................... | 350,012 | $1,024,801.84 | $291,526.14 | $1,316,327.98 | $2.83 |
| One man drill ......................... | 54,758 | 193,935.81 | 94,058.24 | 287,904.05 | 3.34 |

**One-man (Leyner) drill, 59th level, Conglomerate lode.** Photo by O. Gardner
**Calumet and Hecla mine, Calumet, Mich.**

"The miners' wages largely depend upon the efficiency of the man as our work is all on the bonus system and is so arranged that increased efficiency is of mutual benefit to the employer and the employee. We have a fixed contract which is not cut as the efficiency of the employee increases. It is also one of our rules that year it was not necessary to use this minimum wage for a single employee. The one-man drill has resulted in a decided increase in efficiency, which, with further experience, will increase and will result in not only lower costs, but in higher wages to the men. What is more, the drill is popular with the good miners and any sentiment against it is made from without. Any attempt to return to the two-man drill would be a backward step in industrial progress and would work untold hardship to this district in its competition with other copper-producing districts. It is as little to be thought of as the elimination of any other labour-saving device. If copper mining in Michigan is to be a progressive and permanent institution, we must shape our methods now to be able to work deposits of a still lower grade than month of May, 1913, the companies under Calumet and Hecla management paid miners $3.47 and trammers $2.87.

**Number of Employees.**—On July 22, the day before the strike was declared, there were 14,300 men in the employ of the mining companies. The chief employers were Calumet and Hecla 4,107, Copper Range Consolidated 2,716, Quincy 1,483, and Osceola 1,143.

On October 8, 1913, there were 5,445 men at work.

**One-man (Leyner) drill, 59th level, Conglomerate lode.** Photo by O. Gardner.
**Calumet and Hecla Mine, Calumet, Mich.**

have been worked up to the present time, and the one-man drill and the further possible increase in the efficiency along this line is the most important step now before us."

**Wages.**—The recent investigation undertaken by the Copper Country Commercial Club shows that in 1912 the companies paid in wages a total of $12,606,409.34, or a little over $1,000,000 per month. For the six months prior to the strike the average wage was $3.20 per shift for miners, and $2.63 for trammers. For the

## GERMAN CONSUMPTION OF FOREIGN COPPER.

Messrs. L. Vogelstein & Co. report for the months January to July, 1913:

| | Tons. |
|---|---|
| Imports or copper | 134,293 |
| Exports of copper | 6,010 |
| Consumption of copper | 128,283 |

as compared with consumption for the same period in 1912 of 120,071 tons.

Of the above quantity 115,349 tons was imported from the United States.

# CANADA'S NICKEL INDUSTRY*

By Alex. Gray.

(Continued from last issue.)

*Precious Metals in the Nickel Copper Ores.*

It is of interest to have the technical advisers of the Canadian Nickel Corporation formally record the fact that they count on recovering precious metals worth $1 per ton of ore. The cost of this recovery always has minimized its net value to other companies. If the Hybinette process will save $1 out of the estimated content per ton of $1.20, then the precious by-products will become an important factor. It has never been contended by the International Company that these precious metals were other than a negligible quantity, in view of what it costs to separate them.

With reference to these precious metals Dr. Coleman states that native gold was early found in the gossan of the Vermilion mine of the International Company. The mine was taken up as a gold mine. Gold was also obtained, soon after, from the Victoria mine of the Mond Company. More gold was found at the Crean Hill mine. Sperrylite, the arsenide of platinum, was originally obtained from the Vermilion mine, and later from the Victoria. The name, Sperrylite, was conferred upon it in honour of Mr. F. L. Sperry, chemist of the Canadian Copper Company, who had sent it to experts for examination. The mean of the two analyses of samples submitted by Mr. Sperry, was:

| | |
|---|---|
| Arsenic | 40.98 |
| Antimony | 0.50 |
| Platinum | 52.57 |
| Rhodium | 0.72 |
| Palladium | trace. |
| Iron | 0.07 |
| Cassiterite | 4.62 |

"The sperrylite of the ores is mainly contained in copper pyrites," says Dr. Coleman. . . . . "This mineral has not been found at the other mines, though the platinum obtained from matte made from their ores suggests that it is really present. It is known that palladium occurs in the Sudbury ores in larger amounts than platinum, but no palladium compound has yet been discovered. The silver, also, is not accounted for unless contained in the copper pyrites."

However, it is manifest that the nickeliferous ores do not all carry anything like the percentage of precious metals determined by Professor George R. Mickle about 16 years ago. He found that gold and the arsenide of platinum were not confined to the Vermilion mine gossan. He located these metals in the unweathered sulphides, both in the pyrite and pyrrhotite. His results must have been exceptional, because "the average of six samples of solid ore gave over 3 dwts. of platinum and a trace of gold, while pyrrhotite with little chalcopyrite gave considerably less than the average, and one sample of ore with much chalcopyrite gave 7 dwts. 12 grs. of platinum and a trace of gold." The highest assay from the Mickle samples, was 1 oz. 3 dwt. of platinum and 3 dwts. of gold, from decomposed ore resting on the solid ore. Of themselves those results would create furore were they at all indicative of the average. They find their quietus in the historical events attending the exploitation of the Vermilion mine as a gold mine, as related by Dr. Coleman:

"The Vermilion was first taken up as a gold mine in 1887, and a shaft was sunk by Messrs. Tough and Stobie on a small quartz vein the following year, on the low ground 930 feet north of the present mine and just beyond the Crean Hill Railway, the name coming from the Vermilion river, which flows 2 or 3 miles to the southeast. A shaft was sunk 40 feet on the quartz vein and some very rich ore (wire gold) was found on the surface and also to some extent in the wall rock. Mr. B. Charlton, president of the Vermilion Gold Mining Co., states that several thousand dollars worth of gold was obtained by means of a three-stamp prospecting mill while sinking the shaft.

"The rich ore presently ran out and then gold was found in the gossan on the hill at the present mine, which was put through the little mill. The men in charge were puzzled to find the carpet used to collect the coarse gold whitened by shining grains of a tin white mineral, afterwards named sperrylite. Since the owners were in search of gold, and not platinum, the mine was sold in 1890 to the Canadian Copper Co.

"It was presently found that the gossan contained palladium, as well as platinum and gold, and the Canadian Copper Company made attempts to dispose of the mineral to various firms dealing in the rare metals, such as Balbach & Co., and Johnson, Matthey & Co. In 1896 the two firms mentioned reported that the ore contained from 6 to 9 ozs. of platinum and from 8 to 14 ozs. of palladium. In 1897 a consignment of 14 casks (5 tons) of platinum sand was made to Johnson, Matthey & Co., who found its treatment a matter of extreme difficulty, as the ore could not be levigated nor treated successfully by any acid process, and in smelting the palladium contents are sacrificed. The platinum contents could be recovered only by smelting with a large proportion of silver ore, involving considerable cost in its subsequent separation. In 1899 they paid for the ore at the rate of £8 per ton, and after deducting various charges, the net return from the consignment was at the rate of $22 per ton. An offer was made to buy the ore at the rate of £9 5s. per ton if quantities of 100 tons or more were shipped: but no more seems to have been sent to them, probably because the price was so low for ore running on the average 7 ozs. of platinum and 11 ozs. of palladium per ton. Platinum was worth about $16.00 per ounce at the time.

"Negotiations were carried on in 1899 and 1900 with a French company on the basis of 35 per cent. of the value of the two metals, palladium to be taken as equal to platinum in value, but apparently without result.

"In 1902 a small amount of platinum sand was sent to the Orford International Works at Bayonne, and in September, according to Mr. A. Wadhams, experiments were carried on under the direction of Mr. Hybinette for the separation of the precious metals. They seem not to have been very successful and finally the material was turned in with the ordinary nickel-copper matte, so that only a small percentage of the platinum metals was recovered.

*From Journal of Commerce.

"In October, 1903, 155.65 tons of 'platinum dirt' was shipped to the Orford works, according to official records at Copper Cliff, and Mr. Browne states that 90 barrels of gossan were removed in 1903, containing 6.88 per cent. copper, and 2.91 per cent. of nickel, with 6.5 ozs. of palladium, 4.1 ozs. of platinum, 4.3 ozs. of silver, and 0.28 oz. of gold per ton.

"Since sperrylite and gold are very easily separated from the gossan by panning, there is no doubt that most of the platinum and gold could have been saved by sluices or cradles, and it is surprising to find Johnson, Matthey & Co., stating that the ore could not be 'levigated.' The source of the palladium is not known, since analyses of sperrylite show only traces of that metal.

"In 1902 the Canadian Copper Company began taking out unweathered ore, sinking the main shaft to about 50 feet and drifting in various directions to follow the ore underground, and there is a record of 198.28 tons having been shipped in February, 1905. This was very rich in nickel and copper, averaging 20 to 25 per cent. of the combined metals. Assays made apparently in 1903, show that the ore contained 4 ozs. of silver, 4 ozs. of palladium, 1.5 ozs. of platinum, and 1/3 oz. of gold per ton.

"An assay of clean chalcopyrite, made by Mr. Waern in the laboratory of the Canadian Copper Co., in September, 1909, showed a trace of gold. 0.79 oz. platinum, 3.62 ozs. of palladium, and 3.78 ozs. of silver—a total of 8.13 ozs. per ton of the precious metals."

In the absence of complete data relating to the past recovery of precious metals from these ores, when dealt with in bulk, possibly there is considerable misconception. The Vermilion and Victoria mines cannot be regarded as indicative of the whole district. Undoubtedly some of the precious contents are saved. Taking certain complete analyses of bessemer matte as a basis, and including other high matte analyses, which showed only traces of palladium and 0.13 oz., 0.50 oz., 0.44 oz., 0.25 oz., and .40 oz. of platinum, Dr. Colesman says: "It came as a surprise to learn that for several years more palladium than platinum was recovered from the Canadian Copper Company's matte during the process of refining at Constable Hook, New Jersey. In 1902 no less than 2,375 ozs. of platinum and 4,411 ozs. of palladium were recovered. doubtless belonging to ore mined in previous years. If it all came from the ore mined in 1902 there were 0.0102 ozs. of platinum and 0.0189 ozs. of palladium, or 0.0291 of the combined metals, per ton of ore. In 1903 the amounts were 0.0077 of platinum and 0.0144 of palladium, and in 1904, 0.0052 ozs. of platinum and 0.0093 ozs. of palladium; showing a rapid falling off, due probably to the fact that Creighton ore had largely replaced others." No platinum, since 1904, has been reported, according to Dr. Coleman; yet another authority claims, without giving his grounds for so doing, that "there were recovered by the Orford Copper Company Works, at Constable Hook—the refining concern of the International Company—in dealing with the nickel-copper mattes shipped from Copper Cliff during the six years ended with 1912, 2,864 ozs. of platinum and 4,986 ozs. of palladium, 15,675 ozs. of gold, and 459,250 ozs. of silver." Lest the data be confusing, however, it is stipulated "that it cannot be specifically stated that this entire production was from the nickel-copper ores since certain residues from other mines are treated along with the matte in the process of refining. Doubtless, however, a large proportion is traceable to the nickel and copper-carrying pyrrhotite. The value of the production was almost $817,030."

At first blush that amount is a handsome extra. Reference to the tonnage smelted in those six years—and recollection of the other "residues" referred to—will dispel the impression that each ton of International ore had had more precious contents than has been commonly supposed. Were all the ore similar to that from the Victoria and Vermilion mine, the per ton precious metal contents would be quite important. But the Vermilion was somewhat incidental to the larger operations at the Creighton and Crean Hill Mines. It is different with the Mond Company, which mined the Victoria mine, almost exclusively, until lately. This leads Dr. Coleman to remark: "Since the Victoria mine in the early days contained so much sperrylite and gold that they could be panned from its gossan, it is probable that the Clydach refinery in which its bessemer matte is treated, must separate important amounts of gold and platinum and also of palladium, though there is no published account of the production of the metals."

### The Alexo Mine.

In 1908 Alex. Kelso discovered a body of ore in Dundonald township, near Matheson, on the line of the Timiskaming & Northern Ontario Railway. Dr. Coleman, while recognizing the limitations of the locality, pronounces the Alexo Nickel mine to be "the most promising recent find of nickel ore in Canada, aside from the Sudbury deposits." No attempt has been made by the present owners, Mr. E. F. Pullen being the president to erect anything in the nature of a smelting plant. Perhaps the tonnage proved thus far does not warrant it. All told, the shipments from the property to July 31st, totalled 2,785 tons. This went to the Mond smelter, the yield in metals as notified by the smelter returns, being:

| | |
|---|---|
| | Contents. |
| Nickel .................... | 241,563 lbs. |
| Copper .................... | 32,565 lbs. |
| | Aver. Analysis. |
| Nickel ...................... | 4.34% |
| Copper ...................... | .58% |

The ore is mined from an open cut, using one No. 43 Rand steam drill, a small hoist, buckets and derrick. It is loaded direct into wagons and teamed to the mine siding, three-quarters of a mile away on the Porcupine branch of the railway. The open cut is about 60 feet long, 10 feet wide and over 40 feet deep. Further along the ore body has been opened at surface for a distance of 200 feet, the cut being 9 feet wide and 9 feet deep. The total length as exposed, is given as 300 feet, beyond which it is said to be covered by drift. Pyrrhotite, however, is found some 1,200 feet away from the present workings, seemingly on the strike of the ore body being mined.

With a somewhat improvised plant—large enough for current purposes, unprepared for more than it is called upon to perform, it is complimentary to the owners that they modestly capitalize their company at $40,000 in dollar shares, issued $30,000, and have reserved $10,000 in the treasury. No stock has been sold. It is all held by the original partners who staked the property—which is a new departure. On the other hand there have been overtures looking to the purchase of the property, contingent on the demonstration of more ore than is indicated in the shallow workings and at outcrop.

A profit is realized from the shipment of the raw ore to the Mond Company, but the large producing companies of the Sudbury District declined to purchase the Alexo mine. A short time ago the Messrs. Guggenheim were prepared to explore the property and take it over if the tonnage became greater. Several years ago Mr. David Fasken interested the Canadian Copper Company in the matter. Some diamond drilling was done, but results were not deemed sufficient to warrant a deal. The Mond Company also is said to have drilled the property. It may be extensions to the ore bodies will be uncovered. Dr. Coleman, in describing the Alexo situation, says:

> "The ore crops out for about 200 feet, with about 6 feet of solid ore at the widest place, followed by several feet of mixed ore and rock, and finally by serpentine with only a few specks of ore. Below the surface the solid ore thins out and at 100 feet depth there is only mixed ore and rock against the foot-wall."

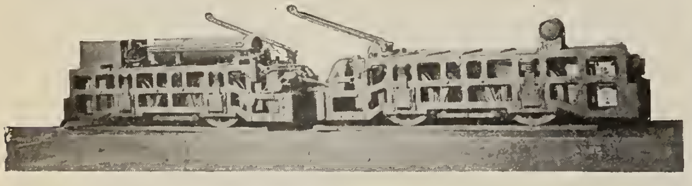
The latter feature doubtless was ascertained by means of the drilling; because the open cut boring is not 100 feet deep.

## ELECTRIC MINE LOCOMOTIVES.

The Carnegie Coal Company has recently installed at the Charleroi Coal Works two of the largest mine locomotives ever built. These locomotives weigh 30 tons apiece and are of the Baldwin-Westinghouse "Barsteel" type. It is estimated that each locomotive can haul 100 cars each loaded with 3 tons of coal over the local grades.

The Carnegie Company recently acquired possession of the Charleroi mine, which is of considerable size and is well developed. A large production is desired from it, but the haul is about two miles long with the grade largely against the load. Hence the average haulage locomotive of from 15 to 25 tons would not be sufficiently large to keep production up to the estimated tonnage.

The locomotives possess a number of interesting features.



A 30-ton mine locomotive

Each locomotive consists of two separate units which can be separated and used as 15-ton locomotives if desired. This use of two units in tandem is advantageous in such large machines because the weight is distributed over 8 wheels instead of 4, and hence the locomotive has great tractive power and is also easier on the track than if the weight were more concentrated.

The "barsteel" construction represents the most modern type of design. As is clearly seen in the illustrations, the frames are not built up of plates, but are formed of a grid of steel bars of heavy cross-section. The side frame of each unit is cast separately forming an extremely strong and rigid construction. The openings in the frame give ready access for inspecting, oiling, replacing brake shoes, adjusting brake rigging, etc., and also provide thorough ventilation to the electrical apparatus so that its all-day efficiency is higher than would be the case if the frame were totally enclosing. This type of frame has been in use for many years for large freight locomotives, but has been only recently adapted for mine locomotives.

Air brakes are used owing to the greater ease of handling so large an engine, but each unit is equipped with hand brakes which can be operated together from

A 15-ton unit on the tipple

the operating stand of the leading unit. An auxiliary reservoir is provided on the trailing unit, the main reservoir and compressor being located on the leading unit. The hand brakes are operative on both units when disconnected for independent operation.

The controller for the tandem is of the individual magnetic blowout type, and handles all four motors at once. When the tandem is split, the four-motor controller handles the two motors of its unit without change in connection while the other unit has its own two-motor controller.

The tandem with train of coal cars

In addition to the two large haulage units the Carnegie Co. has installed at Charleroi ten traction-reel gathering locomotives or "crabs," also of the Baldwin-Westinghouse barsteel type.

## CANADIAN COAL AND COKE CO.

The Canadian Coal and Coke Co., of Montreal, Quebec, has arranged to take over the properties of the Western Coal and Coke Co., the Pacific Pass Coal Fields, the St. Albert Collieries, and the Lethbridge Collieries, all developing coal mines in Alberta. The authorized capital of the Canadian Coal and Coke Co. is $15,000,000, divided into $4,000,000 preferred and $11,000,000 common. Of these amounts about $3,750,000 of preferred and between $9,000,000 and $10,000,000 of common has been issued, the remainder being retained in the company's treasury. The company has authorized an issue of $3,000,000 of bonds, $2,000,000 to be issued shortly; the proceeds will be applied in discharging certain current liabilities incurred by the several other companies above-mentioned in doing their development work, and the balance will be appropriated for completing development and equipment of the properties and for working capital. Negotiations in connection with placing the bonds are in progress.

# BOOK REVIEWS

**MINERAL DEPOSITS—by Waldemar Lindgren, Prof. of Economic Geology, Massachusetts Institute of Technology; Geologist, United States Geological Survey—McGraw Hill Book Company, N.Y.—Price $5.00 net.—For sale by Book Department, Canadian Mining Journal.**

This work is one of the best on the subject that has yet appeared. Dr. Lindgren's experience as geologist for the United States Geological Survey, and as a teacher in one of the leading technical colleges, has given him unusual qualifications for a masterly presentation of the subject. He has long been recognized as a leading authority on ore deposits. His published works win admiration everywhere.

The scheme of the book is to outline the broader principles of the science of ore deposits. The several mining districts are dealt with only in so far as they afford good examples of the type of deposit being described. The classification adopted is a purely genetic one, and in this the book differs markedly from the well-known texts on mineral deposits which are now in use.

In most of the standard texts an attempt is made to discuss mineral deposits without strict adherence, if any, to a genetic scheme of classification. In most texts, metals and non-metals are discussed separately. Several authors classify the deposits according to the chief metal contained.

Dr. Lindgren avoids the customary treatment and classifies the deposits according to origin rather than according to the contents.

A complete treatment of the subject which would include discussions of distribution, occurrence, structure, origin, production, and valuation of deposits, as well as statements of the uses of the materials mined, process of mining and reduction, and criteria for judging the value of the products, is not attempted. The treatment is from a scientific rather than from a utilitarian viewpoint, the object being to give the student a clearer insight into the geologic relationship of the various deposits.

The first chapter is devoted to definitions of terms used, and to a general discussion of the distribution of the elements, composition of the earth's crust, traces of metals in rocks, price of metals, etc.

Chapter I. deals with the deposition of minerals, solution and precipitation, etc.

The next four chapters deal with underground water. The flow, composition, chemical work; and the origin of the water and its dissolved substances are discussed. These chapters give one of the best presentations yet written of this important subject.

Chapters VII. and VIII. are devoted to spring deposits, and the relations of mineral deposits to mineral springs.

Chapter IX. deals with folding and faulting, definition of the terms, classification of faults, etc.

Chapter X. is entitled, "Openings in Rocks." Attention is called to the various ways in which fractures and other openings are made.

The next two chapters deal with the form, structure, and texture of the mineral deposits and ore shoots.

In Chapter XIII., Dr. Lindgren presents his scheme of classification of mineral deposits, and each of the succeeding chapters deals with one of these classes:

Deposits formed by mechanical processes of transportation and concentration (placer deposits, etc.).

Deposits produced by chemical processes of concentration in bodies of surface water by reactions between solutions (limestones, limonite, bog-manganese ore, phosphate beds, etc.).

Deposits formed by evaporation of bodies of surface waters (saline residues, gypsum, nitrates, etc.).

Mineral deposits resulting from processes of rock decay and weathering (residual iron ores, manganese deposits, hydrated silicates of nickel, etc.).

Deposits formed by concentration of substances contained in the surrounding rocks by means of circulating waters (sulphur, asbestos, Lake Superior iron ores, Mansfeld copper-bearing shales, etc.).

Deposits resulting from regional metamorphism.

Deposits of native copper with zeolites in basic lavas (Lake Superior copper deposits, etc.).

Lead and zinc deposits in sedimentary rocks; origin independent of igneous activity (lead and zinc ores of the Mississippi valley).

Metalliferous deposits formed near the surface by ascending thermal waters, and in genetic connection with igneous rocks (quicksilver deposits, gold at Tonopah, Comstock, Cripple Creek, Goldfield, etc.).

Metalliferous deposits formed at intermediate depths by ascending thermal waters, and in genetic connection with intrusive rocks (gold quartz veins, California and Victoria type, Nova Scotia gold, Cobalt silver, etc.).

Veins and replacement deposits formed at high temperature and pressure, and in genetic connection with intrusive rocks (tin-bearing veins, some Ontario quartz veins, gold telluride veins of Western Australia, etc.).

Deposits formed by processes of igneous metamorphism (contact metamorphic deposits, Clifton, Bisbee, Cananea, Bingham, Boundary district, B.C., etc.).

Mineral deposits of the pegmatite dikes (feldspar and quartz, mica, apatite, etc.).

Mineral deposits formed by concentration in molten magmas (diamonds, chromite, magnetites, Sudbury nickel-copper, etc.).

Metamorphosed deposits (Swedish iron ores, etc.).

In Chapter XXIX., Dr. Lindgren discusses the oxidation of metallic ores, the general conditions, the principles, changes at surface, and secondary enrichment.

Chapter XXX. is a short statement of methods of calculation of rock analyses.

While the work from the mode of arrangement of its material leaves something to be desired from the standpoint of the student who desires to obtain information concerning all the types of deposits in which any one metal occurs, the text is undoubtedly by far the best available for those who wish to study the subject of mineral deposits scientifically.

A number of Canadian deposits are briefly mentioned, and it is interesting to note Dr. Lindgren's ideas of their origin, gathered from the literature rather than from personal observation. Naturally it is with the United States deposits that the author is most familiar. He has evidently, however, perused the literature very carefully and has been able to classify a number of the better known Canadian deposits also.

The asbestos deposits of Quebec are classed, following J. A. Dresser, as concentrations from the surrounding rock—a recrystallization of the serpentine proceeding inward from the cracks.

The native silver deposits of the Cobalt district come under the heading — Deposits formed at intermediate depths by ascending thermal waters and in genetic connection with intrusive rocks. In this he agrees in the main with the published writings of W. G. Miller, A. E. Barlow, J. B. Tyrrell, W. A. Parks, R. E. Hore, and others. Attention is called to the probability that there has been ample opportunity for the deposition of secondary silver by descending solntions as the veins have been long within a short distance of the surface. The peculiar fact that the mineral smaltite, which alters very readily in oxidizing waters, is found a few feet from surface practically unchanged is not mentioned by Dr. Lindgren.

The Porcupine gold deposits are considered by the author as formed at high temperature and pressure and in genetic connection with intrusive rocks. While the Porcupine deposits are very briefly mentioned, the text contains very interesting discussion of similar deposits in Calfornia and Victoria, which are supposed by Dr. Lindgren to have been formed at lower temperature.

The Sudbury nickel-copper deposits are considered to have been formed by concentration in molten magmas.

The Granby and adjoining ore bodies at Phoenix, B.C., are described as deposits due to igneous metasomatism not distinctly related to contacts.

The Rossland gold-copper deposits are considered to have been formed at high temperature.

For the Lake Superior native copper deposits and a few other very similar occurrences a special place is given in the scheme of classification. The deposition is thought to have been connected with the cooling processes of the Keweenawan lavas.

The zeolitization is considered as an after effect of volcanism and the native copper is supposed to have the same origin as the zeolites with which it occurs in the lavas. In this chapter there are a couple of errors which may here be pointed out. The section, on page 400, should be titled Calumet, instead of Houghton. The Calumet conglomerate is on page 401 incorrectly called a 'volcanic' conglomerate. R. E. H.

**CYANIDE PRACTICE, 1910-1913—edited by M. W. von Bernewitz—Mining and Scientific Press—Price $3.00—For sale by Book Department, Canadian Mining Journal.**

This is the third of a series of books published by the Mining and Scientific Press on Cyanide Practice. It includes numerous articles on all phases of current cyanide practice based upon experience in all parts of the world. Most of the articles have been published in the columns of the Press, and a few of them in other periodicals.

An attempt is made to present these articles according to the subjects dealt with rather than according to dates of their original publication.

There are several papers on each of the following subjects:

Chemistry of Cyanidation, Crushing, Concentration and Treatment of Concentrates, Roasting, Agitation, Decantation, Filtration, Precipitation and Clean-up, Disposal of Residue, Measurement and Estimation of Tonnages.

There are also a number of descriptions of present practice in several districts, and detailed descriptions of several mills. The names of many prominent metallurgists are included in the list of authors, and the publishers deserve much credit for gathering together so much up to date discussion and description of cyanide practice.

# RECENT STRIKE OF OIL AND GAS IN WESTERN ALBERTA

By R. W. Brock.

The Geological Survey has received a sample of the oil recently struck in No. 1 well of the Calgary Petroleum Products Company, situated at Black Diamond, sixteen miles west of Okotoks, Alta. This oil was struck at a depth of about 1,560 feet. It is what is technically known as a "white oil," being transparent and of an amber colour. It is phenomenally light for a natural mineral oil, having a specific gravity of about 62 Baume. Evidently it consists largely of gasoline. In fact, it has been successfully used in its raw state in place of gasoline in an automobile.

"White oils" are rarely found in quantity. They would appear to be the result of filtration through clay strata, under pressure, of the lighter portions of ordinary petroleum. That this has occurred in the present instance is made probable by the fact that at a higher horizon in this well a flow of gas 2,000,000 feet a day was struck.. This gas is also peculiar in the large amount of gasoline it contains. It probably represents a farther stage in the process of filtration.

The amount of oil present has not yet been determined, so that the commercial value of the strike is still unproved. If the amount of gas encountered in the higher level is any criterion, this may prove to be the exceptional case, and a considerable quantity of oil, for a "white oil," be obtained.

Whether oil is present in large quantities or not, the strike is of importance, as the "white oils" are usually found only in the vicinity of large bodies of the ordinary petroleum. Thus it is an excellent indicator.

Mr. D. B. Dowling, of the Geological Survey, who visited the well shortly before the strike was made, reports that the well is located on an anticline, in shales of the Pierra formation, and that the oil was encountered in underlying Belly river beds. On either side of the anticline overlying Edmonton beds are exposed. Going eastward therefore the covering will rapidly thicken. Westward toward Moose Mountain, according to the work of D. D. Cairnes, of the Survey, the formations are folded into a number of anticlines bringing lower formations to the surface, and in Moose Mountain faults are encountered. Between this faulted ground and the well are several anticlines where prospecting for oil might be undertaken. These anticlines probably run in the direction of the main structural lines, that is, roughly parallel to the mountain ranges. Mr. D. B. Dowling, of the Geological Survey, is now in the field, having been commissioned by the Director to examine the well and make a study of the geology of the district.

# PERSONAL AND GENERAL

Mr. J. G. McMillan has been appointed inspector of mines for the Cobalt district. Mr. McMillan is a graduate of the mining department of Toronto University. Some years ago he was in charge of the Foster and later the Hargraves mines at Cobalt. Mr. McMillan has made numerous explorations in northern Ontario for the Provincial Government and recently returned from Hudson Bay where he was making harbour surveys for the Dominion Government. Mr. McMillan succeeds Mr. T. F. Sutherland, who was appointed successor of Mr. E. T. Corkill.

Mr. Clement Foster is in England. It is understood that his visit is in connection with the flotation of the Tough-Oakes Mining Company.

A number of mining engineers have been recently examining properties in Bartlett township, south of Porcupine.

Mr. H. S. Robinson, engineer of the Trethewey Mining Company, is now at the West Beaver mine, in the Port Arthur district, which is under option to the Trethewey.

Mr. H. Grattan Tyrrell, bridge engineer, of Chicago, gave an illustrated lecture on October 15th, before the Engineering Society of Northwestern University, on the subject of "Bridge Engineering." Mr. Tyrrell, who is a graduate of Toronto University, was formerly chief engineer for one of the Ohio bridge companies, and afterwards special engineer of bridges for the Harriman railroads in the Western and Pacific States. He is author of several books on bridge and structural engineering.

At the Buffalo mine, Mr. J. M. Swent has been appointed engineer, and Mr. C. Beech assistant engineer.

Mr. J. H. Plummer is in London.

Mr. W. H. Aldridge, of New York, formerly managing director of the Consolidated Mining and Smelting Company of Canada, Ltd., now managing director of the Inspiration Consolidated Copper Company, has been elected a member of the Executive of the American Mine Safety Association, which held its annual session at Pittsburg, Pennsylvania, at the end of September.

Mr. A. W. Allen, of Victoria, B.C., has been in Winnipeg, Manitoba, conferring with the directors of the Lucky Jim Zinc Mines, Ltd., as to resumption of operations at the company's Lucky Jim mine, in Slocan district, B.C. Since the death of the managing director, the late Mr. Thos. G. Procter, Mr. Allen has been in charge of the company's affairs in British Columbia.

Mr. A. J. Beaudette has gone to New York to report to his principals the result of the 1913 season's prospecting work on a coal property situated in Dockrill's basin, southeast of Hazelton, Omineca mining division, B.C.

Mr. Wm. Blakemore, of Victoria, B.C., has been in the Flathead country, Southeast Kootenay, examining coal and oil lands.

Mr. R. W. Brock, director of the Geological Survey, after his return from Yukon Territory, was leader of a party of International Geological Congress excursionists who visited Rossland on their way back East. Before returning to Ottawa, Mr. Brock spent a week or so in British Columbia on Survey business.

Mr. Chas. Camsell recently gave an address in Vancouver, B.C., illustrated by lantern slides, under the auspices of the Vancouver Chamber of Mines, on the mineral resources of the western part of the Northwest Territories of Canada. He also gave information relative to parts of Similkameen district, B.C.

Mr. Paul S. Couldrey, formerly manager for the Le Roi No. 2, Ltd., at Rossland, B.C., but now superintendent of the Cerro de Pasco Co.'s copper mines in Peru, has been spending a holiday in the south of France.

Mr. R. G. Drinnan, for years superintendent of coal mines in the Crowsnest district, B.C., now in charge of coal properties in Alberta, is making Edmonton his headquarters instead of Vancouver, B.C.

Mr. Chas. Fergie and Mr. J. M. Gordon, of Montreal, were recently at coal mines in Alberta, of which the former is the managing engineer.

Mr. R. P. Featherstonhaugh, well-known in connection with placer-gold mining operations in Atlin district, B.C., lately returned to the Omineca Gold Mines Co.'s placer mining work on Quartz creek, in Omineca mining division.

Mr. Thos. Graham, chief inspector of mines for British Columbia, when on an official visit to the Crowsnest district last month, took advantage of the opportunity to see some of the coal mines about Lethbridge, Alta.

Mr. W. D. Greenough, manager of the Atlas Mining Co.'s mines in Whitehorse copper camp, Southern Yukon, left that camp last month for a trip to see his principals in the United States.

Mr. F. T. Hamshaw, of New York, formerly managing a placer-gold mine on McKee creek, Atlin, B.C., after having obtained an option on several of the working claims in Shushanna gold field, Alaska, left that field last month for "the outside," to make arrangements for operating them next mining season.

Mr. H. L. Hollis, of Chicago, Illinois, recently examined the Surprise silver-lead mine, in Slocan district, B.C.

Mr. Henry Kehoe, of Spokane, Washington, who spent several months of last year in Ontario, has been appointed engineer in charge of mining operations of the recently organized London-Arizona Consolidated Copper Co., in Pinal county, Arizona.

Mr. Jas. McEvoy last month examined a coal mining property situated about 12 miles from Princeton, Similkameen, B.C.

Mr. John McMartin has been in British Columbia, both in the country most conveniently reached from Prince Rupert, the Grand Trunk Pacific Co.'s western terminus, and at Sheep creek Nelson mining division.

Mr. O. B. Perry, manager of the Yukon Gold Co., arrived at Skagway from Dawson early in October on his way south.

Mr. Royal Pullen has been appointed assistant superintendent of the operations of the Canadian-Klondike Mining Co.

Mr. Wm. Fleet Robertson, provincial mineralogist for British Columbia, is making investigations in connection with placer-gold mining about Barkerville, Cariboo district.

Mr. F. M. Sylvester, for several years assistant to Mr. Jay P. Graves, general manager for the Granby Consolidated M. S. and P. Co., has been appointed general manager on Mr. Graves' retirement owing to ill-health. Mr. Graves remains on the directorate of the company as vice-president.

Mr. Francis A. Thomson, head of the mining engineering department of the State College of Washington, Pullman, Washington, has been appointed acting dean of the faculty of the college. Professor Thomson is well known in the more productive metal mining camps of southern British Columbia, with operations in some of which he has been associated.

The Canadian Westinghouse Co., Hamilton, has issued a bulletin describing carbon circuit breakers.

The McKiernan-Terry Drill Co. has issued a bulletin describing 'Wizard' rock drills.

The H. W. Johns-Manville Co. has secured the contract to furnish 67,500 square ft. of J-M built-up asbestos roofing to cover the new railway exchange at St. Louis.

This firm's product is built up on the roof from successive layers of asbestos (rock) felts, cemented together and coated with Trinidad lake asphalt.

The Siemens Company, of Canada, has received an order from the Dome Mines Company, Ltd., of South Porcupine, Ont., for 1 450-h.p., 250 r.p.m. 550 volt, 50 cycle slip-ring type induction motor, and short circuiting and brush lifting device, pedestal bearings, together with a Siemens type liquid starter. The motor is for driving a compressor made by Belliss & Morcom.

One of the contracts in connection with the construction of the new Michigan Central Terminal at Detroit is for 200,000 square feet of J.-M. Built-Up Asbestos Roofing, involving five carloads of material, to be used for railroad sheds alone. If placed end to end these sheds would extent over a mile. The contract for this roofing was given to the Detroit branch of the H. W. Johns-Manville Co., the well-known manufacturers of asbestos products, who are also furnishing the waterproofing, J.-M. Vitribestos Smoke Stacks Lining, two thousand feet of J.-M. Sectional Conduit, and 16,000 linear feet of J.-M. Asbestocel Pipe Covering for plumbing, heating and power lines throughout the building.

# SPECIAL CORRESPONDENCE

## YUKON TERRITORY

A Norwegian named J. Nielson, who, after conviction on a charge of having attempted to blow up one of the gold dredges of the Guggenheim Co., out of spite for having been discharged from employment, was sentenced to 20 years' imprisonment, is now in the penitentiary at Kingston, Ontario. He was taken down from Dawson by two of the Northwest Mounted Police; the journey occupied 15 days, close steamer and train connections having first been arranged for. He is thought to be a little off his head.

After having spent 14 years in Yukon Territory, Mr. G. W. McLean recently retired from the important position of Comptroller and left Dawson for Ottawa. When in Vancouver, B.C., en route, Mr. McLean stated, as reported in a local newspaper, that efforts were being made to extend the Yukon mining season this autumn. New machinery and gold dredges were being taken north. The output of gold, which was nearly $5,550,000 in 1912, will exceed $5,000,000 this year. It is expected that gold will be found in the Canadian Yukon, across the International boundary line from the Chisana field in Alaska.

**Wilson Creek.**—Capt. O. J. Newcomb, master of the packet St. Michael, which arrived at Dawson from the mouth of the Yukon river on October 8, brought news of a gold strike having been made on a stream running into Palta slough, one of the most travelled channels on the Yukon, about 200 miles from St. Michael and 50 miles below the Russian mission. The scene of the strike is a stream 18 miles long, called Wilson creek. The tundra is 7 to 8 ft. deep, similar to that of the Nome country. Captain Newcomb stated that men were taking out $30 a day to the rocker, and he had seen several with small pokes of gold. The strike was made four or five weeks ago, and when his steamer passed up the slough about September 20, 50 men had already staked claims. The same men had also staked on smaller streams, called Disappointment and Independence, in the vicinity. The Northern Commercial Co. has stocked one of its barges with supplies and placed it on Wilson creek as a floating store.

**Lone Star.**—Mr. T. A. Firth, secretary of the Lone Star Quartz Mining Co., is reported in newspapers to be shipping to San Francisco one ton of high-grade gold ore from the company's property, situated near the head of Victoria gulch, a tributary of Bonanza creek. The ore has been insured for $2,000; in it are specimens estimated to run at a rate of more than $10,000 to the ton. It is expected the returns from the shipment will be between $4,000 and $5,000. The company owns eight claims and shareholders in the company are chiefly Dawson men. Dr. D. D. Cairnes included in the information he prepared for the International Geological Congress excursionists, who visited the Yukon in September, the following brief notes: "On the Lone Star group several hundred feet of work has been done in open-cuts, trenches, shafts, and tunnels. A Joshua Hendy 4-stamp mill has been erected on the property, and a gravity tramway 3,500 ft. long has been constructed to convey the ore from the mine-workings to the mill on the creek 900 ft. below. In addition, a power line four miles long has been built to transmit current to the mill from the power line of the Northern Power and Light Co. on Bonanza creek. The total gold production from this property has so far been small; not nearly enough to pay for the development work. All the quartz properties in the district, however promising their character, have still to be considered as being in the uncertain prospect stage." (Note.—It must be remembered that Dr. Cairnes wrote some time ago, probably before the work of the 1913 season was done.)

**Shushanna.**—Mr. O. B. Dickeson, president of the White Pass and Yukon Route, which has a railway from Skagway to Whitehorse, 110 miles, and thence steamers for the season of navigation and stages for winter—461 miles to Dawson, on his return from the Yukon said: Our mining engineer this year examined the White River district, which we believe has a bright future. The gold strike in the Chisana country, just beyond the White River copper region, is bound to assist considerably in providing transportation business for a railway if we extend our system into the White River district. With reference to the Chisana district to date our company has refrained from saying anything regarding the value of the gold finds there, but the best evidence of what we think is, however, the fact that we have spent more than $150,000 in buying horses, supplies, etc., with the object of providing for the needs of that camp, and this will not come anywhere near supplying the requirements of those going into that country. We know for a certainty that in one place, 250 by 16 ft., $27,000 in gold was taken out in six weeks, and that is not the only place at which gold has been discovered, different discoveries being some distance apart. Practically all of the prospectors who went in by our route came out for supplies and are returning to the field, which is the best evidence of what they think of it. There are three distinct routes: First, the Whitehorse-Kluane trail, which is the shortest in point of distance from Seattle or Vancouver; second, the White River route, from the mouth of the White river to Donjek; third, the Coffee Creek trail. The two first-mentioned are stated by men who have gone in and out to be the best. Up the White river to Donjek will be the most economical and best summer route for many reasons. We sent a light-draft steamer two trips up White river and landed passengers and goods at Donjek, the nearest point of organized transportation to the diggings, about 80 miles. We have sufficient faith in the country to immediately extend our operations to take in passengers and supplies whenever the conditions warrant our doing so.

A suit in equity, filed in the Yukon Territorial Court by Henry Dubois and Hugh Brady, hotelkeepers, Dawson, against William James, discoverer of the new gold field named Shushanna, in Chisana River district, Alaska, M. Wales, who accompanied James, and William Johnson, for an injunction restraining the defendants from selling the Shushanna claims and disposing of the gold obtained therefrom, they having grubstaked James and Wales. The suit has been settled out of court. The claimants state that they are to receive a substantial interest in some of the claims staked by the defendants, who have bonded the Shushanna property to F. T. Hamshaw, of New York, it is said, for $500,000.

**Close of Navigation.**—Navigation on Yukon river was nearing its close for the season toward the middle of October. Ice had already formed in many places along the river prior to October 10, and some of the larger steamers were being prepared for their winter quarters. Mails will be taken to river points in launches until the freeze-up. Down the river the water in tributaries was so low that boats had difficulty in navigating them, consequently some of the camps nearly missed getting in their winter's supplies, but rain fell and relieved the situation.

### ALBERTA.

A discovery of placer gold on the Macleod river, west of Edmonton, has been reported by John Gentle, an old prospector, who showed some nuggets, one of which was stated to weigh a little more than two ounces. Several men, well-known in Edmonton, have been taken by Gentle to the scene of his discovery to stake claims. Meanwhile no confirmation of the report has been received.

Coal mining news items, from the District Ledger, Fernie, follow: The mines at Pocahontas, about 200 miles west of Edmonton, worked only part time lately; miners are quitting the camp owing to the dull times prevailing. Many students are attending Mr. Tom Stephenson's classes in mining, which are being held weekly at Bellevue, in the Blairmore-Frank district. Men responsible for guiding the destinies of the Western Coal and Coke Co. recently visited the company's Beaver mines, west of Pincher creek. They were led by Messrs. Chas. Fergie and J. M. Gordon, of Montreal. It is stated that operations on a large scale will be commenced next spring; meanwhile, No. 2 mine is to be worked as at present, producing 200 tons of coal a day, but in order to keep it working expenses are to be cut to a minimum for the time being. At Coalhurst, the mine is being worked steadily, with plenty of railway cars always on hand and plenty of labour power for production. The mine-rescue men are hard at work training—one team in the morning and one at night. Three times a week they tackle the smoke chamber, testing their own endurance and the abilities of their oxygen helmets. A big blaze at Galt No. 3 mine, Lethbridge, caused much excitement one evening lately, many thinking the tipple was on fire. Fortunately, it was found to be less serious—a stack of mine timber was burning, and the fire was at the end farthest away from the bankhead. Both No. 1 and No. 2 fire teams were quickly there, and they worked hard all night keeping water continuously playing on the burning and surrounding timbers. By daybreak all danger of the fire spreading was over, but all the following day men were working at the smouldering timber. It is estimated that ten carloads, about 30,000 props, were destroyed and that the loss is about $5,000.

Work has been commenced on the Keystone Cement Co.'s property just west of Frank. Men are busily employed clearing the ground and preparing for building.

In an address recently given before the local Chamber of Mines, at Vancouver, B.C., Mr. Chas. Camsell, of the Geological Survey of Canada, predicted a great future for the country from Athabasca, in Alberta, right through the Mackenzie river district to the Arctic ocean. Oil and tar exude from the ground in many places, and having in mind the present value of oil the country has great commercial possibilities.

In connection with the foregoing, attention is drawn to Memoir 29-E, "Oil and Gas Prospects of the Northwest Provinces of Canada," recently published by the Geological Survey of Canada.

There has been much excitement at Calgary, following the reported striking of oil in what is known as the Dingman well, in Okotoks district, south of and about 30 miles from, Calgary. Local newspapers state that Mr. A. W. Dingman, manager for the Calgary Petroleum Products Co., has admitted that the strike is of more importance than was at first given out, and that oil of good quality is present in commercial quantity. There are many applicants to the Dominion land office, Calgary, for leaseholds in the vicinity of the Dingman holdings. Several other wells are being drilled in the district.

## NOVA SCOTIA

### THE NOVA SCOTIA MINING SOCIETY.

The headquarters of the Nova Scotia Mining Society has been removed from Halifax to Sydney. Rooms have been rented in the centre of the business section of the town, and the library of the society will be suitably housed. The local secretary is Mr. E. C. Hanrahan. The editing of the transactions will be still in the hands of Mr. Harry Piers, the Provincial Librarian, and the society will continue to be represented in Halifax by Mr. Saunders. The removal of the society to Cape Breton is significant of the remarkable change in the industrial life of Nova Scotia that recent years have brought about. Coal is overwhelmingly the mineral staple of the province to-day. Gold mining has declined to small proportions, iron ore mining has entirely ceased; in fact, metal mining at the present time in Nova Scotia is negligible, and the mineral industry is confined almost altogether to non-metallic minerals, namely, coal, gypsum, and limestone, building stone and brick-clays. The great bulk of these minerals is being mined in Cape Breton Island. The percentage of coal mined in Cape Breton is steadily increasing, and it is, moreover, the only part of the province where larger coal outputs may be expected in the future than have been obtained in the past. It is, therefore, beyond question that the capital town of Cape Breton should be the headquarters of the long established Nova Scotia Mining Society, with its honourable traditions, which Sydney may be relied upon to preserve and possibly to add to, as its citizens, and the mining fraternity in particular, appreciate the compliment implied in the change.

**Need of Technical School.**—The next thing that Cape Breton needs is a technical school, properly housed and with adequate equipment, and there can be little doubt that this provision will soon be forthcoming. It would be difficult to find anywhere else a concentrated industry so large and important as the coal mines and steel works of Cape Breton with so little opportunity offered to the workers to improve their intellectual grasp and their technical knowledge. In making this statement there is no intention to disparage the present schools. On the contrary, indeed, for every praise is due to those who are now endeavouring to carry on the evening technical classes under difficult conditions and with miserably inadequate appliances. The amount of money sent out of Nova Scotia as payment for correspondence courses in technical subjects is very large, and there can be but little doubt that the money sent from Cape Breton during the past twenty years for correspondence tuition would have gone a long way towards providing proper facilities at home. It must, of course, be admitted that the industrial development of Cape Breton has been very rapid and it has been difficult to provide all the requirements of an urban industrial population as quickly as the need has become apparent. The great expansion of the steel-coal industry dates back but a little over ten years, and things have not always looked rosy during that time. The bustling town of New Waterford, the most recent addition to the incorporated towns of the Province, was but quiet farms and forest less than five years ago, although to-day the municipality contains four large collieries and has a population of approximately five thousand persons. From now on it is not likely that the increase in tonnages and population will be so spectacular, but it may be safely assumed that there will be no looking back and that the industries of Cape Breton have attained a permanence that justifies the ambitious and thoughtful portion of the community in looking forward to the provision of educational facilities similar to those already in existence in similar communities in other parts of the world. We can assure the members of the Royal Commission on Technical Education that there is no part of the Dominion where the governmental aid suggested by the Commission could be more usefully applied than in Cape Breton.

## BRITISH COLUMBIA

The approach of winter has been made evident by light falls of snow in some of the mining districts where the elevation is comparatively high. No interruption of operations has yet been reported, though, except that in placer-mining camps the season is near its close.

Lode mining is maintaining its customary rate of production, as a rule. The larger producers—Granby Consolidated, British Columbia Copper, Consolidated Mining and Smelting, Britannia, Hedley, and several companies mining silver-lead or lead ores—Standard, Sullivan, owners of the Bluebell, and others—are together keeping the ore-tonnage figures well up to the level of other years.

Some progress has been made toward increasing the production of coal from Vancouver Island mines, the Western Fuel Co. having made a beginning from its No. 1 mine at Nanaimo, while the Pacific Coast Coal Co. at its Fiddick colliery, and the Canadian Collieries at its Extension mines, are also working in the direction of resuming production to some extent. The Jingle Pot, near Nanaimo, and in very much larger degree the Canadian Collieries at the Cumberland mines, are working to practically full capacity.

### SLOCAN.

**Sandon.**—More ore has been found in the Slocan Star mine. About October 8 the crosscut which is No. 8 level from the main rise from the deep-level drift to the old workings, broke into ore, and where it entered the veins there was between two and three feet of clean shipping silver-lead ore. About two years ago the Slocan Star Mines, Ltd., was organized to acquire and operate the Slocan Star and Rabbit Paw groups of mineral claims which had been the subject of extra-lateral rights litigation between the Star Mining and Milling Co. and the Byron N. White Co. during a period of about ten years. The matters in dispute were finally determined by a judgment of the Supreme Court of Canada in 1909. Afterward a merger was arranged and the present operating company incorporated. Following the recommendations of Mr. A. G. Larson, of Vancouver, the new company drove a crosscut adit more than 2,000 to the Slocan Star vein, which was drifted on for some distance without any considerable quantity of shipping ore being met with. Eventually a raise was made to the old workings, No. 5 level, the lowest opened out to the surface by the old company, was 300 ft. vertically above the new low-level drift, and twice that distance on the average dip of the vein down to No. 5. The vein and ore-shoots, however, had been followed to a vertical depth of 132 ft. below No. 5. After making the necessary through connection, the work of driving a series of crosscuts from the raise to the ore-shoot, the direction of which had been ascertained, was undertaken. That first above mentioned is one of these, the ore-shoot having been reached previously at a level between the old workings and what is now No. 8. While no information has yet been received on this point, it is probable that No. 8 is about halfway between the old workings and the deep level below—say 300 ft. on the incline—deeper than No. 5. Whatever its precise depth, the fact remains that ore of shipping grade has been found at greater depth than the old workings, which is a decidedly important and encouraging development.

### BOUNDARY.

**Grand Forks.**—Granby Consolidated Co.'s report for September shows a total of 103,830 tons of ore treated at the company's smelting works here; of that quantity, 102,310 tons, was from the company's mines at Phoenix, and 1,520 tons custom ore. Blister copper shipments totalled 1,855,490 lbs., while the refined copper produced was 1,824,659 lbs.

**Greenwood.**—The Jewel-Denero Mines, Ltd., is employing 35 men; more will be put on as soon as accommodation for housing them shall be completed. The company's 15-stamp mill is being regularly operated, difficulties that occasioned frequent stoppages previously having been overcome by the present general manager, Mr. Chas. A. Banks. Finer grinding in a tube mill has admitted of a change from the earlier custom of shipping concentrate being abandoned and the gold being recovered in the mill.

### SIMILKAMEEN.

**Hedley.**—The Gazette included among its recent mining news of Camp Hedley some items of which the following is a summary:

Mr. C. H. Poirier, mining engineer, has been sent in to examine the Golden Zone mine. After looking over the ground he decided to have the workings pumped out so that he could make an examination underground. The mine is being unwatered for the purpose.

The Minister of Lands has given his decision in the Similkameen River water rights case in which the Hedley Gold Mining Co. had appealed for recognition of its claims. The company is given the lower record on the river under certain conditions and the holders of the prior right are to have for their intake and headworks a site higher up the river. Certain costs in connection with the survey of sites by the latter are to be borne by the company, which will then be free to proceed with its water power project should it accept the conditions imposed. More power is required by the company to allow of a proposed considerable enlargement of its stamp-milling operations being carried out.

The Hedley Gold Mining Co., in line with its past policy of paying its employees a higher rate of wages on a graduating scale when the price of copper goes up (as is done by some of the copper-producing companies operating in the province) notwithstanding that it does not benefit a cent from a higher price for copper, since it produces only gold, has notified its men that their pay has been increased 25 cents a day as from August 31. A number of men in the company's employ, apart from this general advance, for special capability in their work, are paid at a higher rate than the regular scale for similar work in other camps.

### YALE.

**Hope.**—Work has been suspended in the tunnel of the Aufeas mine pending the construction of an aerial tramway and ore bins. The mouth of the tunnel is on a steep hillside with no place there for storing ore. The face of the drift is in solid ore, so arrangements are being made to facilitate its transportation.

At the Araucumo, enough work having been done to show the existence of a good body of ore, a roadway is being cleared a distance of 3,000 ft. to the Cariboo wagon road.

Negotiations in connection with the project to install a stamp-mill on Hidden creek, delayed by the death of the late Mr. H. R. Bellamy, who previously had them in hand, have been resumed.

**Kamloops.**—More machinery is to be installed at the Iron Mask mine from which shipment of ore to the smelting works at Trail has been made lately. W. Clay has arrived from the Eastern United States to put in the additional plant which is expected to reach the mine shortly.

Prospects in the vicinity of Lake LeBois show promising looking deposits of ore containing lead carbonates. The ore has been exposed for more than 100 ft.

The erection of a small stamp mill has been completed up the North Thompson river, and preparations are being made to commence crushing a lot of ore from various claims in the vicinity.

Mr. W. M. Brewer has been looking over the Cotton Belt group of claims in Seymour Arm camp, to prepare a report on them for the Provincial Bureau of Mines.

### SKEENA.

**New Hazelton.**—Harris Bros. have completed the work of driving on the 100-ft. level of their American Boy silver-lead mine on Nine-Mile mountain. They are now preparing to sink their No. 3 shaft 100 ft. deeper.

Camp has been removed to below timber line on the Highland Boy group on Rocher Deboule mountain and preparations are being made for the winter's work, which is to include driving an adit about 1,000 ft. to crosscut four veins, one at a depth of 1,500 ft. below its outcrop.

Mr. R. P. Trimble, who recently purchased the Great Ohio group of eight claims on Rocher Deboule mountain, has let a contract for the erection of bunk and boarding houses, blacksmith shop, office, etc.; construction of a trail, and running a drift 300 ft. on No. 1 vein. The contractor has commenced the work.

At the Silver Standard, on Glen mountain, from which ten cars of silver-lead ore that averaged $106.42 a ton was shipped to Trail, the drive to the north of the 250-ft. level has entered what is believed to be the same shoot of ore as occurs on the 100-ft. level. Some extra good ore has been found in a drift on the upper vein. Nearly all the men are now employed in taking out ore, to have it in readiness for shipment as soon as the snow shall be deep enough to allow of its being taken to the railway.

### OMINECA.

**Hazelton.**—Manson is the centre of the Omineca River placer gold field. Official statistics for the current year are not yet available, but for 1912 they showed that 38 new placer leases had been taken up and many transfers of old leases made, the tendency being for consolidation of leases in financially strong hands, owing to the existing necessity for putting in heavy plant and machinery to work to advantage.

The Omineca Gold Mines has completed its 1913 season's work and the superintendent, Mr. R. D. Featherstonhaugh, has left Quartz creek for Vancouver. Mr. F. E. Groffman, also with this company, when on his way to Hazelton lately met on the trail 120 pack animals, most of which were carrying supplies for companies operating at Manson or on Omineca river. Prospecting work during the season just closed has generally resulted satisfactorily.

### GENERAL NOTES.

A ditch line has been surveyed for the Summit Creek Hydraulic Mining Co., Ltd., in Cariboo mining division. The company intends shortly to commence construction of the ditch, so as to be in shape for gravel-washing operations in the first part of next season.

A miner who in July, 1912, was so injured that as a result he has since suffered from partial paralysis of the lower limbs, has succeeded in obtaining a Supreme Court judgment for $5,000 against the Little Billy Mining Co., which has been operating the Little Billy mine near Van Anda, Texada island.

The British Columbia Copper Co. is continuing the development of the Eureka, situated within a dozen miles of Nelson. Recently there was developed ore of higher grade than any previously mined; beside its copper content silver shows freely in it. The company is also working the Queen Victoria copper mine, situated about eight miles below Nelson and on the opposite side of Kootenay river.

## COBALT, GOWGANDA, ELK LAKE AND SOUTH LORRAIN

**Millerett**—Surface development on the Millerett, which is now the property of the Miller Lake-O'Brien at Gowganda, is most encouraging. Trenching under the direction of an old prospector this summer has revealed the presence of a series of veins and cross veins on the Millerett, close to the contact between the Keewatin formation and the diabase, although entirely in the diabase. Silver is found in the smaltite veins, and as leaf in the wall rock over an area of several feet. The ore on the surface is patchy, sometimes two to three inches wide, sometimes a mere crack with cobalt bloom; but in comparison with the surface showing made by the system of veins being worked on the Millerett now, they are rich. Several promising leads have also been found on the Miller Lake-O'Brien. It is a matter of interest if not of economic importance to note that very high gold assays have been made from the ore taken from these new finds. Ore which showed little or no free gold ran as high as 37 ounces to the ton. To develop these new ore bodies a shaft will be sunk and vigorous development commenced at once. In view of local conditions the management attach great importance to the new discoveries.

**Miller Lake-O'Brien.**—Underground on the Miller Lake-O'Brien a 90-foot ore shoot has been developed on one of the cross veins at the 300-foot level. This is all high grade ore. Last month (September) the Miller Lake-O'Brien made a record production with a total of 70,000 ounces. August was almost as good with 65,000 ounces, and it can be said that the property owned by Mr. M. J. O'Brien has never been in better shape. There have been six cars shipped this year averaging about 40,000 ounces a car. Nothing but high grade ore and concentrates is shipped. The Millerett mill has been treating about 30 tons a day since it was taken over, the rock being transported from the shaft at the Miller Lake-O'Brien to the mill in an auto truck. Owing to the high cost of fuel the mill has been shut down until the hydro-electric plant which the company is building is ready. When it is operated again the ore will be taken over on a tramway which is now being built.

**New Power Plant.**—To continue to operate the Miller Lake-O'Brien had to find some solution of the power question. Wood has now to be transported a distance of three miles, and it cost the company a minimum of four dollars a cord. Encouraged to look for a long life by reason of the new discoveries and the improvement underground the company is now expending a considerable sum of money in installing a power plant between Gowganda and Burt lakes. The first unit of the plant will give the company 300 horse power. Two sets of water wheels will be installed and one generator and a pole line two and a half miles long built to the mine. It is estimated that the power will constitute a saving over wood fuel of from $15,000 to $20,000 a year.

**The Mann** on the west ridge at Gowganda, is meeting with considerable success in its development of the Boyd-Gordon which was purchased some time ago. The ninety foot shoot of high grade ore being developed on the 120-foot level is largely in Boyd-Gordon territory. The Mann has a carload of very rich ore on hand but it is not likely that it will be shipped until January when the winter roads will make transportation easier and more inexpensive. On two veins an aggregate of about 130 feet of good ore has been developed at the 120-foot level. During the year the Mann has been examined by several English syndicates and it was under option for some time. It has not yet changed hands.

General conditions in Gowganda have not much improved. The lack of money for speculative purposes has hindered development in the Montreal River district probably more than anywhere else. While camps with fair prospects can be reached by rail in Northern Ontario, syndicates fight shy of investing in a section where transportation expenses are necessarily higher.

The Gowganda road is much better than it has been previously, but it is still a day's journey from Elk lake in the summer months, and the freighting of supplies is an expensive matter. The government has done a little work on the road this summer in improving bad places and the Miller Lake-O'Brien is doing much to make the stretch of road between the mine and Gowganda quite good. But there is a great deal of work to be done on the road yet before it can be said that it is not the worst in Northern Ontario between two such important points as Elk Lake and Gowganda.

**Beaver.**—It is probable that the Beaver Consolidated will resume dividends before the end of the year. The directorate has decided that the shaft shall be put down with all expedition to the 1,000-ft. level. A level has already been established at the 800-ft. level, but the vein has not yet been cut. Another level will soon be opened up at the 900-ft. On the 460-ft. level some new ore has been found in the wall of the main drift and a new vein has been found at the 700-ft. level.

**Nipissing.**—During the month of September the Nipissing Mining Company mined ore of an estimated net value of $191,753, and shipped bullion from company and customs ore of an estimated net value of $442,588. The ore produced was all from the mine's own workings, but a good deal of bullion was produced from customs ore. The high grade mill treated 156 tons, and shipped 728,204 ounces. The low grade mill treated 6,879 tons.

The most significant development during the month was the announcement as to the policy to be pursued at shaft 64. Cross-cutting at the 650-foot level the main vein was found to be six inches wide, but assaying low in silver. It has been decided to continue the exploratory work in the Keewatin formation, and the main shaft will be sunk to the 900-foot level, and the vein sought at that depth. This is the most important development work the Nipissing has undertaken, and it will go far to solve the question of whether the Keewatin under the Cobalt conglomerate is of any value as an ore-bearing formation.

**McKinley-Darragh-Savage**—The production of the McKinley-Darragh-Savage mines for the month of September was 242,266 ounces, an increase of 30,000 ounces over the production of the preceding month and the highest for the year. The rich ore shoot developed on the 150-ft. level of No. 40 vein is responsible for the higher production, as this ore body gave alone 100,000 of the month's total. The McKinley-Darragh contributed 192,706 and the Savage 49,560 ounces. Of the total from the McKinley no less than 73,000 ounces was of high grade ore sorted and bagged underground.

**Casey-Cobalt**—The new line from the Northern Ontario Light and Power to the Casey-Cobalt has been completed and the mill is now dropping thirty stamps. This gives a capacity of 90 tons daily. The mill had previously but ten stamps, so that the production from the mine will take a considerable jump.

**Trethewey.**—The estimated production of the Trethewey Silver Cobalt mine for the month of September was 56,400 ounces of silver, as compared with 55,000 ounces for the preceding month. During the last two months the Trethewey has been in better shape than for some time previously. In September the mill treated 2,900 tons of ore with the heads running 24 ounces to the ton. The extraction was 82 per cent. as compared with 80 per cent.

**Wettlaufer.**—Owing to the fact that there has been a cave-in of rock at the lower levels of the Wettlaufer mine, the property will be abandoned earlier than was at first anticipated. The South Lorrain property is practically closed down now.

**Water Power.**—Owing to the low water level attained on the Montreal River consequent on the dryness of the summer and fall and the great increase in the demand for power there has been a shortage of power for the mills. Before the rains came in the past two or three days all the eighteen mills of the camp have had to close down in rotation for 24 hours, and there will consequently be a reduction in output of considerable dimensions. It is hoped that the rains will put an end to the shortage. The two plants of the Northern Canada Power Company have a capacity of 12,000 horsepower, but they are overloaded. When the power plant at Fountain Falls is completed it will give an additional 4,000 horsepower, but no service is expected from this quarter this year.

**Difficulty in Selling Ore.**—There is still a very considerable difficulty experienced in selling ore, but competition has been invited from outside and firms not previously interested will probably be customers of the Cobalt mines. It is also hoped to enter the European market.

**Express rates** on silver bullion from Cobalt to England which were raised from $4.50 per hundred pounds to $7.00, have been reduced to $6.00. The Nipissing is shipping to New York, but the remainder of the companies still seek the London market.

**Hollinger.**—Mr. P. A. Robbins, the general manager of the Hollinger gold mines, announces that the gross profits for the four weeks ending Oct. 8th amounted to $145,866, the mill ran 94 per cent. of the possible running time, treating a total of 12,264 tons, of which 311 tons were treated for the Acme Gold Mines, Limited. The average value of the ore treated was $17.80, the approximate extraction 96.40 per cent., and the milling cost $1.376. Mr. Robbins points out that the working cost at $5.18 per ton, is the lowest point yet reached. Development work upon the main vein upon the lowest level is demonstrating that values are about the same as upon the upper levels. Practically one-half the ore milled came from development. In cross-cutting upon the 100-foot level an ore body was found with the same characteristics and high value as No. 1 vein. On the 300-foot level an extension of No. 8 vein has been picked up.

## PORCUPINE, SWASTIKA AND KIRKLAND LAKE

**The Dome Mines, Limited,** has adopted a policy of publishing monthly production records. For September the record reads tonnage milled 10,790, value of gold produced $70,135, mill running time percentage of total monthly hours, 95 per cent. These figures compare with those given out earlier as follows:

| | Tons Milled. | Value. |
|---|---|---|
| April | 9,863 | $129,333 |
| May | 10,852 | 148,499 |
| June | 11,300 | 98,215 |
| July | 11,150 | 75,958 |
| August | 12,720 | 67,660 |
| September | 10,790 | 70,135 |
| | 64,675 | $529,802 |

**Three Nations.**—One hundred and fifty shareholders of the Three Nations Mining Company visited the property at Porcupine this month in a special train. The new ten stamp mill which has been in operation for the past four weeks was visited and while there the first run was made. The entire party was taken underground and shown the veins at the 100 and 200-foot levels.

## THE CALGARY OIL STRIKE.

After a meeting of the Board of Trade and city officials recently, when the matter of the exploitation of the recent oil discoveries was discussed, the following warning was issued to the press and the public:

"To whom it may concern: Attention having been directed from many parts of the world to the reported discovery of crude petroleum in the vicinity of Calgary, it seems expedient that some announcement should be made on the subject with the purpose of preventing false or harmful statement or statements being circulated with respect to the result of the oil-boring operations in this territory.

"After several months of boring, crude petroleum of a limited quantity was struck on October 7, at a depth of 1,562 feet, in the boring upon the property of the Calgary Petroleum Products Company, Limited, located in Section 6, Township 20, Range 2, west of the fifth meridian.

"It is impossible to state whether the oil found merely came from a seepage or indicates the existence of a larger deposit at a greater or lesser distance of depth. Meanwhile boring continues, with some promise of ultimate success, but until oil has been struck in volume, the public is warned against placing too great confidence in circulated reports, and particularly urged to exercise care in investments in oil leases, or in the stocks of companies or syndicates which have been or may be formed for oil exploitations."

The warning was signed by Mayor Sinnott for the city and J. A. Campbell for the Board of Trade.

## PROBLEMS OF OUR STEEL INDUSTRY.

Mr. J. H. Plummer, president of the Dominion Steel Corporation, is due to arrive in London, England, this week-end. When he visited Montreal last week en route to New York, it was not generally known that he had begun his mission which will have direct bearing on the new financing arrangements on which it is believed that the Dominion Steel Corporation must now embark.

It is understood that the corporation will make a satisfactory showing for its quarterly statement to September, the definite figures of which will scarcely be available to the shareholders and the "Street" for a couple of weeks. Mr. Plummer, however, from his close association with the plant's operations during the past four or five months is in intimate touch with conditions and will be able to present his showing where required in the London market.

The "Street" has been more or less favourably impressed by estimates of what the corporation was likely to show in its quarterly report. While the president rarely makes any "estimates" for the public, there is at least the statement of one of the Steel directors, Sir Henry Pellatt, of Toronto, who recently expressed the opinion that the 1913 earnings would be $1,000,000 higher than last year. "The company was never in such shape as it is today," was his statement.

Realization, however, that the corporation has still a number of problems to face, among them being this matter of new financing to liquidate heavy bank loans, gives rise to confusion of sentiment on the "Street." The corporation's bank loans are estimated at from $3,000,000 to $4,000,000.

In the early part of September it will be recalled that innumerable bear rumours were circulated. The favourite bear report to go out is the possibility of the common dividend being discontinued with each quarter. The directors, however, soon put at rest all fears of the October dividend and they had scarcely more than done so when it was hinted that the January dividend would be passed. That, of course, still remains for the future to determine. But those who know the president know that one of his chiefest concerns is to maintain the dividend policy once established. He will do his utmost within reason, though it is quite possible that unforeseen circumstances may upset his calculations.

Mr. Huntly Drummond who returned this week from an extended stay in London points out that while the demand for English money is greater than the supply at the present moment, those in immediate need can secure capital if they are in a position to pay the price.

Just as expressed by Mr. Drummond, there does not seem to be any doubt in the minds of men in close touch with the financial situation that Mr. Plummer will undoubtedly have to pay well for what borrowing he is able to effect. It is obviously premature to venture an opinion as to the nature the new financing arrangement will take. A new issue of preference stock seems likely.

Mr. Plummer has spent almost his entire summer at the Sydney plant, in constant attendance, watching the working out of the plant under the new extensions which have only been in operation since June 1. He is confident that it will in the ultimate do what is promised of it.

Last year, with net earnings of $4,714,057, the corporation only earned at the rate of 4.30 per cent. on the common stock outstanding, a mere fraction of a margin over the quarterly dividend, as critics were quick to point out. If the corporation can earn this year an additional $1,000,000, as Sir Henry Pellatt has predicted, the financial position would be very substantially altered.

However, the corporation is face to face with the recent reductions in the price of steel products in foreign markets. It is admitted that this may mean a little hardship for a time—and it would seem that the present moment was particularly unfortunate—but Mr. William McMaster, vice-president of the corporation, in an interview, expressed the opinion this week that the situation need not be looked upon with undue concern.

Mr. McMaster does not think that these reductions will have a permanent effect on the steel industry of Canada. It was brought about by a dullness which had come over the market, as an effect of the world wide monetary stringency of the past few months.

"I have known half a dozen such periods," he said, "when steel prices were down to the low level. But every time they have come back equally strong."—Financial Times.

## THE NANAIMO STRIKE.

Judge Howey passed sentence recently on more than two score Nanaimo rioters. The maximum sentence was two years. Many union officers will spend the next year in jail.

Three men and two boys were sentenced to serve two years in the penitentiary, twenty-three were given imprisonment for one year and fined $100 each, and eleven were sent to jail for three months and will have to pay a fine of $50 each. All sentences date from the time of arrest. This means that those sentenced to serve three months will be liberated in about thirty days' time.

Those sentenced to serve two years are: J. J. Taylor, Vice-President of the British Columbia Federation of Labour and Vice-President of the Ladysmith local of the Union Mine Workers of America; Samuel Guthrie, President of the Ladysmith Union; Paul Heaconink, a leader, and two boys, John Morgan, son of a prominent mine foreman, who was also given a jail term, and William Simpson, jr., son of a mine contractor.

Taylor and Guthrie pleaded guilty to having taken part in the disturbances, and gave as their excuse that they headed processions of the union miners which led to disturbing the peace.

### One Year Sentences.

A sentence of one year in jail and $100 fine was imposed upon John Allsopp, J. H. Armstrong, Carl Axelson, E. F. Saugman, William Baul, George Baul, George Baumgartner, Sam Brightman, James Colley, Robert Castar, Peter Kluska, H. H. Langdon, Duncan Mackenzie (Secretary of the Ladysmith Union), Joseph Mairs, jr., James Marshall, Charles Mortimer, Steve Merue, Steve Puyanich, George Porter, William Stackhouse (formerly a lieutenant in the United States army, and a prominent business man of Ladysmith); Martin Stogar, James Wallace, Robert Walkinshaw, and Charles Yogle.

Baul served last year on the Ladysmith City Council, and has for years been closely identified with public movements. He declared in his defence that he had not been out of the house at the time he was accused of taking part in the disturbances.

In connection with those sentenced for participating in the riot, George Pettibrew, International Board member and Organizer of the United Mine Workers, and Walter Nelson, a miner, on a charge of intimidating John Weeks, a mine boss, were found guilty and sentenced to two months in jail.

### To Call Strike Off.

In connection with the coal miners' strike on Vancouver island, it was reported recently that the international headquarters of the Miners' Union have ordered Frank K. Farringdon, an American lawyer unionist, who came to British Columbia and handled the official end of the strike, to stop the strike and have the men return to work. It is said Farringdon tried to stop it, but has failed.—The Globe.

---

The Granby Consolidated Mining, Smelting & Power Co., Ltd., is putting in a new water supply system for its copper smelting works near Grand Forks, Boundary district. A reservoir has been constructed at a higher level than that of the works and connection made by pipe-line with a small lake in the mountains, distant a mile and a half from the smeltery. The supply of water will be practically unlimited and the pressure will be ample for all purposes.

# STATISTICS AND RETURNS

### DOMINION COAL OUTPUTS.

The Dominion Coal Company's production is maintaining a steady advance over last year's figures, although the capacity of the mines is greater than the outputs actually produced, which are being limited by an insufficient labour supply. In September the production was 407,532 tons, comparing with 380,084 tons in September, 1912. The output for the first nine months of the year totalled 3,527,707 tons against 3,321,362 tons in the same period of 1912, showing an advance of over 200,000 tons to the end of the third quarter. The production for October to the fifteenth of the month was 217,000 tons, and for the month the outputs will probably total 435,000 tons, or 10,000 tons greater than the record of 425,000 tons achieved in July last.

From present indications it is probable that the production for 1913 will reach 4,750,000 tons. The steady increase in the tonnage obtained from the Glace Bay collieries may be seen from the following tabulation.

| Year. | Production in tons. | No. mines on full production |
|---|---|---|
| 1908 | 3,555,068 | 10 |
| 1909 | 2,734,774 (strike) | 11 |
| 1910 | 3,526,754 | 12 |
| 1911 | 3,984,749 | 13 |
| 1912 | 4,513,269 | 15 |
| 1913 | 4,750,000 (Est.) | 18 |

The workings of No. 17 colliery are practically unwatered, but it is not probable that any large amount of coal will be mined in 1913. By next spring, however, the colliery should rank as an important producer. The railway branch to this mine is approaching completion, and fifty miners' houses are about ready for occupation.

No. 11 colliery, which was unwatered only this year, is now producing between 7,000 and 8,000 tons monthly, and will continue to rapidly increase in output.

No. 22 colliery has now an electrically driven air-compressor and is equipped with mining machines. The output, which is at present running around 6,000 tons per month, will rapidly increase, and by next spring this colliery should be producing between 12,000 and 15,000 tons monthly.

### NINE MONTHS' DIVIDENDS.*

In no other nine months' period in the history of American mining and metallurgy have mines and works shown as large dividend disbursements as those in the period just ended. And this too, despite the general belief that the present year has not been a profitable one as relating to mining. When 146 companies, looking to the operations of mines for their profits, can pay in nine months, $78,772,652, it would seem that there has been little reason for the pessimism prevailing. Compared with the same period in 1912 there is shown an increase in the amount of dividends paid of $12,972,109, and with 1911 an increase of $17,993,232. In the 1913 period 146 companies participated, while in 1912 there was 138, and in 1911, 123. In total dividends paid the 146 companies paying dividends in 1913 have to their credit disbursements amounting to no less than $896,232,195.

The copper properties, 34 in number, have had a particularly satisfactory nine months' period, despite the strike in the Lake Superior region, for dividends were paid totalling $38,270,115. This shows an increase over the same period in 1912 of $9,449,687. Since incorporation these companies have divided among shareholders $420,434,064.

The properties classed as gold-silver-lead-zinc producers, too, have had a fairly prosperous nine months' period, for 106 of these yielded profits sufficient to pay to shareholders $28,406,999. To date these companies have paid dividends totalling $333,097,467.

Six metallurgical companies disbursed during the period $12,095,538 and 10 securities-holding corporations $18,707,042.

The accompanying table gives the amount of dividends paid by Canadian companies during September, the date of payment and the amount per share.

| September Dividends. | Sept. | Amount per share. | Total |
|---|---|---|---|
| Crown Reserve, Ont. | 15 | .02 | 39,999 |
| Granby, B. C. | 2 | 1.50 | 224,977 |
| Hedley, B. C. | 30 | .50 | 60,000 |
| Hollinger, Ont. | 2 | .15 | 90,000 |
| Hollinger, Ont. | 30 | .15 | 90,000 |
| International Nickel, com. | 2 | 2.50 | 195,000 |
| Kerr Lake, Ont. | 16 | .25 | 150,000 |
| Timiskaming & Hudson Bay | 22 | 3.00 | 23,283 |
| Yukon Gold | 30 | .07½ | 262,500 |

### COBALT SHIPMENTS.

The ore shipments for the week ending Oct. 18, were:

| | High | Low. | Total |
|---|---|---|---|
| Nipissing | 0 | 2 | 131,610 |
| McKinley | 1 | 0 | 65,900 |

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

## DESIGN OF MINE STRUCTURES

By MILOS. KETCHUM, CE., Dean of College of Engineering, University of Colorado.

460 *pp.*, 265 *illus.*, $4.00 (17*s*) *net, postpaid.*

Dean Ketchum's books have been in wide demand. They have met the needs of practical engineers not only because of their clear treatment of theory and for the real designs, but because of the data and details of construction, costs, etc.

This new volume covers the design of head frames, coal tipples, coal washers, coal breakers, concentrators, mine buildings, bins, retaining walls, trestles and other mine structures made of steel, timber and reinforced concrete.

### WALLS, BINS, AND GRAIN ELEVATORS

*Second Edition—fully revised,* 556 *pp.*, $4.00 (17*s*) *net. postpaid.*

This standard work has in its new edition complete, modern material on design and construction. It has entirely fresh material on "Reinforced Concrete" and "Methods of Construction and Cost of Retaining Walls."

### DESIGN OF STEEL MILL BRIDGES

464 *pp.*, $4.00 (17*s*) *net, postpaid.*

### DESIGN OF HIGHWAY BUILDINGS

550 *pp.*, $4.00 (17*s*) *net, postpaid.*

# Westinghouse Motors for Mine Ventilating Fans

# *Hofman* GENERAL METALLURGY

By H. O. HOFMAN, E.M., Met. E., Ph. D. Professor of Metallurgy, Massachusetts Institute of Technology. Author of "Metallurgy of Lead." 909 *pages,* 6 x 9, 836 *illustrations.* $6.00 (25s) *net postpaid.*

*Published Aug. 1913*

Metallurgical literature contains many treatises and monographs dealing with the metals proper and parts of metallurgical activity, but, heretofore, not a single work upon general metallurgy which meets present requirements.

Prof. Hofman aims here to cover the field of General Metallurgy as a whole.

He combines the good of older endeavor with the best results of modern research.

He treats the whole from the point of view of the metallurgist who has a leaning toward physical chemistry.

He devotes special care and much space to **Mechanical Processes.**

He has been aided by specialists in the departments of the work in which he felt that his experience had been too limited.

The main divisions of the work are:

**I. Introduction.**
**II. Properties of Metals.**
**III. Alloys.**
**IV. Metallic Compounds.**
**V. Ores.**
**VI. Fuel.**
**VII. Refractory Materials.**
**VIII. Pyrometallurgical Processes and Apparatus.**
**IX. Hydrometallurgical Processes and Apparatus.**
**X. Electrometallurgical Processes and Apparatus.**
**XI.** Mechanical Metallurgical **Operations.**
A. Ores; B. Betal Alloys; C. Liquids; D. Gases; Air Supply, Preheating and Drying of Air, Purification of Gases.
**XII. Metallurgical Products.**
**XIII. Economic Considerations.**

# Jeffrey Ball Bearing Motors

*Used on all Jeffrey STANDARD Mine Locomotives and Coal Cutters*

*Points of Vantage Over Other Motors for Mine Service:*

Motor has a uniform air gap, consequently more uniform commutation.

The armature is never down on the pole pieces, therefore:

- The armature bands and armature coils are never injured.
- Excessive lubrication is unknown, thereby eliminating the disintegration of commutator insulation common to the use of bushed bearing motors.
- Brushes have minimum movement in the brush holders, consequently longer life.
- The commutator runs truer and takes a better polish.

*Write for Jeffrey Ball Bearing Motor Bulletin No. 19-A, as well as our New Mine Catalog No. 117, illustrating and describing our STANDARD Locomotive Equipments.*

CONTENTS.

## MINING IN ONTARIO

Ontario is an important producer of minerals. The silver mines at Cobalt, the nickel-copper mines at Sudbury, the gold mines at Porcupine and many other mines and quarries throughout the province are pouring out a steady stream of wealth.

The industry is flourishing and the producing mines are making good records at a time when money is at a premium. The present condition of the money market is of course affecting exploration work; but the mining industry is making an excellent showing as a producer of wealth, while many other industries are in very unsatisfactory condition.

In our issue of December 1 will be found much interesting information on mining in Ontario. Official statements of production of the numerous metals and non-metals, statements of dividends paid by the several mining companies and descriptions of visits to some of the mining districts will be given. Numerous photographs will be used in illustrating the articles.

## ONTARIO BUREAU OF MINES REPORT FOR 1912

Part one of the twenty-second annual report of the Ontario Bureau of Mines has just been issued. This volume contains the Statistical Review of mining in the Province for the year 1912, which has been prepared by the Deputy Minister of Mines, Mr. Thos. W. Gibson.

Mr. E. T. Corkill, formerly chief inspector of mines for Ontario, reports on Mining Accidents in the province in 1912, and on work done during the year at the various mines.

Prof. A. P. Coleman contributes reports on the Whiskey Lake Area north of Lake Huron, the Massey Copper Mine Area, and on Glacial Phenomena of Toronto and Vicinity.

Mr. J. B. Tyrrell reports on the Hudson Bay Exploring Expedition, which was undertaken for the purpose of selecting lands, waterfront and easements to which the Province of Ontario is entitled under an agreement with the Province of Manitoba. Mr. Tyrrell's return trip was made through the District of Patricia, that part of the District of Keewatin which has been recently added to the Province of Ontario.

Mr. Arthur L. Parsons reports on geological work done in the vicinity of the Lake of the Woods.

Mr. Robert B. Stewart reports on the West Shining Tree Gold Area.

The report of Mr. Stewart appears elsewhere in this issue.

Mr. Frank B. Taylor describes moraines north of Toronto.

In our next issue, which will be a special issue devoted to mining in Ontario, we will publish extracts from several of the other reports.

## WEST SHINING TREE

During the past few years a number of gold-bearing quartz veins have been discovered in the vicinity of West Shining Tree Lake, north of Sudbury. Several parties have done some development work on the claims staked; but there has been little yet done on most of the claims. It is known that there are a number of gold-bearing veins in the area, and the district seems worthy of more attention than it has received.

In 1912, Mr. Robert B. Stewart examined the deposits for the Ontario Bureau of Mines. His report has just been published, and is reprinted in this issue of the Journal. It will be seen from Mr. Stewart's descriptions that coarse gold can be seen in several places in fractured quartz and that fine gold, as determined by assays, is present in a large number of veins. Many of the rich shoots are narrow and not deep, and so far no large body of high grade ore has been developed. Exceedingly rich specimens have been taken from several veins; but they must be regarded as specimens rather than as samples.

Enough has been proven, however, to show that some of the properties are well worthy of systematic exploration.

## PRESENTATION TO DR. W. G. MILLER

On Saturday evening, November 1, a number of mining men met in Toronto at a banquet in honor of Dr. Miller, Provincial Geologist of Ontario.

Some time ago Dr. Miller was asked that the mining men be allowed to present him with a portrait to be painted by Mr. J. W. L. Forster. A committee composed of Messrs. D. A. Dunlap, R. H. Flaherty, H. E. T. Haultain, G. G. S. Lindsey, J. C. Murray, W. E. Segsworth and C. E. Smith called on mining men for subscriptions and made arrangements for the presentation.

The dinner was followed by a number of speeches, the tenor of which was the same—all the speakers showing that both for his services to the mining industry and on account of his splendid qualities as a man among men, Dr. Miller has won the admiration of those who know him and his work.

## THE CALGARY OIL STRIKE

From the article in our last issue, furnished by the Director of the Geological Survey, concerning the recent discovery of oil near Calgary, Alberta, it is evident that while the prospects are distinctly encouraging there is no justification for wild excitement or high prices for oil leases, for nothing is as yet proven. The existence of a commercial oil pool has to be established and something demonstrated as to its shape, extent and depth from the surface before the lands in this vicinity will have much real value as oil lands. What is certain at the moment is that there is a good prospect and that prospecting will cost a lot of money.

On the present showing, intelligently-directed capital will be willing to thoroughly test the prospects, provided it does not have to pay too dearly for the privilege of risking a heavy expenditure. The discovery of a commercial oil field would create business and industry in this section as nothing else could, so that everyone in the west is directly interested in having the oil prospects properly tested, and it would be a calamity if those who would be willing to spend their money in thoroughly and scientifically determining the possibilities of this district were prevented by the designs of mere speculators and, as a result, this opportunity should be lost.

## THE CHISANA (SHUSHANNA) GOLD DISCOVERIES

Canadians, and particularly those interested in the Yukon, were pleased to learn this summer that rich placer gold had been found in the Chisana district, Alaska, a few miles from the Alaska-Yukon boundary.

The section of the Yukon territory immediately adjoining is one which the Geological Survey of Canada considered to be of exceptional promise, and for some years it has had the investigation of the region in contemplation. Circumstances prevented this until the present year when the Canadian Geological Survey despatched two parties into the district, a topographical party under Mr. W. E. Lawson and a geological party under Dr. D. D. Cairnes. These parties were at work in the district when the stampede to the Alaskan placer field commenced, and to correlate the geology of the Chisana with that on the Yukon side of the line, and also to determine whether the gold-bearing gravels are likely to extend into Canadian territory, Dr. Cairnes visited the discoveries in August.

Dr. Cairnes states that rich gold-bearing gravels have been found in an area not exceeding ten or twelve miles in extent. He regards the conditions favourable for the occurrence of similar deposits some distance eastward in Canadian territory.

The original discovery in Chisana district, generally known as the James discovery, is located 30 miles west of the international boundary line, at about latitude 62° 10′ N. and longitude 141° 55′ W. The gold-bearing belt lies along the southern edge of the Nutzotin mountains, and within 25 miles of the northern slopes of the snow and ice-capped Wrangell mountains which include several peaks exceeding 12,000 feet above sea-level, the highest of which—Mount Sanford—rises to a height of 16,200 feet above the sea. The Chisana gold deposits, situated as they are near the headwaters of the White and Tanana rivers, are in a district which is very difficult to reach and may be considered one of the least accessible portions of Alaska.

Five main routes to Chisana are available, two of which may be considered as Alaskan, and the remaining three as Yukon routes. The two Alaskan routes are respectively by way of the Copper River and Northwestern Railway, and the Tanana river.

All three of the Canadian routes proceed from tidewater at Skagway, over the White Pass and Yukon Railway to Whitehorse, a distance of 110 miles. From Whitehorse, the routes diverge and may be named the Kluane, Coffee Creek, and White River routes, respectively.

# WILLET G. MILLER

Provincial Geologist, Ontario.

By H. Mortimer-Lamb.

Were I invited to name a man to worthily exemplify a Canadian of the highest type, I should have no hesitation in indicating the Provincial Geologist of Ontario. In point of lineage, Dr. Willet G. Miller is a more representative Canadian than many of us, for both his father and his father's father were native born; and relatively few in this Dominion can lay claim to this distinctiveness. In him too the influences of descent and environment are markedly manifested, for one instinctively associates Miller with Canada. He is not only essentially a product of the country, but he typifies it. He is a big man physically and intellectually; and his heart, though he carefully guards the secret, is as big as his body. His manner is reserved and even shy, and he is a thinker rather than a talker; yet when occasion demands he can speak with fluency and to the point. He has a well-developed sense of humour, and there are not many better judges of human nature. His sterling uprightness of character, his absolute integrity, his generosity and his disregard for money, are among the qualities that have won him respect and esteem. Few men have fewer enemies; few can boast a greater number of loyal friends. It is impossible to know him or to work with or for him, without giving him one's regard. He is a man who inspires confidence and affection. His scholastic career at the University of Toronto, and at the Universities of Chicago, Harvard and Heidelburg, was distinguished and brilliant. Later as a professor of geology in Queen's University he demonstrated for nearly ten years, his ability as a teacher; and he was beloved by his students. Between the years 1897 and 1901, he was in charge of field work in Eastern Ontario for the Provincial Government, and his report on the corundum occurrences led to the development of the area and the establishment of the industry. In 1902, resigning his professional duties, he accepted the office of Provincial Geologist and Inspector of Mines. It was work for which he was peculiarly adapted both by natural inclination and training. He had specialized in economic geology, and his whole energy was directed to turning his knowledge to account in the interests of the mining industry. What he has accomplished is on record. The achievement is a notable one. Incidentally it may be mentioned that in 1902 the value of the mineral industry of Ontario was $13,391,634 (in 1912 it was $53,127,489. At least some of the credit for this prodigious progress redounds to the Provincial Geologist.

Dr. Miller was the first to recognize the importance of the silver discoveries in Cobalt. It was by following his advice that more than one man became a millionaire. Dr. Miller might also have become rich. He received numerous tempting offers to resign his post and accept in exchange interests in properties and handsome retaining fees from mine owners who competed for his services; but it was all to no purpose. He is indifferent to money making; his heart is in his work. His classification, by-the-way, made in 1904, of the Cobalt rocks stands to-day with but minor modifications. From the first he expressed a preference for veins in the conglomerate as distinguished from those in the Keewatin and diabase as sources of silver production, and expressed the opinion that in passing from the conglomerate to the Keewatin the silver values would tend to diminish. These views have since been substantiated. His maps of the area, in the compilation of which, however, his assistant, Mr. Knight, materially helped, have proved of the greatest value in the development of the district. In 1908 he was elected President of the Canadian Mining Institute, an office he held for two years. These were the two most active years in the Institute's history. He was the ideal president—tactful, resourceful, progressive, energetic. Other honours have been showered on him. He was made an honorary member of the Institute of Mining and Metallurgy, a Doctor of Laws of Queen's University, a Fellow of the Royal Society of Canada, and still more recently an LL.D. of the University of Toronto. The mining men of Canada have subscribed that his portrait may be painted and hung permanently in the halls of the Legislature Building of Ontario.

But these things count for relatively little. Honours as great have been bestowed on smaller men. The reward of such as Dr. Miller is the consciousness of work well done and of friendships well earned.

Since writing these few lines of appreciative testimony, I have received a letter from one high in authority who has been associated officially with Dr. Miller for many years. I quote a paragraph from this letter as an appropriate corollary. My correspondent writes: "In describing Professor Miller's work I would say generally that his mind is conservative in its tendencies and he is not inclined to be sanguine or optimistic, but in interpreting the difficult and confusing pre-Cambrian geology of Ontario, in working out the relationships of ore deposits to the enclosing rocks, and in deductions from field and petrographic evidence, no more brilliant record has been achieved by any geologist in America. Mining men in Ontario have come to regard Miller as practically an oracle on Ontario geology, and his opinion once expressed is regarded as second to none in authority.

# WEST SHINING TREE GOLD AREA*

By R. B. Stewart.

Late in May, 1912, the writer was instructed by the Provincial Geologist of Ontario to proceed to West Shining Tree and continue the examination of that area made during September, 1911. Mr. Dowler Freeman served as assistant.

Transportation facilities have improved during the year. The regular train service on the Canadian Northern railway has been extended to Ruel, sixty-six miles from Sudbury. Two dams were built in the fall of 1911 on the Opickinimika river in order to deepen its shallow portions. This enables small gasoline boats or pointers to run from Ruel to the north end of Allin lake, which is 1½ miles from West Shining Tree lake. Mr. Thomas Clemow, of Ruel, had two boats on the route during the season, giving a tri-weekly service to West Shining Tree lake.

A wagon road will be built during the coming season into the area from mileage 80 on the Canadian Northern railway.

Mr. John Moore, of Sudbury, has established a general store and accommodation for travellers on the south side of West Shining Tree lake. In September, a post office (Tungsten) was established at the store with Mr. Moore as postmaster.

During the year considerable development work has been done. Assessment work was performed on a large number of claims, and a number of the most promising properties and adjacent holdings have been surveyed. In several places, shafts 20 to 50 feet deep have been sunk, and in other places open cuts have been made, chiefly on properties under option.

**Geology of the Area.**—The rocks of the area are chiefly of Keewatin age. They consist of ellipsoidal basalts, altered diabases, ampibolite and hornblende schist. The ellipsoidal rocks predominate. Small areas of quartz porphyry, syenitic porphyry and felsite resembling rhyolite are also present.

A schistose structure exists in most of the Keewatin, but is most pronounced in narrow shear zones that have a general east-west trend, and the developed schists dip nearly vertical. Ferruginous calcium and magnesium carbonates are present in much of the schist.

A lamprophyre dike cutting the older Keewatin rocks was observed on the boundary between Churchill and McMurchy, about 20 chains from the southwest corner of the latter township.

Numerous dikes and small areas of fresh quartz and olivine diabase are found in the area. The diabase dikes intrude all other rocks, and also cut the gold-bearing veins.

**Auriferous Quartz Veins.**—A large number of quartz veins occur in the Keewatin rocks and many of them contain visible gold. Most of the veins are in the ellipsoidal basalt, but two gold-bearing veins have been found in the hornblende schist.

The veins vary in width from 15 feet to a few inches, but most of them are less than 4 to 6 feet across in the widest parts. They present little uniformity in width. They pinch out or narrow to mere stringers in a few yards, then widen again or break up into stringers. The dip of the veins is usually nearly vertical, but several dip at much lower angles—45 degrees or less.

Considerable variation is presented in the strike of the veins. Many veins occur in the east-west shear zones and conform in a general way to the strike and dip of the enclosing schists. Others having an approximate north-south strike occur in the more massive rocks.

Several irregular masses of quartz or quartz and schist occur. The largest one that has been found, so far, is on W.D. 1157. It is roughly 160 feet long and 60 feet wide.

The veins and adjacent country rock are usually well mineralized with iron pyrites. Specular hematite and barite are sometimes present. Much rusty decomposed material resulting from the oxidation of the pyrites and the decomposition of the ferruginous carbonates is almost invariably associated with the veins.

Several small areas of felsite and porphyritic syenite are found in the vicinity of the veins just east of West Shining Tree lake. The latter rock occasionally contains many stringers of quartz cutting it in a very irregular manner and sometimes veins of quartz 3 to 4 feet wide.

Gold occurs in many of the quartz veins and to a small extent in the enclosing schists. Much of the gold in the quartz is in a fine state of division, but nuggets several grains in weight are frequently found. Examination of several specimens showed that a large amount of the gold has been deposited along fracture lines in the quartz. The schist immediately adjacent to the veins appears to be impregnated with quartz to a certain extent, and contains some gold, but assays of several samples of schist taken in the vicinity of the veins do not indicate that the amount of gold in the schist is of importance.

### Gold Claims.

**Gosselin.**—The mining locations, W.D. 1151-52 and W.D. 1155-56-57-58 and 59, are commonly known as the Gosselin claims. The first discovery of gold in the area was made on these claims. A mass of quartz about 160 feet in length and 60 feet wide occurs on W.D. 1157. Gold has been found in this outcrop. Just east of this quartz body is a vein 3 or 4 feet wide, striking about north and uncovered for about 100 feet. About three chains to the north of this vein is a mass of quartz 50 feet long and about 15 feet wide that contains some visible gold, and immediately east of here on W.D. 1175 is a mass of quartz extending 70 feet in a northeasterly direction and about 15 feet wide. Near the northern boundary of W.D. 1151 is a vein 1½ to 2½ feet wide, having an east-west strike and dipping to the north at about 45 degrees. Gold was observed in this vein. Another vein has been located southeast of this claim and extends into W.D. 1156. It has been traced for 8 or 9 chains. The vein strikes a little west of north and varies in width from a few inches to 15 feet. Gold was seen in several places. This is a promising looking vein.

A Duluth company had an option on the properties early in the year. Surface work was carried on to determine the extent of the quartz bodies and these were

*From 22nd annual report Bureau of Mines, Ontario.

Geological Sketch Map of West Shining Tree Gold District. Prepared by R. B. Stewart, for Ontario Bureau of Mines, 1913 systematically sampled. A shaft was put down 50 feet on the incline on the east-west vein on W.D. 1151.

**Caswell Claims**—Claims W.D. 1418-19-20-21 constitute the Caswell property. They are situated west of lake Wasapika, in MacMurchy township. Several veins have been located, but the one which has attracted most attention occurs on the south end of W.D. 1410 and appears again across the lake on W.D. 1418. The vein is of the east-west type and is seldom over a foot wide. The rusty weathering schist alongside the vein contains many stringers of quartz.

The claims were under option during the winter. Most of the development work carried out was done on the vein described above. An open cut 25 feet in length and 12 feet deep at the face was put in on the east shore of the lake on W.D. 1420. Some very fine specimens of gold were obtained, but the work was discontinued when the option had expired.

**Seville Claim.**—Claim W.D. 1417 is located west of the south end of lake Wasapika. The outcrop of a vein that appears to strike several degrees west of north occurs near the east side of the claim. An open cut 30 feet in length and 16 feet deep at the face has been made here. The quartz at the face is about 6 feet wide and well mineralized with pyrites. A little gold was observed in the bottom of the cut. The vein pinches out about 30 feet north of the cut, but comes in again for a short distance and then is concealed by the drift. Along the strike of this outcrop another one occurs near the northern boundary of the claim. The quartz is about a foot wide and contains visible gold. Another outcrop 3 feet wide and uncovered for a chain and a half occurs at the south boundary of W.D. 1418. These three outcrops probably belong to the same vein.

**Jefferson Claim.**—The claim is not surveyed. It is situated immediately east of the Seville property. Gold was first found on this property in a vein that occurs on the west side of lake Wasapika. This vein has an east and west strike and dips 60 degrees to the north. It has been uncovered for over a chain. The quartz is about four feet wide, but pinches out several times. Considerable iron pyrites occurs in the quartz. Finely divided gold was observed about the centre of the outcrop.

Six chains west of this vein, another outcrop has been uncovered for about 200 feet. It has a similar strike and dip to the one described, but the quartz is narrow and irregular.

Two chains north of the latter vein, another has been uncovered for about 200 feet. It strikes a little south of east and is nearly vertical. The quartz is about 2 feet wide and maintains its width fairly well. Pyrites is abundant in the quartz. Much gold was observed in many places in this vein.

**The Bennett Claim.**—This claim (W.D. 1406) is situated on the east side of the Montreal river just south of lake Wasapika. During the fall of 1911, a vein carrying visible gold was discovered along the eastern side of the claim and running into the adjoining property. It appears to strike about northwest, and has been uncovered for about four chains. The quartz in the vein is seldom over a foot wide, but many stringers occur in the vicinity of the vein. Gold was observed in several places in the quartz. An option was secured on the property to the east, and a shaft 34 feet deep was sunk just east of the line. Encouraging quantities of gold were found in the quartz taken from the shaft. This vein occurs in the ellipsoidal greenstone.

**Knox's Claim.**—This claim is located east of lake Wasapika. Several veins varying in width from three to fifteen inches occur in a greenish-gray schist. Their general strike is a little north of east. Coarse gold was observed in one of the veins.

**MacDonald and MacIntyre Claim.**—This property is located just south of lake Wasapika. Very little work has been done on it during the year. Outcrops of quartz and small areas exposed by surface work extending a distance of 8 to 10 chains seem to indicate the existence of a vein running southwest from the west side of the Montreal river and gradually bending to the west. The quartz is four feet wide in places. No gold was observed in this vein, but farther north a vein has been uncovered for a short distance that contains considerable free gold. The latter veins seems to strike west of north and dips to the east. It is two feet wide in some parts. The formation is rather massive greenstones, but some schistosity is developed. Much rusty material occurs in the vicinity of the veins. An option was taken on the property in September, and a shaft was commenced on the vein where the free gold occurs.

**Moore and MacDonald Claims.**—These claims are situated in the vicinity of Moore lake. Several east and west shear zones, 60 feet wide or more, have been located on the properties. The shear zone on W.D. 1164 has been traced for 9 or 10 chains. What is apparently a continuation of this one has been located on W.D. 1163 and on W.D. 1427. Similar areas have been located on W.D. 1171. These shear zones contain many quartz veins and stringers, and are usually well mineralized with iron pyrites. The quartz is seldom over a foot wide, and constitutes a small fraction of the mineralized areas. Much rusty, leafy schist adjoins the quartz and good colors can frequently be obtained from this material on panning. Considerable gold was observed in the quartz veins and stringers on W.D. 1171.

**The MacQuire Claim.**—This claim is located south of the southwestern bay of West Shining Tree Lake. Several veins 8 to 10 inches wide occur in hornblende schist and are uncovered for a short distance. The veins dip to the north. A large amount of iron pyrites occurs in the quartz and schist. It is reported that rich samples of gold were obtained here.

**Holding's Claim.**—In September of this year, Mr. R. Holding, of Chapleau, made a promising discovery of gold west of the south end of MacDonald Lake. The formation here is amphibolite and hornblende schist. Gold occurs in the quartz and decomposed schists. Surface work was in progress when the writer left the field.

**Surveyed Claims.**—Following is a list of mining claims surveyed at West Shining Tree Lake, with the names of their stakers or owners. These are shown on the accompanying map:

Bennett, W.D. 1405-6-7; Beilby, W.D. 1172-74; Caswell, W.D. 1418-19-20-21; Clark, W.D. 1169-70; Coleman, W.D. 1411-12-13; Coombs, W.D. 1175; Coulson, W.D. 1166-67-68; Frith, W.D. 1157-58-59; Fulton, W.D. 1162; Gosselin, W.D. 1151-52; Hanch, W.D. 1430; Johnston, W.D. 1426, 1428-29; Lennon, W.D. 1415-16; MacDonald, W.D. 1163, 1164, 1172; Moore, W.D. 1177-78, 1431, 1165, 1171; Odlum, W.D. 1154; Pendleton, W.D. 1161; Peterson, W.D. 1422-23; Seville, W.D. 1417; Speed, W.D. 1155-56; Thompson, W.D. 1176, 1424-25, 1427.

# PRINCIPLES AND PRACTICE IN TECHNICAL EDUCATION*

By Dr. James Douglas.

My first visit to Colorado was made in 1872. My mission was to report on the California mine in Gilpin County, which had been sold to a Scotch company, and was being restored to the original owners by other methods than those of bargain and sale. As a mine expert I got a lesson in how not to conduct legitimate mining. On the other hand I saw the first successful Western attempt at smelting argentiferous and auriferous copper ores at the old Black Hawk works of Senator Hill; and I made the acquaintance of a brilliant young man, Richard Pearce, in charge of the Swansea Works, at the bend of Clear Creek, below Georgetown. This was only forty years ago, but the changes which have been made in metallurgy since then, suggest many reflections on methods of scientific education, and on the equally important habits in self-training we should cultivate and practise on ourselves.

### Development of Reverberatory Furnace.

Let us glance at these changes. The Boston and Colorado Smelter, under the management of Prof. Hill, who had been a professor at Brown University, started their smelting works in 1867 with two hearth roasting furnaces and two reverberatories of 15 by 9 feet, heated by wood as fuel at $5.00 per cord. The lump sulphides were calcined in heaps. Each reverberatory received its charge of two tons of roasted ore and roasted concentrates, which constituted a self-smelting mixture and yielded a matte of about 40 per cent. in copper. This was shipped to England for refining and separation.

It is Mr. Pearce to whom the credit is due for taking the lead in enlarging the reverberatories, increasing their capacity and reducing the fuel consumption.

Startling as was the progress for that day and generation, it was slow in comparison with the service which of late years has been extracted from the reverberatory, not so much by increasing its size as by improving its operation.

Mr. E. P. Mathewson, in his paper before the recent Eighth International Congress of Applied Chemistry, on the Development of the Reverberatory, says:

"The next step in development was made in Butte, Montana, by the Colorado Smelting Company—this plant being at that time, affiliated with the Argo Works—so that Mr. Pearce's influence was apparent. The step referred to, was the lengthening of the hearth to 50 feet, with consequent increase in capacity to 105 tons in 24 hours."

The first furnace of this size—built from the Colorado Smelting Company's plans—was constructed at the Butte and Boston plant in Butte, in the year 1900.

### Oil as Fuel.

At Cananea, under Dr. Ricketts, the use of oil as fuel and the recovery of waste heat were studied with care. But the highest results seem to have been attained at the plant of the Steptoe Company at McGill, Nevada, with California oil as fuel.

Mathewson says: "A record performance at McGill, communicated by Superintendent Sorensen on December 17th, 1911, No. 1 furnace smelting 660 tons of total charge on an oil consumption of five-eighths of a barrel of oil per ton of charge is as follows:

| | |
|---|---|
| Total charge per furnace day, tons | 666 |
| Oil fired per furnace day, bbl. | 421 .. |
| Coal equivalent of oil fired, tons | 124.0 |
| Total charge per bbl. of oil, tons | 1.58 |
| Oil, bbl. per ton of total charge | .63 |
| Equivalent gross coal, as % of total charge | 18.60 |

The substitution of oil for coal has, from the point of view of cheaper operation and the control of the heat, taken place wherever the difference in the cost of the unit of heat value does not forbid it. The low cost of smelting now attained in the reverberatory is attributable also to the conversion of the waste heat, as it escapes from the throat of the furnace, into steam. This loss has always been recognized, though with the old type of boilers, it was never found practicable to remedy it; but in this as in most other metallurgical processes, the mechanic has co-operated with the metallurgist to consummate what each alone would have failed to accomplish. From forty-five to fifty-five per cent. of the heat generated by the fuel is recovered as steam. The combination of the reverberatory with the blast furnace, instead of the often unreasonable, exclusive preference for the one over the other, is now finding many advocates. At the Copper Queen works at Douglas we use both, and there we have imitated Cananea in fettling our furnaces by pouring i ore of suitable fusibility, along the wall of the furnaces through openings in the roof.

But the development of the reverberatory would not have revolutionized the smelting and refining of auriferous and argentiferous copper ores had not two other great inventions intervened during the short period of time under our review. I refer to the introduction of the pneumatic method, through the Bessemer converter, and the refining of copper by electrolysis.

### The Bessemer Converter in Copper Smelting.

It was about 1882 that the news of M. Manhes' successful application of the converter to the concentration of copper induced Mr. Franklin Farrel to introduce the pneumatic method into his Parrot works in Butte. Difficulties, of course, beset him, but they were so slight that by 1885 he had six stands in successful operation. Since then the principle and main features of practice being accepted, the progress in both concentrating to bullion and incidentally in learning how to smelt crude ore in the converter, has been such that the converter has become more essential to the copper metallurgist than to the steel worker. It has grown in size from 4½ feet in diameter to 20 feet, and from a capacity of one and a half tons of matte per charge to thirty-three tons. Instead of an acid lining requiring frequent replacement, the shell is now lined with basic bricks, so refractory that, under proper precautions, from a single lining 15,000 tons of copper are poured, this first lining being still in use. And, owing to the acid ingredients of the charge, a much wider latitude of ores can be allowed for the acid ingredients of the charge, necessary to eliminate the iron from the matte, than when special clays and quartz had to be selected on account of their plastic or other qualities. The converter has thus become a smelting furnace as well as an appliance to eliminate the older methods of concentration by repeated roastings and smeltings, which involved so much fuel and time and labour. And almost simultaneously with the practical introduction of the converter improvements in the generator to produce electric current in large quantities and cheaply, made the electro-

*Extracts from Commencement Address, Colorado School of Mines, July, 1913.

lytic refining of copper and the separation of all impurities, including gold and silver, possible.

**Refining of Copper by Electrolysis.**

When I was superintendent of the Chemical Copper Co.'s works at Phoenixville, in 1878, Mr. Franklin Farrel, to whom the copper industry owes more than perhaps to any one man of the vanishing generation, induced me to make an experiment in the electrolysis of copper, at first on a small scale, with battery current, and then on a working scale, with generators, and in vats arranged in series and in multiple arc.

Our ignorance was replaced by the knowledge and gracious assistance of Mr. Edward Weston, of Newark, who loaned me three of his nickel-plating dynamos, and, better still, came to Phoenixville more than once to advise

James Douglas, LL.D.

and help me out of difficulties. I suppose I may claim the merits of making, in this country, the first electrolytic copper by the ton, but the merit is really due him, who in this and innumerable other instances has concealed his disinterested work for his favourite science and pursuits under a thick veil of modesty and generosity.

My idea at first was that the cathode might be rolled into coherent sheets. I soon found out my mistake, but the copper was all bought at high figures by the Shaker community, who found that the cathodes yielded an extraordinarily good quality of metal for anodes in their depositing vats. The Chemical Copper Co. was always in difficulty. It started with a shortage of capital, and never covered the shortage. The works came to an ignominious close. The company was not prosperous. The price of copper in 1878 and 1879 was at a low ebb, but took a sudden jump to twenty-five cents before the close of 1879. I had a nice stock of copper on hand and in the vats, and was doing well; but the temptation to realize on such a soaring market was irresistible, and I was ordered to refine everything I could find, at the sacrifice of even the precious metal contents. Excuse this personal digression. It was one of the blind steps in the progress of events which had a momentous influence on your immediate neighbourhood; for the rapidity of the pneumatic process and the perfection of the electrolytic process has inevitably supplanted the more intricate, the more interesting process, from a metallurgical standpoint, of Pearce's modification of the Ziervogel method, as practised first at Black Hawk and then at Argo.

Up to date of Mr. Pearce's alliance with Senator Hill the mattes, as I have said, were shipped to England. And the prices paid for ore and concentrates were low. Fortunately, as a compensation, the value of silver was high. Mr. Pearce, in his Presidential address to the American Institute of Mining Engineers in 1889, gives the proportion of values paid the miners in those early days. He says:

**Proportion of Values.**

"The following table, which I have prepared from data collected by a friend, will show the commercial advantages which the miner has experienced by the progressive development of the smelting industry. For the sake of comparison, I have selected ores which have no special value as fluxes, or as aids to smelting, and will consider them merely in relation to their intrinsic value, and endeavour to show the returns which the miner gets now, as compared with the figures of eighteen years ago. In other words, the net percentage value of an ore to the miner to-day is compared with the value for successive periods from 1871. The value of the silver has been figured from $1.29 per ounce in 1871, down to 93 cents in 1899, and, for the years prior to the resumption of specie payment, the premium on gold is taken into consideration. The slight falling off in 1874 and 1875 was due to the depression following the financial panic in the fall of 1873. For a time, silver-ores were rather a drug on the market and prices consequently fell off.

**Table Showing Percentage of the Total Value of Ores Paid to Miners Each Year During a Period of Eighteen Years.**

| Place. | Year. | Contents in Silver per ton. | Percentage of total value paid to the miner. |
|---|---|---|---|
| | 1871 | 100 oz. | 65. |
| | 1872 | " | 65. |
| | 1873 | " | 65.5 |
| Black | 1874 | " | 53.6 |
| Hawk | 1875 | " | 60. |

"The difference between the maximum and minimum is 30.4 per cent.

"I have avoided making any figures to show the changes in value of gold-ores from year to year, but, without going into details, I may state that a Gilpin County gold-ore which would net the miner 53 per cent. of its value in 1870, would now yield him 80 per cent., a difference of 27 per cent. and, on a somewhat lower grade of ore, the difference is 33 per cent."

Since then the gold would yield the miner 90 per cent.

Comparing the prices paid for tailings in 1874 and 1889 he quotes 24 per cent. of the value as that of 1874 and 78 per cent. as that in 1889.

Prof. Hill in 1872 defended himself in the Central City Register against the accusation of extortionate charges based upon unjust comparison of his furnace treatment with California milling practice. The Professor says:

"The Boston and Colorado Smelting Company are treating ores, of which the gross value of the gold and silver estimated in currency, is \$50, \$100, and \$150, at a cost to the miner of \$35, \$40, and \$45 respectively, that is, for ores which contain \$50 per ton, currency value, all over \$35.00 is paid to the seller, and for ores containin \$100 per ton, also all over \$40 is paid to the seller, and so on. For intermediate grades a pro rata charge is made.

"This company also pays for the copper \$1.50 for each per cent. on the dry Cornish assay, which is the assay on which all copper ores are sold.

"No one who is acquainted with the facts will deny that the ores of Colorado are the most complex which are worked on this continent, containing, as they do, mixed with the sulphurets of copper and iron, large quantities of the sulphurets of antimony, arsenic, zinc and lead, and a refractory gangue. Neither can any one deny that the actual costs of all the principal elements employed in smelting, viz., fuel, labour, fire bricks, and iron, are more than double here what they are east of the Mississippi River, and much higher than they are in California.

"Dr. Raymond, in his report as Commissioner, for 1870, gives the following as the scale of prices paid at the Hill works:

| For ore containing per ton | Is paid of the value. |
|---|---|
| 2 ounces gold | 20 per cent. |
| 3 ounces gold | 30 per cent. |
| 4 ounces gold | 40 per cent. |
| 5 ounces gold | 45 per cent. |
| 6 ounces gold | 50 per cent. |

"For silver, seventy-five cents per ounce is paid, after deducting as many ounces of silver as there are per cent. of copper in the ore. For copper \$2 for each per cent., deducting one-half per cent. from the amount indicated by wet assay. No account is taken of quantities less than one ounce of silver, one per cent. of copper, or one-quarter ounce of gold. The above rates are in coin."

In 1875 Prof. Egleston published a paper in the Transactions of the American Institute of Mining Engineers on the Boston and Colorado Smelting Works, after Mr. Pearce had joined Prof. Hill and was separating the precious metal. His description is significant of the small scale on which work was still conducted, and the high terms on which ore was bought. He says:

"The works are thus located in the very centre of the gold and silver producing regions of Colorado, and are also most favourably situated with regard to transportation. They treated in 1874, 30 tons of ore and tailings in 24 hours, and produced 700,000 ounces of silver, 12,000 ounces to 15,000 ounces of gold, and 225 tons of copper. With matte from Alma their production in 1875 will be 110,000 ounces of silver, 25,000 ounces of gold, and 250 tons of copper.

"The gold ores are divided into three classes. The first class consists of auriferous copper pyrites containing from 2 to 10 per cent. of copper, 2 ounces to 10 ounces of gold, and 2 ounces to 10 ounces of silver. These ores average 4 per cent. of copper, $3\frac{1}{2}$ ounces of gold, and 6 ounces of silver. The second class are tailings from the gold mills, consisting of pyrites with about $1\frac{1}{2}$ per cent. of copper, $1\frac{1}{4}$ ounces of gold, and 4 ounces of silver. The third class consists of tellurium ores, which have a very silicious gangue, and contain 100 ounces to 200 ounces of gold, and 6 ounces to 10 ounces of silver. These ores come mostly from Boulder County, and are often worth \$10,000 to \$15,000 to the ton.

"The silver ores of the first class consist of surface ores, mostly free from sulphur, containing 70 per cent. of silica. They contain 100 ounces of silver and 5 to 6 per cent. of lead, and no gold. Those of the second class are sulphurets, rich in blende and poor in galena and pyrites; they contain 150 ounces of silver, 15 per cent. of zinc and lead, and no gold."

The next contribution to the literature of our subject was the Presidential address from which I have quoted.

By that time the smelting industry of Colorado had expanded from about 20,000 tons per year in 1877 to 596,594 tons in 1888, and Argo was treating some 200 tons of copper bearing material from all sections of the Rocky Mountains, including the matte from the company's famous branch works in Butte, operated under the superintendence of Mr. Williams. When Mr. Pearce had introduced the Ziervogel method, of separating copper and silver, substantially as practised in Germany and England, and his own modification of parting the gold, the heavier expense of shipping the matte to England or Germany was avoided, and, as the above table showed, the miners shared in the saving. But the method was delicate, and costly, involving not only skill, but many operations. And consequently it has not been able to compete with matte concentration in the converter, and the perfect separation of the precious from the baser metal in the electrolytic vat. The requiem of this famous enterprise was thus pronounced in "Mineral Resources" for 1910. Part 1, page 196.

"The year witnessed the dismantling of the plant of the Boston and Colorado Smelting Co. and the passing of this pioneer in the copper smelting industry of the West. Although this company had been successful in its long period of operations, the management did not consider it wise to rebuild the plant, which was becoming out of date. This pioneer plant has had a long and successful career, but copper smelting plants constructed in the State in recent years have been far less successful and have been able to operate but intermittently."

The moral in its effect on us as students is to regard methods, even the most ingenious and scientifically perfect, as merely stepping stones across the river of industrial life, the further side of which is still far away.

### Study of Principles Should Occupy a More Prominent Place Than the Study of Practice.

Looking back, therefore, on the changes in these two branches of mining and metallurgy, namely, in the improvements and changes of methods and the higher values which the miner receives to-day for the products of his industry, we are forced to recognize how, in our system of education, the study of principles should occupy a more prominent place than the study of practice. Even our acceptance of principles, outside of mathematics, should be held as open to modification, but in the main the fundamental laws of physics and chemistry may be accepted as we interpret them, to be correct and our only safe guides. Every improvement made in your own region has been through a better understanding of these laws, and carrying them into operation.

For instance, the effect of the injection of air into molten metal was perfectly understood before Bessemer brought mechanical ingenuity as well as chemical science to bear upon the solution of the pneumatic method. The practicability of extracting the carbon to the exact point at which pig iron is converted into steel proved to be so difficult that the Bessemer process would probably have had a limited range of usefulness had not the suggestion of another chemist been adopted, to oxidize all the carbon, then re-add to the charge the specific amount of carbide of manganese with a known quantity of carbon to re-carbonize the iron, while the manganese absorbed any dissolved oxide of iron. The whole success of this momentous improvement, which was no discovery at all, depended upon the application of known facts to meet certain practical conditions.

Following along the line of steel manufacture, the adoption of the basic lining in the converter, following the Thomas Gilchrist proposal to line the open hearth furnace with a basic material to eliminate phosphorus was a simple application of known chemical facts.

Turning from the pneumatic method as applied to iron to similar methods as applied to copper, we see Holloway carrying his smelting of ore and concentration of matte up to the point where metallic copper began to form, then the occlusion of the tuyeres in the bottom of the steel converter by the chilled copper; and the loss of years, in the adaption of this simple method to the concentration of copper, till Mons. Manhes, adopting a type of converter with elevated tuyeres, which Mr. Bessemer had himself patented, brought the tuyeres within reach of a punching bar, and thus substantially revolutionized the metallurgy of sulphides of copper.

The wonderful progress in the study of the generation of electricity, its transmission, its conversion into power, and its electrical action, has been made within the short period we have been reviewing. It is a special branch of study and research, the intricacies of which the average student cannot thoroughly master, but with the general laws of which he should be familiar. The carrying out of any mining scheme which utilizes electricity involves the employment of an expert in the person of an electrical engineer, but if you are to be an efficient manager of a mine, mill or furnace plant you must personally know what can be done with this mighty but mysterious force, though you may have to leave the handling of it to your electrician.

Another element which of late we have called to our uses for service at a distance from the point of its generation, is compressed air. To determine whether in each particular case, transmission by electricity or by compressed air or by a combination of both should be adopted involves on the part of the manager a fair acquaintance with the fundamental laws of electricity and pneumatics, if he is to be the controlling factor in the administration, instead of a puppet in the hands of his subordinate officers. He may not be familiar with all the practical appliances or the latest improvements for applying these principles, but he must be sufficiently master of the subject to be the master of his staff.

There is another field which the mining and metallurgical engineer of the future will have to cultivate, and that is industrial chemistry. It is of course a branch of industry in which co-operation between the chemical manufacturer and the miner and metallurgist must be closer and keener than it is at present. In fact, our metallurgical activity has been greater than the chemical, partly due to the fact that the market for chemical products has been widely distant from the possible sources of some of the more necessary chemical ingredients, which are essential to all large chemical operations.

We are living at the close of a period of almost unnatural activity and prosperity. We have had half the new world to exploit, and, with steam and electricity as our aids, in little more than a generation we have depleted the fertility of the soil and emptied our mines of their richest ore, taking from each the stores nature had accumulated nearest the surface. The harvest has been abundant and cheaply garnered; but a future generation cannot reap crops without planting, and in our case, if mining prosperity is to be maintained, it must be by saving every product and by-product, and widening, therefore, the field of our operations and consequently of our studies.

The experience here of the past generation demonstrates how rapidly practices have changed under the application of scientific principles. The conclusion, therefore, is that, as a fundamental maxim of education, our studies should aim at a better understanding of the deep and broad laws which underlie all practice rather than the ephemeral methods of the day; and thus train our minds in habits of original research rather than obediently and servilely following the practice of the past or even of the present. The study of methods, however, cannot be neglected, but, if familiar with the principles, you are better able to use your principles in assisting you to devise methods for carrying them into practice.

The danger of too much knowledge of principles is that the scholar becomes so conscious of his shortcomings in practice and sees so keenly the possible perfection of practice ahead that he does not devote himself with sufficient energy to working out and practising the imperfect, practicable methods and using tools he has to his hand to work with. Some of the cleverest men I have had to do with have developed this fault. It should be your endeavour to familiarize yourselves with the scientific basis of the subjects you have to deal with without destroying your practical ingenuity and being depressed by the evident shortcoming of your best efforts to carry principles into action.

## ANALYSES OF COALS.

Government purchasing agents, designing and operating engineers, and the fuel departments of industrial concerns, large dealers in coal, and persons interested in the distribution and character of the different coals in the United States, will find valuable information in a report just issued by the United States Bureau of Mines as Bulletin 22, entitled, "Analyses of coals in the United States, with descriptions of mine and field samples collected between July 1, 1904, and June 30, 1910." This report contains the analyses of 5,000 samples of coal taken from 1,500 coal mines and prospects situated in the various coal fields of the United States. Not only all of the important fields are represented, but practically all of the more important mining districts.

The purpose of the bureau in compiling and publishing this information is to present reliable information regarding the chemical composition and heating value of the coals. The samples of coals were collected by experienced men according to a definite and uniform system, and were analyzed under carefully controlled conditions, so that there might be no question as to the relative merits of the different coals so far as this can be determined by chemical analyses and determination of heating values.

# ELECTROMAGNETIC ORE CONCENTRATION BY THE ULLRICH SEPARATOR

By P. Kranafeldt.

The process of concentrating ores was formerly effected almost exclusively by mechanical operations involving the aid of water and known as hydraulic sorting, in which differences in specific gravity furnished the means of separating the component materials. This method fails, however, when components require to be separated which differ but little in their density. Hence ores having components of this kind, such as spathic iron ore associated with zinc blende, spathic iron and copper pyrites and many others could only be concentrated in a very imperfect manner or could not be treated at all. Attempts were therefore made to devise methods of concentration in which other properties of minerals furnished the requisite element of dissimilarity, and machines were accordingly designed for classifying the minerals by their different behaviours with respect to magnetic attraction.

Substances are said to be more or less permeable or magnetic according to the degree in which they are influenced, i.e., attracted by, the magnetic poles. The subjoined list of coefficients may serve to convey an idea of the degree of permeability or magnetic strength of a few substances:

| | |
|---|---|
| Metallic iron | 100,000 |
| Magnetite | 40,000 |
| Spathic iron | 760 |
| Red hematite | 590 |
| Iron oxide | 280 |
| Manganite | 180 |
| Nickel oxide | 35 |

Permeabilities of a still lower degree are exhibited by the materials composing the gangue such as quartz, limestone, porphyry, etc. Magnetite is accordingly counted among the strongly magnetic ores, whilst the other metalliferous compounds named in the above list belong to the class of feebly magnetic ores. It should, however, be noted that various minerals such as spathic iron ore, red hematite, iron pyrites, etc., may by roasting be transformed into strongly magnetic compounds.

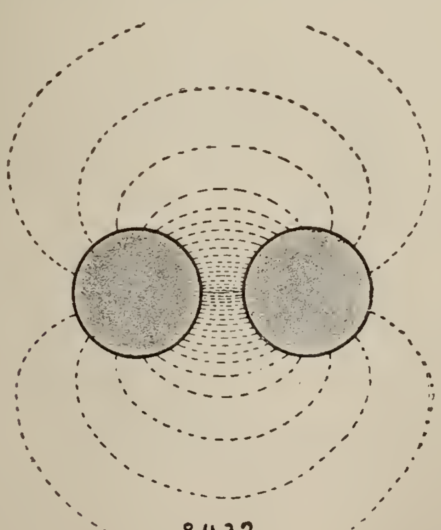

Fig. No. 1

There are two main groups of magnetic separators. In one class the electro-magnets are movable, whilst in the other they are stationary.

**Cylinder Separators.**—The principal representative of the first group is the cylinder separator, in which the poles take the form of two revolving cylinders (Fig. No. 1). The intensity of the field increases gradually until it reaches its greatest value where the two cylindrical poles are nearest to each other after which it gradually declines again. By diminishing the distance between the two poles, the intensity of the field is increased. It is greatest when the gap has been reduced to its utmost limit, which in its turn is governed by the coarseness of the material which has to be passed through the machine. Since the intensity of the field declines gradually from a greatest value it follows that the attracted particles will drop off in succession as they differ in their magnetic qualities. From the description of the process of separation it will, however, be seen that in a machine of this type there cannot be any strict sorting.

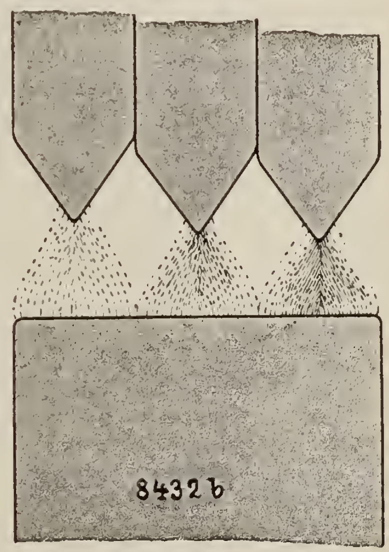

Fig. No. 2

**Stationary Poles.**—More satisfactory are ore separators with stationary poles. They are now almost exclusively fitted with poles designed in the form of V edges. Since the lines of force contract towards the edge it follows that this shape furnishes a means of producing a very intense field and that a V-shaped pole exercises a very powerful attraction. These poles are accordingly particularly well adapted for separating feebly magnetic materials. In the case where a V pole operates in conjunction with a flat pole the zone where the attractive forces due to either pole balance each other is very near to the flat pole, and hence the V-edged pole exercises an attractive force on the greatest part of the field. In separators with stationary poles both the magnetic and non-magnetic components have to be conducted away from the magnetic field by means of belts or other conveyors. With separators of the simple type as here outlined, it is obviously not possible to separate more than two constituents. To deal with more than two components it would be necessary to set up several magnetic poles, one behind the other, so as to create as many magnetic fields. This would add much

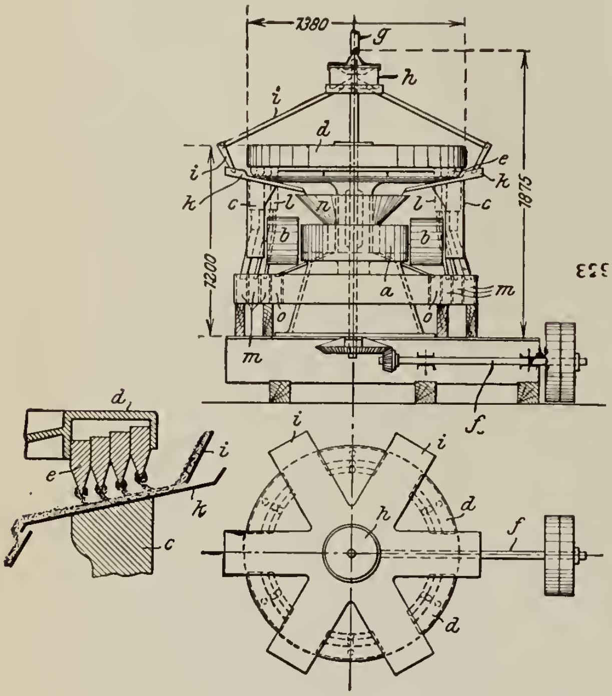

**Fig. No. 3**

to the cost of the machine without being attended with a satisfactory increase of the output.

It will thus be seen that whilst it is possible with the separators described so far to classify disintegrated material into more than two components, machines constructed on these lines yield either an imperfectly sorted material or their initial cost becomes excessive in proportion to the output. Both objections have been overcome by the introduction of the Ullrich Magnetic Separator.*

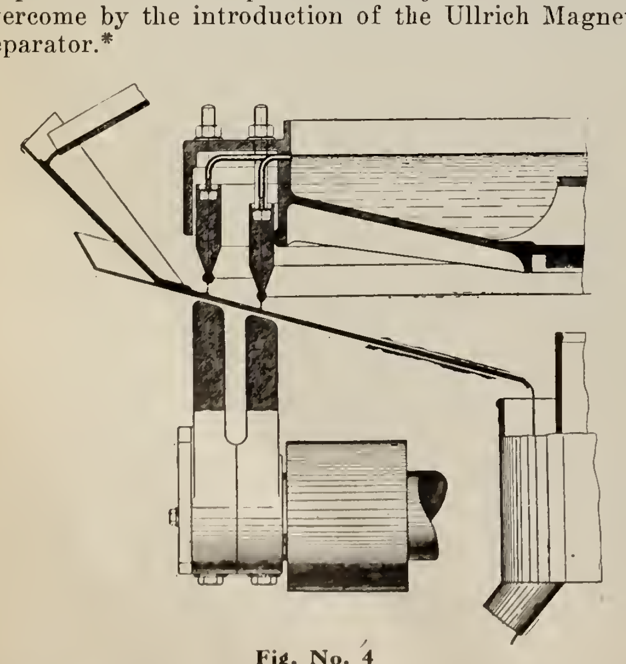

**Fig. No. 4**

**Ullrich Magnetic Separators.**—In these machines there are several magnetic fields, each of which is subdivided into separate zones (Fig. No. 2). These zones can be independently adjusted to a nicety, and, therefore, their intensity so regulated that an individual zone will act on one of the constituents differing but slightly from the former in its magnetic qualities. The Ullrich separator will, accordingly, in each of its magnetic fields, extract from a mixture one or more constituents differing in their degree of permeability and it will deliver these separately; and whilst it can

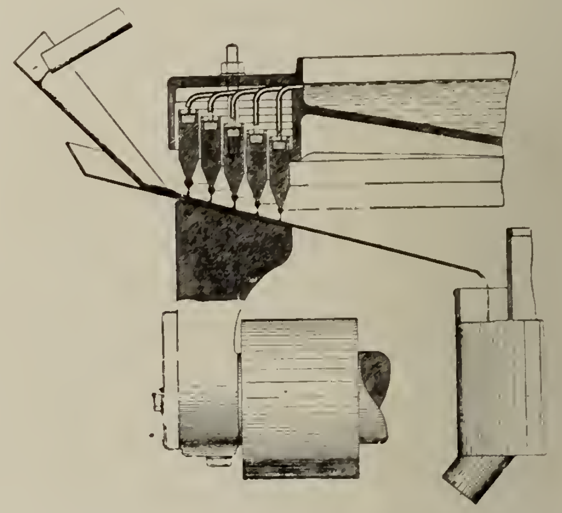

**Fig. No. 5**

deal with large quantities of mixed materials it delivers remarkably pure products.

Before going into the constructive details of this machine attention may be drawn to a feature which distinguishes the Ullrich separator from all other types.

All electro-magnetic separators which had been designed for the treatment of feebly magnetic minerals were adapted for the handling of dry materials only. It will not be difficult to realize that this restriction introduces serious limitations in the application of the machines. We need only refer to the enormous evolution of dust which is unavoidable in machines which deal with dry and finely ground ores with its attendant

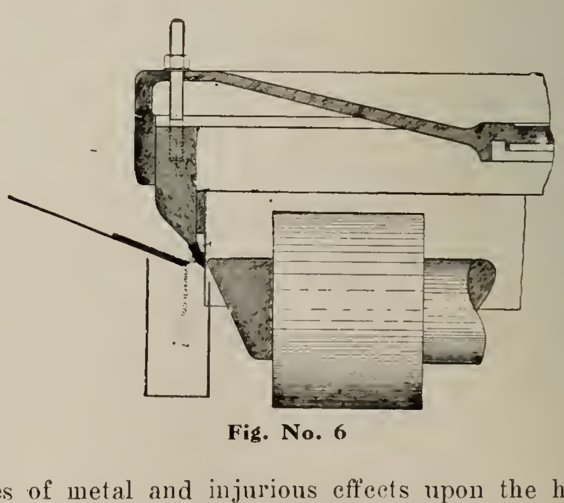

**Fig. No. 6**

losses of metal and injurious effects upon the health of the workmen, etc. The exclusion, as far as feebly magnetic ores are concerned, of the wet process from the scheme of magnetic separation has been all the

*Sole Makers: Fried. Krupp, A. G. Grusonwerk, Magdeburg, Germany; represented in Canada by Jas. W. Pyke & Co., Ltd., 232 St. James St., Montreal.

more serious since in most cases the mechanical and the magnetic processes of ore dressing cannot profitably be separated. On the other hand, ores are dressed almost exclusively by wet methods. In fact, the disadvantages inherent in the dry magnetic method of separation are notoriously such that many ores had to remain unused as it was not possible to concentrate them by any other method. Among ores of this kind are to be found hematite ores, zinc ores, etc.

The Ullrich separator was the first machine to classify feebly magnetic materials under the conditions of the wet process. But as it is available for strongly magnetic material just as well, the scope of its applicability extends to all cases in which magnetic separation may be practicable.

The body (a) sends out a number of radially arranged horizontal arms of soft iron surrounded by the magnet coils (b) and carrying on their extremities adjustable upright pole heads (c). The body (a) supports on ball bearings a revolving disc (d) the rim of which takes the form of a chamber for the reception of the armature rings (e). The disc is keyed upon a vertical shaft and is set in rotation by bevel gearing and a belt drive.

There are either two, four, six, eight or ten pole heads (c) arranged in a circle, providing as many separate magnetic fields. The initial material is generally conveyed to these by shaking feeders actuated by a friction roller in contact with and driven by the rim of the revolving disc (d). In the case of dry material the feeding device takes the form of a band conveyor.

The pole heads may be divided up tangentially to the armature rings into as many adjustable pole plates as there are rings (see Fig. No. 4).

The armature rings (e), of which there are one, two, three, four, five, or six, according to the number of zones required or the number of constituents to be separated, terminate below in V-edges. They rotate above the stationary poles, being suspended by screws from the top of the annular chamber at the circumference of the revolving disc and may, independently of each other, be set at any required height by means of these screws.

The wet separators have the upper portion of the rings made in the form of channels for the reception of water (Fig. No. 5) conveyed to them through small tubes from the container formed by the revolving disc (d) and its rim. The water is discharged through slots in the sides of the channels and in flowing down the sides of the rings serves to clean the products attracted to the rings.

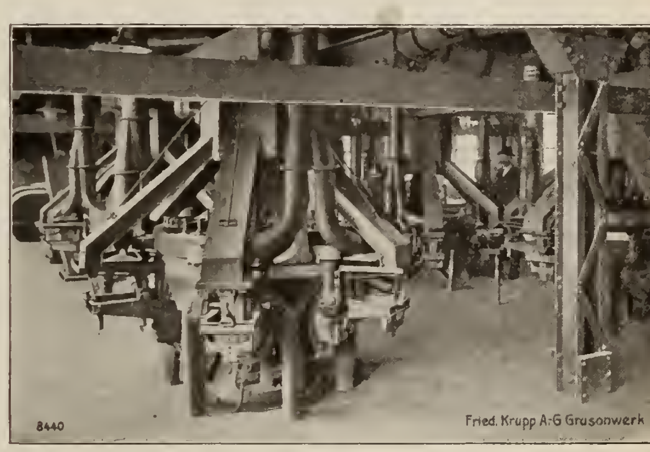
At each magnetic field a feeder passes the material through the active space between the pole and the armature rings rotating above it. When the electromagnets are energized the space between the pole and rings becomes a magnetic field sub-divided into as many zones as there are rings. In consequence of the magnetic force of attraction in the field zones, which may be regulated by raising and lowering the rings or the pole heads, the magnetic constituents are drawn up by the Vs of the rings. In the wet separators the water which flows down the sides of the rings in opposition to the motion of the attracted particles washes down any particles of lower magnetic quality than desired for the particular ring and creates between the poles and the armature hydrostatic columns, within which the separation of the magnetic and non-magnetic constituents is effected without any difficulties being encountered on the score of surface tension.

The particles attracted by the rings are carried by the latter out of the magnetic fields and drop into separate pockets, any particles still adhering to the rings being removed by a spraying device or leather strikers.

In the case of separators provided with one ring only (Fig. No. 6) the material, instead of being passed between the pole and the ring, is merely conveyed up to the magnetic field. The magnetic constituents are then lifted out by magnetic attraction and discharged from the field through the space between the armature ring and the brass ring attached thereto. The non-magnetic constituents drop straight down from the inlet chute.

Machines designed for classifying fine slimes are fitted with stationary feeding channels (k) without shaking mechanism so that the rings can be set very accurately and therefore the components of the slimes can be separated with an exceedingly fine degree of precision.

**WET**



**DRY**

**Ullrich Separators**

The following minerals have successfully been concentrated with Ullrich magnetic separators:

| Minerals. | Separated Constituents. Magnetic. | Non-magnetic. | Remarks. |
|---|---|---|---|
| 1. Strongly Magnetic Ores. | | | |
| Magnetite. | Magnetite. | Gangue. | Apatite, which often forms part of the gangue, is likewise separated out. |
| *Magnetic Iron Pyrites.* | Magnetic Iron Pyrites. | Copper Pyrites. | |
| 2. Minerals which require to be prepared by roasting for the electro - magnetic treatment. These include: Zinc ores containing iron pyrites, copper pyrites in the form of raw ores or washed middlings, tin ores containing sulphur, tin or tungsten ores. | Iron Pyrites. Copper Pyrites. Zinc Blende or Tungsten. | Gangue, Zinc Blende or Tin. | Ores containing Iron Pyrites in which these constituents can be rendered strongly magnetic by partial roasting or calcining with access of air. |
| 3. Feebly Magnetic Ores. | | | |
| *Iron Ores.* | Hematite Ores. Red Hematite Ores. Brown Hematite Ores. | Gangue. | |
| | Spathic Iron Ores. | Zinc Blende. Iron Pyrites. Copper Pyrites. | |
| *Zinc Ores.* | Ferruginous or Manganiferous Silicates. | Zinc Blende. Feebly Magnetic or non-magnetic minerals. | e.g. Broken Hill Tailings containing, besides Zinc Blende, garnets and rhodonite. |
| | Zinc Blende. | (Iron Pyrites) | |
| | Franklinite. | Zincite Willemite. | |
| *Tin and Tungsten Ores.* | Tungsten. | Cassiterite. | |
| *Copper Ores.* | Spathic Iron Ore, Copper Carbonate (if sufficiently magnetic) | Copper Pyrites. Gangue. | |
| | Atacamite. | Gangue. | |
| *Monazite Sands.* | Magnetite. Ilmenite. | Zirconium and other Silicates. | |
| *Concentrates, from jigs, of Diamantiferous Sands.* | Ferriferous Grits or Sands or Ferruginous Silicates (Garnets). | Diamonds. | |
| *Magnesite* | Burnt Magnesite. | Lime, Alumina. | |
| Raw Minerals or Roasted Materials containing as impurities ferriferous minerals. | | | Treated with the object of *cleaning ferruginous sands and clays for the manufacture of glass and pottery.* |

From this list it will be seen that the Ullrich separators not only serve for concentrating ores, but are also well adapted to eliminate ferrous impurities from the raw materials employed, e.g., in the manufacture of glass and earthenware.

The capacity of these separators greatly depends on the magnetic permeability of the ore. In the case of strongly magnetic and coarse-grained material, which may size up to 2 inches, up to 7 tons per hour, may be passed through the machine, whilst with fine material the maximum capacity is about 4 tons. In the case of feebly magnetic materials which may contain pieces up to ⅜ inch diameter, the machines can deal with quantities ranging from ½ to 3 tons per hour.

The power absorbed by the Ullrich separators varies according to the nature of the minerals and ranges from ½ to 2 h.p. The wear is quite insignificant.

The operation of the machine is very simple, and one man can attend ten machines.

Thanks to its merits the Ullrich separator has already met with a considerable measure of success and appreciation. Though it was introduced but four years ago there are already a considerable number of plants operating with Ullrich magnetic separators.

We append a table to illustrate the practical results achieved with these machines:

| Ores | Crude Ores Per cent. | | | Zinc Concentrates Per cent. | | | Iron Concentrates Per cent. | | | Recovery Per cent. | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Fe | Mn | Zn | Fe | Mn | Zn | Fe | Mn | Zn | Fe | Mn | Zn |

Messrs. Jas. W. Pyke & Co., Limited, 232 St. James Street, Montreal, are the Canadian representatives for the Krupp Engineering Works, and will be glad to give any further information to interested parties who may wish to send samples of ore over to the Krupp testing station for examination.

## IRON ORE.

E. C. Eckels, a geologist, giving his testimony in the United States steel hearing, furnished some interesting data on the Newfoundland and Nova Scotia ore deposits. He said that the ore had been located at 1,071 feet below the bottom of Conception Bay, and that the Nova Scotia Iron & Steel Co. is now successfully operating submarine mines. The economically workable ore within five miles of Bell Island is estimated at 3,500,000,000 tons. Besides this, there are billions of tons which are not economically available at this time. In one deposit alone in the Newfoundland district the witness said that the ore runs 30 feet thick and contains about 90,000,000 tons to the square mile.

Mr. Eckels estimated that ore could be brought from the Newfoundland mines to Philadelphia and the eastern steel market at a cost of about four cents per unit. Foreign ore sells at Philadelphia at seven and one-half cents per unit, showing the profit on the Newfoundland ore at Philadelphia and Baltimore. Lake Superior ore cannot be laid down at Baltimore and Philadelphia for less than nine cents per unit, according to the witness, or from two to two and one-half cents per unit more than the foreign product.

# THE GOLD DEPOSITS OF NOVA SCOTIA*

By E. R. Faribault.

**General Character and Distribution.**—The gold in Nova Scotia occurs chiefly in quartz veins, but a small amount of gold has been recovered from detritus. The deposits of auriferous antimony ore occurring in cross-country veins in the Halifax formation at West Gore have been worked considerably for antimony and gold.

The gold-bearing quartz has been reported as occurring in the granite, but the authenticity of the reports may be regarded with suspicion. With this possible exception, all the known veins occur in the sedimentary strata of the Gold-bearing series. Although there are a few important veins that cut across the stratification, most of the auriferous quartz veins are of the interbedded type. They occur chiefly in the beds of slate which are found inter-stratified with the beds of quartzite throughout the whole thickness of the Goldenville formation, and their distribution and structure are to a great extent the result of the action of dynamic forces to which the enclosing rocks were subjected. The interbedded veins are found in great numbers, aggregated in groups on the domes along the anticlines; and in some few cases on the pitching portion of the anticlines. Rarely they are formed in the synclinal troughs. The domes thus determine the location of nearly all the groups of veins and each of them may be considered as an independent gold district. Some domes, however, especially in the west, do not show the presence of quartz veins, but this appearance may be simply due to the concealment of the bedrock by drift.

A tabulation made of the principal anticlines with the gold districts located on them, from the map-sheets published by the Geological Survey, shows that to the east of Halifax 33 gold districts are distributed along 14 anticlines in an area 40 miles in width by 100 miles in length.

The gold-bearing districts are much less numerous and generally less productive in the western part of the field than in the east. This is chiefly due to the folding being more gentle and the domes broader, hence the slipping of the beds and fracturing has been less pronounced with the consequent failure to produce channels favourable for the circulation of solutions and the deposition of vein matter.

Quartz, with hardly an exception, forms by far the largest proportion of the vein filling, but occasionally inclusions of country rock or certain minerals are quite abundant. Associated with the quartz, the principal minerals are pyrite, arsenopyrite, calcite and galena, less frequently chalcopyrite, sphalerite, dolomite, chlorite and pyrrhotite, and more rarely scheelite, stibnite, feldspar, rutile and specular iron.

Silver is found in the gold recovered from cross-veins at Leipsigate, Brookfield and some other districts, sometimes in such amounts as to reduce the value of the product to $16 an ounce. But the gold produced from the interbedded veins is generally very fine and varies in value from $19 to $20 per ounce. The gold generally occurs free and visible and is amenable to amalgamation, but it is also in part intimately bound up with the sulphides, thus requiring other methods of treatment for its recovery. In the white, coarsely crystalline quartz it is found in coarse, visible particles, while in the bluish, oily quartz of the laminated veins it is usually disseminated more finely or is found in plates in the layers parallel to the walls. It is generally most abundant on the footwall, is very commonly associated with arsenopyrite, frequently in lenses or nodules forming large nuggets, and almost invariably with galena. Small crystals of gold are sometimes found in rhombic dodecahedra and octahedra, generally distorted, with bevelled edges and finely striated surfaces. Plates and scales are often found in the adjacent slate, but close examination always reveals the presence of minute films or threads of quartz traceable to the parent vein.

**Interbedded Veins.**—As has already been pointed out, the auriferous veins are found on domes, although in some few cases, as at the Richardson mine, they are found on the pitching parts of anticlines remote from domes. In such cases, however, conditions favourable for ore deposition have been brought about by a notable change in the angle of pitch, producing virtually a doming of the anticline that is not apparent at the surface.

The distribution of the veins on any particular dome is intimately related to the rock structure, and complexity is introduced by the unsymmetrical character of the domes. On sharp, closely folded anticlines, where the two limbs form an angle of less than 40 or fifty degrees, the veins are found close to the apex and curve over the anticline, forming a succession of superimposed saddles, similar to the "saddle-reefs" of Victoria, Australia. On broad folds, on the other hand, where the angle formed by the two limbs is over 45 degrees, the veins are found at a greater distance from the axis, but generally within the limit of curvature of the strata of the fold beyond which the dip ceases to increase and becomes uniform. If one end of a dome is flatter than the other, the veins at that end are further removed from the axis than at the other; and if veins occur on both limbs of a transversely unsymmetrical dome those on the limb with the higher angle of dip will be nearer the axis and more abundant than those on the limb with the lower dip. In many districts the veins are found on one limb only, and then they invariably occur on the limb with the higher dip, which is generally the south dip.

The interbedded veins have a more or less crescentic outcrop. On the sides of long domes, they form nearly straight lines, but finally curve with the strata around the apex of the fold, and some have been traced continuously around the end of the dome from one limb to the other. But generally the outcrops of veins form only small portions of elliptical curves, and these are most frequently arranged en echelon so that they lie in zones radiating from the centre of the dome and diverging more or less from the major axis according as the fold is broad or narrow. These zones are on those parts of the dome where the strata do not strike approximately parallel with the axis of the fold, but curve towards the axial line. In symmetrical domes, like that of Oldham, there may thus be four zones, and these four zones may be considered as merging into one another so as to favour the formation of veins, the outcrops of which form almost complete ellipses. In most districts, however, there are only two zones of veins, as at Waverley, where they may be regarded as merging into one to form saddles; and in some districts there is only one zone, as at South Uniacke.

*Extracts from article in Guide Book No. 1, published by the Geological Survey for the twelfth International Geological Congress, August, 1913.

Mining operations in several districts have shown that underlying the veins exposed at the surface are other parallel interbedded veins. Each district has thus a vein-bearing zone with a horizontal extent determined by the outcropping veins and with an indefinite vertical extent. In its vertical extension each zone is believed to be roughly parallel with the axial plane of the anticline. The distance of the exposed veins from the axis depends on the dip of the strata, and it is probable that the distance from the axial plane of any portion of the zone of veins extending into the earth is also dependent on the dip; if the fold gets sharper with depth, the zone of quartz veins probably approaches the axial plane, or if it flattens with depth, the zone of auriferous veins recedes from the axial plane.

**Corrugated Veins.**—Interstratified veins often exhibit a remarkable folded or corrugated structure within the beds of slate that contain them. The corrugations, or crenulations, usually occur at or near the apex of the anticline and sometimes in the syncline, and run parallel with one another and in a direction approximately parallel with the axis of the fold. At the apex of the fold the corrugations dip with the dip of the strata, which then corresponds to the pitch of the fold, but on each side of the apex they radiate more or less from the centre. The aptitude and interval of the folds generally vary with the thickness of the vein and of the enclosing bed of slate. Also the nearer the veins lie to the anticlinal axis the more pronounced these corrugations become. In some veins the folding has been so intense as to separate the quartz with disconnected rolled portions. The name "barrel" quartz has been given to the larger corrugations, because when such a corrugated deposit was first uncovered at Waverley, it looked to the miner like the back or top of barrels lying in rows.

Where one of the corrugations becomes enlarged or some part of a vein swells out and takes on some peculiar form extending for some distance in one direction, this portion of the veins is called a "roll." A roll is generally richer than other parts of the vein. Its position is usually dependent on some peculiarity of rock structure, such as some small subordinate crumple, some slight flexure in the beds indicating an incipient crumpling or some zone of fracturing. As such structures usually affect a great thickness of strata, a number of veins are affected by similar conditions and a roll in one vein is succeeded by similar rolls in the underlying or overlying veins. Series of such rolls are found in most districts and constitute one of the principal and more persistent forms of ore deposits.

**Thickness of Interbedded Veins.**—The thickness of the interbedded veins varies from a fraction of an inch to 20 feet (6 m.). The greater number may not be over an inch (25 cm.), but those that have been worked, generally vary from 3 to 18 inches (7 to 45 cm.). The largest veins are usually found on sharp anticlines in the shape of saddle veins. Saddle veins attain their maximum thickness at the apex of the fold and become thinner as they extend down on the limbs. Thus the Richardson saddle vein, while 20 feet (6 m.), thick at the apex thinned down to 6 feet (1.8 m.) at the 300-foot level. Some leads have been followed in depth several hundred feet with little or no decrease in size, but others have been found to pinch to a mere film and it is probable that nearly all of them pinch out at no great depth. The Dominion lead at Waverley was found to decrease from 15 inches (40 cm.) on the surface to a mere film of quartz with small lenticular pockets at 500 feet (150m.) and to be completely wanting at 600 feet (180m.).

Veins are frequently thickened by local disturbances, such as a bend, a crumple or a faulting of the strata.

Although leads show a great similarity and are very numerous, yet many of them possess a certain individuality, some peculiarity of colour, structure, lamination, distribution of sulphides, quantity or form of gold, serving to distinguish them from others of the same district.

**Cross or Fissure Veins.**—A few important veins cut across the strata for a considerable distance, and in some districts they form the principal auriferous deposits. These cross veins, often spoken of as fissures, sometimes curve and branch, contain inclusions of country rock, and have a gouge on the walls. All the most important are found on domes, generally cutting the main anticline at various angles. They occur chiefly in the Goldenville formation, but also in the Halifax formation, especially at the base. Seldom does a cross vein lie in the fault plane. In the case of the Cope lode of Central Rawdon and the Baker vein of Oldham, which are exceptions to this rule, the faults are probably younger than the veins.

The thickness of the cross veins is less regular than that of the interbedded veins, probably because they generally intersect alternating beds of different hardness. They do not attain great thickness, except sometimes at their intersection with interstratified leads, flexures or rolls. The mineral content is generally the same as that of the interbedded veins, but the laminated structure is wanting. In many cases the value of the gold extracted is much reduced by the presence of silver. At West Gore enough stibnite was found to form gold-antimony ore deposits of considerable value and extent.

**Bull Veins.**—There is another kind of vein differing from those already described. It may cross the strata or roughly lie in a stratification plane. It shows little or no trace of lamination, carries few metallic minerals and is composed of white crystalline quartz in which geodes with quartz crystals are sometimes found. These veins are usually thicker than the others, varying from one to several feet. They are not auriferous and are known as bull veins.

**Angulars**—Many of the main veins have branches passing into the foot or hanging wall. These branches are termed angular, and they play an important part in the ore deposition in certain veins. The point from which an angular passes from the main vein into the hanging wall is usually higher than that from which it passes into the foot wall, and the intervening portion of the vein is frequently thicker and richer than other portions. Their distribution and attitude are dependent on the structure of the dome. In some parts of a dome they may be numerous or completely absent; they may have a general strike and dip quite different from what is found in another part of the dome. In crossing the bedding, they generallly run nearly perpendicularly to the quartzite, but obliquely through the slate. In a closely folded anticline they are more numerous at or near the apex, where they often form a reticulated system of veins extending along the axial plane from one lode to an overlying or underlying one.

The quartz of the angulars differs from that of the main veins in being of a fine, granular texture, free from laminations.

(To be continued.)

# JEFFREY SHORTWALL MINING MACHINE

The principal parts of this machine may be grouped as follows: Motor, reserve switch, starting box, gearing, friction disc clutch, feed drum, retarding drum, cutter bar, truck and electric cable reel. All of these, with the exception of the truck and cable reel are insulated from the box and operating handle. The reverse switch (as the name implies), is used for obtaining two directions of rotation of the motor, for cutting in either direction and for operating the self-propelling truck.

The driving mechanism of the truck is supported by a bearing mounted on the rear of the truck and known as the sprocket and worm shaft bearing. It consists

**Figure 1. Illustrating the method in which the machine enters the room on its own truck**

mounted on a cast steel frame, known as the bed frame. The motor is mounted on the rear of the bed frame and is of the consequent pole type, having two series and two shunt coils. The armature is of the drum wound type and is mounted in a horizontal position. The motor is built either open or enclosed, and all of the late type are equipped with ball bearings on the armature shaft. The reverse switch is entirely enclosed. It consists of four stationary contacts mounted on a slate base and two movable contacts mounted on a heavy moulded insulation centre. All "live" parts are well

of two shafts, one in line with the armature shaft, and on which is mounted a clutch and worm. The other shaft is at right angles to this and on it is mounted a worm wheel and 6 tooth drive sprocket. The worm wheel is keyed to a sleeve mounted loose on the sprocket shaft and is driven by the worm mentioned above. The worm wheel also forms a housing for the friction disc clutch, which drives the sprocket shaft. The speed of the truck may be varied from 0 to 350 feet per minute and is regulated by the pressure applied on the discs. Trucks of former design were equipped with a jaw

**Figure 2. Illustrating method of sumping**

clutch in place of a friction disc clutch. The 6 tooth drive sprocket is connected by No. 152 steel roller chain making all four wheels drivers. A bank brake is used for stopping the truck, or controlling the speed on grades. It is operated by the same lever used for the friction disc clutch. With one movement of the lever the pressure is released from the discs and applied to the brake.

The machine is brought into the room on its own truck as is illustrated in Fig. 1.

The machine is unloaded by releasing the pin clutch on the truck which connects with the clutch on the end of the armature shaft, raising the jack arm (beneath the starting box), starting the motor and throwing the shifting lever to the right. This operation causes the clutch to engage with the clutch gear and gives the fast speed which is used for handling the machine.

Where the props are set close to the face, it is necessary to move the machine to the face before moving to the rib, using the idler sheave wheel hooked in the cutter bar in order to move the machine in limited space. The angle at which the machine is placed for making the sumping cut depends almost entirely upon the nature of the coal to be cut and the condition in which it is necessary to leave the rib. Under ordinary circumstances, the machine is placed at an angle of 30 degrees to the right hand rib, although in some places it may be placed at an equal distance between the face and rib.

The sumping cut is made by turning the eccentric to engage the pin clutch with the chain sprocket, and then starting the motor. The clutch shifting lever is then thrown to the left—this causes the clutch to engage with the clutch pinion and gives the slow speed which is used for cutting. As the cutter bar advances into coal, the machine will slowly swing toward the right hand rib. In some cases, however, this movement is so rapid that it is necessary to use the rope from the rear drum to retard the rear of the machine.

After the sumping cut is completed, preparations are made for cutting across the face. The feed rope is unwound from the drum and carried across to the left hand rib, where it is fastened to the bottom plate of a jack placed about 18 inches from the face of the coal. The retarding rope is fastened to the jack which was used for the feed rope while sumping.

In cutting across the face, the slow speed is used, which, as explained heretofore, is obtained by throwing the clutch shifting lever to the left. The retarding rope, which is controlled by the steed band on the drum, is used to hold the machine at the proper angle to the face.

# DESULPHURIZING SILVER ORES AT COBALT

Mr. James J. Denny, writing in the Mining and Scientific Press, gives the following account of the process of desulphurizing silver ores as worked out by him and now in use at the Nipissing low-grade mill. "In the fall of 1911 I undertook a series of experiments in connection with the projected Nipissing low-grade mill to test the possibilities of several proposed methods of treatment and to discover, if possible, an all-cyanidation process that would improve on the general practice.

"After a considerable amount of experimenting I found that my results varied greatly, and to determine the cause I ran separate tests on the principal silver-bearing veins. My experiments showed that while some veins gave excellent results by ordinary cyanidation methods, the tailing from the treatment of other veins was persistently high, owing to the presence of varying amounts of the complex minerals, pyrargyrite, tetrahedrite, pronstite, dyscrasite, and argentite. Some of the veins on the Nipissing property contain considerable amounts of these minerals, and my experiments were therefore directed to discover some inexpensive chemical or electrical process for breaking up these refractory compounds and so rendering them amenable to cyanidation. Working along these lines, I finally discovered that all of these minerals excepting dyscrasite were readily decomposed into their respective elements when brought into direct contact with aluminum in an alkaline solution. This preliminary reducing treatment left the silver in a spongy metallic state and when followed by the usual cyanidation process the results were found to be very satisfactory.

"By the preliminary treatment the silver, and in part at least, the antimony and arsenic, are reduced to the metallic state, and are so found. The reduction is accomplished by the nascent hydrogen resulting from the action of caustic soda on the aluminum according to the following equation:

(1) $2Al+2NaOH+2H_2O=Na_2Al_2O_4+6H.$

The probable reactions involved in complete reduction are indicated by the following equations:

(2) Argentite.

$$6H + 3Ag_2S + 6NaOH = 3Na_2S + 6H_2O + 6Ag$$

(3) Pyrargyrite.

$$6H+Ag_3SbS_3+6NaOH=3Na_2S+6H_2O+3Ag+Sb$$

(4) Proustite.

$$6H+Ag_3AsS_3+6NaOH=3Na_2S+6H_2O+3Ag+As.$$

The reactions being reversible, probably the arsenic and antimony are not completely reduced to the metallic state in practice, and the investigation of the subject is rendered difficult by reason of secondary reactions by which the arsenic and antimony are possibly redissolved to form arsenates and antimonates by the excess caustic of the reducing solution, and the protective alkili of the cyaniding solution. The working solution shows the presence of these compounds, "but in practice they are found to have no detrimental effect either in the reducing or the cyaniding treatments. The solution assays, antimony 0.0084% and arsenic 0.026 per cent.

"I then undertook a large number of tests on a commercial scale, using ordinary run-of-mine ore to determine the following points: (a) the effect of the reducing treatment; (b) the time of treatment; (c) the degree of comminution required to give the best economic results.

"These results show clearly that on the run-of-mine ore the desulphurizing treatment raises the extraction appreciably and greatly reduces time. These and similar experiments establish the efficacy of the desulphurizing process and point to 48 hours as the most economic time of treatment.

"It was early apparent in this preliminary investigation that extremely fine grinding was absolutely essential to give a high extraction in the desired time (48 hours), and this fact has been substantiated by many later experiments.

"The method of treatment as outlined above was immediately put into practice at the Nipissing low-grade mill on the recommendation of Charles Butters, the consulting engineer."

# THE DISASTROUS EXPLOSION AT THE UNIVERSAL COLLIERY (SOUTH WALES)*

So terrible is the disaster at the Universal Colliery, which lies near a tributary of the Rhymney, amongst the barren hills of East Glamorganshire, that the whole industry must be reduced to a numbed silence. The immensity of this calamity—the greatest, numerically, that has ever visited the British coalfields—coming at a time when science has half promised us that to-morrow shall see the end of all colliery explosions, stuns and bewilders. Pity and grief for the time must be supreme; but the energy and heroism of the rescuers, some of the best stuff that Wales possesses, give the first trumpet call to renew the battle, and, whatever errors may lie hidden for the present with the dead men behind the wall of fire at Senghenydd, we can at least hope that they may direct us nearer the truth, and so be the means of saving generations of pitmen yet to come.

Below is given a list of the most serious explosions that have occurred in British Collieries since 1851:

| Mine. Date of Explosion. | No. of Deaths. |
|---|---|
| Ince Hall, Lancashire, Feb. 18, 1854 | 89 |
| Cymmer, South Wales, July 15, 1856 | 114 |
| Lund Hill, Yorkshire, Feb. 19, 1857 | 189 |
| Burradon, Northumberland, March 2, 1860 | 76 |
| Risca, South Wales, Dec. 1, 1860 | 142 |
| Oaks, Yorkshire, Dec. 12, 1866 | 361 |
| Talk-o'-the-Hill, Staffordshire, Dec. 13, 1866 | 91 |
| Ferndale, South Wales, Nov. 8, 1867 | 178 |
| Moss Pit, Lancashire, Sept. 6, 1871 | 70 |
| Swaithe Main, Yorkshire, Dec. 6, 1875 | 143 |
| Blantyre, Lanarkshire, Oct. 22, 1877 | 207 |
| Haywood Wood, Lancashire, June 7, 1878 | 189 |
| Abercarn, South Wales, Sept. 11, 1878 | 268 |
| Risca, South Wales, July 15, 1880 | 120 |
| Seaham, Durham, Sept. 8, 1880 | 164 |
| Naval, South Wales, Dec. 10, 1880 | 101 |
| Trimdon Grange, Durham, Feb. 16, 1882 | 74 |
| Clifton Hall, Lancashire, June 18, 1885 | 178 |
| Mardy, South Wales, Dec. 23, 1885 | 81 |
| Udston, Lanarkshire, May 28, 1887 | 73 |
| Llanerch, South Wales, Feb. 6, 1890 | 176 |
| Morfa, South Wales, March 10, 1890 | 87 |
| Park Slip, South Wales, Aug. 26, 1892 | 112 |
| Thornhill, Yorkshire, July 4, 1893 | 139 |
| Albion, South Wales, June 23, 1894 | 290 |
| Universal, South Wales, May 24, 1901 | 81 |
| National, South Wales, July 11, 1905 | 119 |
| Maypole, Lancashire, Aug. 18, 1908 | 75 |
| West Stanley, Durham, Feb. 17, 1909 | 167 |
| Whitehaven, Cumberland, May 11, 1910 | 136 |
| Hulton, Lancashire, Dec. 21, 1910 | 344 |
| Cadeby, Yorkshire, July 9, 1912 | 87 |
| Universal, South Wales, Oct. 14, 1913 | 427 |

It will be seen that this ill-fated colliery has already been the scene of a disastrous explosion, which occurred in the early morning of May 24, 1901. That explosion was even more violent than the last, practically every part of the workings being penetrated, and 81 of the 82 men at work in the pit at the time were killed. In the light of after events it is a notable fact that Prof. William Galloway, who made a report following the explosion, urged that it was a conspicuous example of a coaldust explosion. He says:

"The intake airways contained pure air and inflammable coaldust, but no firedamp; the return airways contained air mixed with all the firedamp produced in the workings, and uninflammable stonedust, but no coaldust; and as the return airways, speaking generally, were untouched by the explosion, the conclusion that the coaldust when mixed with air played the part of an inflammable quasi-gas in the explosion seems to be irrefragible."

He added: "It is evident that an explosion of coaldust in a confined space like the workings of a mine is of a totally different nature from the conceptions of it that have been published from time to time both in this country and on the Continent."

Prof. Galloway considered that the explosion was due to a shot igniting coaldust, but no very positive evidence was available. At the same time he pointed to the dry and dusty condition of the mine, and particularly called attention to the faulty construction of the trams. The jury added a rider to their verdict asking that Parliament should make watering compulsory in all mines of this character.

Read now, after the lapse of 12 years, these quotations from Prof. Galloway's report give food for thought. Have we travelled very far in that time? It is a question which we scarcely care to answer. The original cause of Tuesday's explosion cannot yet be even surmised, but there is abundant evidence that, if coaldust was not ignited in the first instance, it was largely responsible for the propagation. The course of the explosion wave against the current is a familiar phenomenon of coaldust explosions, and the impressions of survivors within the area are consistent with the supposition. Why the force of the explosion emerged with such violence up the downcast instead of traversing the eastern workings has yet to be explained; it may have been due to the condition of the roadways, or again to some of those divergent forces which have been studied so carefully by the French investigators. This divagation of the explosive wave to the upper air, at any rate, probably saved the lives of half the men in the pit.

It has never been the policy of the Colliery Guardian to hazard reckless opinions as to the cause or incidents of an explosion upon the morrow of its occurrence. Such speculations should always be left until the facts are ascertained. There are many points upon which it will be of great interest to have information in the present case—such as the steps that had been taken at this colliery to prevent or mitigate explosions and their efficacy in the light of actual experience; the utility of the breathing appliances employed in the work of recovery; the bearing of the accident upon such latter-day questions as the reversal of the air current, the construction of stoppings, etc. It seems probable that the condition of the mine may afford valuable evidence on all these subjects, to the ultimate advantage of all those whose livelihood is bound up with the getting of coal.

We cannot pass from this phase of the Universal explosion without remarking that once again the upholders of the high-barometer theory are claiming its substantiation. On this occasion they are guilty of a definite misstatement of fact. Any of our readers who care to examine the weather charts for the past week will see that for some time prior to Tuesday a low-pressure system was advancing from Iceland towards these islands after a period of tolerably high barometer. To say, as does the Morning Post, that "at the time of the explosion the barometer was declining

*From the Colliery Guardian.

slowly at the scene of the accident, but it was still as high as 30¼in. over the estuary of the Severn, a height considerably above the normal for the district," is directly to ignore the fact, well known to mariners and others for whom the barometer is more than a toy, that it is not the height but the tendency of the mercury column that matters. Of course, we do not go to the extremes of our contemporary and conclude summarily that this falling glass in itself was the cause of the Senghenydd explosion, but possibly it formed a link in a chain of coincidences.

It may at once be stated that, in this case, shot-firing can be removed from the list of suspects, as blasting was only carried out at week-ends. The explosion appears to have been strictly limited in its effect, so that had it not been for the outbreak of fire before the rescue parties could reach the working faces, it is probable that accurate data would even now be in the possession of the experts. This malignant fire seems to have selected a site of all the most unfortunate, effectually barring entrance to a wide network of workings beyond; it does appear, indeed, that after we arrive at the point when it is possible to control the dynamic consequences of an explosion, we have still an even more potent enemy in fire. In every disaster of recent years—Whitehaven, Hulton, Cadeby Main and Cadder—the fire element has been predominant. This seems to indicate the absolute necessity of preventing the initial ignition, instead of setting dubious traps to ensnare the explosive wave after it has started on its errand of death. Further, it is becoming increasingly obvious that if the trained rescue brigade is to fulfil its natural function, it must be better equipped for dealing with the fire peril. In this way, experience is once more bringing us back to original intentions.

# THE MINE SURVEYOR*

By Alex. Richardson, M. Inst. M. M.

Mine surveying is to-day recognized throughout the Union as a distinct profession. This recognition is partly due to the increased responsibility attaching to the work through the magnitude and systematic organization of modern mining operations, but mainly owing to its being necessary for mine plans to be signed by a certificated mine surveyor before the Government will officially accept them. Now every profession has its own characteristic scope, and calls for special skill in certain directions; and it is therefore desirable that anyone who aims at becoming a surveyor should devote particular attention to those lines of study which have a direct bearing on his work. With the object of assisting students of surveying, or those just beginning as assistants on the mines, to form an idea of the knowledge that will be required of them, I have drawn up a concise syllabus embracing those subjects which experience has shown me require closer attention than others.

**Arithmetic.**—Addition, subtraction, multiplication, and division; their tabulation, short cuts, abridged methods and checks. Greatest common measure. Least common multiple. Fractions. Decimals; rough tests for checking the position of the decimal point. Alligation. Square and cube measure. Ratio, proportion, and rule of three. Application of the terms average and per cent. Square root. Calculation of numerical values from simple formulae. Weights and measures.

**Algebra.**—Addition, subtraction, multiplication, and division. Brackets. Fractions, Factorisations, Indices. Transformation and simplication of formulae. Simple, simultaneous, and quadratic equations.

**Geometry and Mensuration.**—The theorems, problems, and corollaries of Euclid, books 1 to 4, 6 and 11, but not with strict adherence to the Euclidian order and method. Scales. Drawing to scale. Problems relating to lines, circles and plane figures. Location by rectangular co-ordinates. Projection of points and lines. Projection of plane figures on inclined planes. Line plane and plane. Areas of plane figures with rectilinear and curvilinear boundaries. Areas of surface of solids. Volumes of regular solids. Volumes of excavations, embankments and irregular solids. Density and relative density. Capacities and weights of structures. Use of planimeter. Measurement of quantities from plans. Measuring quantities and extending in schedule form.

**Trigonometry.**—Measurement of angles. Trigonometrical ratios. Application of algebraical signs. Trigonometrical ratios of two angles. Formulae for the division of angles. Relation between the sides of a triangle and the trigonometrical functions of the angles. Transformation and reduction of trigonometrical expressions. Logarithms. Mathematical tables. Properties of triangles. Solution of triangles. Measurement of heights and distances.

**Geology and Mineralogy.**—The external and internal forces effecting changes in the earth's crust, and the processes of disintegration, transportation, and deposition. Laws of stratification. Subsequent features; jointing, inclination, folding, and faulting. Sedimentary, metamorphic and igneous rocks; their formation, characters, and modes of occurrence. The simpler forms of ore deposits. Common rock-forming minerals. Methods of determining the strike and dip of strata, faults, dikes, and veins. Dip and strike problems. Faults and fault problems. Methods of physical and chemical examination by which minerals and rocks can best be identified in the field and in the laboratory. Geological sketch mapping and section drawing. Preparation of geological reports.

## MINE VALUATION.

Careful and systematic methods of sampling, booking, and preparing the sample for assay. Correct sampling procedure to adopt in difficult or unusual cases. Preparation of well arranged written or graphic records for easy reference. Right and wrong ways of averaging, and a clear understanding of the principles involved. Calculation of stoping and milling widths, tonnages, and values, of the ore reserves of a mine. Incidence of stoping width and sorting on the yield, working cost, and profit.

## SURVEYING.

Use of the steel tape in ordinary and precise work. The transit theodolite, its types, construction, adjustment, care, and use. Field books and methods of book

*From Presidential address, Chemical Metallurgical and Mining Society of South Africa.

ing. Sources of error. Prevention and elimination of error, instrumental or otherwise. Degree of accuracy required in different classes of work, and the simplest ways of obtaining it. Co-ordinates, their calculation and application. Problems and exercises in the use of co-ordinates. Traversing with the theodolite. Minor triangulation. Connecting surface and underground. Dumpy and wye levels, their construction, adjustment, care, and use. Levelling. Tacheometric surveying and levelling. Setting out above and below ground. Contouring. Sketching. Overcoming obstacles inseparable from underground surveying. Development and stope measurement. Concise methods of south African survey practice. Inclusive checks for the detection of error in instrumental, booking, calculating, and plotting work. Lettering, and general draughtsmanship. Enlarging and reducing plans, tracing, and blue printing. Supreme importance of accuracy in all departments of survey work.

### MISCELLANEOUS.

Manipulation of calculating machines. Methods of statistical presentation. Sufficient knowledge of structural design for the preparation of plans, specifications, and quantities relating to the simpler forms of foundations, dams, buildings, etc. Use of technical books and periodicals. Collection of significent data, and the compilation of reports. Ordinary mining methods and mining routine.

You will notice that, in the foregoing syllabus, I have made mention of several elementary divisions to which reference might seem to be more fittingly made in the prospectus of a preparatory school. I have included them because I wish to draw attention to the desirability of acquiring a more specialized knowledge of such simple processes than the average school or college course enables one to obtain. It is not common, for instance, to find, outside of financial circles, men who can cast long columns of figures with accuracy and despatch, or who are acquainted with the many time-saving arithmetical devices of the expert computer; and the mine surveyor will find that familiarity with such matters will ease his work considerably. Several things, such as the determination of azimuth from the sun or stars, the microscopical identification of rocks from thin sections, etc., I have omitted from my list because they come outside his ordinary work; but at the same time, he will be all the better equipped for any emergency if he knows how to carry them out.

Having now dealt with the training of the mine surveyor, I shall, following the practice of historians, skip a few uneventful years, and take up his work at a point where, after obtaining his certificate, he has been appointed to a producing mine of moderate size. On entering on his duties, his first care will be to ascertain what plans are in existence, and if they have been prepared in accordance with the government regulations, and that sufficient essential data exist to enable him to carry on and bring them up to date. Should the plans be much in arrear, he will proceed with the underground survey first; but before doing so he will assure himself that the instruments with which he is to work are in proper order and adjustment. In carrying out this extension of the underground survey, he will on each level begin several stations in from the last available one, and so, by overlapping, check the work of his predecessor at several points. While this work is proceeding, he will attend to any matters of urgency that crop up, such as giving lines for developers to work to, measuring up contract work, and so forth. The surface plan will then engage his attention, and, in addition to surveying in recent additional works, he may have occasion to check the position of some of the beacons by means of minor triangulation. At all times and seasons, his services will be in danger of being requisitioned by the engineer, to mark out sites, give centre lines and levels for construction work, measure up contract masonry and earthwork, and, generally, to attend to various matters appertaining to the office of clerk of works. He will also peg out and give levels for some tennis courts, and find out how few laps to the mile the sports ground will conveniently accommodate. The plotting of additional survey and geological data will always be in progress, as will also be the recording of development values and general mine sampling results. Special plans will have to be prepared from time to time for the Mines Department, consulting engineer, municipality, insurance company, and others. He will also be expected to make a thorough study of the faults and dikes in the mine, in order that he may assist the manager in correlating them, determining their course, and in forecasting the conditions likely to obtain in the lower levels, so that development may be planned out without incurring the risk of disagreeable surprises. The measuring of contract stope and development faces will necessitate the expenditure of much pedestrian energy, and require close application at the end of the month; and in the pursuance of this arduous duty something will be learnt of the value of tact and patience as neutralizers of acerbity. Once every year, at least, the ore reserves of the mine will have to be recalculated, and this work will call for considerable judgment in determining which blocks may be legitimately classed as developed, the stoping widths likely to be obtained in breaking the ground, the best way of arriving at the value of those blocks whose peripheries have been irregularly or incompletely sampled, and in estimating the value of many other factors not amenable to rule. He will, if ambitious, keep the mine manager's certificate and the mine manager's position in view, and endeavour, by taking an active interest, if possible participation, in every phase of underground work; with a studious regard for the surface departments, to qualify himself for taking control of the mine should it ever become his privilege to do so.

## LABOUR AND CAPITAL

It is very much the fashion nowadays, even with those of otherwise sane judgment, to speak of capital invariably as the villain of the piece and labour as the long suffering, exploited hero. There is as little common sense in this attitude of mind as there would be in considering the right hand and the left as irreconcilable enemies. In fact, each is indispensable to each, and harm to the one inevitably reacts on the other. In the history of capital there are many dark pages; but will any fair-minded judge affirm that the book of labour is unstained? Long ago it has passed into an axiom among captains of industry that high wages, good conditions, security of employment, and shorter hours are a sine qua non of the best production. As civilization progresses these things grow increasingly evident, and only doctrinaires, fanatics, and self-seeking demagogues will deny them. But all this, like all natural processes, is slow in growth, and your enthusiast, who would build Rome in a day, cannot wait for its realization. He is impatient for the millennium and cares not greatly through what disasters he travels to attain it. After all, it is his dupes who suffer when they discover that the earthly paradise has a disturbing affinity with the poorhouse.

# THE NANAIMO STRIKE

The Daily Colonist, Victoria, publishes the following account of the sentencing of men found guilty of rioting in connection with the U. M. W. A. strike on Vancouver Island:—

In passing sentences, His Honour said: "It is the custom when sentences are given that the judge make but little comment thereon, but in this case I am going to depart from the usual custom, for these cases are out of the ordinary, and call for a few remarks from me. Let me say to you men, before going any further, that you have been well defended, and this has been shown not only in the handling of your cases, but in the selection of those of you who pleaded guilty or not guilty. Your counsel has said all that could be said, and if I have found you guilty it is not because your counsel has erred, but because you have woven around you a net of circumstances beyond the power of any counsel to untangle.

"This was not an ordinary riot. It was not a sudden ebullition of pent-up feeling, but it shows all down the line a deliberate scheme, a design from one end to the other. The riots at Nanaimo, South Wellington, Extension and Ladysmith were all for one purpose, were simultaneous and carried out with one line of action. Bombs were thrown, property destroyed and peaceful citizens made to flee for their lives, and a persistent state of terrorism indulged in. After the bomb-throwing at the Temperance Hotel, parades were formed, evidently for the purpose of showing your numerical strength, and that you were in charge of the situation.

"After this, mobs ran at large all over the city, picking out various houses and stoning them. Then, later on, another mob or two went around on what they termed a 'peace mission,' but which really meant that a band of lawless citizens went around ordering peaceful citizens out of town at the risk of their lives. And these people had a right to work as you had. Anything less than this is mob rule.

"Your counsel has made to me various pleas. He has told me that many of you pleaded guilty, and that this is a factor which must be taken in consideration. I have looked over your faces to see if I could see any sign of sorrow or repentance for what you have done, but I fail to find one man among you to express sorrow for his lawless act.

"Your counsel knows there is no more sympathetic man than myself, one ever ready to extend mercy, but I have read over all the depositions and find but little mercy you have shown. I read where homes in which there was sickness were not free from missiles which you threw, and little children hid in cupboards and under beds to escape rocks thrown upon them in merciless fusilade. The only time any mercy was shown was when one of you said: 'Don't throw a rock at that house; there is measles there,' and when the cowardly bombs were thrown at the Temperance Hotel and at the home of Alex. McKinnon, the only mercy shown was the mercy of God.

"I was appealed to on behalf of your wives and children, but what do I find here? I find your women singing, 'Drive the scabs away,' and throwing rocks themselves, and these actions take away very much of the strength of the appeal for mercy on your behalf because of your women. The evidence shows not only a riot here, but that a far more serious charge might have been laid against you.

"I recognize I have a duty to perform, painful in the extreme, but the law-abiding people in this community must be protected and punishment meted out, so that there may be no further occurrence of these lawless riots.

"I have arranged you into three lists according to your degree of guilt.

"In the first list are Paul Deconich, Samuel Guthrie, John Morgan, William Simpson, jr., and Joshua John Taylor. The maximum penalty for rioting is two years. I have gone down the line, through the depositions, and find Guthrie and Taylor to be the leaders, to be fomentors and not peacemakers, in a determination to carry out an illegal purpose. Deconich, Morgan and Simpson, while not leaders in the rioting, the evidence showed you in this thing from beginning to end, and I see no reason why I should give you any clemency on account of your age, and I will therefore sentence you all five to a term of two years in the penitentiary, the sentences to date from now.

"In the second list I have placed John Ollsopp, jr., J. H. Armstrong, Charles Axelson, William Bauld, George Bombero, Sam Brightman, James Colley, Robert Cossar, Peter Galuska, H. H. Langdon, Duncan McKenzie, John McKenzie, Joseph Mairs, jr., James Marshall, Charles Mortimer, Steve Mrus, Steve Puyanich, George Portray, William Stackhouse, Martin Slogar, James Wallace, Robert Walkinshaw and Charles Yoga. I do not find you men as deeply involved as the ringleaders, but you were engaged in the work of destruction, and the sentence of the court is one year's imprisonment and a fine of $100, or, in default, four months.

"In the third list are Henry Dyer, John Fisher, Ernest James, Alvar Kotilla, Richard Morgan, sr., William Paterson, William Sterling, John Scott, Henry Taylor, Richard Whisker, and Edward Williams. I find you men not to be involved very deeply, and the sentence of the court is three months in jail and a fine of $50, or, in default, two months.

"Dyer, you were shown to be badly mixed up in this affair, but you were the only one who told me the truth when I asked for a statement from the accused, and when the work of destruction was going on, you were the only one who had any sympathy in your heart for the victims of the mob's vengeance."

Mr. Leighton, counsel for the prisoners, submitted that His Honour should consider the length of time the men had already served, and make the sentences date from the day of arrest, which request His Honour granted.

Concluding his remarks, Judge Howay said: "In conclusion, I want to say this is the most painful matter I have ever undertaken, and if I were to consider my own feelings this is the last thing I would wish to do. But in my position I must recognize the community as a whole, and I feel, and I believe, the public will feel, that I have exercised an extremely fair tempering of justice with mercy. I wish to thank the officers of the militia and the court officials for their kindness and services during the progress of these trials."

The court thereupon adjourned.

---

The satisfaction which all law-abiding citizens must feel at the vindication of law and justice and at the dignified and merciful manner with which they have been administered in the case of the Nanaimo strikers, is tempered with a feeling of regret, amounting to sadness, that so many men habitually peaceable and law-abiding, who under ordinary circumstances could not be induced to overstep the bounds of reason and moderation, should have been brought within the clutches of the law. There is little satisfaction at any time in meting out punishment to men who are not habitually criminal and while there may have been no alterative in the present case, there is no doubt that Judge Howay spoke truly when he said that he had never been called upon to perform a more painful duty. The feeling of sadness is deepened when one reflects on the occupation of these men, an occupation at all times hazardous, the only occupation which deprives its followers of at least eight hours daylight every day and compels them to toil in Cimmerian darkness. Not only are miners at the mercy of the natural elements and natural laws, but they are only too often the victims of the oversight and carelessness of officials or of their fellow workmen.

There is no class of workers in the world which has so seized upon the popular imagination, which has so aroused popular sympathy, or which has written its history more indelibly on the pages of industrial records by deeds of valour unexcelled on the battle-field. Then perhaps, there is the last consideration that these men are engaged in a perilous calling in order that their more fortunate fellows, whose occupation is both lighter and pleasanter, may be furnished with one of the prime necessaries of life. That half a hundred of such men should have to be punished by terms of imprisonment because in a mad moment they followed the advice of unscrupulous leaders must ever be a matter for regret.

Now that the law has had its "pound of flesh" and bitterness has been brought into many a home, it is surely time to consider whether some means cannot be devised for preventing the recurrence of what is nothing short of a social calamity. It is true that the remedy rests to a large extent in the hands of the miners themselves. No plea can justify acts of violence, but there were many circumstances which tended to provoke the recent uprising and which without mitigating its illegality render the consequences less worthy of censure than if there had been no provocation. All men have to suffer for their own ignorance and folly and coal miners cannot be exempt from this natural law. They cannot be compelled to choose wise counsellors and honest leaders, but if it be possible to devise any means, legislative or otherwise, to limit the possibilities of such unscrupulous leadership as has brought the Nanaimo strikers to the recent pass, it should be done without delay. The miners are not so ignorant that they cannot learn a lesson. It may have to be knocked into them by many hard blows, of which the Nanaimo strike is one of the hardest on record, but now that is a thing of the past there is room for mediation and conciliation, not of the stereotyped class, but of the kind which honestly seeks to help those who cannot help themselves and who at ordinary times are amenable to reason. The Week puts forward a plea for more sympathetic consideration of the coal miners' claims without for one moment receding from the position it has always taken in condemnation of their excesses during the recent strike. It goes further, and urges that such an attitude is necessary if the future of coal mining on Vancouver Island is to be peaceable and profitable.—The Week, Victoria, B.C.

## IRON IN 1913

The American Iron & Steel Association reports that the production of pig iron in Canada in the first six months of 1913, including ferrosilicon and ferrophosphorus, amounted to 545,981 gross tons. The output in the whole of 1912 was 912,787 tons. The production of pig iron in the two halves of 1912 is not available. Of the total in the first six months, 532,431 tons were made with coke and 13,550 tons with charcoal, coke and electricity, etc. The production of basic pig iron in Canada in the first half of 1913 amounted to 292,625 tons, bessemer pig iron to 125,052 tons, and foundry pig iron, ferrosilicon, ferrophosphorus, etc., to 128,304 tons. Forge pig iron was not reported. Of the 545,981 tons of pig iron produced, 345,810 tons were delivered to mixers, openhearth furnaces, etc., in a molten condition, 141,680 tons were sand cast, and 58,491 tons were machine cast.

On June 30, 1913, Canada had 20 completed blast furnaces, of which 13 were in blast and seven were idle. Of the total 16 furnaces usually use coke for fuel and four use charcoal. In the first half of 1913 two plants made ferrosilicon and ferrophosphorus in electric furnaces. During the first six months of 1913 the number of furnaces actually in blast during a part or the whole of the period was 15, of which 14 used coke for fuel and one used charcoal. The average number of days the 15 furnaces ran was 167.6, which would give an average make per furnace day of 217 tons.

One entirely new furnace was completed in Canada during the first six months of 1913, No. 7 coke furnace of the Dominion Iron & Steel Co., at Sydney, Cape Breton, Nova Scotia, which was first blown in on May 22. It has an annual capacity of 91,250 tons of basic pig iron.

Two blast furnaces were being built in the Dominion on June 30. One of these furnaces will be operated by the Canadian Furnace Co., Ltd., at Port Colborne, Ont. When completed it will be 85 x 19½ ft. and will have an annual capacity of about 125,000 gross tons of bessemer, foundry and malleable pig iron. Lake Superior ore and Connellsville coke will be used. It is almost ready to blow in. The other furnace is being built at Parry Sound, Ont., by the Standard Iron Co., Ltd., of Montreal. When completed it will be 60 x 12 ft. and will have an annual capacity of about 36,000 gross tons. Charcoal will be used for fuel. Hematite and magnetite ores from Michigan and Ontario will be used. The Standard Iron Co. also operates a charcoal furnace at Deseronto, in Ontario. The annual capacity of the 20 completed blast furnaces on June 30, 1913, was 1,391,550 gross tons, and of the two building furnaces 161,000 tons, a total of 1,552,550 tons.

## MEETING OF TORONTO BRANCH, CANADIAN MINING INSTITUTE.

A meeting of the Toronto branch of the Canadian Mining Institute was held at the Engineers' Club on Saturday, Nov. 8. The reports of Chairman Jas. McEvoy and Secretary A. G. Burrows were presented. A. M. Hay was chosen chairman for the ensuing year and R. E. Hore secretary. The executive committee is composed of D. A. Dunlap, G. C. Bateman, C. E. Smith, W. F. Ferrier, A. J. Young, J. M. Clark, W. G. Miller, J. C. Murray and H. E. T. Haultain.

The chief topic discussed was that of securing permanent headquarters for the Institute. It was announced that friends are willing to make liberal donations for the purpose.

# PERSONAL AND GENERAL

Dr. F. H. Hatch has been elected President of the Institution of Mining and Metallurgy for the forthcoming year.

Mr. Geo. Watkin Evans, consulting coal mining engineer of Seattle, has completed the examination of the Matanuska coal field of Alaska for the United States navy. Mr. Evans will soon resume his private practice in Seattle.

Mr. Julius M. Cohen has resigned his position with Graphite, Limited, St. Remi d'Amherst, Que., to accept the position of assistant manager with the Porcupine Crown Mines, Limited, Porcupine, Ont.

Mr. W. F. Battersby has been appointed mill superintendent at the Dome, South Porcupine, succeeding Mr. Languth, who is giving all his time to the construction work in connection with the additions being made to the present mill.

The Western Mining Directory Company, Denver, Col., is preparing a 1914 edition of the International Mining Manual.

Mr. Jas. Ashworth addressed the Vancouver, B.C., Chamber of Mines on November 3 on "Notes on the Coalfields of the Coast Inspection District of British Columbia."

Mr. T. Walter Beam has returned to Denver, Colorado, U.S.A., after having spent the summer and autumn in Camp Hedley, in charge of the diamond drill operations of the New York Syndicate No. 2, which has under option of purchase a group of mineral claims in the vicinity of Hedley, Similkameen, B.C.

Mr. Melbourne Bailey, of Barkerville, B.C., manager of the John Hopp hydraulic placer-gold mines in Cariboo district, was in Victoria for several days in October, where he was a witness in a water-record dispute case that was before the Supreme Court.

Mr. Chas. F. Caldwell, managing director of the Utica Mining Co., of Kaslo, B.C., was in Winnipeg, Manitoba, last month, in connection with transportation difficulties during the reconstruction by the Canadian Pacific Railway Co. of the Kaslo & Slocan Railway, upon which the Utica mine depends for transportation facilities.

Mr. W. A. Carlyle has gone to South Africa.

Mr. Patrick Clark, of Spokane, Washington, U.S.A., who holds a comparatively small proportion of the shares in the Standard Silver-Lead Mining Co., was at the company's mine and concentrating mill, near Slocan Lake, B.C., last month.

Mr. E. J. Conway is in charge of the camp the Granby Consolidated M., S. & P. Co. has established at Swamp point, near Maple bay, Portland canal, in the vicinity of which are some large deposits of limestone on claims purchased by the company in case lime flux shall be needed when the company's blast furnaces shall be running at Anyox, Observatory inlet, a towing distance of 65 miles.

Mr. H. W. DuBois, of Philadelphia, has been investigating a prospective water power on an arm of Quesnel lake, Cariboo district, B.C.

Mr. D. B. Dowling, of the Geological Survey of Canada, left Ottawa on October 23 for the Okotoks district, south of Calgary, Alberta, to make investigations there in connection with the reported recent encountering of oil in a bore in that part of the country.

The death was announced last month of Mr. W. M. Doull, of Montreal, who was associated with the mining and smelting industries of British Columbia through his connection, as president, with the West Kootenay Power & Light Co., which supplies electric power to several of the larger companies engaged in mining and smelting in that province. Mr. Chas. R. Hosmer has succeeded Mr. Doull as president of the Power Company.

Mr. Geo. E. Farish, for some time manager of the Motherlode Sheep Creek Mining Co., operating a gold mine and stamp mill in Nelson mining division, B.C., in which enterprise several Ontario capitalists are largely interested, recently left Nelson for San Francisco.

Mr. Irving R. Gard, for nearly three years engineer in charge of the drafting room of the Canadian Collieries (Dunsmuir), Ltd., at Victoria, B.C., recently left that city for the United States, the important engineering works in hand during the period mentioned having now been advanced nearly to completion. It is probable Kentucky will be the next scene of Mr. Gard's professional activities.

Mr. A. B. W. Hodges, for years local manager in Boundary district of British Columbia for the Granby Consolidated M., S. & P. Co., and afterwards general manager for the Cerro de Pasco Mining Co., at Lima, Peru, has opened a consulting engineering office in Los Angeles, California.

Mr. John Hopp was last month successful in defending his right to the use of water from the upper part of Lightning creek, Cariboo, which right had been disputed by Mr. L. A. Bonner, representing an English company that is engaged in a venture having for its chief object working old river channels for placer gold. Twice part of Mr. Hopp's Lowhee ditch was destroyed by dynamite for which offence Mr. Bonner was sent to jail. During recent months water gates have been surreptitiously opened and the water run to waste. Possibly Mr. Hopp's use of the water will not again be interfered with, but this remains to be seen.

Mr. Ernest Levy, representing in British Columbia Messrs. Alexander Hill & Stewart, of London, engineers in charge of the operation of the mines of the Le Roi No. 2, Ltd., at Rossland, and the Van-Roi Mining Co., in Slocan Lake district, recently spent a week examining mineral claims on Rocher Deboule mountain, in Skeena district, in which Old Country people are interested.

Mr. Oscar Lachmund, general manager for the British Columbia Copper Co., Ltd., has returned to Greenwood, Boundary district, from a visit to the company's headquarters office, in New York.

Mr. Chester F. Lee, of Seattle, Washington, U.S.A., has been examining ground covered by placer-gold leases and extending some ten miles up Similkameen river from Princeton, B.C.

Mr. W. A. McDonald has been appointed manager for the new owners of coal lands on which the Columbia Coal & Coke Co., of Winnipeg, Manitoba, during recent years expended a comparatively large sum of money in doing work that proved of little value in the direction of developing commercial coal. Under the new auspices, exploration and development work will be done on parts of the property believed to give promise of much better results from a coal-mining point of view, while townsite exploitation will be relegated to the background.

Mr. I. L. Merrill, president of the Hedley Gold Mining Co., during October, paid another visit to the company's gold mines and 40-stamp mill, in Camp Hedley, Similkameen, B.C. Other directors of the company were also there. Besides looking through the mine under the guidance of Mr. G. P. Jones, general superintendent, Mr. Merrill gave his attention on the spot to matters connected with the development of additional hydro-electric power preliminary to considerably enlarging the output of ore from the company's Nickel Plate group of mines in which the proved ore reserve at the close of the last fiscal year was estimated at more than 400,000 tons of an average assay value of $11.35 a ton.

Mr. G. J. Milton, manager of the Tantalus coal mine, Yukon Territory, was one of a number of mining men from the North who left the Yukon late in the autumn to spend a winter vacation on "the outside."

Mr. G. W. Otterson, manager for the Kildare Co. on Slate creek, in the Omineca River district of British Columbia, has completed his season's placer-gold mining work and left the district for Ottawa, to report results to his principals.

Mr. H. Peploe Pearse was in Victoria at the end of October from Birch creek, Atlin camp, in which part of British Columbia he has been in charge of hydraulic placer mining for several years.

Mr. Newton W. Pilger, of Butte, Montana, U.S.A., is superintendent at the Iron Mask mine, near Kamloops, B.C., where mining operations were resumed a short time ago. Mr. E. G. Wallinger, of Duluth, Minnesota, is general manager for the United States Company now owning this property.

Mr. Noble W. Pierrie, of Vancouver, B.C., was married to Miss Mabel Corbett on October 16.

Mr. C. H. Poirier, of Poillon & Poirier, New York City, has been examining the Golden Zone mine, in Camp Hedley, B.C.

Mr. Wm. Fleet Robertson, provincial mineralogist for British Columbia, last month paid a visit to Barkerville, Cariboo, in company with Dr. Alfred W. G. Wilson of the Mines Branch of the Canada Department of Mines. Returning southward, several days were spent in the vicinity of Slocan lake and of Nelson.

Mr. Elias Rogers, of Toronto, president of the Crowsnest Pass Coal Co., was at the company's mines in Southeast Kootenay, B.C., at the end of October.

Mr. W. J. Rolfe, of Toronto, has been examining mining property in Portland Canal mining division, British Columbia. Mr. Ralph Stokes, who was with him in the Portland Canal Camp, went thence to Juneau, Alaska.

Mr. R. T. Stewart, who for some time had been mine manager for the Corbin Coal and Coke Co., operating in Southeast Kootenay, British Columbia, a short time ago left that ditsrict for the Brazeau coal field in Alberta.

Mr. R. P. Trimble, who for some time past has been actively associated with the development of mineral claims in the Rocher Deboule mountain part of Hazelton district, Omineca mining division, recently left there on a month's visit to Portland, Oregon. He lately arranged to acquire the Great Ohio group of mineral claims, in Rocher Deboule camp, and let a contract for making a trail, erecting buildings and driving an adit.

Mr. John Vallance, for about eight years closely identified with the development of the Standard silver-lead mine, in Silverton camp, B.C., and in recent years mine superintendent there, has left on a visit to Montana, U.S.A.

Mr. W. E. Zwicky, of Kaslo, B.C., for many years in charge of mines in Slocan district, has been on a business trip to Winnipeg, Manitoba.

The Orenstein-Arthur Koppel Co. have issued a catalogue, No. 900, describing rails, tracks, switches, dump cars, platform cars, buckets, electric locomotives, etc. The Canadian Fairbanks-Morse Co., Ltd., Montreal, are the selling agents in Canada.

The McKiernan-Terry Drill Co. has issued a bulletin describingrota ting hammer drills for sinking, stoping and drifting. Canadian Allis-Chalmers, Ltd., Toronto, are the selling agents for Canada.

## HOLLINGER.

Gross profit for the four weeks ending October amounted to $131,510.18.

The approximate average value of all ore hoisted was $17.44.

Waste rock from development amounting to 1.218 tons was hoisted, bringing the total of ore and waste up to 12,650 tons.

Based upon the tonnage of ore and waste hoisted the cost per ton for mining was $2.720.

One thousand tons were added to broken ore reserves.

Two thousand tons were drilled off ready for shooting.

The mill ran 88 per cent. of the possible running time, treating 11,850 tons, of which 164 tons were treated for the Acme Gold Mines, Limited.

The average value of all ore treated was $17.39, approximate extraction 96.70 per cent. Milling cost, $1.594.

Costs show an increase over those previously reported. This increase is primarily due to shutting down the tube mills for the purpose of relining. It will be noted that the mill only ran 88 per cent. of the possible running time, treating 11,850 tons, while the tonnage treated during the previous four weeks was 12,264. This reduction in tonnage treated has naturally resulted in an increase in the costs per ton in all departments.

An unusual item is "strike expense $2,834.30," which has added 24.2 cents per ton to costs. This item included legal fees and expenses incurred during the recent strike and is, we believe, the last expenditure which will be charged under this heading.

Work in the mine continues to show satisfactory progress, 573 feet of drifting having been added to development work during the four weeks. Approximately 100 feet of drifting has been done upon the 425 ft. level upon No. 1 vein, and the values and widths encountered are extremely gratifying, showing as they do that there is no falling off in grade or width of ore.

Work was started upon the winze, which will be carried to 550 feet with as little delay as possible.

## GRANBY.

The Granby management continues to acquire new properties. It has recently exercised its option on the Midas mine in the Valdez section of Alaska, which is showing copper ore running 5 per cent. or better. The Snowshoe claim in the Phœnix camp is understood to have developed satisfactorily, and if the option has not already been exercised, it is expected to be acquired in the near future.

Still a third property is under option which, if present indications hold good, will prove a worthy successor to the original Granby property itself.

Thus far the management has made no statements regarding the extensive development and exploratory work which it has undertaken entirely apart from the Hidden Creek development, but the directors have apparently set out so to rehabilitate the company's ore reserves that earlier errors will be forgiven if not entirely forgotten.—Boston News Bureau.

# SPECIAL CORRESPONDENCE

## PORCUPINE, SWASTIKA AND KIRKLAND LAKE

**Hollinger.**—For the four weeks ending Oct. 7th the Hollinger gold mines made a gross profit of $131,510, against $145,866 in September. This decrease, Mr. Robbins explains, is due to the fact that the tube mills were shut down for the purpose of being relined and the mill only ran 88 per cent. of the possible time. The approximate value of all ore hoisted was $17.44 per ton. The surplus now stands at $722,579. Approximately 100 feet of drifting has been done upon the main vein at the 425 ft. level. There has been no falling off in width or grade of ore.

Mr. P. A. Robbins, general manager, states in his report that the costs show an increase over those previously reported. This increase is primarily due to shutting down the tube mills. The mill only treated 11,850 tons, while the tonnage treated during the previous four weeks was 12,264. This naturally resulted in an increase in the cost per ton in all departments. Work in the mine continues to show satisfactory progress, 573 ft. of drifting having been added to development work during the four weeks.

Based upon the tonnage of ore and waste hoisted the cost per ton for mining was $2.72.

1,000 tons were added to broken ore reserves; 2,000 tons were drilled ready for blasting.

**The Hughes Porcupine Mine** has shut down temporarily. There has been considerable trouble in getting adequate power.

**The Dane Mining Company** lost by fire its cooker, dining-room, office and one bunk-house, with all contents and stores. The loss is estimated at about $5,000. Re-building will commence at once. The property is about six miles from the Dane station on the T. and N. O. property, and the company is mining for copper.

**Teck-Hughes.**—In the place of Mr. John Redington, who has resigned, Mr. Alex. Smith has been appointed. He has taken active charge of operations already. Mr. Alex. Smith is a member of the firm of Carter and Smith in Toronto. He was for some years in South Porcupine, coming to the gold camp from Cobalt. He has had experience in Mexico.

**The Tough-Oakes** property has shipped another car of high grade ore. It consisted of 30 tons and has been sent to Campbell and Deyell for sampling. This makes the fifth car to be shipped from the Tough-Oakes. Previous total tonnage was 104.20; average gold content, 23.37 ounces per ton. This last shipment is said to be of much the same grade as previous consignments.

**McIntyre.**—The September figures of the McIntyre Porcupine mines show that the mill treated 2,786 tons during the month of 30 days, an average of 93 tons of ore per day, producing $28,015, or at the rate of $913 per day. The average value of the ore is thus shown to be $10 a ton. Operating costs $28,127, slightly in excess of the amount produced. During October the mill will treat 135 tons per day, which would be increased to 160 tons per day.

**Hollinger Reserve.**—The Kerr Lake Mining Company is now operating the Hollinger Reserve property in Ogden township. It is now sinking a winze below the 200 ft. level on the main vein. Six weeks ago the Hollinger Reserve claims were sampled by Mr. Robert Livermore for the Kerr Lake, with the result that an option was taken. It is the intention to develop the property at the 300 ft. level. About 40 ft. more of sinking will be necessary to make the next level.

**Porcupine Crown.**—In the 60 ft. of sinking in the winze of the main vein below the 400 ft. level at the Porcupine Crown mine, five feet of vein matter averages $80 to the ton. At 300 ft. the vein showed a continuous ore shoot of 600 ft., being cut off at one end by a fault. The 400 ft. level promises to be fully as long. In regard to the rumor that the company will increase its acreage by the purchase of the Vipond, the Airth and the North Thompson claims, it is understood that nothing definite has been decided upon yet, though undoubtedly negotiations have been entered into.

The September clean-up amounted to $29,000, and as the current expenses were in the vicinity of $4,000, the net surplus was a handsome one.

**North Dome.**—Owing to the unfavourable development of the Timiskaming mine it has been decided to stop work on the North Dome prospect at Porcupine. This property has already been paid for, but it is desired to stop the drain of current expenses for development there and conserve the surplus remaining for the Timiskaming Company to endeavour to find more ore at the silver mine.

**Bartlett and McArthur Township.**—A syndicate of influential Cobalt mining men has taken an option on the St. Paul Hewitt and Hull claims. The operations under the direction of Mr. Robert Bryce have already commenced. These claims are situated in the townships of Bartlett and McArthur, south of the Porcupine district proper. There are five claims in all and stripping will commence at once in order that the veins may be sampled. To date rough sampling indicates the possibilities of a big ore body of low grade. The road has been cut by the government from South Porcupine to the scene of operations.

## COBALT, GOWGANDA, AND SOUTH LORRAIN

**Kerr Lake.**—Results from the draining of Kerr Lake have already been remarkable. The basin of Kerr Lake is now free of water, but there is between 14 and 15 ft. of slime, that will be more difficult to get rid of. Little attempt will be made to do so before the freeze-up this year. However, the banks of the basin are now quite dry, and Kerr Lake has commenced to prospect with remarkable results. Three veins have been discovered on the surface—two to three inches wide of high grade ore. They have also been cut below. Seams that did not appear very profitable to follow up were found to widen out into good high grade ore.

But the remarkable discovery is on the extension of the East Main vein, which has been trenched for 200 to 250 ft. on the surface. For almost the entire length there is high grade ore. At the northern or Drummond end of the property it is from two to three inches wide, but the trench towards the main shaft opened up a remarkable ore body.

The vein runs parallel to shore line of Kerr Lake near the scow upon which the pumps are working, and between them and the camp's buildings. Near the pumps there is a fault, which throws the vein about three ft., and it is remarkably well defined. Alongside the massive smaltite and silver vein which is at this spot from nine to ten inches wide of "plate" silver there runs a small calcite lead, also full of silver. The vein, which has not yet been stripped to the boundary of the Kerr Lake, is heading directly for the Drummond Fraction, and the Caribou-Cobalt. It is probably the main vein of the Drummond, from which so much silver was obtained in the early days of the camp. Very little stoping has been done on the East Main vein above the 140 ft. level. On the 140 ft. level the vein while high grade is not half so wide as on the surface. The last annual report states that the East Main vein has been stoped only a short distance above the 140 ft. level. The production for the year ending August 31 from the East Main was 140,366 ounces only.

The East Main is without doubt the most spectacular surface showing in the Cobalt camp, and it is doubtful if there ever was one to equal it—length, grade and width being all taken into account.

**La Rose**, for the period ending Sept. 30 showed cash and ore in hand of $1,882,833. President McGibbon states that net value production for the first nine ating expenses; the net profits are then equally divided between the Gould and the Porcupine syndicate.

The vein was cut in a cross cut at the 200-foot level, and is about two inches wide. There is little doubt that it is an extension of the Seneca-Superior ore body.

**Penn Canadian.**—Between three and three and a half inches of two thousand ounce ore has been cut in development work on the 300 foot level of the Penn Canadian mine. The crosscut was driven northwest and encountered the ore at a distance of 350 ft. The vein is in the conglomerate.

In addition to the vein proper the wall rock should make good milling ore for several feet. No work had previously been done in this section.

**Crown Reserve.**—Some ore shoots hitherto overlooked in old stopes of the Crown Reserve have been found within the past month. New ore bodies have been found on No. 14 on the 200 and 220 ft. levels and on Nos. 17 and 24 on the 100 ft. level. On the 100 ft. level some high grade has been found on the No. 14

**Kerr Lake as it appears to-day**

months amounted to $905,039. More high grade ore had been taken out than had been estimated in the reserves at the beginning of the year and profit on mill rock has been 23 per cent. of the total estimated as the reserves, while the dumps remain practically unchanged. On the other hand, the high grade ore reserves are considerably less.

Pan Silver.—Some patches of high grade ore have been found on both the Calumet and Patterson claims of the Pan Silver Mining Company in Southeast Coleman. These finds were made in crosscuts at the 200 ft. level. The Pan Silver is controlled by the Cartwright interests.

**Gould.**—After four or five years of more or less continuous development some high grade ore has at length been found on the Gould lease on Peterson Lake. This lease is being worked by the Porcupine syndicate. The Porcupine syndicate pays 25 per cent. gross royalty of all ore mined to Peterson Lake and deducts the oper-

vein in the west drift at a point believed to be barren. No. 2 is also yielding unexpectedly good results.

**Temiskaming and Hudson Bay.**—At the annual meeting of the Temiskaming and Hudson Bay Mining Company in New Liskeard the following officers and directors were elected. Geo. Taylor, president; A. A. McKelvie, vice-president. Directors—Messrs. T. McCamus, D. M. Ferguson, John Duncan, S. S. Ritchie, D. L. Sherrill; secretary treasurer, F. L. Hutchison. The only new member of the board is D. L. Sherrill of Buffalo.

The total production for the year was 659,927 ounces, or a slight falling off as compared with last year. The cost per ounce was 18 cents, dividends paid during the year, 2,400 per cent, or $186,264.

The work on the Gowganda property was discontinued in July.

The Hudson Bay output for the month of September was 1,776 tons crushed; average assay head ounces, 23.9; average assay tails from the mill, 3.1 ounces; extraction per cent., 87.4; month's production, 42.643 ounces.

**Colonial.**—Working with one machine on the lowest level of the Colonial, the man left in charge of that property, which has been shut down for some time, found some good ore. Two rounds were taken out in an old drift when the good ore came in. The vein itself is about two inches wide of high grade, and there appears to be some milling rock.

**Caribou-Cobalt.**—Recent developments on the Caribou-Cobalt include opening up of high grade ore on vein 11 at the 100 ft. level and the cutting of two high grade veins in No. 5 shaft. Drifting on the 100 ft. level of Vein No. 11 has opened up an ore body 50 ft. long, one to three inches wide of high grade ore, together with mill rock extending from two to four feet on each side of the vein assaying from 25 to 30 ounces. Ore of the same quality still continues in the breast of the drift. A cross cut driven on the 100 ft. level of No. 5 shaft, under the old workings at No. 1 shaft, has cut two high grade veins, each one to two inches wide, of 2.000 ounce ore. The adjacent mill rock assays 30 ounces. The property has been milling about 100 tons daily at the mill of the Dominion Reduction Company, and the Northern Customs concentrator.

**Extension of East Main vein, Kerr Lake Mining Co. Vein is here 9 to 10 inches wide of bonanza ore.**

## NOVA SCOTIA

**The Dominion Explosives Act.**—An article went the round of the Canadian newspapers recently which forecasted a great improvement in mining conditions and a decrease in mining accidents when the regulations of the new Federal Explosives Act become effective. There appears to be considerable misapprehension with regard to the scope and intent of this salutary enactment. It is not in any sense an "Explosives in Mines Act," similar to the regulations governing the use of explosives in coal mines in Great Britain before the passing of the Consolidated Coal Mines Regulation Act last year. The intention of the Dominion Explosives Act is more particularly to regulate the manufacture and the transportation of explosives. It provides for proper and safe conditions in explosives manufactories and for standardization of the ingredients and the quality of explosives, and provides machinery for the establishment of a list of "Permitted Explosives" along the lines followed by the Home Office in Great Britain. Provision is also made for safeguards in transportation. The new legislation has for some time been necessary, as it is apparent that the manufacture and transportation of such a dangerous commodity can be properly regulated only by a Federal law, seeing that explosives made in one Province may be intended for use in several different Provinces. It is slightly gratuitous, however, to conclude that there will be any diminution of mining accidents when the new bill becomes law, at any rate, so far as the coal mines of Nova Scotia are concerned. There have been some very distressing accidents arising from the careless and improper handling of explosives in railway construction work in Canada, but the percentage of accidents in coal mines arising from the use of explosives is quite small. It is, however, a matter for congratulation that the tendency of modern coal mining practice is towards the elimination of the use of explosives in coal getting, and coal operators, of their own initiative, are continually making more stringent the regulations governing the firing of shots.

**The Stag Canon Explosion.**—The Nova Scotian readers of the Journal were interested to notice that the rescue corps who endeavoured to penetrate the workings of the Stag Canon mine, near Dawson, New Mexico, after the recent explosion, were headed by Mr. J. B. Morrow, of Halifax. Mr. Morrow canvassed the Province for the Canadian Mining Journal in 1907, shortly after the familiar present cover of the Journal replaced its predecessor the Canadian Mining Review. For some time Mr. Morrow has been in charge of the well-equipped station of the Stag Canon Company, and his friends will await with interest more definite accounts of the rescue work in which he took part. The explosion has also further interest for Canadian readers in that one of the principal shareholders is Dr. James Douglas, a gentleman whose benefactions to students of mining in the Dominion are well known.

**October Output.**—As forecasted in the middle of the month the outputs from the Glace Bay Mines of the Dominion Coal Company in October will total 437,000 tons, or 12,000 tons greater than the largest previous monthly output record. As October is for some reason invariably a good producing month it is more than likely that this new record will remain unapproached for some time to come.

**Broughton Mine.**—The first coal shipments from the Broughton mines were made towards the end of October. An arrangement has been come to between the Dominion Coal Company and the Cape Breton Coal, Iron & Railway Company covering the transportation of coal from the Broughton mine to Louisburg pier, and regular shipments will no doubt be made from now on. The Cape Breton Co. has received 30 wooden cars, of thirty tons' capacity each. The Broughton colliery is putting out about 100 tons daily. Now that arrangements have been made for shipping, the output will be increased.

## BRITISH COLUMBIA

News from Atlin and Cariboo districts is to the effect that in those placer-gold mining camps the season's gravel-washing operations are practically at an end. No particulars of the quantity of gold recovered are yet available, but it is probable that the production of the 1912 season has been exceeded. The figures for last year were: Yield of Cariboo district, Cariboo division, $180,000; Quesnel division, $50,000; total, $230,000. Of Atlin division, $290,000. Then there was $8,000 from Omineca division, $9,000 from several divisions in Cassiar district, and $18,500 from various other parts of the Province. The total value of the year's production of placer gold was $555,500. It is quite probable the 1913 total yield will be found to have been the highest in value of any year since 1907.

In connection with lode mining, a noticeable feature is the considerable increase in the quantity of ore received at the Consolidated Company's smeltery at Trail. For the week ended October 30, the quantity received was 9,460 tons, while for the immediately preceding week it was 9,197 tons. The highest weekly figures in previous recent weeks were—for week ended Sept. 18 7,950 tons and Sept. 4 7,917. The greater part of the increased quantity came from the company's own mines, though the Bluebell in Ainsworth division, the Standard in Slocan, and the Iron Mask at Kamloops each contributed appreciably to the total increase.

### CARIBOO.

**Barkerville.**—The manager of the John Hopp hydraulic placer-gold mines early in October stated that there was enough water in the big reservoir on one of the properties to allow of continuance of sluicing until about the end of the month. Shortly afterward the first snowfall of the season occurred; about two inches of snow fell, but bright weather following, it quickly melted. At the end of October the indications were that there would be several weeks of "Indian summer" before the winter set in.

The Supreme Court of British Columbia has dismissed, with costs against the plaintiff company, an action of the Lightning Creek Hydraulic Co. vs. John Hopp, claiming an injunction against the defendant's further use of certain water, and damages. The plaintiff company alleged that under a water record obtained in 1897 it was entitled to 1,000 inches of water from Lightning creek, and that the defendant had taken water from above plaintiff's intake, thus diverting water the latter should have had. Defendant contended that plaintiff's water record lapsed in 1902, while his own record for 500 inches of water, obtained in 1898, had ever since been kept in good standing, so that he was entitled to the water. The dispute had attracted general attention among those interested in placer-mining in the district, where Mr. Hopp has for years operated large hydraulic mines.

**Quesnel.**—Mr. Hebson reports that excellent progress has been made in the development of the Yanks mineral claim, on Snowshoe creek. In the lower tunnel the vein is 8 ft. in width, and the ore contains good value in gold.

### LILLOOET.

From the Lillooet Prospector it is learned that Mr. J. M. Williams in the later half of October went to property of the McGillivray Mountain Mines, Ltd., accompanied by several miners, to do development work through the winter. It is stated that Mr. F. J. Crossland's report on the property is so favourable that those interested have decided to proceed to develop it.

Mr. Fred. M. Wells, who in quite recent years has been in charge of development work at the mine of the Surf Inlet Gold Mines, Ltd., on Princess Royal Island, lately examined Dr. Christie's mineral claims on a tributary of the north fork of Bridge river, on which there has been opened a quartz vein containing gold, silver, and copper.

For many years a noted Indian character was accustomed to periodically put in an appearance at Lillooet with gold, but it was not during his lifetime discovered where he obtained it. Since his death another Indian, known as Mission Peter, has been searching for the source of riches so long kept secret. Lately he induced Mr. C. L. Copp, for some time superintendent for the Coronation Mines, Ltd., operating on Cadwallader creek, a tributary of Bridge river, to go with him to the vicinity of Whitewater river. Since their return to Lillooet the statement has been published that an old sluice box was shown to Mr. Copp at one place where placer mining had been done years ago, and, on prospecting the ground, good results were obtained, the gold obtained being coarse. It is claimed that not only has a new placer field been found, but that there were seen in the neighboring country indications of gold-bearing quartz.

### AINSWORTH.

Shipment of ore from the Highland mine adds another to the list of producers in Ainsworth camp. The Consolidated Mining & Smelting Co. has acquired this property; the concentrating mill has been overhauled, the aerial tramway from mine to mill put in running order, and development work undertaken. Latterly shipment of ore has been in progress.

In the western part of Ainsworth mining division, work has been continued at the Utica; driving another cross-cut adit on the Eureka is making satisfactory progress; some ore is being sent out from the U.S. claim in Jackson basin; further development of the Whitewater group by Retallack & Co. is being pushed on, and supplies have been taken up to the Panama so that work may be continued throughout the winter.

### SLOCAN.

A proposed reorganization of the Lucky Jim Zinc Mines, Ltd., is being considered. The present pressing need is money—to pay off existing debts and make provision for concentrating the large quantity of available ore unsuitable for shipment without previous concentration.

Encouraging reports come from the Rambler-Cariboo mine, which is stated to now be realizing a fair profit on mining and milling operations. The work of driving a deep-level crosscut adit on the Payne is being continued; near Sandon, the Richmond-Eureka, Ruth, Slocan Star, and Wonderful are all being worked; in the vicinity of Cody, the Colonial, Reco, Surprise, and Noble Five, have all been operative, and work is to be continued throughout the winter at most of them. Near New Denver, the Apex is being developed; in Silverton camp, the Standard is well maintaining production and doing important new development work as well, the Hewitt mill is being prepared for operation, the outlook for the Van-Roi has improved, and the Lucky Thought is making promising progress. In Slocan City division, the Eastmont, Neepawa, Black Prince, Ottawa, and others are being worked.

# STATISTICS AND RETURNS

## COBALT SHIPMENTS.

No less than nineteen cars left the Cobalt camp from Cobalt and Kerr Lake last week, but the fact that half of this was low grade indicates that the great increase in tonnage did not necessarily mean the same proportion of increase in silver ounces.

The Trethewey shipped two cars, one of high grade ore and one of low grade. The Crown Reserve car went to Hamburg, Germany, and was of very high grade ore.

Bullion shipments were lower than usual. Kerr Lake is now marketing its own bullion.

The shipments from the Cobalt camp for the week ending Nov. 7 were:

| | High. | Low. | Total |
|---|---|---|---|
| Cobalt Townsite. . . . . . . | | 504,000 | 504,000 |
| Trethewey. . . . . . . . . . . . | 50,870 | 42,380 | 93,250 |
| Penn-Can. . . . . . . . . . . . | 101,490 | | 101,490 |
| Cobalt Lake . . . . . . . . . . | 62,950 | | 62,950 |
| Coniagas. . . . . . . . . . . . | 257,000 | | 257,500 |
| Crown Reserve . . . . . . . . | 62,850 | | 62,850 |
| La Rose . . . . . . . . . . . . . . | 87,010 | 80,000 | 167,010 |
| McKinley-Dar. . . . . . . . . | 56,460 | | 167,010 |
| | 679,460 | 626,380 | 1,305,840 |

The bullion shipments for the week ending Nov. 7, were:

| | Bars. | Ounces. | Value. |
|---|---|---|---|
| Nipissing. . . . . . . . . . | 87 | 102,812.77 | $61,687.36 |
| Kerr Lake. . . . . . . . . | 14 | 15,152.00 | 7,291.00 |
| | 101 | 117,964.77 | $68,478.36 |

The bullion shipments for the year now total:

| | Ounces. | Value. |
|---|---|---|
| Nipissing. . . . . . . . . . . . . | 5,147,596.91 | $2,958,900.08 |
| Penn-Can. . . . . . . . . . . . . | 31,299.60 | 18,750.90 |
| Buffalo. . . . . . . . . . . . . . . | 1,301,409.90 | 809,301.57 |
| Crown Reserve . . . . . . . . . | 428,060.00 | 261,278.25 |
| Dom. Red. . . . . . . . . . . . . | 373,672.40 | 216,385.00 |

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

# DEPARTMENT OF MINES GEOLOGICAL SURVEY.

## PUBLICATIONS

**The Geological Survey has published maps and reports dealing with a large part of Canada, with many local areas and special subjects.**

A catalogue of publications will be sent free to any applicant. A single copy of a map or report that is specially desired will be sent to a Canadian applicant free of cost and to others at a nominal price. The applicant should state definitely the precise area concerning which information is desired, and it is often of assistance in filling an order for a map or report if he states the use for which it is required.

Most of the older reports are out of print, but they may usually be found in public libraries, libraries of the Canadian Mining Institute, etc.

### REPORTS RECENTLY ISSUED:

CANADA

1085. Descriptive Sketch of the Geology and Economic Minerals of Canada. Accompanied by a geological and mineral map of Canada, by G. A. Young and R. W. Brock.

NOTE.—Maps published within the last two years may be had, printed on linen, for field use. A charge of ten cents is made for maps on linen.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon. Letters and samples that are of a Departmental nature, addressed to the Director, may be mailed O.H.M.S. free of postage.

*Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.*

# BUYERS AND SELLERS OF METALS

# PROVINCE OF QUEBEC

## Department of Colonization, Mines, and Fisheries

*The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, Etc.*

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is $10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from the date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of $10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of $10 an acre for SUPERIOR METALS when more than 20 miles distant from a railway and $20 an acre when less than 20 miles.

For INFERIOR METALS the prices are $2.00 and $4.00 an acre respectively.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

**THE HONORABLE THE MINISTER OF COLONIZATION, MINES, AND FISHERIES, QUEBEC.**

# The Minerals of Nova Scotia

The extensive area of mineral lands in Nova Scotia offers strong inducement for investment.

The principal minerals are:—Coal, iron, copper, gold, lead, silver, manganese, gypsum, barytes, tungsten, antimony, graphite, arsenic, mineral pigments, diatomaceous earth.

Enormous beds of gypsum of a very pure quality and frequently 100 feet in thickness are situated at the water's edge.

The Province contains numerous districts in which occur various varieties of iron ore practically at tide water and in touch with vast bodies of fluxes.

The Gold Fields of the Province cover an area of approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Deposits of particularly high grade manganese ore occur at a number of different localities.

Tungsten-bearing ores of good quality have lately been discovered at several places and one mine has recently been opened up.

High-grade cement-making materials have been discovered in favorable situations for shipping.

Fuel is abundant, owing to the presence of 960 square miles of bituminous coal and 7,000,000 acres of woodland.

The available streams of Nova Scotia can supply at least 500,000 H. P., for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

**Copies of the Mining Law, Mines Reports, Maps and Other Literature may be had free upon application to**

**HON. E. H. ARMSTRONG,**
**Commissioner of Public Works and Mines,**
**HALIFAX, N. S.**

# Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals, extending northward from the great lakes and westward from the Ottawa River to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The silver mines of the Cobalt district have astonished the world by their richness, and promising gold discoveries have recently been made in Porcupine Lake.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

**HON. W. H. HEARST,**

Minister of Lands, Forests and Mines,

**Toronto, Canada.**

# *Hofman* GENERAL METALLURGY

By H. O. HOFMAN, E.M., Met. E., Ph. D. Professor of Metallurgy, Massachusetts Institute of Technology. Author of "Metallurgy of Lead." 909 *pages*, 6 x 9, 836 *illustrations*. $6.00 (25s) *net postpaid*.

*Published Aug. 1913*

Metallurgical literature contains many treatises and monographs dealing with the metals proper and parts of metallurgical activity, but, heretofore, not a single work upon general metallurgy which meets present requirements.

Prof. Hofman aims here to cover the field of General Metallurgy as a whole.

He combines the good of older endeavor with the best results of modern research.

He treats the whole from the point of view of the metallurgist who has a leaning toward physical chemistry.

He devotes special care and much space to **Mechanical Processes.**

He has been aided by specialists in the departments of the work in which he felt that his experience had been too limited.

The main divisions of the work are:

**I. Introduction.**
**II. Properties of Metals.**
**III. Alloys.**
**IV. Metallic Compounds.**
**V. Ores.**
**VI. Fuel.**
**VII. Refractory Materials.**
**VIII. Pyrometallurgical Processes and Apparatus.**
**IX. Hydrometallurgical Processes and Apparatus.**
**X. Electrometallurgical Processes and Apparatus.**
**XI. Mechanical Metallurgical Operations.**
A. Ores; B. Betal Alloys; C. Liquids; D. Gases; Air Supply, Preheating and Drying of Air, Purification of Gases.
**XII. Metallurgical Products.**
**XIII. Economic Considerations.**

## NEW AND STANDARD METALLURGICAL BOOKS

**Hydrometallurgy of Copper**
By WM. E. GREENAWALT. 506 pp., $5.00 (21s).

**Refractories and Furnaces**
By the late F. T. HAVARD. 356 pp., $4.00 (17s).

**Practice of Copper Smelting**
By EDWARD D. PETERS. 693 pp., $5.00 (21s).

**Principles of Copper Smelting**
By Dr. EDWARD D. PETERS. 612 pp., $5.00 (21s).

**Principles of Metallurgy**
By CHARLES H. FULTON. 536 pp., $5.00 (21s).

**Ore Dressing**
By ROBERT H. RICHARDS. Four vol., 2000 pp. Per set, $20. per vol., $5.00 (21s).

**Metallurgy of Tin**
By HENRY LOUIS. 138 pp., $2.00 (8/4).

**Metallurgical Calculations**
By JOSEPH W. RICHARDS. The set, 3 vol., $6.00 (£1 15s) Per vol., $2.00 (8/4). I—Introduction. Chemical and Thermal Principles. Problems in Combustion. 219 pp. II—Iron and Steel. 245 pp. III—Metals other than Iron. 204 pp.

**Metallurgy of Lead and the Desilverization of Base Bullion**
By H. O. HOFMAN, 600 pp., $6.00 (£1 5s).

**Lead Smelting and Refining**
Edited by WALTER RENTON INGALLS. 336 pp., $3.00 (12/6).

**Metallurgy of Zinc and Cadmium**
By WALTER RENTON INGALLS. 700 pp., $6.00 (£1 5s).

**Metallurgy—Fundamentals**
By HERBERT LANG. 255 pp., $3.00 (12/6).

**Metallurgy of Iron and Steel**
By BRADLEY STOUGHTON. 537 pp., $3.00 (12/6).

For Sale by **The Canadian Mining Journal, 44-46 Lombard Street, Toronto**

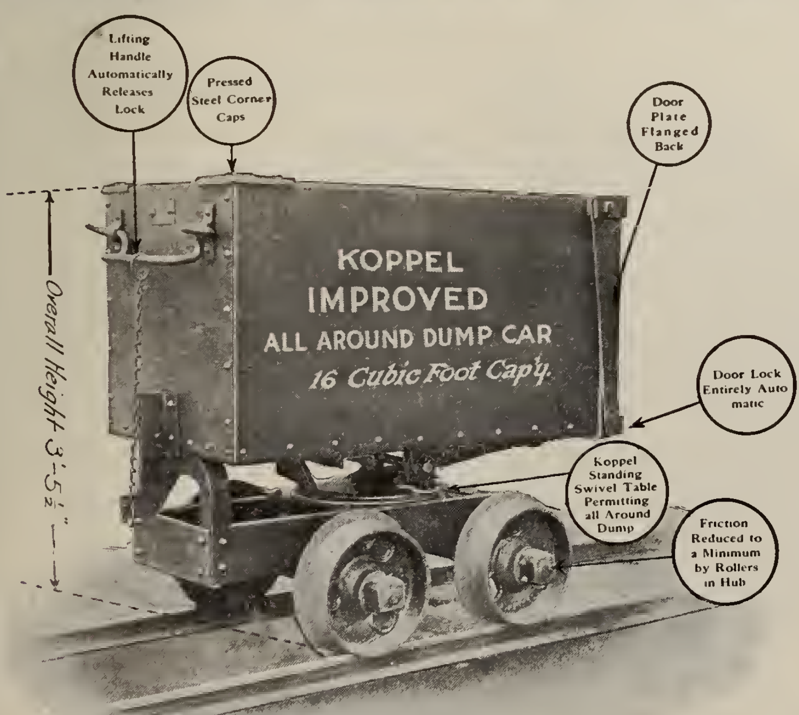
TYPE "SS-2"

# Koppel Improved Type of All Around Dump Car



This type of car is especially adapted for mine service.

The swivel table permits all around dumping. It is a very easy running car as the friction is reduced to a minimum by rollers in the hubs of the wheels.

We construct these cars for 12 and 16 cu. ft. capacity and for 18 or 24 inches gauge. They are carried in stock at Koppel, Pa.

Our catalogue on "Koppel Railways in Mines" will be of interest to you.

## SUDBURY, COBALT AND PORCUPINE

In this issue, Mr. A. G. Charleton writes on the three most prominent mining districts in Ontario, which he visited during the past summer.

This article is reproduced by kind permission of the "Financial Times" from a series of articles by A. G. Charleton, Sept. 15, 27, 29 and Oct. 6.

Mr. Charleton, who is a past president of the Institution of Mining and Metallurgy, visited Canada to attend the twelfth session of the International Geological Congress. He was a member of one of the excellently planned and carried out excursions to Northern Ontario mining districts. In letters to the Financial Times he pays fitting tribute to the Ontario Bureau of Mines and to W. G. Miller, the leader of the excursion, A. P. Coleman guide for the Sudbury district, C. W. Knight, A. G. Burrows, and P. E. Hopkins, who acted as guides in the Cobalt and Porcupine Districts, W. R. Rogers the secretary of the excursion, A. A. Cole. mining engineer of the Timiskaming and Northern Ontario Railway, and to many others to whom the success of the excursion was largely due.

Mr. Charleton was 30 years ago resident in Canada at Deloro, Ontario, where he was assistant manager of the Canadian Consolidated Gold Mines. After a long absence he found on his visit this year a startling improvement in the mining industry. On his return to England he contributed several articles on the mines of Ontario to the columns of the Financial Times. In this issue we present several extracts from these articles, together with a number of photographs, most of which were taken during the summer at the mines visited by the excursion of which Mr. Charleton was a member.

## ANNUAL REPORT OF T. W. GIBSON, DEPUTY MINISTER OF MINES, ONT.

The annual review of mining in Ontario, written by Mr. Gibson, and published in the reports of the Bureau of Mines, is one of the best reports issued by mining bureaus.

It is an accurate summary of mining activities. Statistics of production of the several metals and non-metals are presented in an interesting manner, and are, owing to the reliable information furnished by the mining companies under the act, to be considered as the final figures. The figures for production are for metal actually recovered, not for total metal contained in the ores.

In this issue we publish several pages from Mr. Gibson's report. The complete text can be obtained on application to the Department of Mines at Toronto.

## METAL MINING IN ONTARIO

Metal mining has become a great industry in Ontario. Gold, silver, nickel and copper are produced in large quantities.

For some years the nickel-copper mines of the Sudbury district have been widely known as the world's chief source of nickel and important producers of copper. The output this year is greater than ever.

Since the original discovery ten years ago the silver mines at Cobalt have placed Ontario in a prominent position as a producer of silver. The deposits are remarkably rich and the profit has been unusually large, amounting to about one-half of the value of the silver. The production is now at the rate of over 30,000,000 ounces per year. For this year to date there is a slight increase over last year both in quantity and in value.

Until quite recently Ontario had few successful gold mines. The discovery of gold in the Porcupine district, however, has resulted in the development of two large and profitable mines. A third, though small, is proving rich and there are others which, while so far not profitable, are looked upon as likely to become so.

There are many miles of territory in Northern Ontario concerning which scarcely anything is known. There are large areas which have been described by explorers as promising; but as yet unprospected.

There is every indication that many more important ore deposits will be found in the Province and that the mining industry will continue to grow.

## AGREEMENT BETWEEN DOMINION COAL COMPANY AND PROVINCIAL WORKMEN'S ASSOCIATION

The agreement covering wages and conditions of work between the Provincial Workmen's Association and the Dominion Coal Company which expires 31st December, 1913, has been once more renewed for a period of three years ending 31st December, 1916. The document on which this agreement was endorsed is now of almost historic importance. It is the original signed award of the Shortt Board of Conciliation, given in March, 1908, which was at that time accepted by the Coal Company and their workmen as the basis of a two years agreement ending 31st December, 1909. The agreement was renewed for a further period of two years ending 1911, and once again for two years ending 1913, and upon the present and last occasion for three years ending 1916. The successive renewals of the award are endorsed upon the original document, which has now become an interesting record of the permanence of the harmonious relations existing between the Dominion Coal Company and their workmen at the mines.

The new agreement continues in force the rate of wages and the conditions of work in existence at the end of 1913, together with an increase of six per cent. to all day-paid labourers in and about the mines whose rates at the end of 1913 were less than $2.00 per day, together with sundry local increases in contract rates to meet special local conditions. In 1907 the rate for common labour was $1.38 per day. This rate was raised to $1.45 in 1908, again to $1.52 in 1910, to $1.60 in 1912, and from 1st January, 1914, will be $1.70 per day. The rate for shiftmen, which has been $1.75 per day since 1908, is raised to $1.85 per day. As previously stated, all day-paid men rated under $2.00 per day will receive the six per cent. increase.

The satisfactory conclusion of the negotiations between the Coal Company and the P. W. A., and the extension of the agreement for another three years, has caused general satisfaction throughout the whole district. On one side it will enable the company to make sales contracts and lay out a programme of development without any fear of labour troubles interfering with their plans, and on the other side, it assures to the workmen a continuance of their present earnings, plus as great an increase as the industry can properly afford. It is the record of the relations between the Dominion Coal Company and the P. W. A. that these have never yet been interrupted by a serious strike, and yet since 1900 the P. W. A. have obtained a continuous series of increases in wages, all of which have been obtained by the same method of negotiating and bargaining and eventual mutual agreement, which the latest contract perpetuates for a further three years. It is hardly necessary to set forth the merits of this constructive and conserving policy as against the destructive and wasteful methods of those who for their own ends caused the deplorable strikes in 1909 and 1910 in the various coalfields of Nova Scotia.

## WORKMEN'S COMPENSATION

The Province of Ontario expects soon to have a new Compensation Act. Sir Wm. R. Meredith, Chief Justice of Ontario, and Special Commissioner of the Ontario Government on Workmen's Compensation, has drafted a bill for submission to the Provincial Legislature. It is proposed, among other things, that compensation last as long as the disability; that employers must contribute towards the expense of administration; that the Provincial Government will contribute to the fund; that contributary negligence is no bar to compensation; that the common law by which an employee takes upon himself risks incidental to his employment be abrogated; that wilful or serious misconduct shall be cause for declining compensation unless death or serious disability results.

Apparently there is no clause requiring that the employee contribute in some small way to the fund. Managers would like to see such a clause, not merely because the workers would be paying a share of the cost of accidents; but because the workers would then have a good reason for striving with the managers in an attempt to prevent accidents. An assessment, even a very small one, would be unwelcome to the worker. He could be expected to strive to keep it as small as possible. In doing this he would go out of his way to prevent accidents to himself and his fellow workers.

# THE DEVELOPMENT OF NORTHERN ONTARIO BY THE MINING INDUSTRY

By J. C. Ross, Editor Journal of Commerce.

It is a far cry from the struggling uncertain days of the Cobalt of 1905 and 1906 to the Cobalt of to-day. In the few years that Cobalt has been in existence, it has made good. The hundreds of mines, prospects and claims have dwindled to a score or more of carefully managed, dividend-paying properties. To date, Cobalt has produced upwards of $100,000,000 in silver and paid back to shareholders almost $50,000,000 in dividends. From the small district known as the Cobalt Area, mining activity has extended until to-day Porcupine, Gowganda and a number of other places far removed from Cobalt, give evidence of a great mineralized Hinterland.

Up to a few years ago, Ontario was regarded as an agricultural province. Some attention was paid to lumbering and to fishing, but the great basic industry was farming. It was with the idea of extending the farming area and tapping the great Clay Belt of Northern Ontario that the Government commenced the construction of the Timiskaming and Northern Ontario Railway. While constructing this road, one of the employees, a blacksmith named La Rose, discovered what proved to be silver about one hundred miles from North Bay. This later became the La Rose mine and the centre of the Cobalt camp. The discovery of silver was followed a few years later by the discovery of gold at Larder Lake, Swastika and Porcupine, and other places, and silver at Gowganda, South Lorrain, and Montreal River. The discoveries of these mineral areas added a new basic industry to agriculture, lumbering and fishing. In the decade from 1902 to 1912, the mineral production in Ontario increased from $13,000,000 to $47,471,000. Last year, the silver produced in Canada, which is practically all from Northern Ontario, amounted to $19,425,000. The value of the Canadian nickel—also a Northern Ontario product—was $13,452,000. The value of the gold produced in Northern Ontario was $1,788,000. To-day, there are over 11,000 men engaged in metal mining in Northern Ontario who receive in wages an average of about $800 per year. The amount of ore shipped out, the freight furnished the railroads, the establishment of smelters, concentrators and other features associated with mining, have all tended to make Northern Ontario an important factor in the economic and industrial life of the Province.

From an investment standpoint, Cobalt has been the surprise of the world. In the early days when veins were found on the surface and outcroppings occurred in the most unexpected places, the impression prevailed that this was but a surface camp and that it would not maintain values at depth. After several years of mining, many of the companies are yet making important discoveries on their properties. Altogether, Cobalt has paid out in dividends almost $50,000,000. Nipissing alone has returned to shareholders over $10,000,000, while Crown Reserve, Coniagas, Kerr Lake and La Rose have paid in the neighbourhood of $5,000,000, and several others have paid out over $1,000,000 in dividends. There has been taken out of the Cobalt camp over $100,000,000 worth of silver, making it one of the most important silver producing areas in the world.

Farther north, Porcupine is making a very creditable showing as a gold producing district. Hollinger, the most important mine, has paid out over $1,000,000 in dividends during the past year. Other gold mines in the Porcupine district are making satisfactory progress, although expenses connected with the mining and milling of the ore are so heavy that it takes time to achieve results. Gowganda is looked upon by many mining experts as a promising district, but owing to the fact that this section has been without roads, development has been exceedingly slow. Some companies have found very valuable ore and it will only be a question of time until Gowganda becomes a heavy producer.

There is no reason to believe that the minerals of the North Land are confined to the three or four districts now being worked. Practically the same rock formation occurs throughout large areas of Ontario's Hinterland and traces of valuable minerals have been found in many outlying parts. Eventually the whole of Northern Ontario will become more or less of a mining district. As new railroads are built and the country opened up, areas, now inaccessible, will be more thoroughly explored and minerals found.

Metal mining in Ontario will doubtless continue to be an important industry. Any falling off in the production of minerals from the Cobalt and Porcupine districts will be offset by fresh discoveries in other parts of the Province. Already reports of new discoveries are being made in districts far removed from the present beaten tracks. Railroad development will doubtless open up many new mineralized areas. It was the construction of the Canadian Pacific Railway that gave us Sudbury with its nickel and copper mines. The building of the Algoma Central gave us the Helen mine, while other discoveries around the Lake of the Woods, Michipicoten, Seine River, Bruce Mines and many other parts of the country, as well as the great discovery of the Cobalt and Porcupine camps, have all been the result of railway construction. To-day, the National Trans-Continental Railway across Northern Ontario is nearing completion. Other roads are being projected through the new district of Patricia and other parts of Ontario's Hinterland. In a recent report, Thomas W. Gibson, of the Bureau of Mines, says: "The only key to the future is found in the past, and in the vast area of pre-Cambrian rocks yet unprospected in Northern Ontario—to which was added the principality of Patricia—it can hardly be doubted that many more deposits of mineral wealth will be found."

Any mining district which, in the course of a half dozen years can produce $100,000,000 worth of silver and pay back to the stockholders $50,000,000 in dividends, cannot be ignored. Cobalt has added a new industry to the life of Ontario. It has created a market for the farmers of the great Clay Belt. It has attracted the world's attention to the Ontario Hinterland and advertised it more quickly and thoroughly than would have been possible by years of ordinary advertising. It has attracted immense sums of money to itself and kindred industries in the Dominion. It has furnished traffic for the Government railway and made what was once regarded as a foolish venture a profitable enterprise. Ontario and Canada owe much in an industrial and economic sense to the mineralized area known as the Cobalt and Porcupine districts.

## MINING EXHIBITS AT PANAMA-PACIFIC EXPOSITION.

At the Panama-Pacific International Exposition to be held in San Francisco in 1915 there will be an impressive display of the mining industry. Charles E. van Barneveld, chief of the Exposition's Department of Mines and Metallurgy, is making every effort to gather under the roof of the great palace that will house the mining and metallurgic display a collection of object lessons that will show the mineral resources of every country and the methods of extracting them from the earth. The display will be a liberal education in the science of mining.

"It has been said that mining operations do not lend themselves readily to exhibition," said Chief van Barneveld recently, when questioned as to the difficulties that might be expected in his undertaking, "and that the legitimate mine-operator has little commercial incentive to exhibit because he has nothing to advertise, nothing to sell. Fortunately, the mining industry in the main is in the hands of public-spirited men, accustomed to taking a large view of things, men who will not allow the lack of commercial incentive, the lack of apparent direct individual benefit, to outweigh the decided indirect, collective benefits to be derived from the right sort of publicity. We hear much of the decadence of prospecting and mining, of the lack of security and stability of mining investments. The miner has suffered greatly from misunderstanding, from public ignorance, and, above all, from persistent misrepresentation. We all recognize, in a general way, the importance of education; it is the greatest remedy for prejudice, superstition and ignorance; it makes for greater all-round efficiency. A well planned exposition is of incalculable value as an educator of the public mind. Many important questions in which the miner is vitally interested are pressing for settlement. When not blinded by prejudice and ignorance, the public is essentially fair-minded; it only needs education. This exposition offers to the men at the head of the mining industry an opportunity which probably will not recur for a decade, to give the public an insight into the importance, the stability and the solidarity of the industry, its legitimate speculative and investment features, the need of capital, of fair treatment, of wise legislation, of public support and co-operation. Surely this is sufficient commercial incentive."

## CHISANA GOLD FIELD, ALASKA.

The following information relative to the Chisana or Shushanna gold field, Alaska, was recently printed in Vancouver, B.C.:

Extensive development work is to be carried on during the coming winter in the Chisana diggings, according to Capt. W. Turnbull, who operates a steamer for the White Pass & Yukon route between Whitehorse and Dawson, and has just come down to Vancouver from the Yukon. He said there are 700 men in the camp awaiting "freeze-up" in order to start operations.

Capt. Turnbull is interested in two claims in the new gold fields, and intends to spend the winter there. He is going into the camp shortly with a large consignment of supplies for the W. P. & Y. R. The transportation company is operating a regular service into the diggings, and has already taken in a large store of supplies for the winter trade.

Reference was made to the fact that several prospectors had recently returned from the north, and had declared the discovery to be greatly over-estimated, and the captain was asked for his opinion on the prospects.

"A lot of prospectors went into the camp without reserve supplies," he commented, "and, consequently, could not stay there very long, as there were few stores up there in the summer. Many of the gold-seekers never reached the diggings at all, as they hit the trail without adequate provision for the long trip. Conditions are different now since the transportation companies have been getting busy—there are ample supplies in the camp and the 'mush' can be made with light packs.

"A large number of prospectors intend going in this winter," he continued. "Many of the claims which were staked early in the rush will be available for relocating on January 1, as the required amount of development work has not been done on them."

Navigation has been closed up north. The last boat from Carcross left for Atlin on October 28. The last trip on the Whitehorse-Dawson route was made on October 22.

## WEST KOOTENAY POWER & LIGHT CO.

The West Kootenay Power & Light Co., which owns hydro-electric power stations at Upper and Lower Bonnington Falls, on Kootenay River, 11 miles below Nelson, and near Cascade City, on Kettle River, Boundary District, and which supplies electric power to the larger mines and the several smelting works at Trail and Rossland and in the Boundary, recently held its adjourned annual meeting at Montreal, Quebec. Statements of accounts submitted showed that last year's gross receipts were \$415,413, an increase of \$82,549, while operating expenses were \$115,279, an increase of only \$5,022. Net profit for the year was \$300,134, which was an increase of \$77,527, as compared with the immediately preceding year. After paying dividends on preferred and common stock and providing for sinking fund in connection with the Cascade Co.'s bonds, a balance of \$74,919 was carried to credit of profit and loss account, which now stands credit \$248,473. The directors were re-elected with the addition of T. J. Shaughnessy to fill the vacancy caused by the death of W. M. Doull, of Montreal, late president. Chas. R. Hosmer, who succeeded Mr. Doull as president, was re-appointed to that office.

## GRANBY CO. BOUGHT ALASKA MINE.

The Spokesman-Review, Spokane, Washington, in which city the Granby Consolidated Mining, Smelting & Power Co. has for years had its general manager's office, recently published the following:

The Granby Consolidated Mining, Smelting & Power Co., with mines at Phoenix and Hidden Creek, B.C., a smelter at Grand Forks, B.C., and another under construction at Hidden Creek, which will be ready to be operated about the first of the year, has purchased the Midas mine, near Valdez, regarded as one of the most promising copper deposits in Alaska, and development is now under way, according to reports received from the Granby offices in New York. The consideration is not made public, but it is reported to be about \$250,000.

An electric haulage system is being installed at the Midas, together with necessary mining equipment, and it is planned to have the mine producing by July or August, 1914. Already approximately \$1,500,000 of ore has been blocked out, assays from which show value averaging better than 5 per cent. copper and several dollars in gold. Granby's present plans provide for an ore storage at tidewater near the Midas and the output is to be treated at Hidden Creek. It is said the company contemplates eventually arranging for a line of steamers to transport the ore to the smelter.

# MINING IN NORTHERN ONTARIO*

By A. G. Charleton, M. Inst. M.M., A.R.S.M.

The twelfth International Geological Congress, recently held in Toronto, Canada, which I had the privilege of attending as one of the delegates of the Institution of Mining and Metallurgy, was a remarkable gathering and proved an immense success.

It brought together geologists from all parts of the world; men of international reputation drawn from every civilized nation familiar with the geological conditions and mineral deposits of almost every habitable portion of the globe thus far explored and surveyed. The delegates of the Congress numbered close upon 500, and 23 tongues were spoken, although but three languages were officially recognized, namely, English, French, and German, in any of which addresses might be delivered. The members of the Congress formed a splendid body of alert, keen men; every type of brain was represented, long heads and round heads, but most of them possessing the clear, far-sighted eyes which generally distinguish men trained in science; whilst most of the members were endowed as well with that fine physique which can only be gained by a life largely spent out of doors, in striking contrast to men condemned to work all their lives confined in stuffy offices, studies and laboratories.

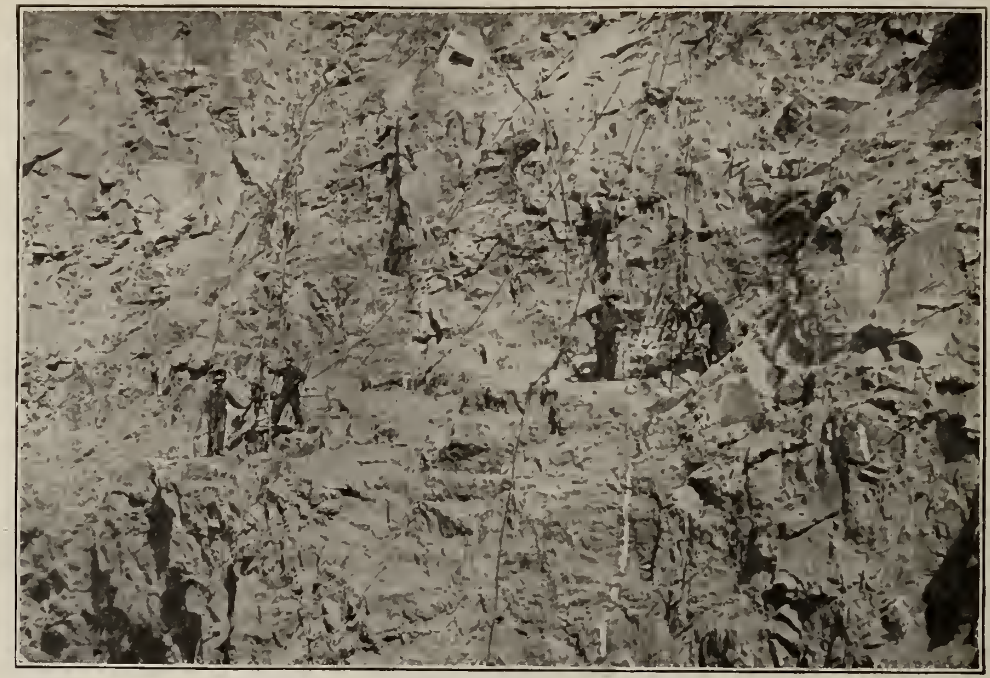
Breaking down nickel-copper ore, Creighton mine, Ont.

The Congress took place in Canada this year on the invitation of the Canadian Government, and although its proceedings proper are now over a number of the delegates have remained in Canada and are taking advantage of the specially arranged excursions, some of which are not expected to return to Toronto before the end of October. As has been well observed, these international meetings serve in a sense as "an international clearing house for geology," whilst, moreover, they focus attention upon the countries in which they are held, thus tending to aid in their development and promote their prosperity. The immense economic value of geological research is now widely appreciated in its application to mining, civil and other branches of engineering, as well as in connection with industrial enterprises, and questions constantly arise, not only in the investigations of ore deposits, but in matters of water supply and the foundations of structures, road construction, etc., upon which geology bears.

It is officially stated that over 40 per cent. of the mineral production of Canada is furnished by Ontario, and Northern Ontario possesses in Cobalt one of the most remarkable and productive silver fields, and in Sudbury the most valuable nickel mines in the world. An official excursion in which I took part afforded an opportunity for members of the Geological Congress to visit Sudbury, Cobalt and Porcupine. Sudbury lies about 35 miles north of Georgian Bay, the northeastern part of Lake Huron. It may be said to be a place of international importance, because it is the chief source of the world's supply of nickel, which is extensively used in steel armour-plate, for ordnance and other purposes in arts and crafts. New Caledonia is the only other locality from which any very considerable supplies are at present obtained. The geological features and the character of the ores of these two localities are, however, entirely different.

**The Sudbury deposits** were first worked in 1887 by the Canadian Copper Company, and difficulties experienced in treating the ore for copper led to the discovery that it contained nickel. The early difficulties in separating the two metals were speedily overcome, but a more serious problem then presented itself, namely, to find a ready market for the large quantity of nickel available. Fortunately, about 1890, the valuable properties of nickel-steel began to be appreciated, and the industry became firmly established, larger profits resulting from the nickel in the Sudbury ores than from the copper it contained, and of late years nickel mining has become exceedingly profitable and has been conducted upon a very large scale.

*Extracts from articles published in the Financial Times, London. Photographs by Reginald E. Hore.



Creighton nickel-copper mine, Ont.

The chief nickel-producing companies operating in the district during the past year were the Canadian Copper Company (controlled by the International Nickel Company) and the Mond Nickel Corporation. The formation of a new development company, the Canadian Nickel Corporation, Ltd., capitalized, it is reported, at $30,000,000, has quite recently been announced.

**The Sudbury ores** are not by any means of a complex character. They consist mainly of an intimate admixture of pyrrhotite, pentlandite and chalcopyrite in amorphous forms, but native gold, silver, platinum and palladium are occasionally found in them as well in appreciable quantities. The generally accepted theory of the origin of the ore bodies at Sudbury is that they are due to "magmatic segregation"—that is to say, the molten mass of eruptive norite was charged with the sulphides of iron, nickel and copper, which separated out before cooling completely; and it is a remarkable fact that nickel ore bodies are also found associated with norite in Norway. Some observers hold the view that the ores have been deposited by the agency of water replacing the original constituent rock minerals. But the weight of evidence seems to be in favour of the first-named theory, which does not deny that there may have been subsequent rearrangement of some of the minerals present by water agency, which is quite probable.

The ore bodies of Sudbury are of several distinct types. 1. "Marginal," (a) dipping towards the axis of the basin consisting of ores with comparatively little rock and more than twice as much nickel as copper. (b) "Faulted marginal," irregular in shape and character—usually mixed with much rock and carrying as much copper as nickel, or sometimes more. 2. "Offsets," (a) columnar, roughly cylindrical bodies, nearly vertical, and going to great depths, usually rich in copper and the precious metals. (b) "Parallel offsets," not columnar, but sheet-like, dipping towards the basic edge, and carrying ore of a similar character to the "marginal deposits." Pentlandite and pyrrhotite form the major portion of the ore-bodies, intimately admixed with each other and with chalcopyrite. The latter mineral, while almost always present is more

Murray nickel-copper mine, Ont.

**Looking along outcrop of ore body, No. 3 mine, Canadian Copper Co., Ont.**

often found in pure masses, small in size, but free from the other minerals. Occasionally some very rich "patches" of ore have been found carrying some of the rare and precious metals, and in the early days several thousand dollars' worth of gold were obtained by means of a three-stamp prospecting mill whilst sinking the shaft of the Vermilion mine.

**The Creighton mine** supplies a good example of a typical Sudbury ore, although the average nickel and copper contents naturally vary somewhat in different mines. The ore contains about 1½ per cent. copper and 4 per cent. nickel, or 38 parts Cu to 100 parts Ni. Near the east end of this mine a characteristic contact of norite with the older gneiss may be seen, and the huge "open-cast," 300 ft. deep, traversed below by underground workings, reached by means of an underlie shaft sunk near the edge of the pit, is a sight not to be forgotten, reminding one of some of the immense open-cast workings in the copper mines in the South of Spain. These open-cast workings are quite a feature of the Sudbury district. The members of the Geological Congress visited the Copper Cliff mine, one of the richest and most important of the early mines, which has now been abandoned. The ore body formed an irregular chimney, which has been followed for 1,300 ft. on an incline of 70 deg. to the east. The gossan-covered ridge at Frood, which was visited afterwards, is believed to contain the largest known nickel deposit in the world, estimated to contain between 35 and 100 million tons of ore. After testing it with diamond drills, the Canadian Copper Company has sunk two shafts and begun work on this deposit; and the Mond Nickel Company, which owns the "Frood Extension," taking in part of the centre of the ridge, is sinking a third shaft. At Murray, and in other parts of the field, explorations are in progress with diamond drills, and at Murray the nickel ore body is already known to reach a depth of 1,100 ft. and is estimated to include more than 10,000,000 tons.

And there are doubtless parts of the district, as yet unexplored, which will repay prospecting in this manner.

**Rock-house No. 3 mine, Canadian Copper Co., Ont.**

Canadian Copper Co.'s smelter at Copper Cliff, Ont.

### Treatment Method.

The general treatment of the Sudbury ores after hand sorting involves four distinct processes: (1) Roasting to remove part of the sulphur; (2) smelting in water-jacket furnaces, to produce furnace or standard matte; (3) re-smelting the standard matte in "converters," to enrich it up to 75 or 80 per cent. of nickel and copper; and (4) the separation and refining of the nickel and copper. Five companies at least, in addition to the Canadian Copper Company, have been engaged in the production of standard matte—the Drury Nickel Company, at the Chicago or Travers mine; the Mond Nickel Company, at Victoria mine (which possesses a remarkably fine plant), the Lake Superior Corporation, at Gertrude; the Vivians, at Murray mine; and the Dominion Mining Company, at Blezard mine—and their general method of treatment varies but little, though the size and equipment of the various plants differs enormously. Canadian matte from Copper Cliff is treated by special methods at Bayonne, N.J., by the international Nickel Company, whilst matte from the Victoria mine is treated by the Mond process at Clydach, Wales; the reduced metals being acted on in the Mond process by carbon monoxide, and the nickel separated from the copper as a volatile compound.

Norwegian matte, obtained from Norwegian ores, is treated differently, and separated electrolytically by the Hybinette process, at Kristiensand, Norway. There are, therefore, three absolutely different ways of separating nickel and copper from the high-grade matte, all of which seem to be commercially successful in a greater or less degree, and able to compete with one another and with the different process used in the treatment of New Caledonian ores.

The Canadian Copper Company possesses a large power plant at High Falls, on Spanish River, about 23 miles west of Copper Cliff Station, which is a splendid

installation. The smelter sub-station—the main distributing point of the system—supplies motors in the building itself and elsewhere, having a total capacity of 7,700 horse power, besides arc and incandescent lighting for the smelter, shops, etc., and the town of Copper Cliff. The Mond Nickel Company has hitherto smelted its ores at its works near the Victoria mines. Recently, however, new works have been erected at Coniston, near the crossing of the Canadian Pacific and Canadian Northern Railways, and the new smelters there when entirely completed will be a modern and magnificent plant. They are near the company's mine at Garson, from which the bulk of its ore is now obtained.

**Nickel steel**, possessing as it does both the qualities of strength and lightness, has afforded an opening for the use of large quantities of nickel, in the development of the automobile industry, flying machines, etc. A chrome-nickel steel made from Mayari ore, obtained from the Island of Cuba, is claimed to possess a greater tensile strength of 8,000 to 10,000 lbs. per square inch and a higher elastic limit in the rolled-forged condition than carbon steel of the same carbon contents. Other nickel alloys, such as "Monel" metal, have attracted attention and come into use for various purposes, and the future of the metal, and, consequently, the future of Sudbury, looks extremely bright. The nickel district of Sudbury has been geologically examined most minutely, and its many interesting features have been most carefully and graphically described by Dr. A. P. Coleman, Professor of Geology at Toronto University, who was one of the guides of our party.

### Cobalt Silver Mines.

The Cobalt camp is situated about 90 miles northeast of Sudbury, and it is remarkable that copper and nickel are found so closely associated in the latter district, occasionally carrying a considerable amount of gold, with but little silver, whilst in the Cobalt field silver in large amount is associated with cobalt, nickel and arsenic, with but little gold present at any time. It was some time before the importance of the Cobalt discoveries were recognized. The district was, in fact, condemned by engineers in the early days, who failed to appreciate its immense value, and, although it seems unlikely that mining will be carried on there to great depths, as in some other fields, this is compensated for in other ways.

The attitude of those who condemned the district at first was doubtless largely owing to the fact that the individual veins of rich ore are narrow, averaging not more than 4 ins. in width, which would be apt to prejudice many engineers, whose training naturally and very properly makes them liberal in their ideas, but cautious and conservative in business matters, and they argued from experience in other cases of a different kind that these narrow veins would speedily cut out. A good illustration that whilst it is frequently the case that men err on the side of undue optimism, they also sometimes miss good business opportunities through ultra-conservatism—in fact, you cannot divest mining of a speculative element, and it would be a dull and poor business if entirely robbed of its romance. The history of Cobalt has been peculiarly romantic. The large number of veins and their extreme richness, as the event has proved, has fortunately compensated for their small width, and sometimes several parallel veins and veinlets ramifying through the wall rocks give a considerable width of concentrating and rich ore, so that stopes are carried to a width of 25 ft. or perhaps more, and individual rich veins may carry 2 or 3 ft. of milling ore on either side of them.

In the early days Cobalt was a poor man's camp, and it was due to the enterprise and pluck of "the prospector" that it has acquired its world-wide renown. One of the earliest "adventures" is said to have extracted ore to the approximate value of $250,000 at a total cost of $2,500, and statistics, I believe, show that the dividends distributed by the mines represent over 50 per cent. of the value of the output of Cobalt.

Fortune, therefore, in this case has been on the side of the optimist and of far-sighted geologists like Dr. Willet Miller, Arthur A. Cole and others, whose confidence in the future of the district has been justified, and has led to its being opened up upon its present scale.

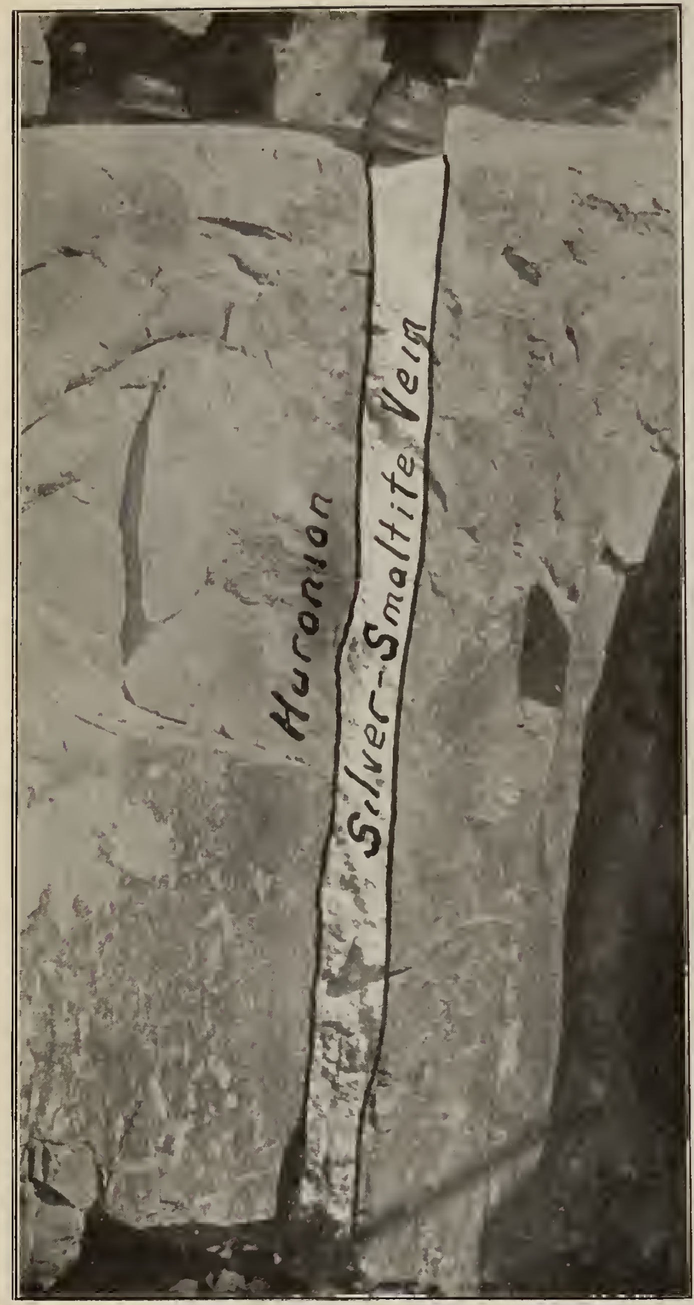
A view of Cobalt from Nipissing Hill

### The Rapid Rise of the Cobalt Field.

The output of Cobalt in 1904, it appears, only amounted to 158 tons of ore, worth $136,217, averaging 1,309 ozs. of silver per ton, or 5.34 per cent.; cobalt, 10.21 per cent.; nickel, 8.86 per cent.; and arsenic, 45.56 per cent. To-day Cobalt is the greatest silver producer of any single field to the extent, it is said, of about 13 per cent. of the world's entire production, whilst the white arsenic produced from cobalt ores is estimated at 20 per cent. of its total output. The silver output for 1912 is given as 22,393 tons of ore, valued at $17,455,080, and 5,449,732 ozs. of bullion, worth $3,338,106, or a combined value of $20,893,186—that is, well over £4,150,000. Upon the present basis of production a rise of 1 cent per ounce in the yearly average price of silver is calculated to increase the income of the producing mines by $300,000. In 1912 the largest shipments of ore (2,000-lb. tons) were made from the following seven mines: La Rose, 3,511; McKinley-Darragh, 2,673; Coniagas, 2,119; Cobalt, Townsite, 1,944; Nipissing, 1,869; Buffalo, 1,251; and Cobalt Lake, 1,085. The largest bullion shipments last year were from the Nipissing, 4,255,013 ozs., value $2,607,734; Crown Reserve, 346,234 ozs., value $210,634; O'Brien, 299,360 ozs., value $141,765; Buffalo, 205,302 ozs., value $124,895; and Kerr Lake, 171,645 ozs., value $104,420. At the commencement of 1912 there were twelve dividend-paying companies. The Cobalt Townsite and Cobalt Lake Companies have since entered the dividend-paying list. At the end of 1912 six companies had more than repaid their shareholders the amount of their capitalization—namely, the Crown Reserve had paid 275 per cent.; the Nipissing 161 per cent.; the Buffalo 156 per cent.; the Kerr Lake 144 per cent.; the McKinley-Darragh 126 per cent.; and Coniagas 107 per cent.; whilst the Trethewey had reached 96 per cent., and the Right of Way 77 per cent.

Cobalt proper covers an area of about six square miles in Coleman Township, but isolated mines have been found outside of the central group, such as Casey, 19 miles northeast of Cobalt; the Wettlaufer, 20 miles southeast; and the Mann claims and Miller-Lake O'Brien, at Gowganda, 50 miles northwest. The Elk

Washing rock surface to expose veins, Nipissing mine, Cobalt



Silver vein in Huronian Greywacke, La Rose Mine, Cobalt

Lake discoveries also lie in this direction. It is, therefore, reasonable to expect that important new discoveries are likely to be made in this vast area, which is approximately 5,000 square miles in extent, much of which has been very superficially, if at all, "prospected" or examined. Even in Cobalt itself, owing to the surface being covered with much timber and drift material, in the early days contacts and outcrops were concealed and difficult to locate.

The Nipissing is the largest property at Cobalt and has the largest output of any individual mine at present. Up to the end of 1912 it had produced no less than 27,741,248 ozs. of silver, from ore, two-thirds or more of which averaged 1,500 ozs. per ton. The proved reserves are estimated to contain nearly ten million ozs., and there is a large portion of the company's area still unexplored.

### Concentration of Low Grade Ores at Cobalt.

The richness of the ore in various mines is illustrated approximately by what it has cost to produce an ounce of silver. The cost in 1911, including mining and all other expenses, is stated to have been at the Kerr Lake 14.69, at the Nipissing 13.95, at the Crown Reserve 10,761 and at the Coniagas 8.8 cents per ounce. There are several "Custom," as well as a number of company mills at Cobalt, and the only mill idle in the camp in 1912 was the Silver Cliff, which was reopened early this year. The concentration of low grade ores at Cobalt is becoming a matter of greater importance each year. In 1912 a new record was reached, 455,516 tons having been treated at different mills, and with enlargements either planned or carried out is likely to show further substantial increases. The "flow sheets" of the different water concentration mills show considerable variation in treatment at the different mills and considerable variety in the machinery employed for the purpose, as well as in the manner in which it is arranged, the details of which cannot be gone into here. But it may be observed that the "concentration ratio" varies within very wide limits, namely, from 130 to 1 downwards to 22 to 1. The most recent and interesting metallurgical innovation at Cobalt is the employment of aluminum dust in place of zinc dust for the precipitation of silver from cyanide solution at the Nipissing mill. Including the necessary alkali, the cost of aluminum precipitation is probably 30 per cent. higher than zinc, but the higher class "precipitate" resulting and the recovery of cyanide seems likely to render its use advantageous.

The bulk of the ore shipments from Cobalt go for treatment to (1) the works of the Canadian Copper Company at Copper Cliff; (2) the Canadian Smelting and Refining Company at Orillia; (3) the Coniagas Reduction Company at Thorold; and (4) the Deloro Mining and Reduction Company at Marmora, all in Ontario.

Compressed air pipe line, Gillies Limit, Cobalt

There are, however, several other smaller buyers. The arsenic in the Cobalt ores is a valuable by-product, and so is the cobalt to a less extent.

From an engineering standpoint, the Taylor plant of the Cobalt Hydraulic Power Company on the Montreal River is a most remarkable installation. This is for the compression of air carried down by a large volume of water into a large tunnel, and in its descent of 351 ft. becomes a mixture of water and compressed air, which is liberated at the lower end of the tunnel 1,021 ft. in length.

In the tunnel the air is compressed to 125 lbs. and is said to be remarkably free from moisture. The machinery for the collection, measurement and distribution of the air is contained in quite a small building, and it is delivered to Cobalt through nine miles of 20-in. pipe, 7½ miles of 12-in. pipe, and nine miles of 6-in. and smaller sizes, and sold at 25 cents per 1,000 cubic feet at about 100 lbs. pressure and atmospheric temperature.

### Prospects of New Discoveries.

The value of the Cobalt veins is such that "intensive prospecting" is being carried on by the Nipissing Company on Nipissing Hill with a hydraulic monitor, which sweeps away the surface soil and lays bare the rock below, so that it can be closely examined for silver streaks no thicker than a knife blade. And, no doubt, important new discoveries will be made in the district from time to time by more thorough prospecting. People on the spot have a marvellous faith in mining at Cobalt. Large prices have, I believe, been paid in a number of cases for properties upon which little, if any, actual prospecting had been done; and important concessions have been taken up under the lakes merely upon geological probabilities, which have in some instances certainly repaid these apparently highly speculative ventures.

### Porcupine Gold Mines.

My last excursion in connection with the International Geological Congress included a visit to the Porcupine gold field, which is situated on the Hudson Bay slope of Northern Ontario, close to the southern fringe of "the great clay belt," destined, it is believed, to become at some future time an important farming country. Porcupine lies 100 miles northwest of Cobalt, at an altitude of about 1,350 ft. above sea level. Little prospecting was done previous to 1909, when J. S. Wilson made a spectacular discovery of gold on what is now the Dome property. The disastrous forest fires which broke out in the middle of May and lasted until the middle of July, 1911, unfortunately gave the district a serious setback, as they swept over South Porcupine and Pottsville and the northern part of Porcupine (Golden City), besides destroying a number of surface plants, and were attended by a very sad loss of life. But with undaunted courage and faith in the district the mine owners set about reconstructing the mills, and gold to the estimated value of about $1,800,000 was produced in 1912.

The two leading mines to-day are the Hollinger and the Dome. The outcrop of the first-named property is crossed by an old Hudson Bay trail, which scores of men must have traversed unsuspecting the wealth buried beneath their feet. Probably some of them camped on the very spot, where the main lode outcrops, where gold was afterwards discovered. The two premier mines differ, however, considerably in character, the Hollinger ore being comparatively rich and yielding a large profit per ton, whilst the Dome is a big deposit of ore of much lower grade on the whole. Other properties in the district include the McEnaney, Miller-Middleton and Dixon. In 1910 the ore treated at Porcupine only amounted to 1,060 tons, which yielded 1,947 ozs. of bullion, valued at $35,539, whilst in 1912 the production of the district had risen to 88,466 tons, which yielded 50,633 ozs. of bullion, valued at $1,032,313. The forest fires of 1911 destroyed the small experimental plants of the Dome, Hollinger and Vipond, but the new mills of these companies and of the McIntyre were in a position to treat the above-named tonnage in 1912, and the construction of two other mills, the Dome-Lake and McEnaney (Crown Reserve Mining

**Gold Quartz, Dome Mine, Porcupine, Ont.**

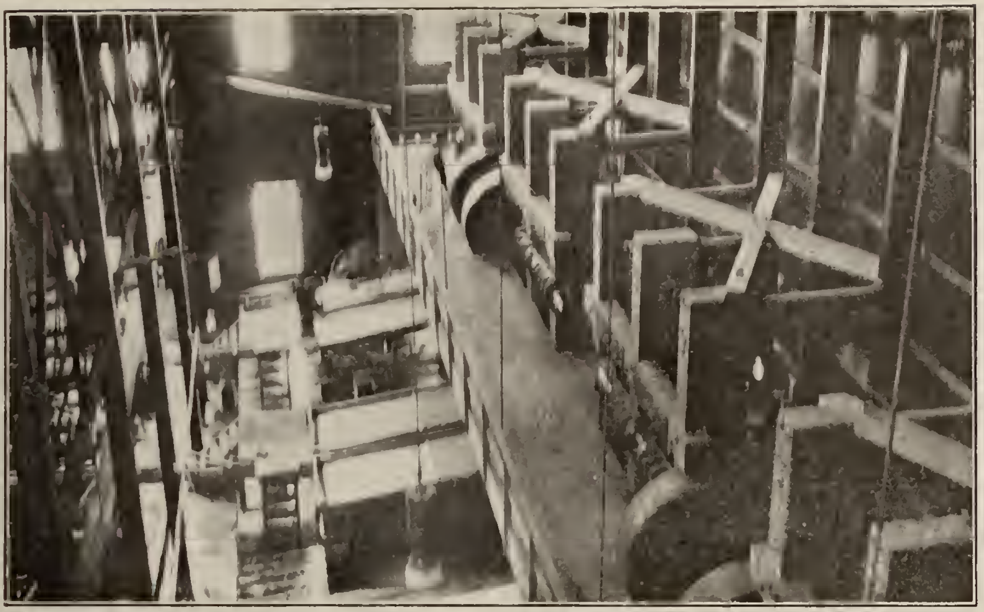
Gold quartz veins, Dome Mine, Porcupine, Ont.

Company) was also put in hand. With these mills in operation it appears reasonable to expect that the returns from this district in 1912 will be exceeded by its production in 1913.

### The Hollinger Mine.

At the Hollinger the ore reserves at the commencement of this year were estimated to amount to 644,540 tons, valued at $11,271,400, and the profit made during the last half of the year was $600,664.42. Up to the end of 1912 the company had paid three dividends of $90,000 each, bringing the total dividend distribution up to that date to $270,000. The reserves showed an estimated increase in value at the end of last year of $1,041,400, allowing for ore standing in reserve at the beginning of the year, to the value of $970,304.89, which was subsequently milled, and the mine at the end of 1912 had only been partially opened up to the comparatively shallow depth of the 300 ft. level. There are stated to be forty-three veins upon the property, of which seven were discovered in 1912, and upon thirty-four of them no work has been done beyond sampling the outcrops. The three principal veins opened up are known as No. 1, No. 2 and No. 4, which showed reserves estimated to be worth $6,026,100, $2,648,250 and $1,012,-

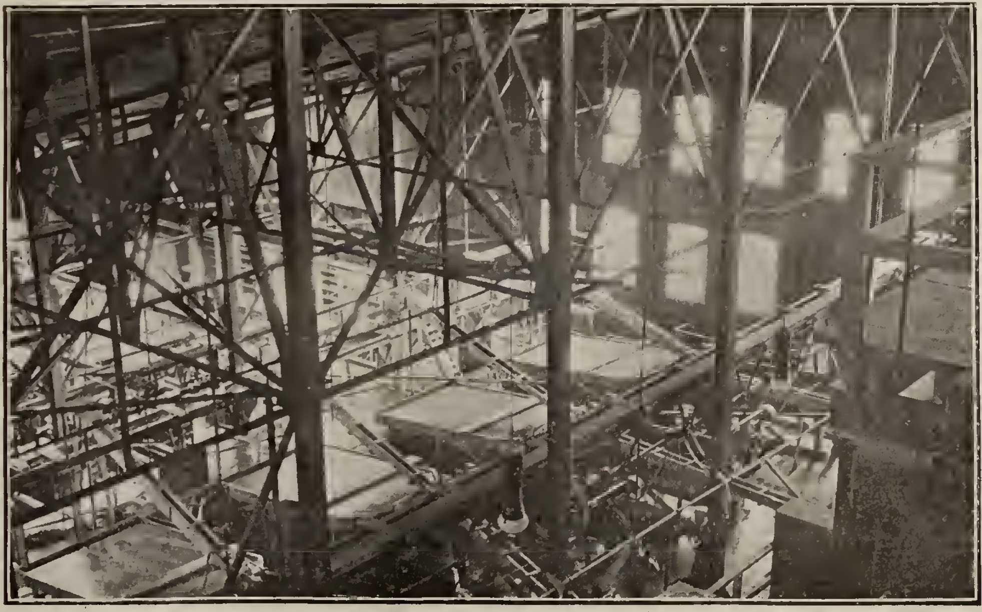
Mining gold quartz in open pit, Dome Mine, Porcupine



**The Dome stamp mill (in 1912)**

000 respectively at the commencement of 1913. But six other veins had been developed to some considerable extent, showing reserves varying in value from $33,200 up to $400,900 individually. The veins occur either in porphyry schist or near the contact, and development so far has been confined to veins in the porphyry. The strike of the schist is generally southwest to northeast, whilst the quartz veins cut across its strike at a small angle. No. 1 vein has a characteristic lenticular structure varying in width from 20 ft. down to a few feet, the lenses frequently overlapping. The average estimated value of all the ore treated in 1912 was $21.40 per ton, including low-grade ore sent to the mill at the start of milling operations and during the strike, but the average of all the ore won up to 5th October, 1912, is figured at $23.69 per ton and 5,777 tons of clean ore milled from the stopes yielded an average value of $37.89 per ton.

The mine costs at the Hollinger in February, 1913, exclusive of several items of extraordinary expenditure, chiefly attributable to the strike and alterations to the mill and plant, are stated to have been: Mining, $3,558; milling, $1.493; administration, etc., $0.407; operating camp, $0.261; general charges, $0.209; clearing surface roads, etc., $0.015; total $5.973 per ton of ore milled. But it is anticipated that, with uninterrupted work, the costs will be reduced approximately to $5.50 per ton. Directly and indirectly, the strike is said to have cost the company $100,000. The company employs about 500 men, and the working shifts are nine hours underground and eight hours on the surface. Skilled labour is paid $3.25 to $3.75 and unskilled labour $2.50 to $3.00 per day. Power is furnished from two independent sources at Mattagami River and Waiwaitan Falls. The new mill is said to be treating on an average 300 tons daily, with 30 stamps and making a 97 per cent. extrac-



**Dome Mill, Porcupine, Ont.**

Tube Mills, Hollinger gold mine, Porcupine, Ont.

tion from $30.00 ore. With 40 stamps in operation its capacity is calculated to reach 450 to 500 tons per diem, as the stamp duty may be reckoned at 12 tons per stamp using coarse screens. The machinery comprises a gyratory crusher of large size, with trommel, Blake crusher and belt conveyor, stamps with tube mills, Dorr classifiers and spitzkasten, Deister slime tables, Door thickeners, Moore filters, Merrill presses and other auxiliary cyanide plant, with bullion furnaces, etc., and preliminary amalgamation is dispensed with altogether.

### Conditions at the Dome.

At the Dome the ore bodies consist of veins and strings of quartz, much intermixed with schist, and the gold seems to occur along numerous small contact planes rather than in the quartz itself; very little sorting can, therefore, be done. Some rich specimen ore may be seen in the original discovery shaft a few feet from the surface at the end of a trench which follows along the back of a massive quartz outcrop. Two three-compartment shafts have been sunk—No. 1 to about 100 ft. in depth and No. 2 some 250 ft. or more—and the ore is carried from the mine to the mill by a double-tracked incline. The tonnage developed above the 45 ft. level is estimated at 315,528 tons, with a sampling value of $7.53 per ton. The new mill constructed after the fire of 1911 is stated to have treated from 23rd March, 1912, to 31st March, 1913, 101,812 tons of ore, which yielded $1,043,995, and its duty has been brought up to 425 tons or more by increasing the tube mill and filter press capacity of the plant. The crushing machinery comprises gyratory crushers (40 1,250 lbs.), stamps and tube mills, whilst the gold-saving appliances comprise Dorr classifiers, amalgamating plates, concentrating cones, Dorr thickeners, Pachuca and mechanical agitators, cyanide solution tanks, Merrill slime presses and bullion furnaces. The works of the company are to be entirely operated by electricity, supplied by the Northern Canada Power Company, generated at Waiwaitan Falls, in place of using coal. The cost of power supplied to the mines at Porcupine in this way is stated to be $50 per horse power per annum, calculated on peak-loads.

The different character of the two deposits makes the mining methods, as well as the mill practice, adopted at the Dome and Hollinger widely different. At the former mine most of the ore is won by the open-cast or "glory-hole" method, whilst at the latter mining is carried on either by ordinary stoping or by "shrinkage stoping" when the ore is wide (running as it does in No. 1 vein up to 20 ft. in width), and it is broken down in benches with long flat holes.

Pearl Lake, Porcupine, Ont.

A view from Tough-Oakes stamp mill towards Gull Lake. Tough-Oakes camp buildings in background

## Kirkland Lake District.

The writer, with several other members of the Porcupine excursion, made a branch visit to the Kirkland Lake district, in which several new discoveries were made last year. It is situated northeast of Swastika, which is about 61 miles north of Cobalt, on the Timiskaming and Northern Ontario Railway. Various gold claims have been opened up in this locality and one property, although only equipped with a small 5-stamp mill, is producing enough gold to pay running expenses. This claim is known as the Foster Tough-Oakes, and several veins have been located upon it. No. 2 vein is regarded as the principal one at present. It occurs in a grey and more or less banded conglomerate, a few feet north of the contact between the sedimentary series and grey feldspar prophyry. The conglomerate seems to dip nearly at the same angle as the vein. A main incline shaft was started from the bottom of an open cast about 30 ft. deep, and had reached a depth of 175 ft. on 28th July last. The principal quartz vein seen at the surface and in the shaft, although narrow, appears to be persistent as well as rich, and the wall rocks are said to carry good values for a width of several feet, payable across the full width of the shaft, and apparently over a width of 15 ft. or more at the bottom. Gold telluride (apparently "calaverite") was first noticed about 18 ft. from the surface, and is stated to have increased in quantity in depth, as the proportion of silver to gold has also done. Two early shipments of picked high-grade ore, won from the open cast, each of about twenty tons, returned 19.6 to 22.5 ozs. in gold and 23.4 to 33.6 ozs. silver per ton, and were valued at $9,235.60 and $8,567.36 respectively. The Burnside is another new discovery in the same locality, and other properties are being opened up between

Teck-Hughes gold mine, Kirkland Lake, Ont.

Swastika and Kirkland Lake, which was formerly rather inaccessible; but this will shortly be remedied by a new road, under construction by the Government.

**Gold Ore as received at stamp mill, Tough-Oakes mine, Kirkland Lake**

**Conclusion.**

Summing up, it is clear that Canada possesses in this little piece of Ontario alone, which the writer visited, immense deposits of mineral, comprising gold, silver, nickel, iron and other metals, that are being worked with large profit, and the old Hudson Bay territory to the north, which is as yet one of the almost unexplored corners of the globe, is said to be rich in copper and other deposits. Canada, it is true, cannot at the present time boast of many deep mines; but it is a mining country in the making, and the gross value of its metallic products alone came in 1912 to over $61,000,000, silver contributing $19,425,656, nickel $13,452,463, copper $12,709,311, and gold $12,559,443. Neither does the Dominion at present possess many large mines encompassed in a small area, like those of the Rand, Broken Hill, Kalgoorlie, Charters Towers and other places, if one excepts Sudbury and Cobalt. But there are numerous mines, more or less scattered over Ontario and the West, and as railways and roads are pushed out into new, unexplored districts, one can scarcely doubt that many important individual discoveries will be made, and probably large new mining camps will be opened up, which will vastly increase its mineral production in a few years' time, and place it in the front rank amongst other mineral-producing countries.

And this brings me to the vital question whether these vast territories, with their potential mineral wealth, will lie idle for a time or will be left entirely to American and Canadian capitalists to explore and develop, or whether in the future, as in the past, British capital and British brains will take an active interest and an active part in co-operating in this important, beneficent and Imperial work, or will they leave it to Empire builders possessing greater enterprise and greater foresight?

---

# SAMPLING COBALT SILVER ORES

### Sampling High Grade in the Mines.

Owing to the richness and the irregularity of the distribution of silver in the veins, it has always proven difficult to get an accurate sample of an ore shoot at Cobalt. Some engineers have little faith in the samples however taken. Others believe that a reasonable approximation of value can be obtained; but that to do so the samples must be taken at very frequent intervals. In sampling along a drift at intervals of over 5 feet only a rough approximation is obtained. For a block sampled on all four sides it has been found that if the block is large—over 75x100 feet, a very inaccurate estimate is often obtained. For the smaller blocks it has been found that reasonably close approximation is possible; but that it cannot be considered a close estimate of contained values. Fortunately the latter is seldom necessary; but in many cases the mine managers have so little confidence in the regularity of ore shoots that they prefer to make no statement of the reserves blocked out. At some mines, however, the ore shoots are regular enough to allow reserves to be approximately estimated, and this is done by the managers in their annual reports.

### Sampling Low Grade in the Mines.

Most of the low grade ore that has so far been sent to the mills is ore that is broken along with high grade ore in following the veins. It is common practice to sample each breast, and to break as wide as the assays indicate the values to extend. It is usually the case that rock showing even occasional particles of native or ruby silver to the naked eye contains ore, and most of such material from the stopes is sent to the mill without assays being made. Where rock showing no visible silver is broken, a sample is sent to the assay office to determine whether it is ore or waste.

As much high grade ore had been removed before any attempt was made to treat low grade ore, the early workings on veins are now being extended to take out the milling ore. A large quantity of low grade is also being taken from the dumps where it was piled before concentrators were available.

In testing the walls of openings a common practice is to take the channel samples across the face at short intervals. At the Nipissing mine the walls are sampled by drill holes. In taking these samples, 6 holes are drilled horizontally from one set-up—3 holes in one wall opposite three in the other. The holes are placed in a vertical row and driven at right angles to the drift. The upper hole is 4.5 ft. deep, the middle 6 feet and the lower 3 feet. The hole is started with a diameter of 2½ inches, and a smaller size is drilled for each succeeding sample. When a depth of 18 inches has been drilled the holes are carefully cleaned out. The drillings give the first sample. Then another 18 inches is drilled and cleaned out, giving a second sample. This process is repeated every 18 inches, so that from upper holes there are taken three samples, from middle holes four samples, and from lower holes two samples. Where assays show good values for some distance in, the drilling is continued further.

The samples are all assayed and the results plotted. The construction of elaborate assay plans of the Nipissing property has thus been started.

In places where the samples show good values a further test will be made by breaking a sample for mill treatment. In doing this holes will be drilled at an angle with the holes made in sampling and the latter will then be used in breaking the ore. The assayed samples will thus be checked by a mill run before preparations are made for stoping on a large scale.

### Sampling Ore for Shipment.

By far the greater part of the silver shipped from Cobalt is in the form of ore or concentrates. There are large shipments of bullion from the Nipissing high grade plant and smaller ones from the cyanide plants treating low grade ore; but the camp is still largely dependent on the smelters. It is obviously necessary that an accurate sample must be made the basis for the sale of the ore.

The practice for some years was either to have the sampling done at the smelters in the presence of a representative of the seller, or to have the sampling done by independent assayers in the United States. Much of the ore has been sampled by Ledoux & Co., of New York.

To provide for accurate sampling of the ore at Cobalt, Messrs. Campbell and Deyell established a plant which has proven of great value to those who use it, and also, indirectly, to the other mines.

The plant and process of treatment have been recently described in a booklet issued by the owners. From this I will quote a few paragraphs describing the process and giving some notes on the characters of the ores that make sampling difficult. The accompanying figure gives the flow sheet. The authors of the booklet say:

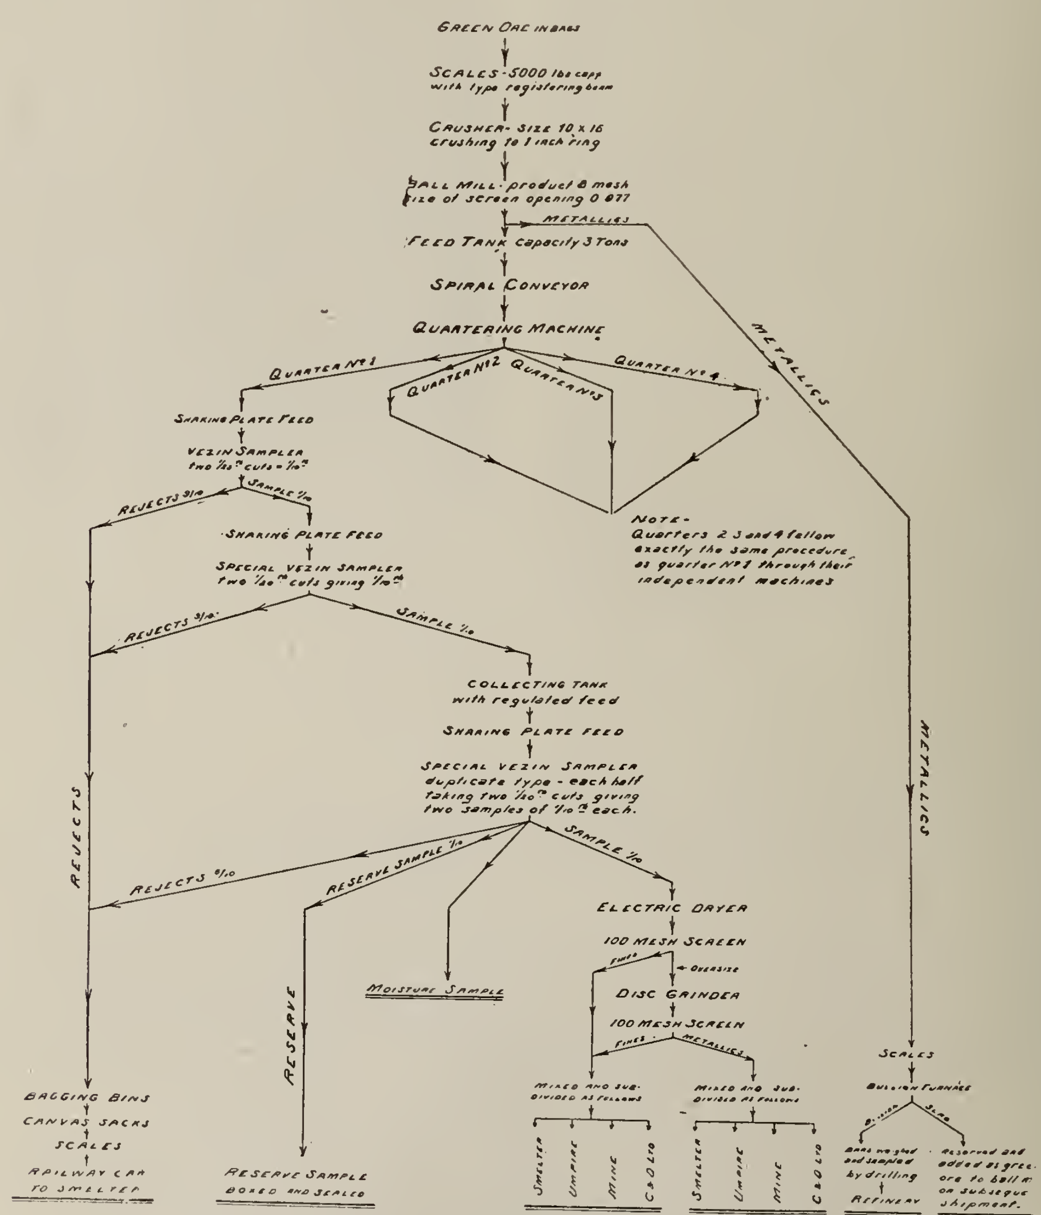
"The sampling of high-grade Cobalt ore for either of the purposes outlined presents some difficulties owing to its extreme variability, its richness, and to the presence of large and small nuggets and flakes called 'metallic silver.' In the reduction of the ore to suitable sizes for sampling by the ordinary method these pieces of metallic silver would be caught on the necessary succession of screens and would involve extremely laborious calculations throughout the process.

"To make our meaning more clear: In sampling a lot of ore composed of large pieces it is necessary in the first place only to crush to a size which will permit of thorough mixing and the extraction of a representative sample—say one-tenth. If this sample is still too large in bulk the pieces must be further crushed and mixed before another sample can be taken; and each extraction of samples must be paralleled by suitable crushing and mixing of the ore in this manner. In the Cobalt ores the pieces of metallic silver, being malleable will not crush, and consequently they must be screened off at each stage, weighed and the portion from which they were taken also weighed and finally the 'metallics' melted and their bearing on the rest of the ore-lot calculated separately by assay. This operation is necessary with each crushing, hence the laborious calculations as intimated above.

"However, by performing all the crushing in one or two consecutive operations at the very beginning the friable portion of the ore is reduced to fine powder and the uncrushable pieces of metallic silver are screened off for separate treatment, in one operation. The material passing through the screens is fairly homogeneous, and can be reduced, after mixing, to a very small representative sample before further treatment. The sampling of this ground product can be done entirely by machines—which have no personal equation—while the handling of the metallics and the finishing of the small samples can be closely supervised by the mine or smelter representative.

"It now is proposed to give in more or less detail a description of the method employed at Cobalt for the sampling of Cobalt ores, but before passing from generalities it might be well for us to express our opinion regarding the attitude from which sampling should be regarded.

"The bags are trammed from car or wagon into the mill, being weighed at the door on a Canadian Fairbanks type-registering scale. The car and ore-sacks are subsequently weighed and this tare deducted, giving the net green, or receiving weight of ore. The ore is either placed in locked bins, or, if to be sampled immediately, is carried by electric elevators to the second, or 'crusher' floor. Here the bags are opened and the ore shovelled over a one-inch grizzly, the oversize going to a 10-inch by 16-inch Buchanan crusher, which reduces it to 1½-inch ring.



**Flow Sheet of Campbell-Deyell Sampler**

"The company's chief works are situated in Cobalt immediately beside the line of the Timiskaming and Northern Ontario Railway, with a special siding leading to the mill entrance. From the mine, therefore, most of the ore is delivered to the plant in railroad cars, a certain proportion, however, being sent in by wagon. In all cases the ore is contained in jute or canvas sacks which weigh from 80 pounds to 150 pounds each.

"The discharge from both crusher and grizzly pass to a cylindrical steel tank with conical bottom, and is thence discharged automatically to the ball mill by an adaptation of the Challenge feed. The ball mill reduces the 1½-inch product continuously and passes it over a spiral screen (8-mesh), thereby discharging the 'throughs' into a steel hopper-bottom car and returning the over-size to be reground. Necessarily each lot of ore has to be crushed and sampled separately, and requires a complete clean up of the mill and the machinery after each lot has passed.

"After the ball mill receives the last portions of ore from the crusher tank, the presence of metallics becomes evident from the nature of the ball mill discharge. When it is adjusted that the metallics have been freed from the brittle ore and the mill is discharging a product composed mostly of pellets of silver, a section of the screen is removed allowing the metallics to be discharged in their unreduced form, into a suitable receptacle. These metallics are, at the discretion of the mining company, either bagged, weighed, and shipped to the smelter; or else they are taken to the bullion department and are there melted and cast into ingots. Samples are taken by drilling the ingots. It is usual to ship the bullion by express to the London or United States markets.

"To return to the No. 8 mesh product that has been discharged from the ball mill into hopper bottom cars; this is occasionally held in reserve in a steel hopper tank until required for further treatment; rarely it is bagged; usually the car is trammed, directly it is full, to the elevator, elevated to the top of the mill, and there discharged into the sampler feed-tank.

"From this point the ore is treated entirely by machines until four separate samples, of about 15 pounds each, are obtained.

"The sampler tank discharges its burden into a steel pipe fitted on the inside with a spiral band of steel. This spiral conveyor is rotated by a chain drive, the ore having the combined motion of advancing in the pipe and being tumbled over. This last motion, which gives a mixing action, while not equalizing the whole tenor on the ore passing through, cuts out the sharp lines of difference and enables the sampling machines following to have a uniform product discharged to them during each of their revolutions.

"From the spiral the stream of ore is fed by a spout to the quartering machine, which in each of its revolutions takes four equal sections of the ore stream. Each of these quarters is separately led by a pipe to a shaking plate, which equalizes the intermittent discharges and delivers a constant stream to the No. A Vezin sampler which takes a one-tenth cut from the stream (2 1-20 cuts per revolution). The reject falls directly by a pipe to the reject bin. The sample (1,500 pounds) is taken continuously by a second shaking plate and thence to No. B Vezin sampler, which, as before, takes one-tenth cut. The second reject is also led to the reject bin; and the sample (150 pounds) caught in a sealed sample safe. At the completion of the run all the machines are brushed down and the samples taken to No. C Duplicate Vezin Sampler.

"Here a shaking plate delivers a stream of ore to two double revolving vanes that extract, each, one-tenth sample (15 pounds) depositing each into a separate receptacle and the reject into a third. One 1/20 sample is boxed, sealed, and stored as a reserve; the other is taken to the finishing room; the reject goes to the bagging bin, or is held over until the next shipment from this particular mine, as are also the mill sweepings and the rejects from the finishing room. These operations are carried out with each of the four quarters from the quartering machine.

"From the bagging bin the ore is drawn off into canvas bags, which are tied, weighed, and shipped to the smelter.

"Up to this point the fine product from the ball mill has been automatically mixed, quartered and each of the quarters independently sampled by machines until eight samples of the lot (two from each quarter) are obtained.

"To follow the samples further; on reaching the finishing room the sample is weighed and dried in an electric oven for six hours at a temperature of 110 deg. C.; the moisture is thus incidentally ascertained —this method has been checked against the theoretical method with no practical difference resulting. The dried product is screened through a 100-mesh and the oversize ground in a Braun disc pulverizer to pass the same mesh.

"It is at this point that the metallic silver in the ore is again in evidence. The small pellets that pass through the ball mill screen are flattened out, or are rolled into spheres by the discs. These metallics, No. 2, are disced until clean as required, or are freed from impurities on the buckboard; the product from all operations either passing through the 100-mesh or being held on it as clean metallics. The metallics are mixed by coning on glass, divided into the requisite number of packets, and sealed. The fines are placed in an Abbe pebble mill, from which the pebbles have been removed, and the jar rotated slowly for half an hour. After mixing, the fines are carefully removed from the jar, placed on the glass table, flattened out with a spatula, and sections taken, packeted, and sealed for each of the parties interested.

"In this way, the ore after passing the ball mill screens is divided into four equal portions, each quarter after treatment resulting in a sample each of fines and metallics. The combined assay values of these two products give one valuation on the ball mill fines. The mean of the four samples is considered to be a fair valuation of this product.

"If now this number of ounces per ton is multiplied by the weight in tons of the ball mill fines, it gives the total silver content, in ounces, of this product. Adding to this the total fine ounces in the ingots obtained from the ball mill metallics, the total number of ounces in the shipment is arrived at. Multiplying this product by the current market price of silver gives the present value in silver of the shipment.

"The flow sheet will serve to give material aid to an appreciation of the above description. It shows in a graphic form every stage in the sampling of the ore.

"It must be understood that the foregoing is descriptive only of the method employed in dealing with high-grade Cobalt ore. As has been explained, there are certain difficulties in connection with Cobalt ores which call for more lengthy and elaborate treatment than is needful with many others. Still, as the greater includes the less, so this plant, equipped for this elaborate method, is capable of dealing, all the more readily, with less complicated processes."

## MANGANESE.

Ores of manganese found in Canada comprise pyrolusite, manganite, psilomelane and wad or bog manganese, and these are found principally in the eastern provinces of Nova Scotia and New Brunswick.

Mining operations have been conducted at Loch Lomond, Cape Breton, Tennycape, Walton and Cheverie in Hants County, East Onslow and Londonderry in Colchester County in Nova Scotia. In New Brunswick there are numerous occurrences and production has been obtained from Markhamville and Jordan Mountain in Kings County; Quaceo head, St. Johns County; Shepody Mountain and Dawson Settlement, Albert County.

# MINING IN ONTARIO IN 1912*

By Thomas W. Gibson, Deputy Minister of Mines.

The mining industry of Ontario continues to expand, not only in the quantity and value of the annual production, but also in the area embraced within its operations.

The beginnings of the industry were on the shore of Lake Erie, where a hundred years ago the settlers smelted the bog iron ores of the locality into stoves and potash kettles. In the eastern part of the Province the rocky areas proved to contain iron, gold, mica, and many other useful metallic and non-metallic minerals on which have been established industries of local, and in some cases more than local, importance. The shores of the great lakes, being accessible by water, lay open to the early prospectors, who were rewarded by the finding of copper at Bruce Mines, and silver at Silver Islet and on the mainland of Lake Superior.

The period of railway building set in, and wherever a pathway was opened in the forest, it became a base, sometimes indeed the actual site, of fresh discoveries. In a cut of the Canadian Pacific Railway, near Sudbury, in the year 1883, the first copper ores of that region were found, which soon proved to contain nickel, and so led to the opening up of the world's chief source of supply of that metal. The building of the C.P.R. enabled prospectors to ply their calling on Lake of the Woods and to penetrate to the valley of

*Extracts from Report of Bureau of Mines, 1913.

the Seine River, where they found gold indeed, but failed to open up a permanent gold field. The rumours of placer gold drew a crowd of prospectors into the wilds of Michipicoten in 1897. They found no golden sands, but in 1898 there was discovered the Helen mine, which brought about the building of the Algoma Central Railway. A stretch of fertile land at the head of Lake Timiskaming had called for years for connection with older Ontario, but not even the standing promise of a substantial bonus by the Government induced private capital to undertake the construction of a railway. The Government itself set about the task, and Cobalt was discovered, one of the richest silver camps ever made known. Gowganda, South Lorrain and Casey followed, and in 1909 Porcupine, now getting into its stride as a producer of gold.

The only key to the future is found in the past, and in the vast area of pre-Cambrian rocks yet unprospected in Northern Ontario—to which was added last year the principality of Patricia—it can hardly be doubted that many more deposits of mineral wealth will be found, some of them perhaps as rich as any that have yet been brought to light.

For the year 1912 the returns made by mining companies and mine owners show the aggregate production of minerals and mineral products to have had a value at the point and in the form produced of \$48,341,612. In 1911 the value was \$41,976,797, so that the increase for the year was \$6,364,815, or 14.9 per cent.

The increase in production as compared with 1911 was largely in the metals, the value of which was greater by \$5,696,876, or 19.5 per cent. Non-metallic substances advanced in value by \$667,939, or 5.1 per cent. Of the entire output, the metalliferous list provided 72 per cent., and the non-metalliferous 28 per cent., as against 70 per cent. and 30 per cent. respectively in 1911.

Among the metals decided gains were made in gold (\$2,071,449), silver (\$1,718,023, or 10 per cent.), nickel \$1,071,986, or 29.2 per cent.), copper (\$303,192, or 23.6 per cent.), and cobalt (\$144,891, or 84.7 per cent.). The gold production given for 1912 includes a considerable output really belonging to the six years beginning with 1907, of which no report has been made until now. The item for cobalt also obtains some advantage from the fact that much of the mixed oxides of cobalt and nickel which are produced in the process of refining the ores from Cobalt are shipped without being separated from each other. Cobalt predominating, both in quantity and value, the whole is credited to cobalt alone. There was a moderate advance in pig iron (\$338,055, or 4.3 per cent). The single decrease was in iron ore (\$207,046, or 46.1 per cent.).

In the non-metallic substances, the chief increases were in common brick (\$376,279, or 13.5 per cent.), paving and fancy brick (\$135,301, or 156 per cent.), pressed brick (\$69,539, or 12.1 per cent.), stone (\$61,212, or 6.8 per cent.), corundum (\$86,054, or 5.8 per cent), quartz, \$115,171, or 17.8 per cent.), and sewer pipe (\$54,563, or 13.3 per cent.). The largest decreases were in Portland cement (\$274,983, or 7.5 per cent.), faldspar (\$22,694, or 43.9 per cent.), iron pyrites (\$47,414, or 40 per cent.), and drain tile (\$69,966, or 20 per cent.).

**An Accelerating Production.**—During the five years beginning with 1908, the products of the mines, quarries and mineral works of the Province have increased in value by 88 per cent. It is in the metalliferous materials that the more notable increases have taken place. The entire list of products of this kind participates in the increase save one—iron ore, the output of which has of late shown a tendency to diminish. Gold remained stationary at a small production until 1912, when the effect of the opening up of the Porcupine deposits began to be seen. Silver, notwithstanding a reduction in the quantity produced, brought a greater return in 1912 than in any previous year, because of the higher prices which prevailed. Nickel expands steadily, and carries along with it its by-product, copper. Cobalt is also a by-product, the figures for which are assuming more importance as the business of refining and especially of marketing it is being mastered. Among the rarer metals platinum and palladium reappear in 1912, after an absence of some years.

The changes in the production of the non-metallic materials have not been so marked. There has been a steady growth in the output and value of brick of all varieties, also of stone both for building purposes and crushed for road material and use as a flux. Portland cement shows a rapid growth until 1912, when for the first time since the manufacture began in 1891, there was a check in the output, the figures falling below those for 1911. Lime alone among the materials of construction seems to be losing ground, possibly because of partial displacement by cement. The decline in the yield of petroleum, remarked on in this report annually for a number of years, shows no symptom of abatement. Natural gas continues to advance, but the increase in 1912 over 1911 is comparatively small. Salt maintains an annual production of less than half a million dollars in value, and shows little fluctuation from one year to another. Sewer pipe made in Ontario appears to be coming into better demand, for the production has been for some years rising in value; but another clay product, drain tile, shows an unusual falling off in 1912. Pottery, too, remains stationary. Notwithstanding private and governmental effort, the manufacture of peat makes little headway, measured at any rate by quantity of actual output. The milling of talc is becoming more important yearly; mica barely holds its own against competition from India; the feldspar quarries on the Kingston and Pembroke Railway were active during the later part of the five-year period, but less so in 1912, and iron pyrites also failed to maintain in that year the advances successively made for several years before. Graphite and gypsum have both increased, the latter markedly so; this is true also of corundum, though the destruction by fire of the only operating plant for treating this mineral may cause a temporary stoppage of production. Quartz for flux and converter linings is being raised in large quantities; white arsenic, made from the ores of Cobalt, has of late found a good market; carbide of calcium, though higher in 1912 than in 1911, did not attain to the level of the earlier part of the five-year term. The production of apatite, or phosphate of lime, has practically ceased, and fluorspar, though appearing in the tables for 1910 and 1911, has not yet been produced in quantity.

**Total Production of Metals in Ontario.**

| Product. | Value. |
|---|---|
| Gold | \$4,734,713 |
| Silver | 97,176,289 |
| Platinum and Palladium | 290,755 |
| Cobalt | 1,072,141 |
| Nickel | 41,012,763 |
| Copper | 17,239,531 |
| Iron ore | 6,724,385 |
| Pig iron | 57,246,101 |
| Lead | 117,290 |
| Zinc ore | 92,410 |

The footing of the valuation column in the above table is $225,706,378. The only item in which there is any duplication or overlapping is iron ore, a considerable proportion of which was smelted into pig iron, and so included in the latter. Making ample deduction for this, it would appear that up to the end of 1912, the selling value at the mine or works of the metals and metalliferous substances produced in this Province was $220,000,000 at least. If the nickel and copper were valued at the prices of the refined metals in New York, according to the method employed by the Mines Department at Ottawa, the total would be about $290,000,000.

**Gold.**—For the first time in the history of Ontario, there was in 1912 a substantial production of gold. The largest previous yield was in 1899, when a number of stamp mills were operating in the Lake of the Woods and Seine River districts. The output that year amounted to $423,978, but the performance of these fields not proving equal to their promise, the production fell off in 1900 to $297,861. Last year the actual yield of gold within the limits of the Province was 86,603 ounces, worth $1,790,087, or over four times as much as in 1899. To this is added 15,675 ounces, valued at $323,999, recovered at the Orford works of the International Nickel Company, New Jersey, in refining the nickel-copper mattes from the Canadian Copper Company's mines in the Sudbury district. This extraction extended over the six years from 1907 to 1912, but no part of it has hitherto been included in the Bureau's statistics, since no returns of it were made. Though the effect is to swell the figures for the twelve months beyond their strict limits, it seems proper to incorporate this production in the official record at the first opportunity. The total number of ounces stands therefore at 102,278, with a value of $2,114,086.

The feature of the year was the coming into production of the Porcupine camp. The Dome and Hollinger mines both suffered the destruction of their milling plants, then well on their way to completion, by the unprecedented fires of 1911, which were also accompanied by so lamentable a loss of human life. It was not until April and June, respectively, 1912, that the new mills at the Dome and Hollinger were ready to begin work, so that the output for last year by no means represents a full twelve months' operations.

**At the Hollinger mine**, the plant went into commission July 1st, with the full complement of thirty stamps, and during the remainder of the year it treated 45,195 tons of ore and rock, from which a recovery was made of $933,682, or an average of $20.33 per ton. Of this, $972,135 was in gold, and $6,547 in silver. The mill and process have proven satisfactory, but after a short time experience led to the abandonment of amalgamation in favour of cyanidation of the concentrates. This necessitated no change in the apparatus, the substitution of cyanide of potassium for mercury in the grinding pans being all that was required. At the end of the year, the underground workings amounted to 8,918 feet, distributed as follows: 5,039 feet of drifts, 2,764 feet of crosscuts, 451 of winzes, 232 of raises, and 432 of shafts. There are levels at 100, 200 and 300 feet. The reserves of ore are placed at $10,230,000, of which $7,560,000 is credited to No. 1 vein, and $1,200,000 to No. 2. In computing the reserves, no allowance is made for ore which may exist beyond a depth of 50 feet below the deepest working of any vein. The total operating profits up to 31 December, 1912, were $600,664, and a monthly distribution of dividends at the rate of 3 per cent. per month was begun in November. Three such dividends of $90,000 each were declared before the close of the year.

Operations here and at the Dome and other mines of the Porcupine camp were much interfered with by a strike of the miners, which began early in November, the men refusing to accept a reduction of wages. The strike was unsuccessful, for the companies were able to procure labour enough to operate the mines and mills, though for a time only partially so, and not a little of the help obtained was of an indifferent character.

**The Dome mine** also operates thirty stamps, and crushed a large tonnage of ore from the date at which work began. The workings of the Dome Company are open cut, and both the quartz and the schist in which it occurs are put through the mill.

**Other mines** which turned out bullion at Porcupine in 1912 were the Vipond and McIntyre. In Eastern Ontario, the Cordova; in Lake of the Woods, the Olympia; and in Sturgeon Lake, the Northern Gold Reef, Limited (St. Anthony) contributed to the output. Of the total production of $2,014,126, Porcupine supplied $1,730,628, and the remainder of the Province, $452,656, including the gold obtained in refining the Canadian Copper Company's mattes during the last six years, as above set forth.

Other mines at Porcupine, such as Jupiter, McEnaney, Pearl Lake, etc., may be expected to become producers ere long, and it is now evident that this camp is destined to make a substantial contribution to the gold output of Canada, and to break the long record of disappointment which so far has been the chief result of gold discoveries in Ontario.

There are other districts where development has been going on with more or less activity for some time, including Larder Lake, Swastika, Munro Township, Long Lake, etc., but none of them have yet reached the stage of permanent production.

**Kirkland Lake.**—A find of more than ordinary interest has been made at Kirkland Lake, in the Township of Teck. On the Tough-Oakes claims, some very rich ore occurs in small stringers. Since the beginning of 1913, several carloads of ore have been taken out by open-cut methods and shipped in bags, the ore realizing $448 per ton. The property is being opened up by Mr. C. A. Foster, of Haileybury, discoverer and first owner of the Foster silver mine at Cobalt.

**A New Find in Michipicoten.**—Towards the close of last season, a discovery of gold was made in township 34, Range 24, Michipicoten. During the fall and winter a number of mining claims were staked out, but no work has yet been done to test their value. The locality of the discovery is about 55 miles southward of White River station on the Canadian Pacific Railway, and about 10 miles north of Lake Superior. A good canoe route, with only two difficult portages, leads up White River, across Pokay Lake, down the Dog River, and over a number of small lakes into Lake Michi Biju. The more promising of the two main outcrops is a 3-foot silicified zone cutting a well-mineralized green schist, and ramified by numerous small stringers of quartz. At the discovery post the hanging wall of the zone is exposed to a height of 12 feet above the adjoining small valley. On the wall, the gold occurs in small blebs and scales and again is heavily intermixed with arsenical pyrites, which occurs in patches. A sample of the pyrites was assayed by the Provincial Assayer and showed a high gold content. This sample was taken from the wall only, and covered but 15 feet of the best material then showing, consequently the result cannot be considered as that of a fair average sample. It is as yet uncertain whether or not the gold-bearing arsenical pyrites is confined to the hanging wall or, what seems more likely, whether it is associated with the numerous small enclosed quartz stringers that follow the trend of the zone.

The other gold-bearing formation occurs a mile farther north. Here, on the edge of a small lake, a quartz vein having a width of at least 20 feet at the discovery post, outcrops prominently for a distance of 200 feet. The only sample taken, from the hanging wall, showed a gold content of $1.20. The quartz looks promising, and it is possible that systematic sampling may prove the vein to be worthy of exploitation.

Owing to the closeness of the freeze-up, nothing in the way of sampling or actual testing of either of the two main outcrops could be undertaken. It is intended to prospect the formations during the coming season. The geological conditions are in general favourable, and resemble those obtaining in other Ontario goldfields. The thick forest growth and the heavy overburden, however, combine to make prospecting in this but little explored part of the Province difficult, tedious and expensive.

**Gold Mining Companies.**—Following is a list of the gold mining companies in operation during 1912, distinguishing between those which produced bullion and those which did not:

**Silver.**—The production of silver last year amounted to 30,719,883 ounces, which was 787,997 ounces less than in 1911. Owing to the higher price of silver, however, the value was greater by $1,718,023, or $17,671,918 in all. Cobalt, of course, was the preponderant source of supply, others being the gold obtained from Porcupine and elsewhere, and the nickel-copper mattes of Sudbury. These sources contributed respectively as follows:

| | Ounces. | |
|---|---|---|
| Cobalt proper | 28,859,764 | |
| Gowganda | 549,976 | |
| South Lorrain | 834,119 | |
| | | 30,243,859 |
| Gold ores | | 16,776 |
| Canadian Copper Company's mattes | | 459,248 |
| Total | | 30,719,883 |

The explanation of the last item is similar to that already given regarding the gold obtained from the same material; the quantity mentioned was recovered at the Orford works of the International Nickel Company in New Jersey during the last six years. It has not been included in any of the statistics previously published by the Bureau of Mines for the reason that it was omitted in the returns for the years in question.

From the year 1904 when the first silver was obtained from the mines of Cobalt, the production of the camp has amounted in all to 15,815,839 ounces, the sum received by the mining companies for which was $81,731,115.

**Ontario Gold Mining Companies.**

| Name of Company. | Name of Mine. | Locality. | P. O. Address of Manager, etc. |
|---|---|---|---|
| Producing Companies— | | | |
| The Dome Mines Company Limited | Dome | Porcupine | South Porcupine. |
| Hollinger Gold Mines, Limited | Hollinger | Porcupine | Timmins. |
| Vipond Porcupine Mines, Company, Limited | Vipond | Porcupine | Schumacher. |
| McIntyre Porcupine Mines, Limited | McIntyre | Porcupine | Schumacher. |
| Northern Gold Reef, Limited | St. Anthony | Sturgeon Lake | Toronto. |
| Cordova Mines, Limited | Cordova | Peterboro county | Cordova Mines. |
| Olympia Gold Mining Company, Limited | Olympia | Shoal Lake | 9 Reaney Street, St. Paul, Minn. |
| Non-producing Companies— | | | |
| Ore Chimney Mining Company, Limited | Ore Chimney | Frontenac county | 335 Brisbane Bldg., Buffalo, N.Y. |
| Crown Reserve Mining Company, Limited | McEnaney | Porcupine | Cobalt. |
| Canadian Exploration Company, Limited | Long Lake | Long Lake | Naughton. |
| Lucky Cross Mines of Swastika, Limited | Lucky Cross | Swastika | Swastika. |
| The Swastika Mining Company, Limited | Swastika | Swastika | 18 Toronto Street, Toronto. |
| The Gilmour Mining Company, Limited | Gilmour | Hastings county | Gilmour. |
| Jupiter Mines, Limited | Jupiter | Porcupine | Schumacher. |
| Dome Lake Mining & Milling Company, Ltd. | Dome Lake | Porcupine | Schumacher. |
| Pearl Lake Gold Mines, Limited | Pearl Lake | Porcupine | Schumacher. |
| Plenaurum Mines, Limited | Planaurum | Porcupine | Schumacher. |
| Goldfields, Limited | Goldfields | Larder Lake | Larder Lake. |

Among the non-producing companies, stamp mills were in course of erection about the beginning of 1913 by Crown Reserve, Lucky Cross, Swastika, Dome Lake. Canadian Exploration Company and Goldfields, Limited, are already equipped, having made extensive alterations during the year, including the installation of hydraulically generated electric power. The former derives current from the Wahnapitae River, and the latter from the falls at Raven Lake.

The producing mines numbered 30 as against 34 in 1911, those whose output was a million ounces or more being—

| | Ounces shipped in 1912. |
|---|---|
| Nipissing | 4,719,578 |
| Coniagas | 3,703,942 |
| La Rose | 2,920,344 |
| Crown Reserve | 2,714,766 |
| McKinley-Darragh-Savage | 2,704,868 |
| Kerr Lake | 1,895,309 |
| Buffalo | 1,890,150 |
| Cobalt Townsite | 1,505,396 |
| Timiskaming | 1,242,243 |
| Cobalt Lake | 1,123,146 |
| O'Brien | 1,091,631 |

**The other producing mines were** Penn-Canadian, Hargrave, Bailey, Hudson Bay, Casey-Cobalt, Colonial, General, City of Cobalt, Trethewey, Right of Way, Chambers-Ferland, Beaver, Cobalt Provincial, Drummond, Seneca-Superior, Miller Lake-O'Brien, Mann, Wettlaufer-Lorrain. New-comers on the producing list are Bailey, Seneca-Superior and Mann. The following yielded more or less silver in 1911, but none in 1912: Silver Cliff, Standard Cobalt, Green-Meehan, Belellen, Nancy-Helen, Wyandoh, King Edward. The name of the Cobalt Central mine is now Penn-Canadian, and Seneca-Superior partially takes the place of Peterson Lake, being situated on part of the bed of that lake, or rather of Cart Lake which at the time of making the grant was thought to be an extension of the former, instead of a separate body of water.

The producing mines in Gowganda were Miller Lake-O'Brien, Millerett and Mann, and in South Lorrain, Wettlaufer-Lorrain.

**Shipments.**—Shipments of ore and concentrates from Cobalt can no longer be taken as indicating the tonnage raised from the mines, since the tendency towards absolute refinement of the silver on the spot is becoming more marked year by year. For instance, two of the leading mines, Nipissing and Buffalo, are now equipped for reducing their entire output, both of high grade and low grade ore, to merchantable bars, which leave the camp in an express car. In consequence, the quantity of bullion produced at Cobalt is steadily increasing, being 5,080,127 ounces last year, as compared with 3,122,976 ounces in 1911. The shipments by freight were smaller than in the previous year, the ore shipped out amounting to 10,719 tons, as against 17,278 tons in 1911, and concentrates to 11,214 tons, as against 9,393. The several classes of material sent out of the camp and their silver contents, respectively, were as follows:

| Product. | Quantity. (tons) | Silver. (ounces) |
|---|---|---|
| Ore | 10,719 | 15,395,504 |
| Concentrates | 11,214 | 9,768,228 |
| Bullion | 11,214 | 5,080,127 |
| Total | 21,933 | 30,243,859 |

**Ore Concentration.**—In all, 456,167 tons of ore were put through the concentrating plants, of which 101,338 tons were treated at the several custom concentrators now working in the camp, namely, those of the Nipissing Reduction Company, the Dominion Reduction Company, and the Northern Concentrators, Limited. The remainder, 354,829 tons, were manipulated by the mining companies in their own plants. The average ratio of concentration works out therefore at 39 tons of ore to one ton of concentrates. The silver contents of the concentrates were 9,768,228 ounces, an average of 871 ounces per ton. The quantity of ore or rock subjected to concentration being 456,167 tons, the recovery was at the rate of 21.4 ounces per ton. Assuming that 85 per cent. of the original silver was contained in the concentrates, the silver contents of the concentrating material as it went into the mill would be 25.1 ounces per ton. These results correspond closely with those obtained in 1911, when the concentrates carried 858 ounces per ton, the silver recovered averaging 21.6 ounces per ton, and the concentrating ore 25.4 ounces per ton.

Four refineries were in operation in Ontario on ore and concentrates from Cobalt last year, namely, those of the Canadian Copper Company, at Copper Cliff, the Coniagas Reduction Company, at Thorold, the Deloro Mining and Reduction Company, at Deloro, and the Canadian Refining and Smelting Company at Orillia. Of these, the one at Copper Cliff worked for part of the year only, and is still idle, while the Orillia works have since been burned down. The total quantity of ore and concentrates treated at these establishments was 8,111 tons, which yielded 15,675,218 ounces of silver. Bullion produced at Cobalt itself amounted to 5,080,127 ounces, so that not less than 67.5 per cent. of the total silver yield of the mines was refined in the Province, as compared with 66 per cent. in 1911.

The Dominion Refineries, Limited, have established a plant at North Bay, for the treatment of Cobalt ores low in silver. A new refinery is being built at Kingston, by the Buffalo and Ontario Smelting and Refining Company, Limited. The Metals Chemical Company, Limited, have also erected a plant for the production of cobalt and nickel oxides at Welland.

A summary of the operations of the silver refineries of Ontario for 1911 and 1912, so far as silver is concerned, is as follows, the by-products being dealt with under their respective headings:

**Operations of Ontario Silver Refineries.**

| | 1911. | 1912. |
|---|---|---|
| Silver refineries in operation | 4 | 4 |
| Silver-cobalt ore received, tons | 9,142 | 8,274 |
| Silver-cobalt ore treated, tons | 9,330 | 8,096 |
| Silver recovered, fine ounces | 17,756,651 | 15,675,218 |
| Value of ditto | $9,248,829 | $9,094,156 |

**Markets and Prices.**—There was a good demand for the silver-cobalt ores during the year. The refining companies in Ontario have, through their efforts to keep their plants supplied, no doubt assisted in maintaining the prices of ore, but in view of the diminution in their number, and the fact that one of them, the Coniagas Reduction Company, is now sufficiently occupied with ore from the Coniagas mine, their influence in this direction is likely for the time being to be less than in the past. New Jersey, Pennsylvania and Colorado smelting works took most of the ore that went to the United States, much of it is low grade, but being silicious, it is found highly useful for mixing with basic material.

Prices of silver are fixed by influences which find their stage largely in the Orient. The requirements for coinage and the arts in the commercial and manufacturing nations of America and Europe absorb considerable quantities, but production continues at a rate which would inevitably depress the price of silver to lower levels were it not for the capacity which India and China have, almost from time immemorial, shown to buy a large share of the world's output. Thus in

1912 the production of silver is estimated to have been 229,569,903 fine ounces, worth at the average price for the year in New York, say, $139,658,850. The imports of India during the year amounted in value to $59,975,802, and of China, to $20,971,423, or together to $80,947,225, a good deal more than one-half the entire output for the year. The explanation of the movement of silver to these countries is two-fold—the medium of exchange is silver, and in India the habit of generations has been, and still is, to use silver in the form of bars, personal ornaments, objects of art, etc., as a means of hoarding the savings of the people. The preliminary market is London, whose control of trade with the East remains unshaken, and to which all the silver mines of the world send their bars of silver, whose size, dimensions and weight are determined by the preferences of the silversmiths of the Indian bazaars. The intercourse between the Pacific coast of the United States and China has led, of late years, to the export of a certain amount of silver to that country from San Francisco. This export last year was in value $11,503,620, as against $9,234,000 in 1911.

The actual price throughout the year was much higher than 1911, the average for fine silver in New York being 60.835 cents per ounce, as against 53.304 cents in 1911. The market steadily advanced from the beginning of the year, and recessions were few and slight. The year closed with silver at 63.365 cents as the average for December. The settlement of the new Republican Government in control of China, and the anticipated reforms in the currency system of that country with their accompaniment of large loans and heavy purchases of silver, the requirements of the Indian Government for coinage purposes which were met by the purchase of £6,000,000 worth of silver in London, and favourable monsoon rains in India, all tended to raise prices, which even the outbreak of the Balkan war in October did not materially check.

The increase in the price of silver over 1911, say 7.531 cents per ounce, applied to the production for the year, meant $2,313,514 additional return to the mining companies of Cobalt.

It may be remarked in connection with the causes which affect the prices of silver that the preference for silver for hoarding purposes which has for so long a time characterized the people of India, seems now to be yielding to a liking for gold. Gold bars, to the value of $39,482,640, were imported into India during 1912, as against $37,699,020 in 1911. How much of this went into the banks for coinage reserve purposes, and how much into the pockets of the people, there are no certain means of determining, but it seems probable that a larger proportion of the savings of the peasants of India are now being invested in gold than formerly, and that the incidence of this tendency will have some effect upon silver prices in the future.

**The other constituents of the Cobalt silver ores** made use of industrially are cobalt, nickel and arsenic. For some time past these elements have not been of interest to the mine owners, since they add nothing to the value of their ore, and for this reason it is impossible to procure exact figures showing the quantities produced. The ores are not assayed for nickel or cobalt or arsenic and it is undoubtedly the case that only a percentage of these substances ever reaches the market in the finished form or in a condition to be made use of industrially. All three constituents are recovered by the Canadian refiners, who treat the ores from Cobalt without admixture of other kinds of ore, and who produce white arsenic, cobalt oxide, nickel oxide, and also a mixture of the oxides of cobalt and nickel which they ship without final separation principally to English and European manufacturers of cobalt oxide. In the case of refineries situated in the United States, the ores from Cobalt are mixed in the smelting charge with ores of lead and copper, etc.; and little or no attempt is made to save the arsenic, nickel or cobalt.

**Health and Labour.**—So far as epidemic diseases are concerned, health conditions were satisfactory during the year at Cobalt. There was an almost complete absence of typhoid, which indeed has not been prevalent in the district since 1909.

As regards labour, the relations between employers and employed have on the whole been tolerably good. The Cobalt miners took no action when their fellow-workmen at Porcupine went out in November, but the question of an eight-hour working day has been the subject of considerable discussion. In several of the leading mines nine hours from bank to bank had for some time constituted a day's labour, and in February, 1913, the mining companies voluntarily made this general.

It will be remembered that a measure to restrict the working hours to eight in every twenty-four for underground employees was introduced into the Legislature by the Government in the session of 1912, but was subsequently withdrawn in order to admit of a fuller investigation of all the conditions not only at Cobalt, but in the other mining districts of the Province. Mr. S. Price, late Mining Commissioner, was appointed to make the investigation, and he reported in favour of an eight-hour day from face to face. An Act was passed in the session of 1913 limiting the hours of underground labour accordingly, and fixing the first day of January, 1914, as the time for the change to take effect.

**The wage scale at one of the leading mines at Cobalt** is as follows per day of nine hours:

Surface.—Surface boss $3.75, carpenters $3.25, carpenters' helpers $2.25, mechanics $3.25, pipe-fitters $3.00, head blacksmith $3.75, blacksmiths $3.25, blacksmiths' helpers $2.75, engineers $3.60, firemen $3.00, head ore-sorter $2.75, ore-sorters or cobbers $2.50, hand-miners $2.75, teamsters $2.50, hoistmen $2.75, cage or bucket-tenders $2.50, other surface labour $2.25.

Underground.—Timbermen $3.25, machinemen $3.25, machinemen helpers $2.75, cage or bucket-tenders $2.50, other underground labour $2.50.

The foregoing scale is about 25 cents per day less than the rates paid at Porcupine at the present time. Much of the labour is non-English-speaking and inexperienced. Skilled miners are in good demand.

**Profits and Dividends.**—The high price of silver made the year 1912 a good one for shareholders in the producing companies, and the sum distributed in dividends was large, being $9,324,049.24, or $590,091.08 more than in 1911. The total amount paid out as dividends and bonuses since the inception of the camp up to the end of 1912 was $39,834,740.54, not including the profits made by private owners, which would increase it by nearly five million dollars more.

The following table gives a statement of the dividends paid by the silver-mining companies of Cobalt, and also other particulars, such as the date of incorporation, amount of capital, etc.

**Dividends and Bonuses Paid and Declared by Silver-C obalt Mining Companies to December 31st, 1912.**

**Cobalt.**—The opening of the silver mines of the Cobalt district has changed the course of the world's trade in cobalt. The chief use of cobalt is as a colouring material in the manufacture of fine chinaware, and the largest users are the great porcelain makers of Germany, France, and England. For this purpose it is employed in the form of cobalt oxide, CoO, the theoretical composition of which is 78,66 per cent. by weight of cobalt, and 21.34 per cent. of oxygen. Commercially, however, the proportion of cobalt is considerably lower. The commoner form is black oxide, which contains from 68 to 71 per cent. of cobalt; some manufacturers prefer the gray oxide, which may contain 73, 74, or even 75 per cent. of cobalt. A small percentage of nickel, or of the other constituents of the original ore, is not considered deleterious.

**Nickel.**—There are now three sources of nickel supply in Ontario:—(1) The mines of the Sudbury district, (2) the Alexo mine in Dundonald township, (3) the ores of the Cobalt silver camp. The last-named is of little commercial moment; the second is significant as indicating the possibility of nickel in quantity being found outside of the recognized area; while the first is the chief source, and one rapidly growing in output and importance.

There were raised from the mines of Sudbury in 1912, 735,656 tons of ore and from the Alexo mine (treated at the Mond Company's works) 1,792 tons, or 737,656 tons in all. The ore was taken from the following deposits:—

| | Tons. | Tons. |
|---|---|---|
| Canadian Copper Company: | | |
| Creighton mine | 518,417 | |
| Crean Hill mine | 33,507 | |
| No. 2 mine | 66,372 | |
| | | 618,296 |
| Mond Nickel Company: | | |
| Victoria No. 1 mine | 34,287 | |
| Garson mine | 83,281 | |
| Alexo mine | 1,792 | |
| | | 119,360 |
| Total | | 737,656 |

There was charged into the smelting furnaces 725,065 tons, the product of which was 41,925 tons of Bessemer matte, containing 22,421 tons of nickel. The value of nickel contents was returned as $4,722,040, or about 10.5 cents per pound. As compared with 1911, the production of matte was greater by 9,318 tons and of nickel by 5,372 tons, being in fact the largest output of any year since the industry was established. The nickel contents of the ore, computed on the basis of the quality of matte produced, were 61.8 pounds per ton of 2,000 lb., or 3.09 per cent., exclusive of the losses in roasting and smelting.

**Progress of Nickel Mining.**—The demand for nickel was active throughout the year, and the two producing companies—the Canadian Copper Company and the Mond Nickel Company—were fully employed. Both indeed have had to increase their facilities for production. The Copper Company has enlarged and improved its plant at Copper Cliff, and the Mond Company has for some time had under construction a new smelter at Coniston, near the point where the Canadian Northern railway crosses the line of the Canadian Pacific, east of Sudbury. When these works are completed, which will probably be in the spring of 1913, the company will abandon their present site at Victoria mines, and move their entire plant to Coniston, which has the advantage of greater proximity to their Garson mines, now the main source of the company's ore supply.

The indications are that a third company will soon be producing nickel. The holdings of the Dominion Nickel Copper Company, of which company Mr. J. R. Booth, of Ottawa, and Mr. M. J. O'Brien, of Renfrew, were leading members, have been bought by interests represented by Messrs. Holmes and Wilson. These holdings included the Whistle and other properties on the northern nickel range and the Murray mine, the first deposit discovered in the Sudbury district, formerly owned and worked by the Vivians, of Swansea, but idle for many years; also the Gertrude and Elsie mines, formerly held by the Lake Superior Corporation. The new concern proposes to erect a smelter at the Murray mine capable of treating 1,500 tons of ore per day, so constructed as to admit of ready enlargement to 5,000 tons capacity. Bessemer matte of the type produced by the companies now operating will be turned out, and there is a possibility that the nickel may be refined in Ontario by the Hybinette process, the rights of which for the American continent are owned by the newcomers.

Results of much significance have been obtained from extensive exploration of the Sudbury nickel fields by diamond drill borings. These have been carried on by all three companies. At the Murray mine, some distance from the old workings, a large body of ore has been found, the existence of which was unknown to the original owners. Owing to this discovery, the site of the proposed works has been changed from Blue lake, near the Whistle mine, to the Murray. At what is known as the No. 3 or Frood mine, the Canadian Copper Company has had a number of drills at work for over two years, and the borings have revealed an extensive ore deposit, stated to be larger than even the Creighton. The company has constructed a railway from Copper Cliff to the Frood mine, and is putting down a four-compartment incline shaft and a three-compartment vertical shaft in order to develop the deposit. The company plans to extract some 10,000 tons per day from this mine. Frood extension, immediately north of the Frood proper, is owned by the Mond Nickel Company. The ore body crosses into the Mond ground, and the latter are sinking a shaft to intercept it at a depth of 800 feet. It is hardly too much to say that these developments have placed the Sudbury nickel field in a position of complete dominancy with regard to the production of this metal.

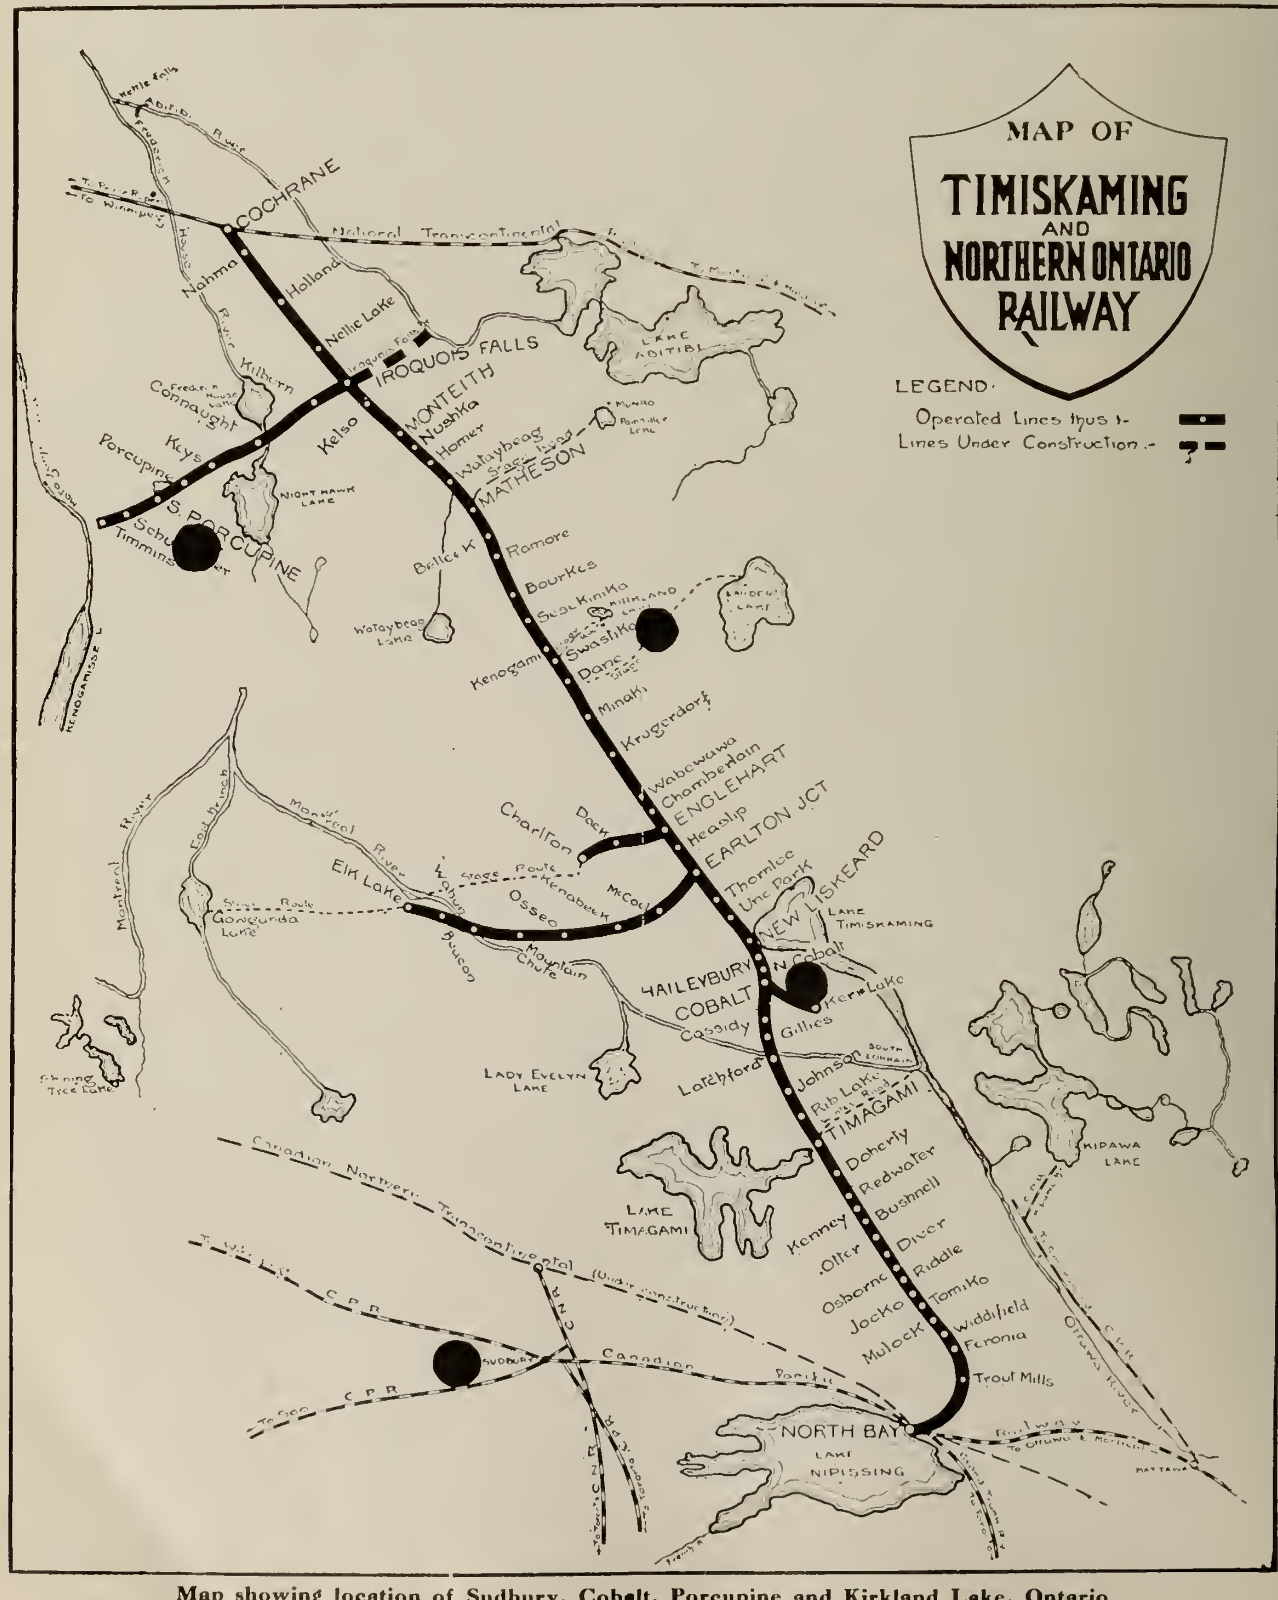
The quantity of nickel recovered from the ore of the Cobalt silver mines can only be estimated, but in any event it is not large. At the proportion of nickel assumed in this Report, namely, 1.47 per cent., nickel contents of the 1912 production would be about 429 tons. Part of this is wasted in the smelting of the ores by the United States refining plants, part of it is separated as nickel oxide in Ontario, and part is exported mixed with cobalt oxide for final treatment by the cobalt oxide makers of Europe, and no doubt is recovered in their works. The quantity of nickel oxide produced and marketed as such last year by the home refiners was 117,160 lb., containing 78,392.20 lb. metallic nickel, the bounty paid on which at the rate of 6 cents per pound of metallic nickel was $4,703.53. The nickel contents of the Cobalt ores would appear to have yielded to mine-owners and Ontario refiners in 1912 some $14,220, and this amount is reckoned in these statistics as the money equivalent of the 429 tons mentioned above.

New uses for nickel are being found from time to time. The Sydney (Australia) correspondent of the Mining Journal (London, Eng.), of 10th May, 1913, states that specimens of a new alloy called "Ormiston metal" have recently been shown in that city. The composition is 90 per cent. aluminum and 10 per cent. nickel. "Ormiston metal" is described as approaching aluminum in lightness. It can, it is said, be turned out as soft as copper or as hard as steel; can be soldered or brazed on another metal; in tensile strength it is equal to mild steel; it does not tarnish; and a piece kept in sea-water for many weeks showed no sign of corrosion.

The course of the nickel industry during the fiveyears beginning with 1908 is shown by the following table:—

**Nickel-Copper Mining in Ontario, 1908 to 1912.**

| Schedule. | 1908 | 1909 | 1910 | 1911 | 1912 |
|---|---|---|---|---|---|
| Ore raised, tons | 409,551 | 451,892 | 652,392 | 612,511 | 737,656 |
| Ore smelted, tons | 360,180 | 462,336 | 628,947 | 610,788 | 725.065 |
| Bessemer matte produced, tons | 21,197 | 25,845 | 35,033 | 32,607 | 41,925 |
| Nickel contents, tons | 9,563 | 13,141 | 18,636 | 17,049 | 22,421 |
| Copper contents, tons | 7,501 | 7,873 | 9,630 | 8,966 | 11,116 |
| Value of Nickel | $1,866,059 | $2,790,798 | $4,005,961 | $3,664,474 | $4,722,040 |
| Value of Copper | $1,062,680 | $1,122,219 | $1,374,103 | $1,281,118 | $1,581,062 |
| Wages paid | $1,286,265 | $1,234,904 | $1,698,184 | $1,830,526 | $2,357,889 |
| Men employed, number | 1,680 | 1,796 | 2,156 | 2,439 | 2,850 |



Map showing location of Sudbury, Cobalt, Porcupine and Kirkland Lake, Ontario

**The nickel mining concerns carrying on active work in Ontario are:—**

| Name of Company. | Name of Mine. | Location. | P.O. Address of Manager, etc. |
|---|---|---|---|
| Canadian Copper Company | Creighton, Crean Hill, No. 2, etc. | Sudbury | Copper Cliff |
| Mond Nickel Company, Ltd. | Victoria, Garson | " | Coniston |
| Holmes and Wilson | Murray, Whistle, etc. | " | Toronto |
| E. F. Pullen | Alexo | Dundonald Tp. | Cochrane |

**Copper.**—The copper product of Ontario for 1912 was 11,126 tons, all of which save 10 tons was from the nickel-copper mines of Sudbury. A quantity of copper ore containing about 7 tons of metal was encountered in the workings of the Timiskaming silver mine at Cobalt, and the remaining 3 tons of non-Sudbury origin was obtained by the Dane Mining Company from a prospect near the station of that name on the T. and N. O. railway.

According to the figures supplied the Bureau by the nickel companies, the 41,925 tons of Bessemer matte turned out by the blast furnaces and converters of Sudbury contained 33,537 tons, or 80 per cent. of nickel and copper. Of this 1,069 lb. per ton or 53.45 per cent. was nickel, and 530 lbs. or 26.5 per cent. copper. Calculated on the quantity of ore smelted, 725,065 tons, the resulting matte showed the ore to contain 3.09 per cent. nickel and 1.53 per cent. copper. These figures, of course, take no account of losses of metal at any stage of the process of treatment. There is probably an appreciable loss of copper during heap-roasting of the ore in the open air, due to the leaching action of rain or snow falling upon the heaps; also a loss in the smelting itself.

**Platinum and Palladium.**—It is known that the Sudbury ores carry not only nickel and copper, but also a proportion of the precious and rarer metals, including gold, silver, platinum and palladium. Cobalt is likewise a constituent, but since the opening up of so prolific a source of supply of this metal in the silver mines of Cobalt, there is no inducement to recover the small proportion of cobalt contained in the Sudbury pyrrhotites. The rare metal rhodium, which is almost invariably contained in crude platinum to the extent of about 2 per cent., and which is at present worth $5 per gram, or $155 per ounce, is also present in these ores, and a little is said to be produced in the United States, partly from platinum sand, and partly from Canadian and other copper bullion.* Another rare metal, ruthenium, an accompaniment of the mineral iridosmine, is also said to occur in the copper ores of Sudbury.†

The platinum is present in the unaltered ores of Sudbury as sperrylite, or arsenide of platinum, and it has been definitely ascertained by T. L. Walker and Charles W. Dickson, to be associated with the chalcopyrite. The increasing demand for platinum, due to its extensive use for laboratory utensils, and also to its employment of late in the manufacture of jewellery, has caused a very decided rise in price, which went up from $21.27 per ounce in 1908, to $43.62, in 1911, remaining at about the same figure in 1912. There has been little or no increase in the supply, the bulk of which, about 300,000 ounces annually, comes from the Ural mountains in Russia. Colombia, with 11,750 ounces in 1912, ranks second as a producer, and smaller quantities are recovered in the placers of northern California, western Oregon, and British Columbia. Under these circumstances any source of supply is important.

Through the courtesy of the International Nickel Company, it is learned that during the six years, 1907 to 1912, inclusive, 2,366.47 ounces of platinum, and 4,216.482 ounces of palladium were recovered at the Orford refining works of that company in New Jersey, while refining the mattes produced by the Canadian Copper Company from the nickel-copper ores of the Sudbury district. No part of this production was previously reported to the Bureau, and hence it has not been covered by statistics previously issued. Under these circumstances, and although not strictly correct, the figures for the six years have been included in those for the year 1912, as the only practicable method of incorporating them in the official record of production. The platinum has been valued at the average price for the several years, and the palladium has been accorded the same figure. The former amounts to $80,736, and the latter to $147,235.

Palladium is a white metal, intermediate in colour between platinum and silver. In hardness it is about equal to platinum. It is malleable, ductile, sectile, and dissolves in nitric acid. Palladium finds a use in parts of astronomical instruments, in watch-making, dental work, and in soldering platinum metals. Not being altered or discoloured by exposure to air or hydrogen sulphide, it is often used for plating metal ware. The demand is greater than the supply.

It should be added with regard to this production of platinum and palladium, and also gold and silver from the same sources, that owing to certain residues from ores from other districts and of different character, which form part of the smelting charge at the Orford works, along with the nickel-copper mattes, it cannot be stated with absolute definiteness that the elements in question are wholly derived from the Sudbury ores; it is, however, believed that they are largely traceable to the latter.

**Iron Ore.**—Iron ore was shipped from three mines during the year 1912—Moose Mountain, Bessemer, and Helen—amounting to 117,357 tons. The Moose Mountain and Bessemer ore is magnetite, while the Helen ore is hematite. The production was considerably smaller than in 1911, when it was 175,631 tons. The Algoma Steel Corporation was actively engaged in developing the Magpie mine, and in installing the roasting plant for the treatment of the sideritic ore of which the deposit is composed. Complete success has not yet been achieved by the process, and the works are not at present in full commercial operation. The Atikokan Iron Company operated the Atikokan mine (magnetite) for a time, but shipped no ore, and the old Belmont or Ledyard mine, in the township of Belmont, Peterborough county, has been taken over by the Buffalo Union Furnace Company, who are carrying out a systematic development of the property. At the Moose Mountain a Grondal plant for magnetic concentration of the leaner portion of the ore body and the production of briquettes has been installed, and it is expected that both ore and briquettes will be placed on the market during the present year. Of the shipments from the Moose Mountain about 35,000 tons were taken from the stock pile, the remainder being mined during the last four months of the year. Some

*The Production of Platinum and Allied Metals in 1911, by Waldemar Lindgren, U. S. Geol. Survey, p. 19.
†Ibid, p. 19.

45,000 tons were sent to the Columbus Iron and Steel Company, Cleveland, Ohio; 5,000 to the Standard Iron and Steel Company, Deseronto, Ont., and 1,263 tons of briquettes were forwarded to Key Harbour, and held there, as against sales for 1913. Mr. J. W. Evans, of the Tivani Electric Steel Company, Limited, did considerable development work at the Orton mine in Hastings county, the ore of which carries 1 to 3 per cent. of titanium. It is Mr. Evans' intention to utilize this ore in the manufacture of steel by means of an electric furnace, which he has himself devised.

The following is a list of the iron mining companies at work last year:—

**Producing Iron Mines in Ontario.**

| Name of Company. | Name of Mine. | Locality. | P.O. Address of Manager, etc. |
|---|---|---|---|
| Moose Mountain, Limited | Moose Mountain | Hutton township | Sellwood. |
| The Canada Iron Mines, Limited | Bessemer | Hastings county | Trenton. |
| The Algoma Steel Corporation, Limited | Helen | Michipicoten | Helen Mine. |
| The Algoma Steel Corporation, Limited | Magpie | Michipicoten | Magpie Mine. |
| Buffalo Union Furnace Company | Belmont | Peterboro' county | Cordova Mines. |
| Atikokan Iron Company Limited | Atikokan | Thunder Bay | Port Arthur. |
| Tivani Electric Steel Company, Limited | Orton | Hastings county | Belleville. |

United States. The proportion of Ontario ore used in making pig iron in this Province is not increasing. On the contrary, it is decreasing steadily. In 1901 it amounted to 56 per cent.; in 1903 it fell to 22.5 per cent.; in 1905 to 19.3 per cent.; rose in 1907 to 23.6 per cent.; in 1909 to 28.7 per cent., and fell again in 1910 to 17.4 per cent.; in 1911 to 7.3 per cent., and in 1912 to 6.3 per cent.

The development of the iron mines of the Province is not keeping pace with the expansion of the iron smelting industry. For this there are several reasons. One is the ease with which supplies of iron ore of known quality and required composition can be procured from the Lake Superior region south of the line, and another is the comparatively small number of mines which have yet been opened in this Province. There are many iron ranges in Ontario, and if the conditions in Michigan and Minnesota afford any analogy there must be numerous bodies of workable ore contained in these iron-bearing rocks. The fact remains, however, that only a few have yet been located, and it seems as if much energy, skill and money must be expended in the search for ore bodies before the iron ore resources of the Province will be placed in a position to respond to the requirements of the smelting trade.

**Pig Iron and Steel.**—From the blast furnaces of Ontario last year there was turned out 589,593 tons of pig iron, having a value of $8,054,369, the pig being worth at the furnace on an average $13.66 per ton. Of the product, 567,892 tons were coke iron, and 21,701 tons charcoal iron, the latter being made at the Standard Iron Company's furnace at Deseronto. Of the nine furnaces in the Province, eight were in blast as follows:—Algoma Steel Corporation, Limited, Sault Ste. Marie, 3; Canada Iron Corporation, Limited, Midland, 2; Steel Company of Canada, Limited, Hamilton, 2; Standard Iron Company, Limited, Deseronto, 1. The Atikokan Iron Company's furnace at Port Arthur was idle throughout the year. Steel to the amount of 457,817 tons, valued at $8,071,339, was made by the Algoma Steel Corporation and Steel Company of Canada, in the manufacture of which pig iron, produced by these companies, to the extent of 312,709 tons, was utilized, besides 17,372 tons of pig iron purchased from other makers. The number of workmen employed in the making of pig iron only was 846, to whom wages were paid aggregating $636,420. This does not include employees in the steel-working departments, who numbered 2,179. Bessemer and basic steel are made at Sault Ste. Marie; basic open hearth at Hamilton. Electro Metals, Limited, Welland, carry on the manufacture of ferrosilicon in electric furnaces, of which they had five in operation during the year. They employed one hundred men and paid out in wages the sum of $70,000.

To produce the above quantity of pig iron, 1,133,660 tons of iron ore were charged into the furnaces, along with 22,252 tons of scale and mill cinder. Of this quantity of ore only 71,589 tons were the product of Ontario mines, all the rest being ore imported from the

Particulars of the pig iron and steel manufacture for 1912 are given in the following figures, and for the sake of comparison, for the year 1911 as well:—

| | 1911. | 1912. |
|---|---|---|
| Ontario ore smelted, tons | 67,631 | 71,589 |
| Foreign ore smelted, tons | 848,814 | 1,062,071 |
| Scale and mill cinder, tons | 18,476 | 22,252 |
| Limestone for flux, tons | 275,628 | 305,509 |
| Coke for fuel, tons | 577,388 | 660,248 |
| Value of ditto | $2,367,704 | $2,584,766 |
| Charcoal for fuel, tons | 1,666,897 | 1,886,748 |
| Value of ditto | $158,354 | $157,597 |
| Pig iron product, tons | 526,610 | 589,593 |
| Value of ditto | $7,716,314 | $8,054,369 |
| Steel product, tons | 361,581 | 457,817 |
| Value of ditto | $9,505,013 | $8,071,339 |
| Workmen employed, number | 3,633 | 2,925 |
| Wages paid | $2,927,573 | $2,383,029 |

The steady growth of the pig iron and steel making industry the past five years is sufficiently shown by the following table:—

**Production of Iron and Steel in Ontario, 1908 to 1912.**

| Schedule. | 1908 | 1909 | 1910 | 1911 | 1912 |
|---|---|---|---|---|---|
| Ontario ore smelted, tons | 170,215 | 220,307 | 143,284 | 67,631 | 71,589 |
| Foreign ore smelted, tons | 342,747 | 543,544 | 678,890 | 848,814 | 1,062,071 |
| Limestone for flux, tons | 179,741 | 226,991 | 248,750 | 275,628 | 305,509 |
| Coke, tons | 322,817 | 436,707 | 471,493 | 577,388 | 660,248 |
| Charcoal, bush. | ...... | 973,413 | 1,133,419 | 1,666,897 | 1,886,748 |
| Pig iron, tons | 271,656 | 407,013 | 447,351 | 526,610 | 589,593 |
| Value of pig iron | $4,390,839 | 6,301,528 | 6,975,418 | 7,716,314 | 8,054,369 |
| Steel, tons | 172,108 | 296,031 | 331,321 | 361,581 | 457,817 |
| Value of steel | $4,397,082 | 6,759,960 | 7,855,407 | 9,505,013 | 8,071,339 |

From the figures given for the operations of 1912 it would seem that, disregarding scale and mill cinder, 1.92 tons of ore were required to produce one ton of coke pig iron, also .53 ton of limestone, and 1.16 tons coke. For a ton of charcoal pig, the materials were, 1.90 tons ore, .114 ton limestone, and 8.35 bushels charcoal.

Following are the blast furnace companies producing pig iron in Ontario:—

**Blast Furnaces in Ontario.**

| Name of Company. | No. of Furnaces. | Fuel Used. | Location. |
|---|---|---|---|
| Algoma Steel Corporation, Limited | 3 | Coke | Sault Ste. Marie. |
| Steel Company of Canada, Limited | 2 | " | Hamilton. |
| Canada Iron Corporation, Limited | 2 | " | Midland. |
| Atikokan Iron Company, Limited | 1 | " | Port Arthur. |
| Standard Iron Company, Limited | 1 | Charcoal | Deseronto. |

**Materials of Construction.**—Building operations in the towns and cities of Ontario were again active, and there was an increased production of brick and stone. At the same time, however, the output of Portland cement fell off slightly, and there was a decrease in the quantity of lime produced.

**Brick.**—Returns to the Bureau show that the brick kilns of the Province turned out 385,000 M common brick in 1912, valued at $3,178,250, as against 354,546 M in 1911 worth $2,801,971—an increase in number of 30,545 M or 8.58 per cent., and in value of $376,279, or 13.42 per cent. It will be seen that the increase in cost was considerably greater than the increase in number, and this is further brought out by a comparison of the price per M which in 1911 was $7.90 and in 1912 $8.20. It is a truism now to state that the cost of living has gone up of late years; but common building brick, which in this country and climate may fairly rank as a necessary of life, well illustrates the tendency to higher levels of cost. In 1901 ordinary brick were worth $5.73 per M.; in 1905 the price had risen to $7.75; in 1909 it was $7.78; in 1911, $7.90, and in 1912, $8.20.

The manufacture of paving brick does not seem to be increasing in Ontario. Objection is taken to them because of their noisiness, and if they are not well made of suitable material, they fail to provide a durable pavement. The value of their production last year was $78,195, as against $86,685 in 1911. Terra cotta, worth $137,239 and fancy brick valued at $6,552, made up a total of $221,986.

Pressed, or re-pressed, brick is highly esteemed for its colour and finished appearance, and the number made rose to 65,598 M in 1912 valued at $634,169, as compared with 52,764 M in 1911 valued at $564,630.

About 40 per cent. of all the brick in the Province is manufactured in the yards on the outskirts of Toronto, which is a city of brick, and in which many millions of dollars have been spent during the last few years in building operations. In capacity these plants range upwards from two million brick per annum. Some turned out five million in 1912, some eight million, one fifteen million, and one—the Don Valley Brick Works—upwards of forty-three million. The average output of 23 yards was 6,900,000 brick. The local supply was insufficient last year to meet the demand, and quantities were shipped in from outside points.

**Sewer Pipe.**—Three sewer pipe manufacturing companies turned out a total of $464,627 worth of pipe last year. This was an increase of $54,563 over the production of 1911. The rapid growth of the towns and cities of Ontario provides a good market for the output.

**Pottery.**—The manufacture of pottery from Ontario clays is not keeping pace with the expansion experienced by other branches of the clay-working industry. Only the coarser and commoner articles, such as flower-pots, hanging baskets, jardinieres, etc., are made from the native clay, any finer varieties of ware requiring the use of imported material. It is not to be wondered at that in a region such as Ontario where there are no coal beds with their seams of fire-clay, and where glaciation has been so active a force in the formation of the present surface, there should be a scarcity of clays sufficiently free from fluxing agents to be suitable for fine porcelain and chinaware. Kaolinic clays have been reported from the valleys of several of the rivers running down the James Bay slope, but in the absence of transportation facilities no attempt has yet been made to test their adaptability for pottery purposes. The value of the pottery turned out by the half dozen potteries reporting their production in 1912 was $52,445, as compared with $50,500 in 1911.

**Lime.**—The output of lime in 1912 was apparently less than in 1911, being 2,297,525 bushels, worth $381,672, as against 2,469,773 bushels, valued at $402,340. Little difficulty is experienced in obtaining lime for any purpose in the older parts of the Province, where limestone occurs abundantly and in strata of various ages and differing composition. Nearly pure carbonate of lime can be procured in some parts; elsewhere the rock contains magnesia from small quantities up to proportions sufficient to constitute a dolomite. All varieties are used for burning into lime, the idea once prevalent that magnesia injured the quality of the product being now no longer generally held. Formerly, much of the production was from small kilns operated by farmers and their sons during their spare time, or when other work was not pressing; now the number of kilns is smaller, but the individual output has increased. In short, the modern tendency towards concentration of industrial effort has made itself felt in lime-making, as well as in nearly all other kinds of manufacture.

**Stone.**—The stone quarried in Ontario is varied in character, and is used for widely different purposes. For construction material, limestone, sandstone and marble are employed; for use as a flux, limestone is required; for roadmaking, limestone and so-called "trap." Granite and gneiss are also used both in blocks and crushed for building and other work. Limestone, however, largely preponderates. An industry is being developed on the basis of the marbles found in the neighbourhood of Bancroft in the county of Hastings. The serpentines of Darling township, of varying shades of green, are also capable of producing very handsome effects. In value, the stone raised last year amounted to $953,839, an increase of $61,212 over 1911. For an account of the limestone deposits of Ontario, arranged by counties, reference should be had to Part II. of the Thirteenth Report of the Bureau of Mines, 1094, by Prof. W. G. Miller, Provincial geologist.

**Portland Cement.**—The Portland cement plants of Ontario last year produced 2,993,367 barrels of cement, worth, at the factory, $3,365,659, being a decrease in production as compared with 1911 of 17,482 barrels, and in value of $74,893. This check is the first which the industry has experienced since it was establisehd in 1891, every year hitherto having shown a decided advance over the preceding one. The average price per barrel also fell from $1,200 to $1,124. A feature of the year was the action of the Dominion Government in reducing the duty by one-half on cement imported from June 1 to October 31, inclusive. The reason assigned for this step was the inability of the plants in Ontario and Quebec to supply the urgent demand for cement from Saskatchewan, Alberta and the west generally, arising not so much from shortness of supply as from the congestion of freight traffic on the railways.

**Arsenic.**—From the silver-cobalt ores treated in Ontario refineries there was produced and shipped 3,927,347 pounds of white arsenic, which realized $79,297, or a little over two cents per pound. The theoretical percentage of arsenic in these ores is assumed to be 14.28, which, on the quantity of ore raised from Cobalt in 1912, would give 8,332,000 pounds of white arsenic. The difference between this quantity and the product actually marketed, must be set down for the greater part as waste. Little or no attempt to save the arsenic is made in the smelters of the United States to which much of the lower grade ore is shipped for treatment. The production of 1911 was 4,234,000 pounds, worth $74,609, the average value per pound being 1.75 cents. Since the close of 1912 there has been a marked advance in the price of arsenic, which is chiefly a by-product of the ores of other metals. There are large deposits of arsenical ore in Hastings county, which at one time were worked for their gold contents, but which have remained untouched since experience showed the values to have fallen below the profit line.

Arsenic is a most useful substance in the arts, being employed as a preservative of skins, as a pigment, in the manufacture of glass for the purpose of imparting brilliancy, but chiefly as the active agent in insecticides. As a constituent of Paris green and arsenate of lead, it plays an important part in controlling the insect pests which annually work havoc amounting to tens of thousands of dollars among the potato fields and apple orchards of Ontario.

**Iron Pyrites.**—No deposits of native sulphur, such as are found in Sicily and Louisiana, occur in this Province, yet there are very large supplies of sulphur locked up in the pyrrhotites of Sudbury and the iron pyrites of many other parts of Ontario's mineral regions. No attempt is being made, or in the present state of the metallurgical arts perhaps can be made, to recover the immense quantities of sulphur annually scattered to the winds in the fumes which ascend from the roast heaps of the nickel-copper companies of Sudbury. This sulphur is worse than wasted, because these acrid fumes blast and wither every green thing within their range, and when carried by contrary winds to centres of population are certainly objectionable. So long, however, as it costs more to entrap the sulphur and convert it into sulphuric acid or some other article of commerce than the price it would bring when sold, this waste is inevitable.

Five deposits of pyrite were worked last year, but from three only were shipments made. These were the mines of the Canadian Sulphur Ore Company of Queensboro, in Hastings county; Nichols Chemical Company at Sulphide, and the Buffalo-Brockville Mining Company at Brockville. The output from the last-named was small, and work ceased about the middle of July. No shipments were made by the Northern Pyrites Company, from their mine on Big Vermilion lake, near Graham, nor from the Helen mine by the Algoma Steel Corporation. The quantity shipped was 20,744 tons, valued at $71,043. This was considerably less than the output for 1911, which was 43,629 tons, worth $118,457.

The Nichols Chemical Company operate an acid-making plant at Sulphide, at which is used not only the ore from the company's own mine at the same place, but also ore purchased from other deposits worked in the neighbourhood. The ore from the Northern Pyrites and Helen mines when shipped goes to the United States for the manufacture of sulphuric acid, or for use in pulp and paper mills.

**Mica.**—The amber mica of Ontario and Quebec has long been highly esteemed by manufacturers, especially those of electrical apparatus, for its flexibility and high insulating efficiency. Nevertheless, mica mining in Ontario shows comparatively little progress from year to year. Its product is meeting with strong competition in the markets of the United States from the white mica of India, where wages are low, and whose mica finds much favour from the form in which it is placed on the market, namely, in small circular boxes or cartons of mica films. These are used in building up the micanite or board mica in sheets of any desired size, which has practically taken the place of the large natural sheets formerly regarded as indispensable, and for which a high price was demanded. The irregular and pocketty nature of the mica deposits here, too, has a tendency to deter systematic exploitation or the expenditure of large sums in development.

**Salt.**—The production of salt from the wells situated on the eastern shore of Lakes Huron and St. Clair and Rivers St. Clair and Detroit, remains at pretty much the same figure from year to year. In 1912 it amounted to 90,986 tons, valued at $450,251. The year previous the output was 88,689 tons, worth $430,835. Besides the ordinary uses of salt in the preparation of food products, a beginning has been made in its utilization as the raw material for a large and varied list of chemical manufactures. The Canadian Salt Company has begun the operation of a plant on the Detroit river, near the eastern boundary of the town of Windsor, having good railway connections and a shipping dock on the Detroit river channel bank. The products at present made are bleaching powder and caustic soda. The former is used for bleaching paper and fabrics and also for sterilization of water and sewage; the latter mainly in the manufacture of soaps, also in the refining of certain grades of oil and glue, and in the manufacture of lye. It is proposed to add other products to the list. The market for the company's goods is found in Canada, the rate of duty preventing export to the United States. There is no protection on these articles in Canada. The number of hands employed last year was thirty-eight, and the wage bill amounted to $23,859.

**Petroleum.**—A steady drying up of the sources which feed the petroleum wells of the Province has been in progress for a number of years. That the influences which cause this diminution are still in operation is manifest from the fact that the output of crude petroleum last year fell to 8,432,730 imperial gallons, or 240,-

935 barrels, as compared with 10,102,081 gallons, or 288,634 barrels in 1911, a reduction of 16.5 per cent. The production of 1912 was only 24 per cent. of that for 1904, when the yield was 34,912,360 gallons, or 997,496 barrels.

**Natural Gas.**—The natural gas field of the Province last year yielded 12,414 million cubic feet of gas, which is valued in the returns made to the Bureau at an aggregate of $2,268,022, being at the rate of more than 18 cents per thousand cubic feet. In 1911 the output was valued at $2,186,762. The retail price of gas is on an average nearly double this figure, but the valuation is not based on the cost to the ultimate consumer, but on the price obtained by the producer, for the most part at the mouth of the well. Naturally, the users of gas in the towns and cities of southwestern Ontario must pay for the cost of piping and distribution, hence the price varies according to distance from the point of production, and other circumstances. As has been remarked before in these Reports, gas is a most desirable fuel, and it would be highly in the general interest if it could be confined to domestic purposes, and not expended on such operations as the burning of lime and brick, or for the generation of steam.

# ONTARIO PRODUCTION OF METALS DURING FIRST NINE MONTHS OF 1913

Returns made to the Bureau of Mines under the Mining Act show that the production of metals and metalliferous substances from the mines and works of Ontario during the 9 months ending 30th September, 1913, was as follows. The changes as compared with the corresponding period of 1912 are also noted:

| Product. | Quantity. | Value. | Increase* or Decrease†. Decrease. |
|---|---|---|---|
| Gold, ozs. | 159,962 | $3,281,027 | *$2,163,692 |
| Silver, ozs. | 23,171,536 | 12,967,138 | *259,312 |
| Copper, tons | 9,237 | 1,311,681 | *169,605 |
| Nickel, tons | 18,233 | 3,825,633 | *457,196 |
| Iron Ore, tons | 143,979 | 314,590 | *213,306 |
| Pig Iron, tons | 440,954 | 5,792,022 | †259,956 |
| Cobalt Ore, tons | 71 | 12,917 | †44,697 |
| Cobalt and Nickel Oxides, lbs. | 740,089 | 290,597 | *113,811 |
| Lead ore, tons | 740,089 | 3,000 | *3,000 |

**Gold.**—The production is chiefly from Porcupine where the Hollinger and Dome are the leading mines. The latter is adding 40 stamps which will double its milling capacity. Porcupine Crown and McIntyre Porcupine also contributed considerable bullion. The total yield from the Porcupine mines was $3,106,250, leaving $174,777 as the product of outside areas. These were Long Lake (Canadian Exploration Co.), Swastika (Swastika Mining Co.), Kirkland Lake (Tough-Oakes), Larder Lake (Goldfields, Limited), and Sturgeon Lake (Northern Gold Reef).

**Silver.**—The production was slightly greater, both in ounces and value, than for the same period last year. The number of producing mines was 31; 27 being in Cobalt proper, 1 in Casey Township, 2 in Gowganda, and 1 in South Lorrain. Nipissing led with a total output of 4,387,765 ounces, followed by Coniagas with 2,662,678 ounces, LaRose with 1,903,345 ounces, and Cobalt Townsite with 1,826,422 ounces. Kerr Lake, McKinley-Darragh, Buffalo, and Crown Reserve were also well up. Of the product, 10,512,396 ounces was in the shipments of ore, 6,184,271 in concentrates, and 6,444,099 in bullion. By camps, Cobalt proper yielded 21,956,561 ounces, Casey 607,212 ounces, Gowganda 342,380 ounces, and South Lorrain 234,613 ounces; silver in auriferous ores 30,770.

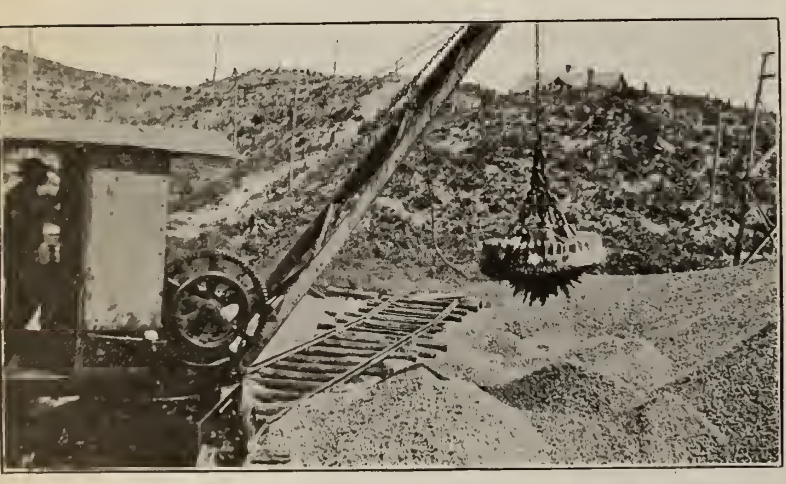
**Nickel and Copper.**—The production was in excess of that of any previous 9 months. There were raised 535,-

Moose Mountain Iron mine, Ont.

Moose Mountain Iron Mine, Ont.

265 tons of ore and smelted 569,898 tons. The Bessemer matte product was 34,243 tons, the estimated contents of which were 18,233 tons nickel and 9,237 tons copper. The Canadian Copper Company remains the principal producer, but the new and well-equipped smelter of the Mond Nickel Company at Coniston which is now in operation, will doubtless increase that company's output.

**Iron.**—There were five iron ore mines in operation, namely, the Helen, Magpie, Moose Mountain, Bessemer and Belmont. The Canada Iron Corporation concentration plant at Trenton is now at work on ore from the



Handling magnetite concentrate by electro-magnet
Moose Mountain, Ont.

Bessemer and Childs mines. At the Magpie mine the roasting plant is treating siderite, from which it expels the carbonic acid gas and sulphur, thus producing a first rate article for the blast furnace. If the process proves commercially successful, it will turn to account an immense quantity of sideritic material, hitherto but little regarded as a possible source of iron.

Four blast furnace companies produced 11,967 tons less pig iron than was made during the corresponding term of 1912, and the average value per ton declined from $13.36 to $13.16. At Port Colborne the new furnace of the Canadian Furnace Co., a subsidiary concern of the Buffalo Union Furnace Co., was blown in on 27th September. The plant has a capacity of 300 to 325 tons of pig iron per day.

**Cobalt Oxide, etc.**—The output of cobalt and nickel oxides, being refined by-products of the Cobalt silver ores, is steadily increasing, and had a value of $176,786 greater than in the first 9 months of last year. A bounty is paid by the Ontario Government of six cents per pound on the metallic contents of refined cobalt oxide and nickel oxide.

Onaping Falls, Sudbury District, Ont.

## MANAGEMENT OF THE GEOLOGICAL CONGRESS

Mr. R. A. F. Penrose, jr., in an article published in the Journal of the Franklin Institute, says: "The management of the Congress by the Canadians was excellent. Everything was done that could add to the comfort, interest, and pleasure of the members. The people of Toronto and of Canada in general were most hospitable and kind, and no member of the Congress could have left Canada without the pleasantest recollections of its people and their boundless hospitality."

## USES OF NICKEL*

An alloy of copper, nickel and zinc, called packfong, has been known to the Chinese since time immemorial, and it is stated that an alloy containing 77.58 per cent. of copper, 20.04 per cent of nickel and 1.72 per cent. of impurities was used for coinage by Ethydemos, who reigned over Bactria about 235 B.C.; so that alloys of nickel were used long before the pure metal had been separated from its ores. It is interesting to note that the Bactrian alloy is closely like that now used for subsidiary coins in the United States.

Pure nickel is employed in small amounts for a number of purposes because of its strength and durability and its white colour, which resists tarnishing. For these reasons several nations have introduced it for coinage, e.g., France, Switzerland and Turkey, and its cleanness and hardness contrast very favourably with copper or bronze, on the one hand, and silver on the other. It is rather surprising that Canada, which produces two-thirds of the nickel of the world, should still retain its ugly bronze cents and troublesomely small silver five cent pieces. These and the ten cent piece should certainly be replaced by pure nickel coins.

One might expect also that iron kitchen utensils, which constantly grow black and rusty, might well be made of the clean and white, and untarnishable metal nickel. For many purposes steel is now plated with nickel to preserve it from rusting.

Though the importance of pure nickel is likely to grow, the chief use of the metal is in the production of alloys, particularly nickel steel, in which the greater part of the nickel now refined is employed.

By the kindness of Dean Galbraith, of the Applied Science Department of the University of Toronto, and of Mr. C. R. Young, the following data bearing on the use of the alloy may be given:

**Comparison of Carbon and Nickel Structural Steels.**
Based upon Average Present Practice (1912).

| | Medium Carbon Steel. | Medium Nickel Steel. |
|---|---|---|
| Percentage of Carbon | 0.20 | 0.38 |
| Percentage of Ni | 0 | 3.50 |
| Elastic limit (lbs. per sq. in.) | 30,000 (Min.) | 60,000 (Min.) |
| Ultimate tensil strength (lbs. per sq. in) | 60,000 (Min.) | 105,000 (Min.) |
| Modulus of elasticity | 29,000,000 | 30,000,000 |
| Safe working stress in tension (lbs. per sq. in.) | 16,000 | 28,000 |

The alloy of nickel with iron is no novelty, since all native iron of terrestrial as well as meteoric origin contains nickel. The telluric iron from Ovifak and elsewhere in Greenland contains, according to Dana, from .34 to 6.50 per cent. of nickel, with an average of 2.11 per cent.; and meteoric iron from various sources runs much higher, containing, according to the same authority, from 3.81 to 59.69 per cent. In Greenland such iron was long ago utilized by the Esquimo, who used to hammer off flakes of it from the large masses left on the surface by the weathering of the parent basalt, making from them knives and spear points. Peary, with his supplies of modern steel tools and weapons, put an end to this industry, at least for the present, and removed the largest masses of telluric iron to the United States.

Steel containing from 2½ to 3½ per cent. of nickel has certain of its properties greatly improved, so that for many purposes it is replacing ordinary structural steel. Its value for armour plate has long been known, and the rivalry of the great maritime nations in the building of Dreadnoughts is one of the causes for the recent increased demand for nickel. It is stated by Mr. Monell, president of the International Nickel Company, that the growth of the motor vehicle business is important in this respect also; and its value for bridge building is shown by the selection of nickel steel for the rebuilding of the Quebec bridge, which fell so disastrously some years ago.

**Approximate Saving in Weight and Cost of Bridges Effected by Use of Nickel Steel.**

Mixed Nickel and Carbon Steel—
  Saving in weight up to 25 per cent.
  Saving in cost up to 17 per cent.
Nickel Steel throughout—
  Saving in weight 10 to 30 per cent.
  Saving in cost up to 12 per cent.

Alloys much higher in nickel are employed for special purposes, such as Invar, steel with 36 per cent. of nickel, which has the property of varying very little in length with change of temperature, making it of great value for tapes to be used in the accurate chaining necessary in geodetic surveys.

**Monel Metal.**—Next to nickel steel the most important alloy is monel metal, so named for Mr. Ambrose Monell, of the International Nickel Company, consisting of 68 to 72 per cent. of nickel with the balance copper, except for trifling impurities (0.5 to 1.5 per cent. of iron, 0.073 to 0.15 per cent. of carbon, and 0.014 per cent. of sulphur). The proportions of nickel to copper are those of the ores now worked by the Canadian Copper Company, so that the alloy may be produced directly from the matte, at a cost not much greater than that of copper. The alloy is silver white and takes a brilliant polish, which slowly turns greyish on exposure. It melts at 1350 degrees C., has the same specific gravity as copper and can be cast or rolled and treated in various ways like copper or steel, but is distinctly stronger than ordinary steel or than manganese bronze. The Orford Copper Company in a circular to the trade makes the following statements as to strength, etc.:

| | Castings. | | 1 inch rods. Rolled. annealed and cold drawn. | ½ inch plates. |
|---|---|---|---|---|
| | Grade C. | Grade D. | | |
| Tensile strength (lbs. per sq. in.) | 70,000 | 85,000 | 110,000 | 90,000 |
| Elastic limit (lbs. per sq. in.) | 27,000 | 40,000 | 80,000 | 45,000 |
| Elongation in 2 in. (per cent.) | 30 | 25 | 25 | 30 |
| Reduction in area (per cent.) | 35 | 25 | 50 | 60 |

*From report on Nickel Industry, by A. P. Coleman, published by Mines Branch, Ottawa, 1913.

They are prepared to furnish ingots, sheets, rods, bars, castings, tubes, and wire of this alloy; and it is stated that the sheets are as flexible and malleable as copper, and that wire may be drawn of all sizes down to 0.004 in., the finest being as soft and pliable as silk thread.

It is not alone strong but resists corrosion, and so may be used for many purposes for which steel is unfitted, such as propellers, boilers, and roofs exposed to acid fumes. During 1908 about 300,000 square feet of monel metal sheets were used to roof the Pennsylvania tunnel station in New York City.

Because of its great power nickel has long been alloyed with copper, zinc, etc., to produce a white metal imitating silver, and called by various names such as German silver, Brittania metal, or argentan. These alloys are familiar from their use in household articles, such as spoons, forks, etc., which are generally plated with silver.

T. W. Gibson, Deputy Minister of Mines, Ont.

## MOND NICKEL CO. BUYS LEVACK PROPERTIES.

According to the Financial Times, the Levack nickel properties in the Sudbury district have been purchased from Messrs. R. J. Tough, Rinaldo McConnell and Jas. Stobie, by the Mond Nickel Co. for $750,000. The property has an area of 1,600 acres and is 30 miles west of Sudbury.

"The Mond people secured an option of this group of properties some months ago and have since had six diamond drills constantly proving up the ore bodies. It is learned that they have over two million tons of ore proven in the bodies drilled. The sum of $40,000 was paid by the Mond Company when the option was granted them and under the terms of the agreement the balance and final payment of $500,000 is due in December, unless amended arrangements are entered into. Singularly, the Mond people secured an option of the same properties, ten years ago for a much smaller amount, and at the time paid $10,000 on account. The big Levack properties were discovered and located about the year 1882, by one of the present owners, James Stobie, at that time of Sudbury, but now of Portfock. Associated with Mr. Stobie now in the ownership of the property is Rinaldo McConnell, of Ottawa, and R. J. Tough, of Toronto.

"The Mond is one of two big nickel producing companies in Canada, the other being the International. A third company was organized this year, the Canadian Nickel Corporation, backed by Dr. Pearson and other interests identified with him in the Brazilian Traction and other enterprises. The company acquired a number of mines, among them the Murray, and was capitalized at $10,000,000 debenture stock, and $20,000,000 common stock. Plans for flotation of the company's securities in London, however, have been held up by the disturbed condition of the market, and little has been heard of the enterprise lately."

W. H. Hearst, Minister of Mines, Ont.

## DIVIDENDS PAID BY ONTARIO MINING COMPANIES IN PERIOD JAN. 1 to NOV. 1, 1913.

| Company. | Amount. |
|---|---|
| Buffalo | $820,000 |
| Cobalt Lake | 165,000 |
| Cobalt Townsite | 144,000 |
| Coniagas | 1,080,000 |
| Crown Reserve | 879,982 |
| Hollinger | 900,000 |
| Kerr Lake | 450,000 |
| La Rose Consolidated | 936,941 |
| McKinley-Darragh-Savage | 1,033,937 |
| Nipissing | 1,800,000 |
| Seneca-Superior | 251,412 |
| Timiskaming and Hudson Bay | 116,415 |
| Timiskaming | 150,000 |
| Trethewey | 100,000 |
| Wettlaufer-Lorrain | 141,758 |
| (U.S. company controlling Canadian Copper Co.) | |
| International Nickel, preferred | 405,000 |
| International Nickel, common | 3,230,000 |

# SMELTING THE COBALT SILVER ORES*

By A. A. Cole.

The shipments of Cobalt ores during 1912 were mostly treated by the same smelters as received the production of the previous year. In Canada the bulk of the output went to the—

1. Canadian Copper Company, Copper Cliff, Ont.
2. Canada Smelting & Refining Company, Orillia, Ont.
3. Coniagas Reduction Company, Thorold, Ont.
4. Deloro Mining & Reduction Company, Deloro, Ont.

A few consignments were also made to three new plants which commenced operations during the year, viz.:

5. Buffalo and Ontario Smelting and Refining Co., Kingston, Ont.
6. Dominion Refineries, North Bay, Ont.
7. Metals Chemical Company, Welland, Ont.

Of the foreign shipments, all went to the United States with the exception of a few high grade shipments from the Crown Reserve mine to the Saxon Government. The American smelting companies in this market were:

8. American Smelting and Refining Company, at their works at Perth Amboy, Omaha, and Denver, and
9. The Pennsylvania Smelting Company, Carnegie, Pa.

While occasional consignments were taken by the

10. Balbach Smelting and Refining Company, Newark, N.J., and the
11. United States Metals Refining Company, Chrome, N.J.

As most of the Canadian plants produce refined cobalt oxide the disorganized state of the market for this material has made it impossible at times to profitably dispose of their output, and they therefore welcomed a betterment of the market towards the end of the year.

When the smelters started treating Cobalt ores, cobalt oxide was selling at $2.50 per pound, but the consumption was so limited that the production from the Cobalt district soon glutted the market. Now the retail price quoted in New York is about 90c. per pound, with an import duty of 25c. per pound. It is selling in England and Europe at from 2s. 2d. to 3s. per pound, or about 68c., and the price paid to the smelters is necessarily still lower.

The Canadian smelters now supply practically the entire world's market with cobalt oxide of excellent grade, and if new uses are found for cobalt they are ready to increase the output and supply the demand.

The Canadian Copper Company decided to close down its Cobalt plant and received its last shipment of cobalt ore towards the end of October. Since that time operations have been continued simply as a final clean up to recover the values tied up in ore on hand, residues, furnace bottoms, etc.

The small smelting plant at North Bay is bidding for ore rich in cobalt and low in silver.

The smelting schedules were practically unchanged from those in effect in 1911.

The ores shipped to the smelters will average about 1,000 ozs. silver per ton, between the limits of 75 ounces and 7,000 ounces. A few exceptional shipments are known to have assayed even above this latter figure, the highest shipment recorded being one of 20 tons from the Crown Reserve mine, which assayed 8,903 ounces silver per ton.

### Coniagas Reduction Company, Ltd.

The Coniagas Mines, Limited, of Cobalt, Ont., owns the issued capital stock of the Coniagas Reduction Co., Ltd., except six shares issued to directors to qualify.

The head office of the company is at St. Catharines, Ont., but the smelter is situated at Thorold, six miles west of Niagara Falls. The company's property comprises 160 acres, of which the smelter occupies about four, with a frontage of 1,500 feet on the Welland Canal. It is also served by the Grand Trunk, and Niagara, St. Catharines and Toronto Railways.

Construction of the smelter started March, 1907 and actual smelting commenced May, 1908. Erected originally for the treatment of ores from the Coniagas mine, Cobalt, Ont., its capacity is sufficient to allow of the smelting of a certain amount of other silver ore from the same district.

The products of the smelter are silver, white arsenic, and the oxides of cobalt and nickel, either combined or separated.

**Treatment.**—The ore is first crushed, then ground in a Krupp ball mill, and sampled by a Vezin automatic sampler, two independent samples being made. The fine ore is smelted with limestone, iron ore, and other substances. The separated silver is cast in anodes and refined electrolytically, while the nickel and cobalt are recovered as speiss, which is worked up for nickel and cobalt oxides. These are put on the market either combined or separately.

The combined oxides will assay 40 to 50 per cent. metallic cobalt, and 15 to 25 per cent. metallic nickel, depending on the grade of the ore treated. The oxide of cobalt will run from 60 to 76 per cent. metallic cobalt according to the call of the market, the only impurity being nickel which will run from .5 to 1.15 per cent.

The arsenic fume from the fume and dust flues and collectors is worked up for refined white arsenic, which will assay over 99 per cent. pure.

The actual output from the smelter since the commencement of operations has been as follows:

**Operations of Coniagas Reduction Co.**

| Year. | Ore Treated, Tons. | Silver, Fine, Ozs. | Cobalt Oxide, Tons. | Nickel Oxide, Tons. | White Arsenic, Tons. |
|---|---|---|---|---|---|
| 1908 | 266.8 | 360,683 | 5.5 | 1.5 | 13.5 |
| 1909 | 1,116.9 | 1,659,604 | .9 | .. | 100.0 |
| 1910 | 2,017.25 | 3,485,243 | 53.8 | 13.2 | 557.7 |
| 1911 | 2,821.50 | 5,770,271 | 60.5 | 17.3 | 766.1 |
| 1912 | 2,288.77 | 4,824,632 | 129.0 | 50.7 | 636.7 |
| | 8,511.22 | 16,100,433 | 249.7 | 82.7 | 2,074.0 |

*Extract from report of mining engineer T. & N. O. Ry. Commission.

Power used at the plant is transmitted from Niagara Falls, and the plant requires from 200 to 300 horse power. The smelter has a monthly capacity of 450 tons of raw ore.

The limestone flux is obtained from Port Colborne, 20 miles distant, and the iron ore from Michigan.

The capacity of the arsenic works is about 1,000 tons per year.

The smelting schedule of the Coniagas Reduction Co., on the 1st January, 1913, was the same as has been effected since November 1st, 1911, and is in condensed form as follows:

**Schedule.**—Percentages of silver to be paid for on commercial assay of silver content per ton of 2,000 pounds as follows:

55 per cent. for 50 ounces and proportionate increase in percentage up to

73 per cent. for 200 ounces and proportionate increase in percentage up to

78 per cent. for 300 ounces and proportionate increase in percentage up to

84 per cent. for 500 ounces and proportionate increase in percentage up to

91.5 per cent. for 1,000 ounces and proportionate increase in percentage up to

92.5 per cent. for 1,500 ounces and proportionate increase in percentage up to

93.5 per cent. for 2,000 ounces and proportionate increase in percentage up to

95 per cent. for 3,000 and over.

Sampling to be at vendor's expense.

All ore purchased to be at a refining charge of 3/4 cent per ounce of silver content.

75 per cent. of amount 30 days after date of weighing and sampling reports.

25 per cent. of amount 90 days after the date of said report.

Price of silver to be determined by New York quotation as given by Messrs. Handy and Harman to Western Union Telegraph Company on dates of settlement.

### Deloro Mining and Reduction Co.

The Deloro Mining and Reduction Co. is a close corporation, controlled by Mr. M. J. O'Brien, owner of the O'Brien mine, Cobalt.

The smelter is located at Deloro, Hastings County, Ont., 1 1/4 miles by road from Marmora station, on the Canadian Northern Ontario Railway. The construction of a railway spur is contemplated early in 1913.

The plant was originally built and operated as an arsenic producer by the Canadian Goldfields, but was entirely remodelled in 1907 by the present owners, to smelt ores from the Cobalt camp, particularly those of the O'Brien mine. During the year 1908 a separate and extensive plant was added for the manufacture of cobalt and nickel oxides, and this has been in successful operation since May, 1910.

**Treatment.**—The ore is first ground fine and sampled by Snyder sampler and hand quartering. It is then charged in a 42 in. Allis-Chambers cupola furnace producing metallic silver, speiss, slag and argentiferous arsenic fumes. The fuel used is a good grade of coke and when flux is required a local limestone is used with an occasional addition of a little scrap iron.

The silver button, which is about 850 fine, is charged in a refining furnace, which brings it up to 996 fine.

The speiss is crushed and roasted in mechanically worked roasters, part going to an intermediate treatment and the other part direct to the oxide plant. In the intermediate treatment silver (999 fine) is extracted with cyanide, the residue reverting to the cupola.

The speiss going to the oxide plant is treated so that the cobalt and nickel go into solution. The liquor and residues are separated in filter presses, the latter being returned to the cupola. The cobalt and nickel are precipitated either separately or together. The cobalt oxide (black oxide) after washing, contains 70 per cent. metallic cobalt and under 1 per cent. nickel, while the combined oxides run from 40 to 45 per cent. cobalt, and 10 to 15 per cent. nickel.

The crude arsenic from the cupola and roasting furnaces is caught in arsenic chambers and bag houses from which it is transferred to the arsenic refining furnaces. After refining it is ground ready for commerce as the oxide, white arsenic. The silver-bearing residue is returned to the cupola.

There is usually a considerable slag revert, not only for the purpose of removing any contained silver, but also to assist in the fluxing of the ore.

The smelter has a daily capacity of from 12 to 14 tons of raw cobalt ore. The capacity of the oxide plant is 20 tons per month, but the enlargements that are nearing completion increase this capacity by one-third.

Power is supplied to the smelter by the Seymore Power Co., from Campbellford, over a 22-mile transmission line, at $20 per horse power. The operation of the plant requires from 300 to 400 horse power. There are 120 men employed at the works.

### Operations of Deloro Smelter.

| | |
|---|---|
| Ore treated .................. | 11,065 tons. |
| Silver Produced ................ | 20,339,860 fine ozs. |
| Cobalt and Mixed Oxides ...... | 500 tons. |
| Refined Arsenic ............... | 3,275 tons. |

The smelting schedule of the Deloro M. & R. Co., in force on the 1st January, 1913, is as follows:

**Schedule.**—Pay for 98 per cent. of the silver contents of the ore determined by commercial assay, on the following terms and conditions:

Treatment charge—$25.00 per ton of ore.

Refining charge—3/4 of a cent per ounce of silver contents on ore assaying 3,000 ounces and over per ton. One cent per ounce of silver contents on ore assaying 2,000 to 3,000 ounces per ton. 1 1/2 cents per ounce of silver contents on ore assaying less than 2,000 ounces per ton.

Terms of payment—Seventy-five per cent. of net proceeds at Handy and Harman's New York quotation, 30 days after completion; twenty-five per cent. of net proceeds at Handy and Harman's New York quotation, 90 days after completion of sampling.

Ore to be delivered in carload lots f.o.b. Marmora Station, C. O. Railway, and to be at shipper's risk until sampling is undertaken.

(To be continued.)

### DOME.

In our issue of November 1 we printed a list showing tonnages treated during each of several months. The figure for August should have been 10,720 tons instead of 12,720. Previous to October the largest tonnage treated in one month was 11,300.

---

Our readers will regret to learn of the death of Major R. G. Leckie, of Sudbury, well-known among mining men and for years one of the most enthusiastic members of the Canadian Mining Institute.

# SWASTIKA AND KIRKLAND LAKE GOLD AREA

The geological map of Swastika and Kirkland lake gold areas, prepared for the Ontario Bureau of Mines by Messrs. A. G. Burrows and P. E. Hopkins, has been completed and is ready for distribution.

Accompanying the map are notes on the general geology and the ore deposits. The following paragraphs are extracts from these notes:

The rocks of the area are all referred to the pre-Cambrian.

**Keewatin.**—The oldest rocks recognized are the greenstones and their schistose derivatives. Their original constituents have generally been altered to secondary minerals. In the less disturbed parts they have the characteristic light greenish weathering surface of the typical Keewatin greenstone. Ellipsoidal and amygdaloidal structures are frequently shown. The predominating rock is a basalt, which can be seen along the railway cuttings east of Swastika and on the shores of Amikougami lake. A diabase is prominent on the north parts of Teck and Lebel townships.

Quartz-porphyry and other acid rocks occur less abundantly than the greenstone.

**Timiskaming Series.**—The Keewatin is overlain by a series of sedimentary rocks which have been folded in the older rocks. Owing to the similarity of these rocks to certain sedimentary rocks of Cobalt and Porcupine, they have been classified as Timiskaming. At two localities excellent unconformities have been found between the Timiskaming and the underlying Keewatin, namely on mining locations L. 1824 on Kirkland lake and on L. 2796 in the northwest part of Lebel township. The series occurs as a narrow band having a crescent shape, extending from Eby and Grenfell townships on the west to McVittie township on the east. Its greatest width of nearly three miles is near the line between Teck and Lebel townships.

The beds of the series are nearly always highly inclined and approximate an east and west direction, while the schistosity is often nearly northeast and southwest. The lower beds include quartzite, graywacke, slate and conglomerate, which have at times been altered to schists. There are also less altered rocks of the same type which are considered to be the upper portion of the series. The highest exposures are generally a hard conglomerate carrying abundant pebbles which often readily separate from the matrix. The pebbles are frequently stretched and the matrix rendered schistose. There is considerable variety in the pebbles, which include various greenstones, porphyries, an occasional granite, and numerous fragments of a bright red jasper, which give the conglomerate a striking appearance.

The series has been greatly impregnated with carbonate, which sometimes forms the major part of the rock. The weathering of the iron in the carbonate has given a rusted surface to much of the rock.

While it has not been definitely proved, it is thought that the series probably forms a syncline, with the older sediments altered to schist at the north and south of the fold, whereas the more readily recognized quartzite, greywacke and conglomerate are toward the centre. To the east of Mud lake the series is represented by the older schistose members with less conglomerate.

Very schistose sediments can be seen one-half mile south of the five-mile post on the line between Teck and Lebel townships. Easily recognizable greywacke occurs just south of No. 3 vein and conglomerate at No. 2 vein of the Tough-Oakes mine. A conglomerate, which is made up of a mass of pebbles closely packed together, can be seen one-half mile north of Gull lake on L. 2452.

**Light-Coloured Intrusives.**—There are several areas of light-coloured igneous rocks which occur in large volume. In the south part of the township of Otto there is a reddish hornblende or augite syenite. In the south part of Lebel township and the north part of Boston township there is a grey hornblende syenite. In the northwest part of Teck township there is a reddish hornblende granite. All these rocks intrude the Keewatin, but only the hornblende syenite in Lebel township was observed in contact with the Timiskaming, which it appeared to intrude.

**Lamprophyre.**—Lamprophyre dikes are common in the Keewatin and Timiskaming series. Narrow dikes of this rock, usually dark-coloured, cut the Keewatin along the railway southeast of Dane. Some reddish minettes can be seen north of Boston creek crossing.

**Feldspar Prophyry.**—There are dikes of reddish and greyish porphyry throughout the area which are believed to be the latest acid rock. These are sometimes only 20 or 30 feet wide; but occasionally the porphyry occurs over somewhat broad areas, as round the east end of the southeast bay of Kirkland lake.

### Veins of Swastika Area.

Two types of veins have been observed in the mapped area. Of these the earliest discovered are those near Swastika. These veins, which are of white quartz, are sometimes several feet wide. The gold occurs along line of contact of quartz and schist, or in fracture planes in the quartz along with iron pyrites. Calcite and crushed quartz occur in the fracture planes. Some molybdenite has been observed in the veins on the Lucky Cross property. These productive veins occur in the Keewatin near the contact with feldspar-porphyry.

Two mills have been in operation near Swastika, there being a five-stamp mill at the Swastika mine and a ten-stamp mill at the Lucky Cross mine. There has been considerable underground development at both these properties.

### Veins of Kirkland Lake Area.

About six miles northeast of Swastika is the Kirkland lake area. The principal rock is greywacke and conglomerate of the Timiskaming series. These have been intruded by lamprophyre and later by feldspar-porphyry. Gold-bearing veins have been found in the conglomerate and greywacke near the contact with the porphyry, and in the porphyry. Veins have also been found which have been traced from the conglomerate or greywacke into the porphyry.

A well defined zone containing several veins has been recognized. It extends in a northeast-southwest direction through Kirkland lake. The veins, especially those in the conglomerate which are narrow and lenticular, have been subjected to secondary processes. Much of the vein material is of a dark grey colour, differing from the white quartz veins of the Swastika area. The vein filling has been crushed, and fragments of white quartz of the early vein are now enclosed in darker material. The wall rock has also been crushed into the veins, different veins showing conglomerate or porphyry inclusions. Calcite occurs as a later filling in many of the veins.

In addition to a main vein, there may be parallel lenticular structures with impregnations of the intervening country rock by quartz veinlets, giving a ribboned appearance to a cross-section of the deposit. In this case the main vein may carry rich ore with a width of low grade ore on either side of it.

The gold usually occurs finely disseminated in the veins, but occasionally quite coarse gold is found. Iron pyrites and tellurides occur in the ore, but the chemical composition of the tellurides, which are found in small particles, have not been definitely determined. One sample examined qualitatively at the Provincial assay office showed lead, silver and tellurium. Molybdenite occurs in fine fracture planes, along which there has been a concentration of gold. There has been a later movement, and molybdenite and gold have been slickensided. Calcite also occurs in the veins, and gold is sometimes seen in the calcite.

A sample of material from a vein, enclosed in porphyry, from the Wright-Hargrave north of the southeast bay of Kirkland lake, was examined in thin section. There has been much crushing of the quartz and considerable calcite has been deposited in the crushed areas. Along the crushed areas, and in cracks between the quartz grains there is telluride with some gold in grains. Fragments of porphyry occur in the vein, and molybdenite has been deposited in fracture planes. A section of vein material from the No. 2 vein of the Tough-Oakes mine showed a grain of telluride encased in gold.

### Development.

There has been extensive trenching on many veins in the area and shafts have been sunk on several of them.

**Burnside.**—(L. 1823).—A number of veins have been discovered by trenching. A vertical shaft is being sunk on a recently discovered vein in the conglomerate which showed rich ore on the surface.

**Oakes.**—(L. 1557.)—A forty-foot shaft has been sunk on an altered portion of a porphyry dike, somewhat greenish in colour, which is intersected by quartz veinlets. Visible gold can be observed at several places on the surface.

**Robbins.**—(L. 2100.)—Trenching has shown numerous veinlets of quartz intersecting the reddish porphyry, while gold and tellurides occur chiefly in the minute slip planes in the porphyry adjacent to the veinlets.

**Teck-Hughes.**—(L. 1238).—This property is being developed from two vertical shafts, one of which is on a vein in the conglomerate and the other on one in the porphyry.

**Tough-Oakes.**—(H. R. 1441, etc.)—The principal development has been done on No. 2 vein. From an open cut two shipments of high-grade ore were made. A shaft has also been sunk from this open cut to the 200-ft. level. The shaft inclines to the south at 60 degrees, which is the dip of the vein. A station and ore pocket have been cut at the 100-ft. level. Part of the ore from development is being treated in a temporary five-stamp mill by simple amalgamation, while the tailings are being retained for future treatment. The mill treats about 12 tons daily, while about the same tonnage is added to the stock pile of milling ore per day. About 72 tons of high grade ore have been shipped from the mine. One average shipment of 19.98 tons assayed 22.5 oz. gold and 23.4 oz. silver per ton.

**Wright-Hargrave.**—(T.C. 709.—A shaft is being sunk on a quartz vein in the porphyry, in which some high grade gold ore with telluride has been observed on the surface.

Shafts are being sunk on other properties, including the Wettlaufer (L. 16626), Wood (L. 1236) and Hunton (L. 16621).

---

## PERSONAL AND GENERAL

Dr. C. M. Carson, a graduate of the University of Toronto, has been appointed head of the department of chemistry at the Michigan College of Mines. He has had experience in teaching at several colleges, and was recently lecturing at Columbia University. Dr. Carson succeeds the late G. A. Koenig, who was for several years in charge of the department.

Mr. Edw. J. Albert, district manager for Cobalt and Porcupine territory for Canadian Allis-Chalmers, Ltd., has been appointed manager of the mining department of the company and transferred to the head office, Toronto.

Dr. H. C. Cooke, of the Geological Survey of Canada, left Vancouver Island, B.C., for Ottawa, about November 7.

Mr. Geo. Watkin Evans, of Seattle, Washington, who spent the field season of last year examining the Groundhog mountain coal basin, in the northern part of Skeena district, British Columbia, has returned to Seattle from the Matanuska coal field in Alaska, where he has this year been superintending coal mining operations for the United States Bureau of Mines which has arranged for a test of coal from that field on a ship of the U. S. navy.

Mr. E. Jacobs, secretary of the Western Branch of the Canadian Mining Institute, attended a joint meeting of the Spokane and Montana local sections of the American Institute of Mining Engineers, held at Wallace, Idaho, on November 15 and 16.

Mr. Robert Keffer, son of Mr. Frederic Keffer, of Greenwood, B.C., has been appointed assistant mining engineer at the Stewart mine, Kellogg, Idaho.

Mr. F. J. Longworth has succeeded Mr. F. R. Weekes as resident engineer at Copper mountain, Similkameen district, for the British Columbia Copper Co., which is developing a large group of copper claims in that camp.

Mr. G. C. McKenzie, of the Mines Branch, Canada Department of Mines, is in charge of the work being done at Nelson, B.C., in connection with the departmental experiments in the metallurgy of complex lead-zinc ores.

Mr. J. P. McFadden, superintendent at the Surprise mine, Slocan, B.C., was on the Pacific coast lately.

Mr. J. W. D. Moodie, vice-president and general manager of the Britannia Mining & Smelting Co., recently returned to Britannia Beach, B.C., from an extended trip in the Eastern States.

Mr. P. L. Naismith, of Calgary, Alberta, superintendent of the Canadian Pacific Railway Co.'s Natural Resources Department, was at Hosmer, Crowsnest Pass, in November.

Mr. E. H. Nutter, of San Francisco, California, chief engineer for the Minerals Separation American Syndicate, was at the Silverton Mines Company's concentration mill, Four-mile creek, Slocan lake district of British Columbia, a few weeks ago, one unit of the syndicate's flotation plant having been put in there.

Mr. Conrad Wolfle, of Spokane, Washington, has again been to a group of copper claims in the northern part of Vancouver island.

# SPECIAL CORRESPONDENCE

## PORCUPINE, SWASTIKA AND KIRKLAND LAKE

**Hollinger.**—Work in the mine continues to show satisfactory progress, 517 feet of drifting having been added to development work during the four weeks ending October 7. Approximately a hundred feet of this has been done upon the 425-ft. level upon No. 1 vein and the values and widths encountered are extremely gratifying showing as they do that there is no falling off in grade or width of ore. Work was started upon the winze which will be carried to 550 feet with as little delay as possible.

**Tough-Oakes.**—It is understood that Mr. C. A. Foster has been successful in floating the Tough-Oakes gold mines of Kirkland Lake, in which he has a controlling interest, in London. The report goes that the three claims which constitute the Tough-Oakes gold mines and two others have been disposed of and that a company will be formed to take them over. Stock is to be offered to the public.

Another high grade shipment has been made from the Tough-Oakes mine. After being sampled at Campbell and Deyell's 30 tons of high grade gold ore has been sold to the United States Metals Company for their smelter at Chrome, New Jersey. It is supposed that the ore will run about the same grade as former shipments, namely, about $400 to the ton.

**McIntyre.**—During October, 3,900 tons were treated in the McIntyre mill, as compared with 2,800 tons during the previous month. With this increased tonnage costs were slightly reduced. The ore ran $9.75 to the ton, 15 cents higher than in September. While the exact cost has not been determined it is expected to be slightly lower than in the previous month when it was $6.60. The extraction was 96.1 per cent., with a total bullion shipment of $38,600. At present 150 tons daily is going through the mill, but this will be increased before the end of the year. The aerial tramway is now in full operation, bringing 60 tons daily to the mill from No. 5 shaft. This working is down to the 300-ft. level where the vein has been developed for 100 ft. Work will be started this month on the new three compartment shaft to be situated midway between the office and the mill. From the 300-ft. level of the mine a raise will be put through to the surface. While this working is under way sinking operations will be commenced. The new work will be connected with No. 1 and 4 shafts on the 300-ft. level, while at 400 ft. connections will be made at No. 5 shaft by means of a lengthy crosscut under the lake. By an evident miscalculation the McIntyre No. 5 vein was cut from the 600-ft. level of the Pearl Lake shaft by the latter company some months ago. Where cut it was 112 feet in on the McIntyre ground and showed a 20-ft. ore body. The deepest point proven by the McIntyre was from the 300-ft. level. A new plant is now being installed at No. 5 shaft consisting of a 12-drill compressor and accessories.

**Dome.**—The October statement of the Dome mine shows that 12,365 tons were milled. The value of gold produced was $118,300, the largest amount produced since May. During the month the mill ran 96 per cent. of the working time, while the value of ore treated is shown as $9.50.

**Schumacher.**—The new shaft at the Schumacher property has been completed and work will start at this point this month. Before the work can be started the compressor plant must be moved to the new point of operations. Recent development on the Dixon property has proven a good ore body within a few feet of the Schumacher line.

The taking up of the option on the St. Paul-Hewitt claims in Bartlett Township by a syndicate of Cobalt and Haileybury men has caused a considerable influx of prospectors into this outlying section of the gold camp. Mr. Robert Bryce, formerly in charge of the Silver Cliff, went south to McArthur with fifteen men to do work on the St. Paul claims. Temporary camps have been erected. In the next few weeks before the option expires in order to ascertain the value of the claims considerable surface work will be done.

The township of Bartlett was first staked two winters ago, but no finds of importance were made. Upon the St. Paul a good showing was uncovered the following summer. The Crown Reserve Mining Company has already had an option on these claims, but allowed it to lapse. As soon as the sleighing is good the road which the Government has cut should be in fair shape.

## COBALT, ELK LAKE, GOWGANDA AND SOUTH LORRAIN

**Cobalt Townsite and City of Cobalt.**—The Northern Customs concentrator sold by the company in which Mr. A. J. Young was a dominant factor for about $250,000, has passed into the possession of the Cobalt Townsite Mining Company. The new owners took charge on November 1st. Of the 120 stamps in the mill 70 are treating Cobalt Townsite ore so that about 175 tons per day are being put through the mill from that mine. This is not yet enough for the mill wants of the Townsite, as is evidenced by the fact that the company is shipping out a large tonnage of low grade ore every week to the smelters. When the new Northern Customs concentrator is ready at mileage 104, the La Rose contract, which required the remainder of the stamps, will be taken there. Until then the La Rose contract must be taken care of and the City of Cobalt cannot yet get access to the mill. When it does it is proposed to treat 50 tons per day. The covered tramway which runs from the top of the shaft house at the City of Cobalt mine to the Northern Customs mill has now been completed. It is expected that the Northern Customs will be able to treat ore between the first and the last of December. The whole of the old mill will then be free for the use of the Cobalt Townsite and allied interests.

**The Chambers-Ferland Mining Company** which is now controlled in England has signed a contract with the Northern Customs concentrator for the use of forty stamps from May 1st next for a period of five years. This will mean the treatment of about 120 tons per day. A writ was issued by Mr. Henry Cecil to block the contract, but it has been signed notwithstanding. The Chambers-Ferland has not been shipping ore since the early months of the year and probably will not until concentrates can be obtained from the mill. It is known that there is a good tonnage of mill rock in the old workings between the La Rose

**View across south end of Cobalt lake**

and O'Brien. There is some good prospective territory in which a shaft is now being sunk to the west of the 64 shaft of the Nipissing.

**The Alladin Cobalt Mining Company,** which took over the old Silver Queen, made its first shipment of the year this week. Thirty-two tons of concentrates were shipped from the old Nipissing Reduction mill which has been leased for a period of two years.

**Casey Cobalt.**—Arising out of a lawsuit in the High Court at Haileybury, some interesting details of the sale of the Bucknell claims to the Casey Cobalt Mining Company appeared. It appeared that Mr. Fred. Connell, the plaintiff in the case, sold the claims through a man named Mitchell to the present English company, who are operating it for $120,000, of which $60,000 was in cash and 12,000 shares of the par value of one dollar. In December, 1906, Mr. Connell received $100 as his commission on the amount paid to date, $100 having been paid down on the deal, and $900 paid within thirty days. In June, 1907, he received $5,000 in full commission of the cash payments as a discount in the selling price he had been granted by the owners. Later that year he received 500 shares of stock of the Casey Cobalt Mining Company.

Last month the Casey Cobalt shipped 30 tons of high grade ore, and already this year has despatched 393.59 tons, all of high grade ore concentrates.

Dr. Willet G. Miller, Provincial Geologist, spent some time last month examining the Casey Cobalt mine and the area in which it is situated.

**Nipissing.**—During the month of October the Nipissing mined ore of an estimated net value of $218,-772 and shipped bullion from the Nipissing and Customs ore of an estimated net value of $348,612. Favourable developments were met with at the fourth level of shaft No. 73. A crosscut was started to encounter possible extensions of several branch veins which showed considerable ore at the third level. This crosscut has encountered what is thought to be the first of those branches. It is 1 to 1½ ins. wide and assays 3,000 ounces. This opening is within a few feet of the Keewatin contact. It is expected that the vein will become more favourable as to widths and values as soon as it is developed further away from the Keewatin.

Preparations for sinking No. 64 shaft from 650 ft. to 900 ft. have almost been completed. A pentice has been put in and sinking has been resumed. At the third level of No. 64 shaft a crosscut is being driven to connect with the third level of vein No. 73. During the month three veins were encountered, one of them assaying several hundred ounces over a width of one inch.

At shaft No. 63 the Little Silver stope at the 245-ft. level continues to produce high grade ore. The stope is about 100 feet long and will average one and a half inches over the entire length. The silver content is 3,000 ounces to the ton.

**The Seneca-Superior** has cut its main vein at the 100-ft. level. From the No. 2 shaft a crosscut run at the 100-ft. cut the main vein at 110 ft. It proved to be 6 ins. wide of 1,000-ounce ore.

At the 200-ft. level there is now a shoot of ore for 400 ft. upon which little stoping has been done. The vein averages from three to four inches of very high grade ore. Below this level a winze was put down for 131 ft. all in the conglomerate. Two levels have now been opened up, one at 262 ft. and one at 335 ft. There is the usual high grade in each working. Already on the upper level 100 ft. of drifting has been done, while on the 335 ft. level the drills are working 80 ft. from the winze.

**Penn-Canadian.**—The production during October from the Penn-Canadian mine amounted to 60,015 ounces. This was a considerable increase over any previous month, the largest previous being 45,050 ounces. The new vein has now been developed for a distance of 35 feet, and it is still good in the face. This is at the 305-ft. level where it is in the conglomerate.

## NOVA SCOTIA

**Loss of the s.s. "Bridgeport."**—The loss at sea of the s.s. "Bridgeport" with forty lives and 10,000 tons of coal, is the worst disaster that has yet occurred in the St. Lawrence coal-freighting trade. No particulars can be given of how this fine steamer and her crew came to their end, but it is known that when she was approaching the vicinity of the Bird Rock Island—an outlier of the Magdalens—a full hurricane was blowing accompanied by blinding snow flurries. A piece of wreckage, probably a portion of a steamer's wheelhouse, was picked up on the Bird Rock Island, and it can only be inferred that the "Bridgeport" was endeavouring to clear the Bird Rock by standing out to sea to the eastward, but driven out of her course by the combined force of a northeast gale and the currents, and blinded by the snow flurries, she struck and sank immediately.

There has been irresponsible talk in the newspapers, as there has been in the case of every similar happening in Nova Scotian waters, that the "Bridgeport" went to sea with insecure hatches, or that she foundered owing to the inability of the vessel to ride out the gale. It is not fair to make such loose assertions, as the "Bridgeport" was classed A1 at Lloyds, and she was specially constructed for the service she was in. The "Bridgeport" and the "Glace Bay" were two sister ships, taking 10 000 tons of coal cargo, and were especially adapted and designed for the St. Lawrence trade. The "Glace Bay" ran ashore and broke up near Trepassey Bay, on the Newfoundland coast, last spring, and it is now only too probable that the "Bridgeport" met the same fate, but, unfortunately, with the loss of her entire crew.

The two steamers were under charter to the Dominion Coal Company, but that company does not suffer any monetary loss beyond the loss of the cargo, and the difficulty of chartering vessels as suitable as these specially constructed steamers. As soon as there was reason for anxiety about the "Bridgeport," the Coal Company despatched their own steamer, "Louisburg," to sea and kept her searching for a week.

The freighting of coal in large quantities between Sydney and Montreal has been reduced to an exact science. All the summer long the colliers load and sail, discharge and return, with the regularity of a railway train service, and it has become difficult to realize that such a happening as the loss of the "Bridgeport" was possible. That last accident of a similar kind was the loss of the "Turret Bay" on St. Paul's Island, about nine years ago. She also was loaded with coal and sank with all her crew. When, however, it is remembered that some two million tons of coal will be freighted from Cape Breton ports to St. Lawrence ports during the summer of 1913, and that similarly large quantities of coal have gone up the river for many years past, the record of the coal-freighting vessels is a good one, and will compare favourably with those of other trades plying in the same waters. Such a record infers careful seamanship and stout vessels, because the shores of northern Cape Breton, the Magdalens, the Gaspe Peninsula and Anticosti are not hospitable coasts, and the Lower Gulf can be very nasty in a northeast gale.

## BRITISH COLUMBIA

As the close of the year approaches some guessing is being done as to what the total value of the mineral production for 1913 will prove to be. In most cases the figures published should be regarded as perhaps not dependable, and where the expectation is given expression to of a higher total than, or even as high as that of last year being reached, it may safely be regarded as nothing more than a guess. To anyone well informed as to the position it is evident that it is unlikely last year's record will be equalled, while to suggest that it will be exceeded indicates a lack of knowledge of some of the conditions that have militated against an increase in 1913 over the value of the production in 1912 which compared so favourably with that of 1910 (labour difficulties having so interfered with mineral production in 1911 as to make a comparison with that year not a fair one). When it is remembered that the total of $32,440,800 in 1912 was $6,063,734, or 23 per cent., greater than that of 1910 (it was $8,941,728 higher than that of 1911), it will be seen that only a continuation of exceptionally favourable conditions would have warranted expectation of a further increase in total value of output, and since that essential has in an important degree been lacking, there does not seem to be sufficient justification for the optimism that has characterized some of the forecasts made. However, it will not be long to the time when, with a fair proportion of the production figures obtainable, an estimate more likely to be near the actual value of production will be practicable, so it does not appear to be wise to go into detail just now to show what the total may be. Meanwhile it will be said here that a somewhat lower total than that of 1912 may be looked for.

Mention was made last month of the receipt of favourable news from the chief placer-gold mining districts, namely, Cariboo and Atlin. Since then newspaper accounts of interviews with several men from the latter district have been printed and these have included statements that seem to be wide of facts. For instance, to suggest that Atlin has this year made an output of more gold than in any other year calls for a prompt response that as the output of that camp in 1912 was $290,000, there is no known reason why it should be believed that in 1913 it has exceeded the $800,000 total of 1899, or even the $530,000 total of a later year. Indeed, there were several other years which reached a total of $400,000 or higher, so, bearing in mind that 1912 is credited with a yield of only $290,000, it seems reasonable to think, under the circumstances that no unusually rich new ground of considerable extent is known to have been worked in 1913, that the district will have done well to have reached even half the total of that of the highest year on record, or say $400,000.

Just one other reference to last month's news notes will now be made. It was then mentioned that there had been a considerable increase in the quantity of ore received at the Consolidated Mining and Smelting Co.'s smeltery at Trail, the figures for the week ended October 30 having been 9,460 tons, and for the immediately preceding week 9,197 tons. No doubt there is a good reason for the decrease—indeed, it has been stated in print that owing to a breakage of the crusher at Trail, shipment of ore from Rossland had to be suspended for two days—but the fact remains that the total for the week ended November 6 was 6,302 tons. At the time of writing figures for the week ended November 13 are not available, but it will be seen that the considerable decrease for the first week in November offsets the increase in the latter half of October. There is this satisfaction, though—it is to be expected that the total of ore receipts for the year will show a gratifying increase.

### EAST KOOTENAY.

**Fort Steele Division.**—News from Moyie is to the effect that recently more silver-lead ore of good grade has been found in the upper workings of the Society Girl mine and that sufficient for a carload has been hauled to the railway for shipment to Trail smelting works. The St. Eugene, which for years was the largest producer of lead in Canada, is now but a small shipper, all its known large bodies of ore having been exhausted. Receipts at Trail of St. Eugene ore in October were 122 tons, and for the week ended November 6, 110 tons. The only other metalliferous mine in this division of East Kootenay is the Sullivan, which as well as the St. Eugene is operated by the Consolidated Mining and Smelting Co. During October, more than 3,000 tons of Sullivan lead ore was received at Trail, and for the week ended November 6, 950 tons.

## WEST KOOTENAY.

**Ainsworth Mining Division.**—The work of sinking the main shaft of the Silver Hoard to the 200-ft. level will be completed during November. Good progress is being made with other underground development. It is estimated that there is approximately 3,000 tons of ore of shipping grade blocked out on the 100-ft. level. During two recent months the quantity of ore shipped to Trail has averaged 55 tons a week; preparations are being made to increase the output, by the first of the coming year, to about 20 tons a day. An electrically operated hoist will be installed by the end of December, and it is planned to shortly put in a two-drill combination Temple-Ingersoll compressor. A new cookhouse, with accommodation for 50 men, is being erected and the camp generally put in good condition for the winter. Some 30 men are employed at the mine, and the intention is to add to the number as soon as this can be done with advantage.

**Slocan.**—Late reports from the Rambler-Cariboo state that mine and concentrating mill are in better condition for production than for some time past, and that it is expected an output of ore up to capacity will be maintained from now on. A stope recently opened from the 1,200-ft level is in an ore shoot including from 9 in. up to 3 ft. of clean shipping ore. In addition, there is blocked out in different parts of the mine sufficient ore of milling grade to keep the mill fully supplied for many months. A new cable for the aerial tramway from mine to mill is being placed; this will shortly be available for use and it will increase the carrying capacity of the tramway to 17 tons an hour, or nearly twice as much as under former conditions. A pebble mill is being put in at the concentrator, to facilitate saving the zinc associated with silver and lead in the ore. Twelve cars of zinc concentrate, consigned to Bartlesville, Oklahoma, were shipped lately, and shipment of zinc as well as silver-lead ore is to be continued regularly. The mill is running satisfactorily, and there is general improvement in the mine. The number of men on the company's payroll, including those at both mine and mill, is 65.

A reorganization of the Lucky Jim Zinc Mines, Ltd., which has for several years been operating the Lucky Jim mine, in Slocan district, is proposed. The president told a meeting of shareholders held in Winnipeg, Manitoba, on October 28, that all the known high-grade zinc ore had been exhausted, so nothing remains but to exploit the bodies of low grade lead-zinc ore. A second mortgage of the property had been given. The liabilities of the company total $81,000. Foreclosure proceedings have been commenced by the first mortgagee. In addition to present liabilities, $25,000 is needed to provide for new work proposed. A meeting of shareholders is to be held in Victoria, B.C., during November, and proxies were asked for by the directors to support the proposed reorganization, and an assessment of five cents a share, the proceeds to be used for paying off existing liabilities and providing funds for further development of the mine.

Wm. Thomlinson, who for the last six months has been engaged in collecting for the Provincial Department of Mines samples of ores from numerous mining properties in Slocan and Ainsworth mining divisions, has contributed for publication the following comment: "An effective method of treating economically the zinc-silver ores of Kootenay is very desirable and would be of much commercial importance. In the district lying between the north half of Kootenay lake and Slocan lake there are more than 20 developed mining properties which contain, either entirely or in addition to other ores, large quantities of zinc-silver ore containing from 20 to 55 per cent. zinc and 15 to 250 ozs. silver a ton. Thousands of tons of such ore is on the dumps or in the stopes of Kootenay mines awaiting shipments to metallurgical works where penalties on zinc content of the ore and heavy losses in silver could be avoided."

The report of the Van Roi Mining Co., Ltd., for September from its Van-Roi mine, in Silverton camp, has been received from the company's head office in London. Development work was done, with a small force of men employed, to a total of 98 ft., in drifts on level 9 and in raises from that level. The best showing of ore was in a raise in the main vein where for 33 ft. the ore averaged 16.6 oz. of silver a ton, 3.4 per cent. lead, and 8.7 per cent. zinc across an average width of 60 in. in the western half. The mill was run for 96 hours on accumulations of material produced by recent developments. The total quantity crushed was 587 tons, which yielded 10 tons of lead concentrate assaying 100.2 oz. silver a ton, 53.2 per cent. lead, and 11.7 per cent. zinc, and 20 tons of zinc concentrate assaying 27.2 oz. silver a ton, 3.1 per cent. lead, and 37.8 per cent. zinc.

## ROSSLAND.

The report of the Le Roi No. 2, Ltd., for September from its Josie mine, in this camp, has been received from the company's head office in London. Ore shipments to Trail totalled 1,729 tons, this including 85 tons of concentrate. Receipts from the smeltery were $33,404. Estimated costs for corresponding period were: For development, $8,000; ore production, $7,000; milling, $1,100; total, $16,100. Development work done totalled 230 ft.; this was on the 600, 700, and 900-ft. levels and the shaft tunnel in what is known as the Josie drift. Of 56 ft. advanced in this last-mentioned working, for 40 ft. the average value of the ore across an average width of 13 in. was: Gold 12 dwt. a ton, and copper 5 per cent. On the 600-ft. level, in the Hamilton vein west, 20 ft. advanced was in ore of an average width of 25 in. and containing gold 9 dwt. a ton, and copper 0.9 per cent.

## HEDLEY.

After nearly four months' diamond-drilling on a group of mineral claims on Twenty-Mile creek, Camp Hedley, Similkameen, the New York Syndicate No. 2 has suspended work for the ensuing winter. These claims were bonded last winter by Mr. T. Walter Beam, of Denver, Colorado, for New York principals, among them men largely interested in the Hedley Gold Mining Co. Deep snow and the steepness of the side of the Twenty-Mile canyon made the arrangement of preliminaries slow work, so that it was not until early summer it was practicable to commence drilling. Two pipe lines, one for water and the other for compressed air, were laid a distance of rather more than a mile, from the Nickel Plate mine over the mountain to the canyon, and camp was made as well. With three shifts of men employed and full time worked until cold weather set in and necessitated a stoppage, three holes were drilled, two of them deep ones, but no large orebody was found. The cost of this undertaking was approximately $40,000. Conditionally that suitable arrangements shall be made regarding time of payments on purchase price of claims, it is stated that the syndicate will do more drilling next summer. Mr. Beam was engineer in charge and Mr. G. P. Jones, of the Hedley Gold mining Co., superintended operations during the past season.

## OBSERVATORY INLET.

The Granby Consolidated Co., which is developing a large copper mine and erecting a smelter at Anyox, Observatory inlet, British Columbia, is evidently determined to treat its men well, and is erecting cottages for them. The rental is $3 per month per room, with electric light, bath in every house, even with two rooms. At the mine there are fourteen 4-room and four 5-room cottages completed. The old bunkhouse has been renovated and will house 35 men. A two-storey bunkhouse, 30 by 120 ft., with basement containing lockers, showers, and tubs, is ready for 110 men. The mess has a capacity of 250 men, with cold-storage plant. All buildings are connected with water and sewer systems sufficient for present and future needs.

## PORTLAND CANAL.

Supplies sufficient to last until next spring have been sent to the camp of the Indian Mines, Ltd., situated in the vicinity of Cascade creek, a tributary of Salmon river, and distant from the head of Portland canal about 14 miles. No. 1 adit is now in about 350 ft.; this is being driven to open the ground under an ore deposit 19 ft. wide where a prospect shaft has been sunk in it from the surface at about 160 ft. above the adit. At 100 ft. in the adit exposed what is thought to be the top of a blind lead; at 300 ft. in a shoot of ore 5 ft. in width was encountered, this being at a depth of 125 ft. from the surfaee. No. 2 adit is a drift at a vertical depth of 160 ft. below No. 1; it is now in about 60 ft. and has been in ore all the way running about 3 ft. in width. On the whole, the ore opened is concentrating, though there is a fair proportion that could be sorted out for shipment to the smelting works as crude ore. Assays of samples from the blind lead above mentioned gave returns up to $17 a ton, chiefly in gold; others, from the orebody at 200 ft. in from the portal of No. 1 adit returned on an average about $12 in gold and 4 oz. silver a ton. That from the surface opening gave 40 per cent. lead, 20 ozs. silver a ton, and a little gold.

## GENERAL NEWS.

The Granby Consolidated Co.'s production figures for ten months to the end of October, 1913, are as follows: Granby ore smelted, 1,023,766 tons; custom ore, 12,614 tons; total ore treated, 1,036,380 tons. Blister copper produced, 18,115,987 lbs.

The report that an application had been made to the Minister of Labour for the appointment of a board of investigation and conciliation in connection with the strike of coal-mine employees on Vancouver island has been contradicted. No progress had been made by the middle of November toward a settlement of the trouble. There is little doubt that the main point at issue now is the recognition of the United Mine Workers of America, which is a serious difficulty and one not likely to be overcome since the coal-mining companies affected have hitherto shown no signs of making such a concession.

## LA ROSE IN OCTOBER.

The October production of the La Rose Consolidated Mines Company was as follows:

| | |
|---|---|
| Production of silver, 203,454 ozs., of value.. | $120,329 |
| Plus sundry income | 3,724 |
| | $124,053 |
| Less— | |
| Marketing, concentration and operating expenses | 56,126 |
| Profits for October, 1913 | $67,927 |

The cash surplus as of October 31st amounts to $1,709,579, made up as follows:

| | |
|---|---|
| Cash surplus | $1,445,713 |
| Outstanding shipments and ore on hand at mine ready for shipment | 292,407 |
| | $1,738,120 |
| Less current liabilities | 28,541 |
| | $1,709,579 |

## COBALT ORE SHIPMENTS.

The ore shipments from the Cobalt camp for the week ending November 22 were:

| Mine. | High grade. | Low grade | Total lbs. |
|---|---|---|---|
| Townsite | 158,700 | 168,000 | 326,700 |
| McKinley-Darragh | 63,410 | ...... | 63,410 |
| La Rose | 87,200 | 160,000 | 247,200 |
| Dom. Reduction | 64,500 | ...... | 64,500 |
| Cobalt Comet | 75,138 | ...... | 75,138 |
| Right of Way | 80,520 | ...... | 80,520 |
| Seneca Superior | 79,334 | ...... | 79,334 |
| Cobalt Lake | 103,570 | ...... | 103,570 |
| Penn-Can. | 81,450 | 56,110 | 157,560 |
| | 713,832 | 384,110 | 1,097,942 |

The bullion shipments for the week ending November 22 were:

| | Ounces. | Value. |
|---|---|---|
| Nipissing | 180,879.61 | $108,075.56 |
| Dom. Reduction | 12,441.00 | 7,371.29 |
| | 193,320.61 | $115,426.85 |

## McINTYRE.

Official returns from the McIntyre Porcupine mines for the month of October showed that while ore ran $9.57 a ton, costs amounted to $6,133. Total production amounted to $41,098.64.

Detailed figures are.

| | |
|---|---|
| Ore milled, 4,131 tons at $9.57 | $39,551.80 |
| Concentrates milled, 26 tons at $59.494 | 1,546.84 |
| Total ore milled—4,157 tons. | |
| | $41,098.64 |
| Production—Bullion shipped— | |
| Bar No. 24 | $13,502.52 |
| Bar No. 25 | 10,171.25 |
| No. 26 | 13,393.99 |
| Bullion on hand, and slag | 2,174.90 |
| | $39,242.66 |
| Extraction | 95.5 p.c. |

Running time—720 hours or 96.77 p.c. of the possible running time. Expenditures for permanent additions to buildings:

| | |
|---|---|
| Plant and equipment | $7,079.67 |
| Operating costs per ton milled— | |
| General charges | $ .964 |
| Mining | 1.806 |
| Mine development | 1.938 |
| Milling | 1.425 |
| Total | $7.133 |

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

# DEPARTMENT OF MINES GEOLOGICAL SURVEY.

## PUBLICATIONS

**The Geological Survey has published maps and reports dealing with a large part of Canada, with many local areas and special subjects.**

A catalogue of publications will be sent free to any applicant. A single copy of a map or report that is specially desired will be sent to a Canadian applicant free of cost and to others at a nominal price. The applicant should state definitely the precise area concerning which information is desired, and it is often of assistance in filling an order for a map or report if he states the use for which it is required.

Most of the older reports are out of print, but they may usually be found in public libraries, libraries of the Canadian Mining Institute, etc.

### REPORTS RECENTLY ISSUED:

CANADA

1085. Descriptive Sketch of the Geology and Economic Minerals of Canada. Accompanied by a geological and mineral map of Canada, by G. A. Young and R. W. Brock.

NEW BRUNSWICK and NOVA SCOTIA

1165. Memoir No. 18. Bathurst District, New Brunswick, by G. A. Young. Maps not yet published.

QUEBEC

1186. Memoir No. 35. Reconnaissance along the National Transcontinental Railway in Southern Quebec, by John A. Dresser.

ONTARIO

1160. Memoir No. 17. Larder Lake District, Ont., and Adjoining Portions of Pontiac County, Quebec, by Morley E. Wilson.
1242. Memoir 33. Geology of Gowganda Mining Division, by W. H. Collins.

NORTH WEST PROVINCES

1204. Memoir No. 24. Preliminary Report on the Clay and Shale Deposits of the Western Provinces, by Heinrich Ries and Joseph Keele.
1220. Memoir 29. Oil and gas prospects of the Northwest Provinces of Canada, by Wyatt Malc m. Map not yet published.

BRITISH COLUMBIA

1175. Memoir No. 21. The Geology and Ore Deposits of Phoenix, Boundary District, B.C., by O. E. LeRoy.

YUKON AND NORTH WEST TERRITORIES

1228. Memoir No. 31. Wheaton District, Yukon Territory, by D. D. Cairnes. Maps not yet published.

### MAPS RECENTLY ISSUED:

CANADA

1042. Mineral Map of Canada. Scale 100 miles to 1 inch.
1277. Map 91A. Geological map of the Dominion of Canada and Newfoundland. Scale 100 miles to 1 inch.

NOVA SCOTIA

1133. Map 13A. Kingsport sheet, Nova Scotia, No. 84. Scale 1 mile to 1 inch.
1208. Map 53A. Southeast Nova Scotia. Scale 4 miles to 1 inch.

NEW BRUNSWICK

1181. Map 35A. Reconnaissance Map of Parts of Albert and Westmoreland Counties, N.B. Geology and topography. Scale 1 mile 1 inch.

QUEBEC

1178. Map 32A. Larder Lake and Opasatika Lake, Nipissing, Abitibi and Pontiac, Ontario and Quebec. Geological. Scale 2 miles to 1 inch.

ONTARIO

750. Grenville Sheet. Parts of Counties of Ottawa, Argenteuil, Terrebonne, Two Mountains and Vaudreuil, Quebec and Carleton, Russell, Prescott and Glengarry, Ontario. Geology. Scale 4 miles to 1 inch. Reprint.
1177 Map 31A. Larder Lake, Nipissing District, Ontario. Geology. Scale 1 mile to 1 inch.
1244. Map 64A. Advance geological copy of map of Gowganda Mining Division and vicinity. Scale 1 mile to 1 inch.

ALBERTA

1132. Map No. 7A. Bighorn Coal Area, Alberta, by G. Malloch. Scale 2 miles to 1 inch.

BRITISH COLUMBIA

1260-1276. Maps 74A-90A. Geology of the Forty-ninth Parallel. Geology and topography of the International Boundary between British Columbia and the United States. Scale 1 mile to 1 inch, contour interval 100 feet.
1237. Map 62A. Nelson and vicinity, British Columbia. Geology and topography. Scale 1 mile to 1 inch. feet

YUKON and NORTH WEST TERRITORIES

1089. Map 9A. Explored Routes on parts of the Albany, Severn and Winisk Rivers. Scale 8 miles to 1 inch.

NOTE.—Maps published within the last two years may be had, printed on linen, for field use. A charge of ten cents is made for maps on linen.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon. Letters and samples that are of a Departmental nature, addressed to the Director, may be mailed O.H.M.S. free of postage.

*Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.*

## Siemens Electric Hoisting Engine supplied and installed by us for the Dominion Coal Co., Cape Breton

**Output 185 short tons per hour from a 5000 foot slope, peak load 1320 H.P.**

**We have supplied or on order for Canada the following Electric Hoisting Engines:**

| | | |
|---|---|---|
| 1—1900 H.P. | Peak Load, | Dominion Coal Company. |
| 1—1900 H.P. | " " | Dominion Coal Company. |
| 1—1560 H.P. | " " | Canadian Collieries, British Columbia. |
| 1—1320 H.P. | " " | Dominion Coal Co., (in operation). |
| 1— 750 H.P. | " " | Canadian Collieries, British Columbia. |
| 1— 400 H.P. | " " | Dominion Coal Co., (in operation). |
| 1— 450 H.P. | " " | Acadia Coal Co., (in operation). |
| 1— 450 H.P. | " " | Acadia Coal Co., (in operation). |

The Siemens Companies undertake the complete electrical equipment of mines, collieries, factories, steel works, rolling mills, pulp and paper mills, and electrical plants of every description. Over 200 electrically driven hoisting engines have been installed with peak loads from 500 H.P. to 5000 H.P.

Further information will be gladly furnished on request, and schemes prepared showing the economy of electric drive over steam winding.

# Sink Your Shaft with Sullivan Air-Jet Sinkers

## —and economize time, labor and power.

The Advantages of these tools for sinking shafts include:

(1) **Greater Speed** than is gained with tripod drills, because **Air-Jet Sinkers** have no mounting to move, require no set up, and lose no time cranking out steels.

(2) **Less Labor** is needed, since the tool is run by one man and is light and easy to handle.

(3) **Reduction in Power,** because **Air-Jet Sinkers** use less air than tripod drills.

(4) **Less Powder** and less waste excavation. Each hole is placed and pointed exactly where it will pull the ground to the best advantage.

# Amatite ROOFING

## The Test of Weight

DON'T judge a roofing by the cost per roll. Judge it by the *cost per pound.* Of two roofings of equal thickness, one may lack density and may contain much less waterproofing material than the other. But the scales tell the story, and, other things being equal, the heaviest roofing per square foot is the best to buy.

You will find that Amatite Roofing always wins the weight test. You get more material per foot and more per dollar. The weight is 110 pounds to the roll of 110 square feet. That is a pound per square foot—a good heavy roofing.

You will find that Amatite is also the most economical roof to maintain. It has a mineral surface which *needs no painting.* That means the elimination of all the bother of taking care of it. Amatite costs no more than the roofing that requires regular painting. A sample of Amatite will be sent free on request.

## MERRY CHRISTMAS

To the readers of the "Canadian Mining Journal" we extend our best wishes for A Merry Christmas and A Happy and Prosperous New Year.

## WORKMEN'S COMPENSATION

A bill of considerable importance to mining men is that which Sir W. R. Meredith, Commissioner, has recommended to be passed into law.

It has long been recognized that employees should be compensated for injuries received while at work.

In general it is also recognized that the employer must pay the cost of accidents. There are, however, many cases in which the accident is caused by the carelessness of the employee, and then naturally the employer is unwilling to bear the burden.

Where the employer accepts responsibility there still remains to be determined what sum should be paid. Where the employer refuses to admit responsibility the injured must bring suit and then whatever the judgment a large portion of the money paid out by the employer does not reach the person injured.

In recognition of these facts and in an endeavour to revise the law so as to provide for fair compensation to the employee, a Commission was appointed, June 30, 1910, to investigate the compensation laws in force in other countries and to recommend a suitable law for Ontario.

A draft bill has been presented in April, 1913, and on October 31, 1913, the Commissioner made his final report to the Lieutenant-Governor of the Province.

In this final report, Sir William says:

"**At the outset of the enquiry it was contended by those who spoke on behalf of the workingmen:** (1) That the law of Ontario is entirely inadequate in the conditions under which industries are now carried on to provide just compensation for those employed in them who meet with injuries, or suffer from industrial diseases contracted in the course of their employment; and (2) that under a just law the risks arising from these causes should be regarded as risks of the industries and that compensation for them should be paid by the industries.

"**With these two propositions those representing the employers expressed their agreement,** though it is fair to say that it was probably not intended to agree that compensation should be paid in respect of industrial diseases."

It was not considered necessary to enquire into the statements of the workingmen, as employees, employer and the Commissioner agreed that the present law is inadequate. The best means of providing for compensation is, however, a subject which necessitates a great deal of study.

The Commissioner says:

"Agreeing as I did with the contention of the workingmen, there remained only to be considered in what form and by what means the compensation should be provided. For the purpose of reaching a conclusion as to this, and in obedience to the directions of the Commission, I made enquiry as to the laws in force in the principal European countries, in the United States of America and in the Provinces of Canada. I also visited Belgium, England, France, and Germany, and consulted those concerned in administering the laws of those four countries, and others qualified to judge as to whether they have been found to work satisfactorily. Much evidence has been taken bearing upon the general question."

Of the various compensation laws in force in these countries he says:

"**There are two main types of compensation laws.** By one of them the employer is individually liable for the payment of it, and that is the British system. By the other, which may be called the German system, the liability is not individual but collective, the industries being divided into groups, and the employers in the industries in each group being collectively liable for the payment of the compensation to the workmen employed in those industries—practically a system of compulsory mutual insurance under the management of the State. The laws of other countries are of one or other of these types, or modified forms of them, and in most, if not all of them, in which the principle of individual liability obtains, employers are required to insure against it."

The representatives of the workingmen and the Canadian Manufacturers' Association agreed on the German system as the most suitable; but disagreed as to some of the details.

"The employers insisted that a part of the assessments to provide for the payment of the compensation should be paid by the employees, and this was vigorously opposed by the representatives of the workingmen. The employers desired that no compensation should be payable where the injury to the workman did not disable him from earning full wages for at least seven days, and to this the representatives of the workingmen objected."

Mine managers in Ontario do not appear to be very much in favour of asking that employees be assessed and will doubtless not be much disappointed if this feature of the bill is not changed. The main contention of the mine managers is that the money paid out for accidents should go to the injured. At present much too large a percentage of it goes to those who conduct the suits for damages.

In comparing the British and German compensation laws the Commissioner says:

"After the best consideration I was able to give to the important matters as to which I was commissioned by Your Honour to make recommendations, I came to the conclusion, to which I still adhere, that a compensation law framed on the main lines of the German law with the modifications I have embodied in my draft bill is better suited to the circumstances and conditions of this Province than the British compensation law, or the compensation law of any other country. . . . It is in my opinion essential that as far as is practicable there should be certainty that the injured workman and his dependants shall receive the compensation to which they are entitled, and it is also important that the small employer should not be ruined by having to pay compensation, it might be, for the death or permanent disability of his workmen caused by no fault of his. It is, I think, a serious objection to the British Act that there is no security afforded to the workman and his dependants that the deferred payments of the compensation will be met, and that objection would be still more serious in a comparatively new country such as this, where many of the industries are small and conditions are much less stable than they are in the British Isles."

His opinion of the present common law is expressed as follows:

"**According to the common law it is a term of the contract of service that the servant takes upon himself the risks incidental to his employment** (popularly called the assumption of risk rule), and that this risk includes that of injury at the hands of fellow-servants (popularly called the doctrine of common employment). The doctrine of common employment is an exception to the general rule that the master is responsible for the acts of his servants when engaged in his work, and has rightly, I think, often been declared unfair and inequitable. **In my opinion there is no reason why this objectionable doctrine should not, as one of the provisions of Part II. of the draft bill provides, be entirely abrogated.** The draft bill also provides for the abrogation of the assumption of risk rule. The rule is based upon the assumption that the wages which a workman receives includes compensation for the risks incidental to his employment which he has to run. That is, in my judgment, a fallacy resting upon the erroneous assumption that the workman is free to work as he pleases and therefore to fix the wages for which he will work, and that in fixing them he will take into account the risk of being killed or injured which is incidental to the employment in which he engages.

"**Another rule of the common law is unfair to the workman.** Although the employer has been guilty of negligence, if the workman has been guilty of what is called contributory negligence and his injury was occasioned by their joint negligence the employer is not liable. The injustice of this rule consists in this, that though the employer may have been guilty of the grossest negligence, if the workman has been guilty of contributory negligence, however slight it may have been, and his injury was occasioned by the joint negligence, the employer is not liable. It is proposed by the draft bill to substitute for this rule that of comparative negligence as it is called, and provide that contributory negligence shall not be a bar to recovery by the workman or his dependants, but shall be taken into account in the assessment of damages."

A feature of the draft bill which was objected to by the Manufacturers' Association, and which will doubtless meet with further objection, is the providing for payment to continue as long as the disability lasts. Many would prefer to pay a lump sum and have done with it. The question involves not only one of actual compensation, but also that of cost of administration. It is quite evident that the staff required to keep track of the condition of all injured workmen and to determine when they are no longer entitled to payments, must soon become a very large one. The cost of administration will certainly not be small.

Against this argument, however, the Commissioner states that it is in these very cases of long lasting disability that a guaranteed compensation is most needed. He says:

"To limit the period during which the compensation is to be paid regardless of the duration of the disability, as is done by the laws of some countries, is, in my opinion, not only inconsistent with the principle upon which a true compensation law is based, but unjust to the injured workman for the reason that if the disability continues beyond the prescribed period he will be left with his impaired earning power or, if he is totally disabled without any earning power at a time when his need of receiving compensation will presumably be greater than at the time he was injured, to become a burden upon his relatives or friends or upon the community. The payment of lump sums is contrary to the principle upon which Compensation Acts are based and is calculated to defeat one of the main purposes of such laws—the prevention of the injured workman becoming a burden on his relatives or friends or on the community—and has been generally deprecated by judges in working out the provisions of the British Act."

The bill is divided into parts. Part I. deals with the liability of employers to contribute to the accident fund or to pay compensation individually. Part II. deals with liability and with certain common law rules and contributory negligence.

In Part I. there are two groups of industries listed, schedule 1,—industries the employers in which are liable to contribute to the accident fund; schedule 2,—industries the employers in which are individually liable to pay the compensation. Mining comes under schedule I.

While there is room for difference of opinion as to some of the details there should be little difficulty in convincing the Legislature that the bill should be passed. It provides in no uncertain terms for fair treatment for the injured. If a workingman meets with an accident while at work he should, if the accident be not the result of his own gross carelessness, be taken care of by the industry. The bill provides for compensation as long as the disability lasts. The workingman is virtually insured by the Government against accidents. The employers contribute to the fund. The bill provides for a board to administer it.

The concluding paragraph of the report will meet with the approval of all who have a sincere interest in providing for fair treatment of employees. The Commissioner says:

"In these days of social and industrial unrest it is, in my judgment, of the gravest importance to the community that every proved injustice to any section or class resulting from bad or unfair laws should be promptly removed by the enactment of remedial legislation and I do not doubt that the country whose Legislature is quick to discern and prompt to remove injustice will enjoy, and that deservedly, the blessing of industrial peace and freedom from social unrest. Half measures which mitigate but do not remove injustice are, in my judgment, to be avoided. That the existing law inflicts injustice on the workingman is admitted by all. From that injustice he has long suffered, and it would, in my judgment, be the gravest mistake if questions as to the scope and character of the proposed remedial legislation were to be determined, not by a consideration of what is just to the workingman, but of what is the least he can be put off with; or if the Legislature were to be deterred from passing a law designed to do full justice owing to groundless fears that disaster to the industries of the Province would follow from the enactment of it."

## THE MINES BRANCH REPORT

The summary report of the Mines Branch of the Department of Mines for the year 1912 has been issued.

The general report of the Director of Mines, Dr. Eugene Haanel, outlines the work accomplished by the various divisions.

The experimental investigation of processes for the profitable reduction of the mixed zinc sulphide ores of Canada, begun in 1910, is still being carried on. No very successful process has yet been found.

An investigation of the properties of cobalt and its alloys, carried on by H. T. Kalmus at the School of Mining, Kingston, has yielded some interesting results. Some extracts from his report will be found elsewhere in this issue.

Several reports on mineral resources and statistics have been published during the year and may be obtained on application to the Director of the Mines Branch.

The new testing laboratory at Ottawa has been equipped for experimental ore dressing and the Department is ready to make investigation as to best method of treatment of ores submitted.

Preliminary reports on field work are presented by Dr. W. A. Parks, Dr. A. W. G. Wilson, Mr. E. Lindeman, Mr H. Frechette, Mr. H. S. de Schmid, Mr. L. H. Cole, and Mr. T. A. MacLean.

Mr. John McLeish reports on statistics; Mr. G. Middleton on the Assay Office at Vancouver; Mr. B. F. Haanel on tests on lignite coal; Mr. J. G. S. Hudson on sampling lignite; Mr. Edgar Stansfield on the Chemical Laboratory; Mr. A. Anrep on peat; Mr. F. G. Clapp on oil and gas, and Mr. Geo. Mackenzie on ore dressing.

The Mines Branch is doing a great deal of useful work. In the introduction to his report Dr. Haanel says:

"The Mines Branch of the Department of Mines was organized primarily for the purpose of assisting, in a practical manner, the development of the mineral industry of Canada. This object is attained by the gathering and publishing of statistics, relative to the mining operations and economic mineral resources of the country generally; by initiating and conducting original research work, which aims at the commercial utilization of our metallic and non-metallic minerals; by mapping out magnetic ore bodies by means of magnetometric surveys; by defining the characteristics and, in well-equipped chemical laboratories, determining the properties of specimen ores and rocks. Results of the work undertaken are given to the public in the form of monographs on the scientific study of the ore deposits of Canada; and by the publication of reports and bulletins dealing with the investigation of certain processes. As examples of this latter branch of the work may be cited the electric smelting of refractory iron ores; the production of peat fuel; the economic extraction of zinc from refractory zinciferous ores, etc."

Already the Mines Branch has published several important monographs and many reports and bulletins. Important investigations are being carried on. The Branch is doing well the work for which it was organized.

## THE EIGHT-HOUR SHIFT

In Ontario and in Michigan the law requires that, after January 1, underground workers shall not be required to work more than eight hours. Already in Ontario at some mines eight-hour shifts are the rule. At Cobalt, notices have been posted at several of the mines stating that the shifts are to be eight hours after January 1. In the Michigan copper mining district the eight-hour rule went into force on December 1, 1913.

The employees will doubtless be much pleased at the new regulations. Naturally the mine owners are not pleased at the prospect of increased costs of mining; but most of them are willing to do what they can to make life more enjoyable for the men in their employ.

A miner can do a good day's work in eight hours if he wants to.

## MINERS MURDERED IN MICHIGAN

Houghton, December 7.

The most vicious crime of the campaign of outlawry which has accompanied the Western Federation of Miners' strike was perpetrated at Painesdale at about 2 o'clock this morning, when two miners employed by the Copper Range Consolidated Company were murdered, a third mine employee was fatally wounded and a little girl was shot through the shoulder.

The dead:

Arthur Jane, aged 21, arrived in Painesdale yesterday from Toronto.

Harry Jane, aged 24, brother of Arthur, also arrived from Toronto yesterday.

Fatally wounded:

Thomas Dally, aged 40, miner and boarding-house proprietor.

The murdered and wounded were occupants of a double boarding-house on the west end of Baltic Street, one side of which was let to William Nicholson and family and the other to the family of Thomas Dally.

All were asleep when the shooting occurred save Mrs. Dally, who was waiting up for a boarder who was expected at 11 o'clock last night, but had not arrived at the time of the shooting. A bullet whizzed past her as she sat reading at a table and she screamed an alarm to the other occupants of the house. The shot was followed by a fusillade, one bullet entering the head of Mr. Dally, who had arisen from bed when his wife screamed, and Arthur and Harry Jane being shot dead in their beds. Little Mary Nicholson, aged 8, daughter of William Nicholson, was shot in the shoulder.

The two murdered men occupied a room in the third storey of the boarding-house.—Mining Gazette.

Houghton, December 9.

There seems no doubt that the State Department will be asked by the British Foreign Office to investigate the death of the Painesdale murdered men, Arthur and Harry Jane and Thomas Dally. These men were British subjects. The facts have been reported to the proper British consular and diplomatic authorities and an investigation undoubtedly will ensue.

Working men at Painesdale yesterday broke up the strikers' parade and then held an indignation meeting. They threaten the lives of the agitators, and trouble is feared. At Baltic 150 strikers were ordered to stop when crossing mine property.

Sunday was a most eventful day. In the morning several of the Houghton business men met at Houghton Club and formulated plans of action; after this meeting they adjourned to Houghton fire hall, sounded fire alarms for several minutes at a time, gathered together all of the citizens who could be reached for the purpose of getting the views of citizens in all walks of life.

Many speeches were made, and result was chartering of a special train over Copper Range and whole party going to Calumet, where they planned a similar meeting for the citizens there.

Result of the meeting was that next Wednesday is to be a half holiday with full pay and patriotic meetings will be held in the several copper country towns. Good speakers will be engaged and it is thought that before the week is over the agitators will find things too much against them to warrant their remaining. After they go it will be a simple matter, comparatively, to adjust differences between men and mining companies.

# A VISIT TO MINES OF ALBERTA AND BRITISH COLUMBIA

(Continued from November 1 issue.)

After examining the Granby mine the party proceeded to Greenwood. In the evening a visit was made to the smelter of the British Columbia Copper Company, which treats ore from several mines including the Motherlode mine at Deadwood. The copper deposits at Deadwood are, according to Mr. LeRoy, similar to those at Phoenix.

**Trail.**—Leaving Greenwood the party returned to Castlegar and thence to Smelter. Here was visited the smelter and lead refinery of the Consolidated Mining and Smelting Company. Recent changes and improvements in the plant were described by E. Jacobs in the August 15 issue of the Journal.

At Smelter, or Trail (the town of Trail lies just below Smelter), are treated the gold-copper ores from the Rossland mines and the silver-lead ores of the Slocan district. The product from the latter is refined silver and lead. The smelter is situated on the Columbia river a short distance above Trail creek.

"In the summer of 1890, Bourjois and Morris, who were working on the Lily May, crossed over to Red mountain and located in one day the Le Roi, Centre Star, War Eagle, Idaho and Virginia. These claims were recorded at Nelson, the Le Roi being given to E. S. Topping for paying the $12.50 recording fees. He secured specimens and went to Spokane, interesting some business men of that town in the Le Roi, and the development of the camp began. The news of the strike brought prospectors, and the Josie and most of the other claims whose names became so familiar were located shortly after the first discovery—many in the same month.

"Development was for the first few years slow, and the prospects of the camp uncertain. Lack of transportation and the financial panic of 1893 were the chief deterrent factors that nearly wrecked the fortunes of the camp. The first ore sent out of the camp was a small lot in 1891, which was packed to the Columbia river and thence shipped to an American smelter. In 1893, a wagon road having been constructed to Trail, on the Columbia, about 700 tons were despatched. The results were sufficiently reassuring to justify the erection of machinery, and with improved facilities, 1,856 tons of ore, shipped in 1894, returned $75,510. During the summer the Geological Survey, through Mr. R. G. McConnell, made a reconnaissance survey of the camp. Several of the more important properties were bonded for considerable sums and development was begun in earnest. The following year, the young camp received marked attention. The population rose from 300 to 3,000; railroad and smelting facilities were projected, and from this time forward, developments were rapid. The smelter at Trail and a tramway to connect it with Rossland and the mines, were begun in October, 1895, by Aug. Heinze, of Butte, and the first furnace was blown in the following February. In 1896 the Red Mountain railway, connecting Rossland with the Spokane Falls and

**On the Rossland Branch, C.P.R.**

**Rossland.**—From Trail the party were taken up the steep grade to Rossland which is 2,000 ft. above the Columbia river valley. Here excellent arrangements had been made to take the visitors through several of the mines including Le Roi, War Eagle, Centre Star, and Josie. Several small groups were formed and for each a guide was furnished. Each group was provided with plans of the workings. Underground the local geologists had in many places made conspicuous marks which enabled the visitors to find the contacts and identify the several formations. The time was thus used to best advantage.

**Development of the Rossland District.**—Although some of the placer miners who were working the creeks in the Boundary district had discovered evidences of mineralization on Red mountain and had done some exploratory work there, it was not until 1890 that claims were staked. The early history of the Rossland mining district is told by R. W. Brock in his report made for the Geological Survey:

Northern railway at Northport, was completed. Then came the inevitable wild boom. The evil effects of a boom are not confined solely to the thousands of dollars squandered in worthless property, the losses sustained by the innocents, and the damaged reputation of the district, but they are manifest in careless work on deserving claims, in a rash expenditure that may for some time survive the boom; in a loss of interest in properties of merit that only require additional work to demonstrate their worth; and in a tendency to maintain prohibitive prices on promising prospects by owners who have purchased during the period of inflation and are not prepared to accept a serious loss, or by owners who, once having experienced the sensation of being millionaires, are loath to accept present conditions, but prefer to speculate on the improbabilities of the future. Rossland has been called on to pay in full all the penalties attaching to a boom. The phenomenal rise in the value of Le Roi stock, the dividends declared by this company and the War Eagle, and the sale of the latter to Toronto capitalists, for the reported sum of $700,000, produced a feeling of buoyancy that afforded every opportunity to the unprincipled boomster and the amateur mining magnate, the public for the time being cheerfully swallowing whatever was offered. The inevitable slump followed.

"In 1897 Rossland had an estimated population of 6,000 and was incorporated as a city. A broad gauge railway was built from Trail to Robson, giving better connection with the Canadian Pacific railway than was afforded by river navigation along this rapid stretch of the Columbia. Stronger companies were formed to take over and develop promising prospects. In particular, the British American Corporation purchased the Josie, Nickel Plate, Great Western, Poorman, West Le Roi, Josie No. 1 and Columbia-Kootenay mines. Development work had yielded most promising results. The Le Roi Company, having completed its contract for 75,000 tons with the Trail smelter, erected its own smelter at Northport. In 1898 the Canadian Pacific railway purchased the Trail smelter and railway from Heinze, and immediately made an important reduction in smelting charges. The British American Corporation secured the Le Roi mine and smelter by purchasing the stock at a price which was said to represent nearly $4,000,000 for the property. The Centre Star was purchased by Toronto capitalists for $2,000,000 cash. The construction of the Crowsnest branch of the Canadian Pacific, built through the Crowsnest coal fields to Kootenay Lake, was an important event for the camp. It meant cheaper and better fuel and coke, and a consequent reduction in cost of ore production and treatment.

"These reductions brought about a large increase in ore tonnage with a corresponding diminution in the grade of ore mined. Large plants with the most approved machinery for the economical working of the mines, were installed or planned, and operations on a large scale were projected. The construction of the West Kootenay Power Company's plant at Bonnington Falls, 32 miles distant, was another important event. Electric power was now available for the Trail smelter and the Rossland mines, although full use has not been made by the mines of this most convenient and economical form of power. At the close of 1899, the reputation of Rossland suffered from the sudden collapse in the price of War Eagle stock. This stock had been run up to a wholly unwarranted point, and was held in the hope that new machinery would permit an increased output, with a resultant advance in the stock. Unfortunately the machinery proved a failure, and the stock dropped. A general desire to realize followed and brought about a collapse, with a consequent loss of faith in the camp. In 1901, Rossland again received a set-back, this time in the form of labour troubles, which closed up the mines for a part of the year. These difficulties were amicably adjusted, but the evil effects of such troubles in discouraging investments are not quickly effaced. By 1902 the mines had resumed their normal operations and on a more business-like basis than before. Although the great number, size and value of the ore shoots in these mines have been proved, and it is known that much lower grade ore can now be profitably worked, this has so far not had the effect that might be expected in encouraging the search for other pay shoots and new veins outside the area already developed. Experiments in concentration were commenced in 1903 and are still being made, and serious efforts are being made to obtain the greatest possible profit per ton of ore."

**Outcrop of vein, Centre Star mine, Rossland, B.C.**

**Characteristics of the Lodes.**—Some of the noteworthy features of the ore bodies have been pointed out by R. W. Brock in his report made for the Geological Survey:

"As is to be expected from the nature of these lodes, sharply defined walls are frequently lacking, the mineralization of the country rock gradually becoming less. Sometimes a fissure or fault plane bounds the ore, but often where this is the case, the slip has been formed after the mineralization. The transition from pay ore to what is—from a commercial standpoint—waste rock, is generally rapid, but such change is not proof that pay ore does not exist beyond the poor material. The pay ore is localized in shoots distributed within the lodes. These shoots vary greatly in size and shape. Lenticular bodies are commonest, but some terminate abruptly against a dike or fault, sometimes swelling to an enormous width or becoming L-shaped against the dike. In width, they vary from a foot to, in exceptional cases, 130 feet; in length, from 50 to 500 or more feet, and the vertical dimension is on an average the greatest. Stopes, 250 feet long by 20 to 30 wide, are by no means uncommon. One shoot of ore that has been followed down nearly 500 feet vertically, has averaged at least 150 feet long by 56 feet wide, and this is not the largest shoot that has been developed. The pitch of the shoots in the lodes varies from vertical to pronounced easterly or westerly and seems dependent upon purely local conditions. In the shoots themselves, the better grade ore is often confined to particular bands, which are generally parallel to the vein, but which may lie along either wall or within the shoot; more than one such band may be encountered in running a cut across a shoot. The position of such rich bands in the lode may suddenly change, owing to the mineralization forsaking one set of planes for another. In the Le Roi and Centre Star, where there are two important parallel lodes—the "Main" and "South" veins—it would seem, in the light of present developments, that where important shoots occur in the one vein, heavy mineralization is lacking at the corresponding point in the other. It is sometimes difficult to trace the vein from shoot to shoot, particularly where its continuity is interrupted by faults and dikes. In the Le Roi-Centre Star Main vein, a seam of calcite extends almost uninterruptedly along the vein, and occasionally forms a useful indicator where mineralization is slight."

**On the C.P.R. in British Columbia**

**On the C.P.R. at Glacier, B.C.**

**Methods of Mining at Rossland.**—In the mines visited by our party the ore is extracted for the most part by the use of square sets. In some cases, however, the shrinkage method is used. In the Josie mine a narrow rich shoot is being extracted without using square sets. As a rule the ore and rock are very hard. The veins dip at an angle of about 70 degrees. The shrinkage method can be used to advantage where the stoping width is not great. The ore bodies, however, are commonly wide, being in places over 100 feet, and timbering by the square set method has proven to be satisfactory where the shrinkage method cannot be used.

The Rossland mines have produced very large quantities of gold and copper ores and it was pleasing to find that the owners have received considerable encouragement from the deeper explorations which have recently been carried on. Several of the engineers stated that there is good reason to expect a large output from the deeper levels.

After spending the afternoon underground the members of the excursion were entertained at the Rossland Club, and at the several hotels. The citizens of Rossland bore out the statement made by Director Brock at Fernie that the people of the west, and especially those of the mining districts are unsurpassed for their hospitality.

# THE GOLD DEPOSITS OF NOVA SCOTIA

By E. R. Faribault.

(Continued from Nov. 15 issue.)

**Ore Distribution.**—Not all the veins are auriferous. The coarsely crystalline quartz seldom carries gold, while the laminated veins of oily quartz-bearing sulphides, generally do. In a few auriferous veins the gold seems to have had a fairly uniform distribution, but experience has shown that in most of them there was more or less segregation into pockets and shoots.

Some of the richest ore mined has been found n pockets. In the Blackie lead at Oldham the gold was found aggregated chiefly in nodules of arsenopyrite; and in the Hay lead, lying 1,800 feet (584 m.) north of the anticline of the same district, an isolated pocket carrying 60 ounces of gold was found at the intersection of an angular with the main lead.

The great proportion of the ore, however, lies in shoots having more or less definite boundaries and directions. They vary from 20 to 60 feet (6 to 18 m.) or more in breadth and are frequently accompanied by a thickening of the vein. In interstratified veins, many shoots have been worked to a vertical depth of 300 and 400 feet (90 to 120 m.). A shoot on the Hard lead, South Uniacke, was followed 1,200 feet (360 m.) on a dip of 28 degrees east; while that in the Sterling Barrel lead, Oldham, has been worked to a depth of 1,610 feet (487 m.) on a dip varying from 30 degrees at the surface to 43 degrees at a vertical depth of 900 feet (275 m.), and in 1909, the ore averaged 2.88 ounces per ton. The latter is the deepest mine on an interbedded vein.

Several shoots in cross veins have also been mined to a vertical depth of 200 and 400 feet (60 and 120 m.), and two, to a vertical depth of 1,000 feet (300 m.); one of these was worked throughout a length of 2,000 feet (610 m.).

As a rule, ore shoots occur in the rolls that have been already described, that is those parts of the veins in which there is some irregularity in size, form, structure or composition.

The interbedded leads are frequently found to be very rich at their intersection with angulars as well as in the thickened parts lying between the lines of intersection with angulars from below and above. All angulars do not enrich the leads they cut, and frequently only a set coming from some one particular direction have favoured the enrichment of the leads. The angulars themselves are usually not auriferous, but some have proved gold-bearing, especially in those parts where they cut obliquely across slate beds.

There is some order in the distribution of the ore in belts; in some, all the veins are auriferous, in some, only one, and in others, one vein will be auriferous for some depth, then becomes barren and an adjacent one becomes auriferous.

That there is some order in the distribution of the ore shoots was pointed out by Poole as early as 1878. A study of the plans made by Faribault of the different gold districts, reveals an alignment or arrangement of the outcroppings of the ore shoots in nearly every district. In the case of sharply folded anticlines, the line of ore shoots runs roughly parallel with the axis or diverges slightly from it, radiating from the centre of the dome, while in broad folds the line diverges still more from the axis. The shoots pitch in the general direction of the pitch of the anticline and at about the same or a little higher angle.

In some veins two or more parellel shoots have been found. The ore shoot on the Hard lead, South Uniacke, really consists of two streaks lying 40 feet (12 m.) apart; in the Mulgrave lead, Isaacs Harbour, a shoot 30 feet (9.1 m.) broad lay 180 feet (54.7 m.) below another 12 feet (3.6 m.) broad, both pitching west at an angle of 12 degrees.

The distribution of the shoots is frequently dependent on some subordinate flexure or crumple in the strata. For example, the large series of ore bodies worked at Renfrew is due to a subordinate undulation in the strata on the south limb of the dome. In this regard each district has its individuality, the structure of one dome never being just the same as that of another. The distribution of the ore shoots, consequently, is never exactly the same in any two districts.

In cross veins the ore body is found, in some cases at least, to lie at the intersection of the vein with certain strata or main leads. At Cow Bay, the ore body dips south at the same angle as the strata and follows certain beds at the base of the Halifax formation, highly charged with pyrrhotite. The shoot, followed 2,000 feet (610 m.) in the Libbey vein, extended from its intersection with the Mill lead on the north to the vicinity of its intersection with the Jim lead on the south.

**Pay Zone.**—Certain facts point to the existence in most districts of zones extending to a considerable depth, in which a succession of auriferous, interbedded, quartz veins of similar character and extent lie superimposed one above the other. On the north limb of the anticline at Goldenville several parallel veins lying close together pass under one another, and each has been worked to some depth beneath the overlying veins. An example of superimposed saddle-shape ore bodies on the apex of the anticline is found at Isaac Harbour, where the workings of the Burke lead were carried below those of the Archie, McPherson and Saddle leads. So also at Mount Uniacke, a series of ore shoots was worked on the West Lake, Nuggety, Little and Borden leads, where they are affected at successively greater depths by a subordinate crumple with an axial plane dipping north at a high angle.

The observation of these and numerous other relations led the writer to the propounding of the "pay-zone" theory.* As has been pointed out the distribution of ore-shoots is dependent on the structure of the anticlinal fold or subordinate flexures on the fold: they lie in a line passing through similarly curved or twisted portions of the strata that during the folding process were subjected to pressures and tensions and were fractured so as to permit the transmission and deposition of minerals. The subordinate flexures and peculiarities of structure, on which the distribution of ore-shoots depends, extend to an unknown depth, and it is claimed that interbedded veins and ore-shoots should succeed one another with depth so long as the same structural conditions continue as at the surface. These structural conditions generally extend in depth parallel to the axial plane of the dome. We thus get a pay-zone the surface extent of which coincides with the surface over which the ore-shoots outcrop and which extends parallel with the axial plane of the dome to an indefinite depth.

The evidences in favour of the theory are the fact that gold mining has been carried on in the province to a vertical depth of 1,000 feet (300 m.) in fissure veins and 900 feet (275 m.) in one interbedded vein; that pay-ore is not limited to any particular horizon, but has been mined throughout the whole thickness of the Goldenville formation; and the analogy existing between the interbedded veins of Nova Scotia and the saddle-reefs of Bendigo, which have been worked successfully to a depth of over 3,000 feet (900 m.) and proved auriferous at over 5,000 feet (1,525 m.).

While the hypothesis may be of general application it is not claimed that it will hold in all particular cases. Structural features vary with depth; subordinate folds may not persist and main folds may flatten and thus the pay-zone may die out or be shifted in position with regard to the anticlinal axis. For example, in the case of the Dufferin mine, rich ore was found at the apex of the fold at the surface, but in the underlying veins owing to the flattening of the dome it was more remote from it.

Genesis.—Some of the earlier investigators such as Hind and Hunt, maintained that the interstratified veins are syngenetic, that is, were formed contemporaneously with the containing rocks, but later students of the Nova Scotia gold fields are thoroughly convinced that they are epigenetic, i.e., deposited subsequently. That the cross-veins are of later origin all are agreed.

Campbell, the pioneer in the gold fields of the province, expressed the opinion that the veins were of later origin than the rocks, and Selwyn and Poole were strong supporters of his theory. The opinion that prevails to-day is that the veins were formed during the folding of the rocks, in the openings produced by the movements of the strata. During the folding of the interstratified beds of slate and quartzite, or shale and sandstone, there was a certain amount of slipping of one bed over another. This slipping produced openings along the bedding planes, which were in general widest at the apex of the folds, and decreased in width with depth along the limb until at a depth of a few hundred feet they pinched out. During or subsequently to the formation of these openings, which took place within the less resistent beds, the vein filling was introduced by solutions. Thus is explained the dependance of vein distribution on rock structure.

The arching of the rocks on closely folded symmetrical domes produced fissures passing over the apex and down each limb; on broad domes the arches were not strong enough to sustain themselves and the fissures were formed only on the limbs; on unsymmetrical domes the slipping of the strata was such as to produce fissuring along the bedding planes of the limb with the higher angle of dip; and subordinate flexures, in which the strata were given a curve of less radius than ordinary, were especially favourable to the production of fissures.

The process of folding was long continued and the deposition of vein matter probably took place during the process. Small fissures were formed along the bedding planes and filled with quartz only to be followed by other parallel openings between the quartz sheet and the slate and further precipitation of quartz in the new openings. Films of slate adhering to the quartz forming the wall of the new fissure thus became embedded in the vein. A succession of such events produced the laminated character of the interstratified veins. It is also probable that in many cases the quartz was deposited in the slate along a number of parallel planes lying close together in an area of minimum pressure and that the quartz film increased in thickness through a widening of the spaces either by the folding of the strata or by metasomatic replacement.

The bulk of the evidence shows that the veins were filled by ascending solutions of a deep-seated origin. These found a passage upward through the fractured portions of the domes. A fracturing across the bedding as well as fissuring along the bedding planes seems to have been necessary for the formation of veins and ore deposits: veins are not commonly found along straight non-pitching anticlines although there was, no doubt, a great deal of fissuring along the bedding planes; on the other hand, where the anticlines pitch and the rocks were fractured across the bedding, veins are abundant. The cross fractures are themselves filled with quartz forming the angulars entering and leaving the interbedded veins. The cross fractures seem therefore, to have provided channels for the passage of solutions across the beds of quartzite and slate to the interbedded fissure along which deposition took place. That the solutions entered by way of the angulars is borne out by the fact that the rich portions of interbedded veins are those portions lying between the line of entrance of an angular and the line along which it leaves the main lead.

Briefly stated, the observed facts seem to be best explained on the theory that the veins are epigenetic, that they were formed by the deposition of quartz, sulphides and gold in cross fractures and interbedded openings occurring chiefly in the black or pyritous slate beds of the Goldenville formation, that the conditions necessary for the formation of the veins were a great deal of fracturing across the bedding planes, permitting the passage of ascending thermal solutions and that these fractures were produced where the two horizontal orogenic forces manifested themselves in the formation of domes or the pitching of the anticlines.

# THE SHIELDS-THIELMAN SECTIONAL JIG CLASSIFIER AT QUINCY MILL, MICH.

Among the changes made in recent years in treating Michigan copper ores some of the most important are improved methods of classifying the product from the stamps. The jigs devised are remarkably efficient machines and treat an enormous amount of material in a short time.

Recently at the Quincy mill a very satisfactory classifier of a new type has been devised. This is a sectional hydraulic jig classifier, which is making a remarkable recovery of the copper of all sizes and classifying the remaining material for treatment in regrinders and on tables.

The following is an authentic description which has been published in the Mining Gazette:

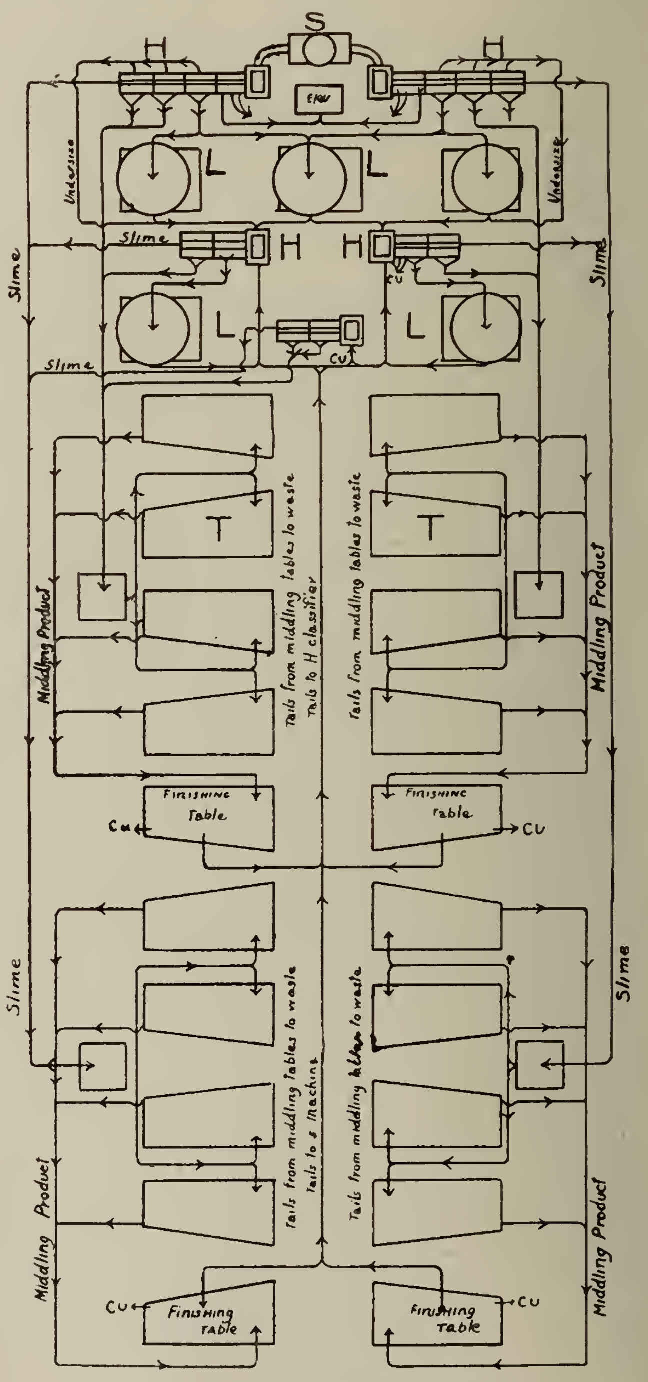
"A machine has been designed at the Quincy stamp mills that tends to revolutionize the treatment of the so-called roughing floor material or roughing jig material where at least 60 per cent. of the losses from all the mills are. It has been in successful operation for eight months and the results have been better than expected. The machine takes up a space of about 12 ft. by 4 ft. and has a capacity of 500 tons.

"At the present time the machine is taking the mixed feed direct from the stamp, the feed coming through a ⅝-inch grate and running direct into the machine. The trommel screens have been discarded together with all the shafting, belting, gearing, etc., that goes with it, also the ponderous bull jig together with its shafting, hangers, belting, etc. The roughing jigs can all be discarded as this machine does all the work of the roughing jigs also. It sorts or classifies the material in about 20 different classifications and at the same time takes out between 65 to 70 per cent. of the total copper direct from the stamps, copper ranging in size from ⅝ down to table copper.

"This simplifies the present practice as the copper at the mills on Lake Superior is scattered all over the different machines, amounting in some cases to as many as 20 to 30 on the roughing floor alone. This machine by taking out so much copper and sorting out the material to be ground, and confining it in a small space simplifies the treatment of the roughing material to a very great extent. Grinders can be placed directly in front of this machine on the roughing floor, and the material coming from the different plugs can be sampled, assayed, and, if rich enough to be ground, can be turned directly into the grinding machines after the free copper has been taken out. This treatment is very simple.

"The problem is to gather together material worth grinding and discard material practically worthless, or in baseball parlance, let the bad ones go by and hit the good ones hard. This has been accomplished to such an extent with the machine that it is hardly believable. The machine takes only from three to four horse power as against 25 to 30 horse power on the present mill practice to do the same work, and a space of 12 ft. by 4 ft. against a space of 40 by 25 ft.

"The machine is called a sectional positive jig classifier, and is made up of a number of sections that can be added to at any time without dismantling the machine. The several sections are divided into pockets of 6 by 12 and 12 by 12 in size, each having a positive plunger, and an independent adjustable stroke. This is very essential in the treatment of the different sizes of material ranging from ⅝-inch to 100 mesh. The plungers are all made of brass, and each plunger carries an oil bath inside, submerging the pin on the plunger at all times in a bath of oil. The plunger cas-



**Flow Sheet of Proposed Mill for Treating Michigan Copper Ores.**

**S—Steam Stamps. H—Shields—Thielman Classifier.**
**L—Regrinding Machines. T—Concentrating Tables.**

ings are made of cast iron, and are independent of each other, and can be removed or replaced at any time if necessary in quick time.

"The sections are lined with a cast iron box to protect the sections proper from wear. They conform as to shape with the partitions in the hutch pockets. Each pocket has a plug of its own, and the material from each pocket is discharged independently. The present roughing jig practice in the mills is more or less crude, inasmuch as there is material going down on the roughs that should go on tables and into a grinder instead. To mix this material on the roughing jigs and afterwards is a difficult proposition, as it cannot be positive, and requires careful watching. The one great object of this machine is to get copper quick, and to sort out the material that is ground without scattering both copper and the to-be-ground stuff all over the mill. Another object is to get rid of the trommel screens, bull jigs, roughing jigs, hangers, shafting, sieve frames, plunger-boards, skimming, sieve wire, and all that goes with the present-day lay out. Both objects have been accomplished."

Mr. Jas. Shields, superintendent of the Quincy mill, claims that the copper stamp mill of the future will contain none of the usual jigs, trommels and classifiers, and gives the accompanying flow sheet as an example of the new type of mill in which the machinery is essentially, stamp, sectional jig, classifier, regrinder and tables.

# BRITANNIA MINE, HOWE SOUND, B.C.*

By R. G. McConnell.

The group of mineral claims owned by the Britannia Mining and Smelting Co., and known as the Britannia mine, is situated in the Coast range east of Howe sound about 20 miles directly north of the City of Vancouver and 28 miles following the steamer route along the coast. Howe sound is an irregular fiord, cutting well back into the Coast range, and is bordered along its whole length by rugged mountains and high ridges. The claims now being worked are situated on a steep ridge, about 4,300 ft. in height, separating Britannia creek from Furry creek. The principal workings are in the north slope of the ridge at a distance of three and a quarter miles from the coast and at an elevation of 3,275 to 3,775 ft. above sea level.

**Rocks.**—The Coast range is built predominantly of granitoid rocks, mostly coarse quartz diorites or granodiorites, but contains at various points a number of inclusions of the older rocks invaded by the granitic magma. There vary in size from small angular fragments, a few feet across, to wide bands extending along the range for miles. The mineralized zone at the Britannia mine occurs in an inclusion or undestroyed area of the intruded rocks from one to two miles in width and running southeasterly from Howe sound for a distance of more than seven miles.

The rocks in the inclusion consist largely of slate, alternating with a dark intrusive, probably a diorite porphyry, usually crushed and altered into a greenish chloritic schist. Volcanic rocks, mostly porphyrites and hardened fine and coarse fragmentals, occur near the northern border of the inclusion.

The slaty rocks, when unaltered, are dark in colour and contain considerable carbonaceous matter. They are seldom regularly cleaved except for short distances and in places pass into fine-grained quartz biotite schists. A hard quartzitic variety due to silicification is common, and alterations into grayish and silvery white quartz sericite schists occur over large areas.

The crushed dioritic intrusive is economically the most important rock in the group. It forms the country rock at the Britannia mine and is also heavily mineralized at other points. It alternates with the slates and their altered equivalents, the sericite schists, in bands and lenticular areas ranging from a few feet to more than 1,000 ft. in width. Like the slates it exhibits varying degrees of alteration, often passing in a short distance from a hard, irregularly joined, gneissic rock to a soft, greenish, well foliated, micaceous schist. A light green variety, spotted conspicuously and fairly regularly with dark green chlorite films often half an inch or more in length, forms the principal country rock along the mineralized zone at the Brittania mine. The origin of the green films has not been definitely determined. They may represent crushed ferro-magnesian phenocrysts, but possibly are derived in part at least from small fragments of slate included in the intrusive and subsequently crushed and altered.

Dikes genetically connected with the surrounding Coast Range batholithic rocks, usually abundant in inclusions, are rare in the Britannia area, except near the contact.

An excellent section of the alternating slates and crushed intrusives is afforded by a tunnel driven from Britannia creek at an elevation of 2,100 ft. above sea level southward diagonally across the strike of the rocks for a distance of 4,200 ft.

**Mineralization.**—Mineralization at the Britannia mine is on an extensive scale. The deposits are of the replacement type and are formed along wide, irregularly fissured zones, enclosed in and striking with the greenstone schists. The most conspicuous croppings occur in the Jane and adjoining claims to the east and consist of two high iron-stained bluffs, about 1,000 ft. apart, facing each other across the drift-covered bottom of Jane Creek valley. The mineralized zone exposed in the two bluffs consists of silicified schists impregnated with iron, copper and zinc suphides, and has a width in the eastern or Mammoth bluff of fully 200 ft. It undoubtedly extends across the concealed interval separating the two bluffs and may be considered to have proved minimum length of 2,000 ft.

East of the Bluff mineral zone a number of disconnected croppings occur in the steep mountain slope covered by the Fairview claim. A tunnel driven under these from the Mammoth bluff at a depth of about 1,000 ft. below the crest of the ridge resulted in the opening of a second important mineral zone, practically a continuation of the Bluff zone, but separated from it by a short lean stretch. The strike is also 30 degrees more to the south. Development work on the second, or Fairview zone, is still in progress, and its full dimensions have not been ascertained. The work done up to the present has shown it to have a minimum width of fully 500 ft., made up of bands of commercial ore, separated by barren, or nearly barren, schists. Drifts have been carried along the zone for a distance of 1,200 ft.

*Appendix to International Geological Congress Guide Book No. 8, published by Geological Survey, Canada, 1913.

**Minerals.**—The metallic minerals in the Britannia ore bodies consist of pyrite, chalcopyrite, considerable zinc blende in certain areas, and rarely some galena. Small quantities of black oxide of copper and bornite occur as alteration products, but are nowhere abundant. The gangue is principally the greenstone schists forming the country rock, more or less silicified. Small quartz veins, generally following closely the direction of the schistosity, but frequently cutting directly across it, are numerous.

Calcite in very small quantities is occasionally present and some fluorspar has been found.

**Ores and Ore bodies.**—The wide Bluff mineral zone originally worked is practically a low-grade copper deposit throughout its whole extent. Pyrite, in masses, disseminated grains, and in veinlets through the silicified country gangue, is the most abundant mineral present. Chalcopyrite, in small lenses, veinlets, and scattered grains, occurs with the pyrite, but in much smaller quantities, and in places a notable percentage of blende is present. No mining is at present being done on this zone. A considerable quantity of ore was mined and concentrated before the discovery of the Fairview zone, but the venture was not commercially successful. Since then transportation to the coast has been improved and better methods of treatment largely increasing the recovery of metal have been adopted, so that the ores could probably now be mined and treated at a fair profit. The average tenor in copper is about 1.5 per cent.; in addition the ores contain 0.5 to 1 oz. in silver, and in the western portion of the zone, 40 cents in gold.

The character and distribution of the ores in the Fairview zone differ markedly from those in the Bluff zone. The chalcopyrite, the principal valuable mineral present, in place of being disseminated more or less irregularly through the whole width of the zone, is concentrated along certain lines in fairly definite ore bodies, ranging in width from a few feet or more, which have proved very persistent. The ore bodies are not confined between walls and are marked mainly by a more or less complete cessation of both metallic and non-metallic mineralization. They are approximately parallel, but occasionally diverge or unite at low angles. The dip is to the south, at an angle of about 70 degrees and is conformable or nearly so to that of the enclosing schists. In the present workings, six ore shoots have been encountered and followed for varying distances up to 1,000 ft. The vertical range has been proved for 500 ft.

The chalcopyrite in the ore bodies occurs characteristically in fairly large, nearly pure, aggregates, usually as short lenses, occasionally a foot or more across, in stringers interleaved with or cutting the schists at a low angle and in reticulating veinlets penetrating the silicified schists in all directions. Only a small percentage occurs in disseminated grains. The quantity present varies in the different ore bodies and along the dip and strike of the same ore body. The general average tenor in copper of the whole system of leads is given at 2.5 per cent. The silver content is small, amounting only to about 0.5 oz. per ton, and gold occurs only in traces.

The proportion of pyrite present is much smaller than in the Bluff zone, and zinc blende, prominent in the latter, is absent.

The production in 1912, according to published statements, amounted to 193,000 tons, yielding 14,300,000 lbs. of copper, and 76,500 ozs. of silver. The present production is approximately 600 tons per day, the full capacity of the present transportation facilities from the mine to the mill.

**Development.**—The Fairview mineral zone has been opened by five levels at elevations of 1,050, 850, 700, 600, and 500 ft below the summit of the ridge into which they are driven. The levels, with numerous crosscuts and raises following the ore bodies, serve to explore the zone for a distance of 1,200 ft. along the strike and 500 ft. along the dip. A long tunnel at a depth of 1,200 ft. below the present lowest level, starting from Britannia creek and running toward the ore zone, is now completed to a point beneath and a short distance west of the ore bodies worked. This will be connected in the near future with the upper workings by a large 3-compartment shaft and an ore chute. The extension downward of the ore bodies below the 1,050 level can be reached from the shaft by short crosscuts.

**Treatment of Ore.**—The chalcopyrite in the Fairview ore bodies occurs as a rule in fairly large aggregates, often separated by considerable waste, and the material mined is concentrated before shipment. The ore is crushed at the mine and transported to the concentrating mill at Britannia Beach by an aerial tramway built in two sections, with a daily capacity of about 600 tons. At the mill it is first washed in a 4 by 6-ft. trommel with 1½-in. perforations. The over-size discharges on to a sorting belt, and about 50 tons of 12 per cent. ore and 150 tons of waste are picked out daily from the 600 tons received. The milling ore, except the undersize from the washing trommel, passes from the conveyor to a Blake crusher, and then through a series of spring rolls, which reduce it gradually to the size required, about 2mm., for treatment in Hancock jigs. The greater part of the sulphides is separated out in these machines.

**Flotation Process Used.**—The tailings and the undersize from 1½mm. trommels are ground in Hardinge pebble mills to a 40-mesh or smaller size, and subjected to the Minerals Separation Co.'s flotation process, the details of which are still kept secret. The Hancock jigs used are of the Anaconda type and the separation of the sulphides by them, followed by the use of the Minerals Separation process on the finer material, has given excellent results, only a very small percentage of the sulphides escaping. The concentration is in the ratio of 4 to 1.

**Equipment.**—The present equipment is inadequate to the needs of the mine, and extensive improvements and enlargements are being made. A new concentrating mill with a daily capacity of 200 tons is contemplated, and work is in progress on a system of transportation of the ores from the mine to the Beach, which involves the construction of a double-track gravity tramway a mile in length with an average grade of 15 per cent.; a switchback track five miles in length with a 3 per cent. grade on which gasoline locomotives will be used; a 9 by 12-ft. tunnel, 3,600 ft. in length; and a 1,200-ft. vertical chute connecting the tunnel with the present workings.

Water power developing 1,800 h.p. from Britannia creek is largely used to operate the mill, compressors and other portions of the extensive plant, and this, with 650 h.p. obtained from steam, is ample for present requirements.

# THE PHYSIOLOGICAL CHARACTERISTICS OF ACETYLENE WITH RELATION TO ITS USE AS AN ILLUMINANT IN MINES*

By E. E. Smith, Ph.D., M.D.

A modern philosopher has told us that life is the continuous adjustment of internal relations to external relations. This means, in less abstract language, that to live we must adapt ourselves to our surroundings. So long as we are able to do this, we live healthful lives. When we are unable to do so, ill-health and death supervene.

Civilization has modified in many ways the external conditions to which we must adapt ourselves. Tent life which was native to the tribe has now very largely given away to house life. That this change has involved adaptation to the new external conditions is illustrated at the present time by the American Indian. With him it appears too often that house life means being domiciled in squalid cabins surrounded with accumulations of filth which becomes the source of disease, conditions that do not exist with the fresher air, ventilation and the frequent change of site of tent life. In order that the change be beneficial, it is important to so regulate the civilized form of living that by avoiding these unhygienic conditions civilization be brought within the capacity of adaptation of the Indian.

This somewhat primitive illustration indicates the general law that new external conditions, without regard to the fact that they mark a signal advance in civilization, must be scrutinized with whatever care may be necessary to determine what is to be avoided that the new conditions may be established to our benefit. It is in this spirit, or at least it should be, that every economic advance receives attention. What are the problems of adjustment which it presents and how may they be solved so as to reap the benefit of the advance and avoid possible disadvantages?

With illuminants, the problem of adjustment have ever been definite and impelling. What concern was in the minds of the generations who worked out the problems presented by the evolution of the candle we need nothing more than conjecture. It may be that the ember of the rosin pine knot gave way to the dip in the candle without apprehension on the part of the housewives of the times, but what we know of human nature strongly suggests that the fear of spattering, the danger of clothes and hangings being fired, the matter of the formation of soot and the possibility of the extinction of the flame by draughts were problems quite as serious to the era of the candle as have been those presented to later generations by the advance which they have witnessed.

The working out of some of the problems presented by the use of oil is within our memory. The newspapers of fifty years ago gave many accounts of lamp explosions with disastrous fires, involving loss of property and life. It remained for the oil chemist of that day to point out the necessity of fractioning the oil, separating the highly volatile and explosive lighter oils and securing the safer and more efficient fraction for use as an illuminant.

The problems of adjustment in the use of common illuminating gas are yet with us. Its poisonous action has by accident ended thousands of happy lives and by intent perhaps as many unhappy ones; and is continuing to do so and, indeed, from its nature must so long as it is used. Its use has been an important factor in the development of modern city life, but it has not been without its price.

So, too, we must acknowledge the loss of life associated with the use of electricity. The innocent wires that transverse our streets and buildings have been and still are the cause of many conflagrations and violent deaths. The brilliant light thus shed by which night is made day is not without its list of fatalities.

Indeed, the fact of new external relations must inevitably carry with it the problems of the adjustment to the internal relations that constitute life. Such adjustment must be continuous. It is necessary and important to every advance to recognize the new external relations that they may be maintained within the capacity of adaption to internal relations, so that their benefits may be realized and their dangers avoided.

Let us, then, in the time at our disposal, look at some of the problems of adjustment presented by the modern use of acetylene as an illuminant.

**Acetylene is not a direct poison.**—Though the division of our subject naturally first directs attention to the carbide or acetylene production as any industry, we shall limit our attention to the problems of adjustment presented by the use of acetylene as an illuminant. This leads us at once to the inquiry, Is acetylene a direct poison? The answer is no. This question is asked with some seriousness, however, because on the one hand of the notoriouly toxic action of common illuminating gas, due to the carbon monoxide which enters so largely into its composition, by reason of which the mind of the inquirer is already not only prepared to believe that acetylene is poisonous, and in fact, in some instances has that idea rigidly implanted there. It is further asked with seriousness, because, in the literature of the subject, we find some views that it is poisonous. Early writers declared that it combined with the blood and had a marked poisonous effect, like carbon monoxide.

**It is capable of doing injury.**—Any gas, when it replaces air, if incapable of supporting respiration, is injurious and even fatal, not because it is poisonous, but because it deprives the body of oxygen. Because of this, acetylene is capable of doing injury. If it accumulate in some small, unventilated space, like the cabin of a boat, it is entirely capable of shutting off the supply of air, of preventing respiration and hence harm and even death. It suffocates because it is incapable of supplying oxygen without which man cannot live.

When acting in this way, acetylene is not a direct poison; it does not do anything to the body that injures it. It does harm only indirectly by withholding air,

*A paper read at a recent meeting of the International Acetylene Association.

The recognition, then, of injury by suffocation throws no light on our inquiry whether it is a direct poison. The presence of common illuminating gas in air even to the amount of a fraction of a per cent., is distinctly injurious and may even be fatal, though such air contain an abundance of oxygen. The carbon monoxide contained in the illuminating gas enters the blood through the lungs and attaches itself strongly to the coloring matter of the blood, rendering it incapable of taking up the oxygen of air though the air contain oxygen in sufficient amount. Thus death supervenes not because the body is denied oxygen, but because through the fixation of the coloring matter of the blood, it has lost its capacity to use oxygen. Has acetylene this or any other directly poisonous action? Some early observers said it had. They found fixation of haemoglobin quite similar to that of carbon monoxide and accordingly declared acetylene a poison. Moreover, it seemed to exercise the action of a direct poison on animals.

All this happened before the production of acetylene from carbide. It happens that the acetylene was made by the incomplete combustion of coal-gas, and that in this process more or less carbon monoxide was present in the acetylene obtained. What wonder, then, that there was some degree of toxic action of the acetylene examined! It contained carbon monoxide, the poison of common illuminating gas.

**Carbide acetylene does not contain carbon monoxide.**—With the discovery of carbide and its use for the production of acetylene, all of this has been changed. It is found that carbide acetylene does not contain carbon monoxide, and that it does not have the property of fixing haemoglobin, and that it does not rob the blood of its capacity to take up oxygen from the air and carry it into the tissues. Hence the old allegation that acetylene is a poison because it deprives the blood of its oxygen-carrying capacity is no longer justified.

Another poisonous product sometimes present in the acetylene made by the combustion process was hydrocyanic acid. Never in large quantities, it yet is so toxic that we can fully appreciate its effect. It is not present in the carbide acetylene and so may be dismissed from consideration.

Another charge that is no longer justified is that acetylene is a poison because of the presence of phosphine as an impurity. This forms when carbide is made from limestone containing phosphate, the action of the coke reducing the phosphate. The selection of limestone free from phosphate has practically obviated this impurity and any poisonous action of the acetylene consequent thereto.

Indeed, the present day product may be said to avoid the pitfalls of impurities so that its effect is determined by the action of acetylene itself. We may consider then whether acetylene as such is or is not a direct poison.

**Small amounts of acetylene produce no effect.**—My present observations have been directed to the inquiry whether it produced noticeable effect on human subjects, when present in increasing amounts up to 2½% during a period of 2½ hours. To this end, four men, including myself, were enclosed in a room of about 800 cubic feet capacity and at the beginning and four times subsequently at intervals of a half hour, acetylene was liberated into the room by throwing 450 grams of carbide into an open tub of water, this corresponding to the liberation of 4 cubic feet of acetylene, each time; that is, 20 cubic feet in all, 2½% of the capacity of the room.

To eliminate, as far as possible, the mental effect of the environment, the subjects were engaged in playing a game of cards. They were interrupted only long enough to take readings of their blood pressures, at half hour intervals. The results of the experiment were quite negative. The game was continued throughout the time, excepting as noted. The blood pressure remained constant with one subject and was very slightly lowered from the inactivity with two and, of course, in the card game two men were defeated and two won, but there was absolutely no effect noted that could be ascribed to any poisonous or other action of the acetylene. It was without effect.

This same result has been obtained in experiments on animals. In such amounts as used in the above experiments there is no effect. Indeed, acetylene may be increased up to 20% and, if the mixture is so made as not to reduce the amount of oxygen, animals may be left in the atmosphere for some time, an hour or more, and will only become drowsy, from which they quickly recover when removed into ordinary air.

**Large quantities induce drowsiness.**—With very large quantities or with 20% admixtures acting for a longer time, the degree of drowsiness is increased. That is to say, the effect of acetylene in large doses is that of a narcotic, producing loss of consciousness in proportion to its degree of action. When this action is pushed to a fatal termination, the final action is upon the breathing centre, inhibiting its action and so producing death.

It thus appears that carbide acetylene is not poisonous in the sense that common illuminating gas is and that in large quantities, acting for some time, it produces a narcotic action. In respect to its toxicity, it presents no problem of adjustment under ordinary conditions. It, of course, may not replace in large degree the atmosphere we breathe, but otherwise it need not be anticipated that it produce any poisonous action.

There are a number of interesting problems presented in conneetiton with the use of the acetylene lamp as an illuminant in mines. I do not refer to those conditions where explosive gases are present and where protection from explosions is obtained through the use of the Davy lamp in some of its modifications, but to that large number of mines where this danger is not presented and which are regularly illuminated by the naked flame. For this purpose, the miner's oil lamp has been used. It is light in weight, but its illuminating capacity is strikingly low and, moreover, is obtained at the expense of a smoking out process that is amazing. It is a tribute to the miner's endurance that in the past he has accomplished so much under the conditions of poor illumination and soot-laden atmosphere which the use of the oil lamp of the past has meant. The use of the miner's acetylene lamp affords an illumination that is wonderfully efficient and entirely soot free. Its use raises some questions that we may at this time answer. Before considering these, let us look at some of the problems which the miner has to face upon which the choice of an illuminant may have some bearing. Of first importance is the composition of the air which he breathes.

**Composition of the air breathed by miners.**—For our present purpose, we may regard the atmospheric air as a mixture of 21 parts of oxygen and 79 parts of inert gas, mostly nitrogen. It is the oxygen that supports life. The proportion of oxygen may be diminished to a certain extent without noticeable effect, especially if the difference is made up by inert nitrogen. Under these conditions a reduction to 14% produces little or no physiological effect. When the reduction reaches 12%, there is apt to be slightly deeper breathing, while 10% is an amount distintly below what is physiological. Seven per cent. may be regarded as the fatal point. It is an amount too small to support the life of animal or man for any considerable time. It must be kept in mind that these figures 10% the physiological insufficiently and 7% the fatal point are for oxygen with inert nitrogen, and without the admixture of poisonous gases.

As you know, there is always present in atmospheric air a small amount of carbon dioxide gas, commonly known as carbonic acid. This amount is very small, ordinarily not over 5 parts in 10,000. It is a product formed from the combustion of organic matter and is present in air that is exhaled from the body in breathing. As we shall see later, it is also a constituent of mine gases and so is of particular interest to us. I want to call your attention to what happens when it is added to the air.

**The Physiological effects of increasing proportions of carbon dioxide.**—To answer this question I have myself made direct observations. The apparatus employed was a closed cabinet, the inside measurements of which were approximately 67 by 30 by 69 inches, having a capacity of 80 cubic feet. It was provided with a sliding door. Into the top a pipe entered and connected with three "sprays," one in each third of the top. Through this system gases were introduced. There was a small sample tube, easily moveable, so that gas was withdrawn from the location desired within the cabinet, which was connected outside with (a) an exhaust bottle for withdrawing residual air from the tube; and (b) a gas sampling tube. Collections were made over mercury and analysis were made over mercury in a Hempel apparatus. The cabinet was tightly built, but not sufficiently so to prevent escape of air sufficient to equalize the pressure without and within the cabinet when gas was introduced. A moveable electric fan within the cabinet was adapted to produce motion of the air.

When carbon dioxide was mixed with atmospheric air, it was noted that such mixture produced an increased rate of respiration, even when the proportion of carbon dioxide was small. Rabbits and guinea-pigs showed a marked increase when as much as 4 to 5% of carbon dioxide was present. With increasing proportions respirations became deep and labored, frequently, as was observed in guinea-pigs, reaching a condition of diaphragmatic spasm. Loss of muscular power developed so that, with guinea-pigs, there was loss of ability to support the body when the carbon dioxide proportion reached 20-25%. These symptoms developed irrespective of whether lamps were burnt in the same atmosphere. With rabbits, when lamps were burning, loss of muscular power appeared with the same carbon dioxide proportion as with guinea-pigs, but in the single observation made without lamps, the loss of power appeared when the carbon dioxide proportion has reached 36%. There was no effort made to determine the carbon dioxide proportions that would produce death, as it was believed that the proportion producing loss of muscular power represented the limit of possible tolerance. It may be noted, however, that in the experiment carried to a 36% carbon dioxide proportion, the rabbit quickly recovered, two guinea-pigs recovered somewhat slowly, and one guinea-pig died, when the animals were removed into fresh air. Thus it appears that even with quinea-pigs, the fatal carbon dioxide proportion is not much if any below 36%, while the carbon dioxide warning point is not above 4 to 5%.

To test the effect of carbon dioxide on man, 10½ cubic feet of carbon dioxide were passed into a cabinet, when a young man entered, the door being opened for that purpose and quickly closed. After entering, the fan was started. The rate of respiration at once rose from 18 to 48, being deeper and labored. He almost immediately complained of feeling dizzy. At the end of 2½ minutes there was a feeling of impending loss of consciousness. A sample of the air mixture was at once taken and at the end of three minutes the man came out. His respiration quickly returned to normal but his face was flushed and he complained for several hours of a slight frontal headache. Analysis of the sample showed a carbon dioxide proportion of 7%. The experiment indicated that with man the warning point is reached below a carbon dioxide proportion of 7%.

There is increase in the rate of breathing which with 3 per cent. dioxide has become so marked that it gives unquestioned warning to the subject that some unusual condition of the air is rendering it unsuited for breathing. We may call this the physiological warning point for carbon dioxide. When the concentration reaches 8 to 10%, the breathing is not only rapid, but becomes very laboured, a condition termed dyspepsia. Beyond 15%, further concentration instead of increasing respirations decreases them and the animal becomes narcotized, quite as though a substance like chloroform had been administered. At a concentration beyond 35% the narcosis becomes fatal.

I have gone into these matters of the influence on breathing, and on life of oxygen decrease and of carbon dioxide increase because these are conditions that may be presented by the air in mines. Moreover, the oil lamp has been used to indicate to the miner whether or not the mine air is fit to breathe, air that sustains the flames being regarded as safe and air that extinguishes the flame as unsafe to breathe.

The disadvantages of the oil lamp are all too apparent. Its dingy light limits the working capacity of the miner from the poor illumination. Aside from working capacity, the miner is not so well able to see the elements of danger presented by weakness in overhanging structures. An even greater disadvantage is the production of soot by the flame. This both adds to the personal discomfort already great and also to the danger of dust explosions by addition of the soot to the dust-laden atmosphere.

**Advantages of acetylene lamp.**—These conditions render an illuminant that is brilliant and soot free a very great advantage. The acetylene miner's lamp supplies such an illuminant in an admirable manner. In connection with its use it is desirable to determine the relation to composition of mine air, so that the miner may know in what way and to what extent it replaces the oil lamp as an index of safety. That is to say, we have a problem of adjustment to which it is important to give a correct and definite answer.

First, then, let us consider the variations in composition that may be presented by mine air. Because of the limitations of access of outside air and especially because of the formation of gases in mines, mine air may present a considerable departure from the composition of outside air.

All ordinary foreign gases were known to the early miners as "damps," from the German damf, meaning vapour, the specific designation being indicated by an individual prefix. Thus, the gas characterized by its tendency to extinguish the flame was called black-damp, or, since it tends to produce suffocation, choke-damp; the damp producing increased brilliancy of light, white-damp; that with a marked stink, stink-damp; that which readily took fire, fire-damp; the gas resulting from burning or explosion, after-damp, etc. The names were applied long before the composition of the respective gases was known. In consequence of indefinite basis of the classification, an individual name was in many instances applied to mixtures that presented wide variation in composition.

**Black-damp,** on chemical analysis, has ordinarily proved to be a mixture of carbon dioxide and nitrogen, the proportion of carbon dioxide varying very little up to 15% or perhaps exceptionally 20%. As it is always mixed with more or less air, a corresponding amount of oxygen is present. Other gases, such as methane (fire-damp), carbonic oxide (white-damp), hydrogen-sulphide (stink-damp), also water vapour, may be present in greater or less amount.

We may well ask, then, what the name black-damp indicates. Does it mean carbon dioxide, which is the characteristic constituent; does it mean the carbon dioxide nitrogen mixture; is it the carbon dioxide nitrogen air mixture; or is it the combination of any of these with other gases that are present in the mine air? Unfortunately, there has been no unanimity of usage in regard to this term, it having been used by different writers in almost every one of the above possible meanings.

If we were to establish anew the definition of the term, it would be doubtless wise to adopt a scientific meaning. As the matter stands, our meaning should be decided by priority, which is that black-damp is not simply carbon dioxide, but rather a mixture of that with nitrogen in varying proportions, but we must not forget the different usages of individual authors.

Our problem is: How does the admixture of black-damp modify the respirability of mine air and how is this indicated by the oil and acetylene flames? It requires no facts other than those now before us to appreciate that it affects respirability in two ways. It diminishes the proportion of oxygen which if reduced to 10%, would be unphysiological and to 7% fatal; and it increases carbon dioxide which when present to the amount of 3 to 4% would produce marked increase in the rate of breathing.

As to when the change in composition, especially the carbon dioxide increase, is indicated by the particular flames, has been the subject of personal experimental observations. The cabinet employed in the experiment with man previously described was used. In the earlier experiments with carbon dioxide, this gas was fed into the cabinet without previous admixture with air; in the later ones both air and carbon dioxide were fed into the cabinet through meters, entering the cabinet through a common tube. Thus they were well-mixed and the rate of flow of each was regulated.

Early experiments indicated that various factors ininfluenced the extinction point, both for oil and acetylene lamps. Let me relate what these factors were and how they exercised their influence.

### A. Acetylene Gas Pressure.

From the outset it was observed that the pressure under which the acetylene gas was fed through the burner exercised a marked influence upon the extinction point. That is to say, with a series of lamps in which the acetylene gas pressure varied as indicated by the character of the flame, it was not difficult in a mixture of increasing carbon dioxide proportion to foretell the order in which the lamps would be extinguished, the lamps with higher acetylene gas pressure going out first. Indeed, it was frequently observed where the escape of gas from the burner was under such slight pressure as not to give direction to the flame that the extinction point would be very much higher than was observed with the ordinary burning flame. Care was therefore exercised to make our observations on lamps in which the gas production showed a normal amount of pressure.

### B. Air Movement.

When there was no movement of air, excepting such as resulted from the convection currents produced by the lamps and by the introduction of the gas mixture, the extinction points were: for the acetylene lamps 23 to 25% carbon dioxide; for the oil lamps, 12-14% carbon dioxide. With the production of a gentle movement of the air by fanning against the side of the cabinet, the extinction points were apparently affected, being lowered in the case of acetylene lamps to from 22 to 17% carbon dioxide; in the case of oil-lamps to from 12-10% carbon dioxide.

With the production of a strong movement of the air, by direct fanning of the lamps, in two experiments, the acetylene lamps were extinguished when the air contained 9.4% and 9.9% carbon dioxide, respectively, while the oil-lamps were extinguished by the same breeze in atmospheric air.

The movement of the lamps worn on the heads of the miners would produce, in quiet air, the effects that result from a breeze with the lamps stationary. We may conclude, therefore, that in the case of the acetylene lamp the extinction point is lower than 25%, in proportion to the rapidity of motion; and with the oil-lamps, correspondingly lower than 14%.

### C. Oxygen Proportioned.

In the experiments mentioned, the oxygen was reduced only moderately by the admixture with air of the carbon dioxide in the form of pure gas. Undoubtedly, such reduction tends to lower the carbon dioxide extinction point. The effect, however, is only moderate, since the oxygen in all experiments was distinctly more than would sustain the flame if the specific effect of the carbon dioxide were neglected.

With the admixture of carbon dioxide in the form of black-damp, however, the question of the oxygen proportion becomes an important factor for consideration. In these preliminary investigations, we were not able to study the effect of black-damp, since with the use of so large a cabinet, the quantity of nitrogen required would be much greater than it was practical to obtain.

### D. Humidity.

In a number of experiments, water vapour was introduced into the gas mixture by blowing over the surface of water within the cabinet. In this way, the humidity was raised from approximately 35 to 65—80. Any effect upon flame extinction by carbon dioxide that may have resulted was within the limits of variation from the other factors considered. The conclusion is therefore reached that humidity affects the proportion of carbon dioxide, producing flame extinction only within relatively narrow limits.

Comparing now the effects of carbon dioxide increase on flame extinction and respiration, we note that the first effect is a physiological one, when the proportion reaches 3 to 4%, there being an increase in the respiratory rate that is entirely adequate to warn persons of the atmospheric conditions. Flame extinction occurs with oil at 13% and acetylene at 26% in still atmosphere, but at 10% and 17% with moderate motion. With either lamp the extinction point is too high above the physiological warning point to make it of value to the miner. The conditions will have been recognized before the extinction point is reached. Should, however, the physiological warning be unheeded, flame extinction will occur, first with the oil then with the acetylene flame, with either in ample time to prevent loss of life. The margin of safety though greater with the oil-lamp is adequate with the acetylene.

In considering the influence of oxygen decreases on flame extinction, I shall make use of observations made by Mr. Chester S. Heath, under experimental conditions different from those I have described.

He finds with the oil-flame that with moderate motion extinction occurs when the oxygen is reduced to 16.5%; in still air to 16.2%. With acetylene with moderate motion, extinction occurred at 12.6% and was dimmed in still air of the same composition, being extinguished in still air 11.5%. It thus appears that the oil-flame is extinguished with considerably less reduction of oxygen than the acetylene, but that the latter is extinguished before the reduction is fatal to man which it will be recalled was at 7%. Moreover, in actual mining conditions, where the lamp is worn on the head, there will be sufficient motion; so that extinction will occur at a point somewhere above that observed with the experimental condition.

Finally it is not to be forgotten that the condition of extreme oxygen reduction without carbon dioxide increase which was preesnt in the experimental observations is not encountered in actual mine air. The specific action of carbon dioxide admixture that will be found in such conditions will add to its effect to the oxygen decrease and bring about acetylene flame extinction that is still further removed from unphysiological atmospheric conditions and hence afford an increased margin of safety.

The miner, then, may conclude that a given admixture of black-damp and air in the absence of other foreign gases will support life: (1) If it does not extinguish flame. (2) If it does not produce markedly increased respiration. Any such atmosphere that does not give these warnings is respirable, though it does not necessarily have a composition desirable for continuous respiration. It does, however, give warning either physiological or by the flame, acetylene as well as oil, that is adequate to prevent loss of life.

---

# EIGHT-HOUR SHIFT IN MICHIGAN

For some time the managers of Michigan copper mines have been planning to shorten the working hours for employees. On November 28, they announced that the change would take place on December 1. The men are now working, in accordance with this announcement, eight hours "face to face."

In the "Mining Gazette" the following explanation of the new arrangement was published on November 29:

The eight-hour day for underground employees and stamp mill men goes into effect next Monday, December 1.

An opportunity is offered miners to add to their monthly pay to the extent of nearly 10 per cent. of their present compensation.

Early in the history of the strike at the mines the mine managers stated in their report to the Governor and to the Federal Department of Labor that the inauguration of the eight-hour day for underground men had long been in contemplation and would be made effective on or before January 1. The statement was repeated in the report made by the mine managers to the committee appointed by the Copper Country Commercial Club.

Making the announcement at this time and making it effective immediately, but follows out the expectations of the mine managers early in the year.

The eight-hour shift will be in operation in all operating mines and mills at once, with the exception of the Calumet conglomerate mine, where practically all of the mining is contract work. There is some doubt as to the application of the new method in operations on the conglomerate lode and it will be tried out in one shaft in that mine of the Calumet & Hecla Company for a period of a week to determine the best way to apply the shorter shift to the working hours of the miners there.

### Eight Hours of Actual Work.

At the different mines and mills there are different conditions and different problems to work out in making the change. In general the rule will mean that eight hours of actual work will be required. Only two shifts in every 24 will be utilized. Most of the men on the day shift will start from surface at 6.45 and be back on surface at 3.45, with 30 minutes for noon meal. At some of the mines the night shift will start at 8 o'clock and at others at 8.30.

While nothing was said about the shop forces, office men and surface forces generally, in the promise of the shorter working day, with the change to the eight-hour day for underground men, the announcement also is made that the working day for such other forces will hereafter be shortened to nine hours. In the shops and on surface this change will be very generally appreciated by the men. It is explained that all these forces work day shift all the time and do not have to alternate on the night work as do the underground forces.

### Opportunity for More Pay.

The opportunity for increased pay comes to all the miners who wish to work the short shift Saturday night. For years it has been the custom in the mines of this district to pay the miners for 26 working shifts per month, when as a matter of fact they only worked 24 shifts. Ordinarily the underground men worked two weeks day shift. When on the night shift they only put in five shifts and were paid for six. This made a difference of nearly 20 per cent. additional in their pay for the night shift week. Coming twice a month it made a difference of close to 10 per cent. per month in the monthly wages. Under the new arrangement the pay will be at the top rate per day and all men who wish to put in the additional short shift, making it six shifts on the night shift week as well as on the day shift will be given the additional wages. No men will be required to work this short shift, but it is believed that most of the men will be glad of the chance to secure the added compensation because of the shortening of the regular shift to eight hours.

### Copper Range's Statement.

While the announcement of the change is to be made by the mining captains to their men to-day, the Copper Range Consolidated, through F. W. Denton, general manager, issued a circular which is applicable only to the conditions at the Copper Range mines. This circular reads as follows:

"Last winter when there was introduced in the Legislature a bill which proposed to require by law an eight-hour working day for underground employees, we, in a small way, began discussing the introduction of such a schedule, irrespective of whether the bill became a law or not. Although our consideration was by no means thorough, it became apparent at once that there was a difference of opinion on the part of the employees who would be affected as to the desirability of any change in underground hours. In general, our impression was, and is to-day, that our miners prefer the present hours because of the Saturday half-holiday and the absence of work Saturday night, but that trammers, pickers, and labourers are in favour of a change to a straight eight-hour schedule.

"It seems unreasonable and not altogether fair to have one set of hours for one class of underground labourers and another set for another class. It would appear to be better, all things considered, to have the same hours for all. However, whatever the difference of opinion there may be on this score, and there is plenty of room for it, public pressure has been sufficiently great to cause the introduction of an eight-hour schedule in the large mining districts of the country, and we believe that the time has come when we shall have to respond to the same demand, and we have promised Governor Ferris that we would arrange such a schedule by the first of January. We contemplate not waiting that long, but if no reason develops for delay, we propose to inaugurate the new schedule on December 1.

### New Schedule Explained.

"In agreeing to adopt an eight-hour schedule we defined that to mean eight hours of work. There has been some discussion in regard to the allowance of time for going to and from work, and the custom in this regard differs slightly in the different districts, as far as I have been able to learn. We propose offering a schedule which calls for an interval of eight and three-quarters hours from the time of starting from the surface to the time of starting up. Of this interval one-half hour is to be taken for lunch and fifteen minutes is taken as representing the time for going down to work.

"Our impression is that the time for starting the day shift that will meet with the most approval is 6.45 a.m., and if the first cage starts down at that time, the first trip up would start at 3.30 p.m., with 12.00 to 12.30 allowed for dinner. For the night shift, it is proposed to start down at 8.00 p.m., which would call for the first trip starting up at 4.45 a.m. It was thought that these hours for the night shift would bring men home at a suitable hour. It may be that starting at 8.15 or 8.30 would be better.

"For Saturdays it is proposed to have the same day shift as for every other day in the week, but the night shift is to start down as soon as the day shift is up, and to start to come up from the mine at 11.00 p.m., making the shift an hour or more shorter than other night shifts and putting everybody up before midnight.

"As to miners working Saturday night; this we believe will be objected to by a great many because of the aversion to working Saturday nights and also because it has been customary in this district for so many years for miners not to work Saturday nights. The company would like to have the miners work Saturday nights the same as other underground labour, both because it would give better operating results and because the present schedule is objected to by the trammers and labourers on the grounds that I have mentioned at the outset, viz.: that there should be no difference in working hours for the different classes of labour. Saturday night shift will also have the advantage of enabling a miner to earn in a month two shifts extra pay.

### Pay $3 Per Shift.

"We propose to make the miners' scale of wages on this new basis of hours $3.00 for each shift worked, and a man would be paid only for the shifts that he works. This rate is the same as is now being paid for actual time worked. On this basis, if a man worked his two Saturday nights in the month and thereby got credit for 26 shifts, he would receive, if being paid on a company account rate, $78.00. In fact, the time books will show credit only for the number of times that a man is in the mine, and the old method of giving credit for Saturday nights will be abandoned. If a miner did not work his two Saturday nights he would receive $72.00. The company proposes to be lenient and liberal in excusing men from work Saturday afternoons and nights during the summer months when there is a general desire to be excused for holiday purposes. Men so excused, however, would sacrifice pay for the shifts thus lost. We believe, however, that a sufficiently large majority of the miners would prefer to work Saturday nights to permit of profitable operations. With the constantly increasing burden which is being placed upon us by public demands, which expresses itself in compensation acts, an ever increasing load of taxes, and charges of all sorts, it is absolutely necessary for us to do everything we possibly can to increase our earnings if we would maintain our existence and keep up a profitable enterprise. It is believed that you underground employees will recognize the situation and meet this proposed schedule in a broad-minded spirit and with consideration of your fellow employees, even though in different occupations, and of the company as well as of yourselves. Although not included in our promise to the Governor, we have decided also to inaugurate an eight-hour schedule at our stamp mills. This will involve a very considerable increase in expenditure, but it did not seem fair to shorten hours of some employees and not of others, even though no demands were made for such shortening. For the shops and all other surface work, quitting time will be 5 o'clock instead of 6 o'clock, with one hour for dinner as heretofore."

## GOLD PRODUCTION OF NOVA SCOOTIA.

Gold was discovered in Nova Scotia in 1860, and mining operations then commenced. Two years after the discovery, gold valued at nearly $142,000 was recovered from the quartz veins, and since that time the annual production has, with the exception of three years, fluctuated between $200,000 and $628,000, nearly attaining the latter figure in 1902.

The total production of gold in Nova Scotia from 1862 to 1912 inclusive, was 936,499 ounces recovered from 2,117,639 tons of ore mined, this production having a value (at nearly $19.00 per ounce) of $17,793,481, equalling an average recovery of $8.40 per ton of ore crushed.

# A DEFENCE OF THE FLAME SAFETY MINE LAMP*

By E. A. Hailwood, M.I.M.E.,

(Manager to Ackroyd & Best, Ltd., Pittsburg and England).

Prior to the days of Sir Humphrey Davy, it was no doubt a natural thing to fix upon the naked flame then in common use as the probable cause of coal mine explosions.

The Davy lamp was then invented, and was thought to be a solution of the difficulties, but, unfortunately, it was afterwards shown that under certain conditions, gas when ignited inside the lamp could be blown through the gauze which surrounded the flame and an explosion created in the mine.

The Davy lamp was, however, remodelled, and the present type of bonnetted marsaut safety lamp was evolved.

It is, however, somewhat unfortunate that the tricks which could be played on the old Davy lamp have so fascinated professors and many so-called Government experts, that they have not been able to realize that the same tricks cannot be played upon the modern safety lamp. These people still devote considerable time in writing about and showing experiments on the safety lamps, and fail to draw attention to the fact that their experiments and their writings really refer to the Davy lamp and that they cannot be performed on the modern lamp.

The natural result is that an unnecessary nervousness is created in the minds of miners and coal operators who have not the time or means at their disposal of learning that these tests do not apply to the modern flame lamp, and whilst the writer agrees that experiments on the Davy lamp are instructive, he contends that it is unfair to the flame lamp manufacturers that more emphasis is not placed upon the fact that the demonstrations refer only to obsolete lamps.

One unfortunate result of these records of experiments is that at the inquiries following an explosion in a mine, many practical men or many so-called experts, get up and calmly state that in their opinion the explosion was caused by a "safety lamp."

From the writer's experience in connection with a vast number of tests on safety lamps, and from a perusal of evidence upon which these statements of experts have been based, the writer is firmly convinced that the persons giving evidence have known little or nothing about the great margin of safety possessed by modern flame safety lamps, or that the person in question has been misled by published tests on the old Davy lamp.

One of the baneful results of verdicts based on such evidence, is that instead of pursuing the inquiry further as should have been done, the actual cause of the disaster may have been overlooked, and perhaps an unnecessary change made in lamps, and yet the real means for creating a fresh disaster still retained in the mine.

Persons who have witnessed the intense heat which is necessary to cause flame to pass from the inside of a well constructed bonnetted lamp to the outside, and which can only be attained after reaching a velocity of over 3,500 ft. per minute of an explosive mixture of from 8 to 9 per cent., will realize that it is a mistake to talk of creating an explosion in a mine by the overheating of a well designed lamp. Many an explosion has been wrongly put down to this cause.

The majority of lamps now in use are fitted with bonnets or shields, and the writer has had lamps of this description in explosive mixtures and the gas inside the gauze burning for hours and the gauze red hot, and yet an outside explosion has not occurred. The writer submits that it will be a very rare occurrence to find in a mine a velocity of 3,500 ft. per minute of an explosive mixture of gas, and at the same time for the lamp to be placed in such a position as to receive the full force of this velocity, and also to have a miner stand by oblivious of the remarkable occurrence which was happening.

Such a combination of circumstances is so remote as to be unlikely to happen and may be dismissed as out of the question.

If the velocity be present, but if the enormous requisite volume of gas be absent, there is no danger. On the other hand, if gas be present, but if the requisite enormous velocity is missing it would be unlikely for an explosion to happen from the lamp. Again, it would be unlikely that the miner would remain in such gas, so that danger from "still" gas is also unlikely to occur, as the light given out from a dangerous mixture of gas burning inside a safety lamp would be so small that the miner could not under the circumstances continue working.

In another series of tests, the gas flame was kept burning in a lamp surrounded by an explosive mixture of gas. At intervals coal dust was scattered inside the lamp and also over the outside of the gauze. After the lamp had been constantly shaken about in the gas, and then coal dust allowed to remain on the crown of the gauze for some hours, the gas flame burned immediately underneath the top of the gauze and had ample opportunity to heat up and coke the coal dust.

The lamp had a single gauze only, and the test was carried out at our Pittsburg factory with natural gas, and yet the flame did not communicate with the surrounding gas, notwithstanding the fact that the gauze was often red hot. If, therefore, single gauzes will not under such conditions pass flame, it is evident that double gauzes will add an enormous extra amount of safety to a lamp.

In other tests the writer has utilized a lamp having the glass so slack that on shaking the lamp, the glass has freely rattled. The glass was split from top to bottom, and a crevice cut right across the top and also at the bottom of the split, the crevice being more than 1/32 inches wide.

This lamp was placed in a very explosive mixture of compressed gas and kept there for over one half hour with the gas blazing inside the lamp. This failed to cause an outside explosion. In the test, the gas mixture was compressed down to two-thirds its original volume, and the gas, therefore, was in a most explosive condition.

In other tests, a ready lit bonnetted lamp has been passed into an explosive mixture of gas, a hole was pierced in the top of the gauze quite ¼-inch diameter,

*A paper read at American Mining Congress, Philadelphia, Pa. (Oct. 17th to 25th, 1913).

and yet the flame failed to pass through the hole and ignite the surrounding gas. No doubt the reason for this was that the product of combustion from the lamp flame covers the hole in the top of the gauze with a barrier of incombustible gas, through which the flame could not pass to the outside gassy atmosphere. To users of flame safety lamps, this test will no doubt be interesting as it is the upper part of the gauze which is subject to the most wear and tear, and fortunately the test demonstrated that it is the top part of the gauze which is usually protected by the barrier of incombustible gas. The writer admits that if the lamp in question be allowed to be extinguished and the products of combustion allowed to escape and the lamp filled with an explosive mixture of gas, and an internal friction igniter operated so as to cause a flame to form in the lamp and ignite the gas inside the lamp, it is possible that this flame would pass through the hole in the gauze to the outside of the lamp, but this of course only refers to this particular type of lamp, and would not refer to lamps of the type which must be completely enclosed when being relit.

Some authorities have made much ado about the possibilities of the heat from the flame of the miners' lamp cracking the glass. As regards this point, it is only a question of a few dollars, as fine clear glasses can now be supplied of such quality that they may be heated up to about 340 degrees F. and sprinkled with water from a watering can, and yet the glass fails to crack.

Some people have been afraid that a fall of roof on a safety lamp may cause an explosion and ignite the gas; but the tests so far carried out by the writer seemed to prove that before the lamp is dangerously damaged the flame of the lamp is extinguished by the "crushing down force."

In one series of tests, a lamp was placed upon an iron piston, and the piston moved rapidly upwards into a cylinder containing gas, so that the top of the gauze came into violent contact with the crown of the cylinder and the gauze was crushed down. No outside explosion followed, the light in the lamp apparently being extinguished by the "crushing force" or by the concussion of the atmosphere. In the coal mine it is very unlikely that this condition of affairs would be so severe as it was in the test in question. In the event of the gas preceding the fall of the roof, the gas would most likely extinguish the lamp flame before the crush came upon the lamp. If the stone got down ahead of the gas, and crushed the lamp, the stone would crush out the light before the gas reached it. In any case there would have to be an immense volume of gas released to reach a lamp crushed on the floor.

In another test, an unbonnetted ready lit lamp was placed in a big jet of explosive gas, and the gauze smashed by a violent blow from a mallet. This also failed to ignite the gas, the blow invariably extinguishing the lamp flame.

The writer, therefore, contends that when using a well designed bonnetted lamp that fear from this "cause" may also be discounted. Whilst the writer does not, for one moment, advocate the relaxation of any possible effort to insure the supply and issue to miners of nothing but the best and safest safety lamp, he is of opinion that the tests referred to herein show that the miners' safety lamp is capable of a safety margin much greater than is generally supposed.

We now come to the consideration of the question of the detection of "gas," and the checking of the state of the atmosphere of the mine.

At a time when the prevailing craze is for more and more complication and intricacy in all appertaining to mining, the writer supposes he will be accused of sacrilege by calling a halt and asking for a hearing in defence of such a simple device for gas detecting as the flame safety lamp. It is somewhat unfortunate that the device is so simple that after, say, only a few minutes' or hours' practice in a simple gas cap observation machine, that practically any mine man can read the percentage of inflammable gas in the atmosphere. It would, no doubt, appeal more to the present generation if the lamp could be fitted with a series of levers, switches, indicating dials, and necessitate reference to elaborate tables of square root, cube root, etc. It would then, no doubt, be looked upon as a marvellously clever device and more attention would be devoted at colleges and mining schools to the elaboration of its mysterious workings.

Now, putting sarcasm on one side, the writer submits that the miners' flame safety lamp is the most simple and most accurate and most reliable device which could possibly be conceived for the practicable ascertainment of percentages of gas in the atmosphere of a coal mine.

In recent years great strides have been made in Great Britain in the organization of evening classes in all the coal mining districts. A very large proportion of both adult and young miners have attended these classes. From conversations the writer has had with many of the teachers and with men in the mines in various parts of the country and from observation of the behaviour of the mining men who visited the works with which the writer is connected, he is of opinion that this course of education will ultimately prove to be one of the biggest factors of safety introduced in recent times into the coal mines.

Up to a few years ago it was a comparatively rare thing to find miners who knew how to test for and read "gas caps." The consequence was that men have often ignorantly continued working in places so charged with gas as to be on or near the border line of explosibility, no doubt things have been done in such atmosphere which would not have been done had the miner known of its dangerous state.

It has now been established that a severe explosion can be obtained from quite a small percentage of gas if coal dust be present. The present tendency in coal mining practice is to employ vast numbers of men in each mine on each shift; to employ more electric machinery, such as coal cutters, locomotives, motors, and to push the coal face forward more rapidly and risk falls of large quantities of rock roof with the possible bringing down of gas and sparks from the grinding rock. There are also the possibilities of explosions from pipes, cigarettes, and matches. It is now, therefore, more necessary than ever to place in the hands of each miner the means whereby he may ascertain the state of the atmosphere in which he is working.

The best course to pursue will, no doubt, be to educate the miners more and more into the best methods of using the flame safety lamp and also as to how best to test for gas. It has been proposed by some parties to place a flame safety lamp at the entrance to each working place, and give it into the charge of the "gangman." This lamp will, however, generally be neglected. As the principal object of the "gangman" is to get as much coal as possible, he will, no doubt, fail to take a lamp into his working place at sufficiently frequent intervals. If each worker be provided with a flame safety lamp the chances of early detection of the presence of gas are more certain.

Some advocate the clearing of the gas out of the mine by increased ventilation. This is all right so far as it goes; but it is a difficult matter to sweep out each and every part of an extensive mine. An explosion started in one small place, may, by the aid of coal dust, carry through the mine. From time to time we read of an explosion happening in so-called model mines, where gas has either never been known, or, at any rate, has not been observed for many years. This emphasizes the need for better education of miners and the inclusion in their outfit of reliable gas detectors.

The next question is that of illumination. Many writers on this subject appear to forget that the coal miner does not go down the mine for the purpose of reading the daily newspaper. He goes down to hew coal from a generally well defined coal face and with constant practice he gets so that he could almost do the work blindfolded. Generally speaking, several men work sufficiently near each other at the face and so get a large general lighting effect from the several lamps. A miner's light may on the surface seem to be a miserable one, yet in the darkness of the coal mine this same light is quite good and sufficient for the work. Certain parties blame the flame of the safety lamp as being the cause of certain diseases of the eyes of miners, but it would now appear that there are miners who have had the benefit of the increased light from acetylene lamps and who now complain that this increased light hurts their eyes. This would seem to raise the question as to what is the proportion of miners whose eyes are naturally weak, and who would suffer pain whether the light be good or bad. The elimination of these cases will possibly show that the remainder will be quite satisfied with the existing miners' flame lamp; if not, the illumination of the flame safety lamp can now quite easily and simply be increased to 1 1/3 candle power.

## FIRE PREVENTION IN THE MINES.

Disastrous and destructive mine fires have had their origin in a majority of cases in causes of a trivial nature. Where proper safety regulations are enforced and proper equipment is at hand for fire fighting, such fires might be quickly extinguished if not prevented altogether.

The agencies for fire prevention and fire fighting should, however, be clearly separated, and the first measure necessary in connection with the former is education. Teach the miner and his children the danger of carelessness in using inflammables; point out the perils which lurk in the casual use of non-safety matches, the throwing away of cigarette butts, the careless handling of lighted candle-stumps and lamp-wicks, and the preventible fire might soon become a memory of the past. The second measure in connection with fire prevention embraces the matter of fire-proof construction, and in this connection the stable or the underground engine room should first demand attention. It is economically possible to construct stables which will be to a very large extent fire-proof, and the same thing applies to the engine room. Even where it is necessary to lay wooden floors in the stable stalls, these can be so imbedded in concrete as to be rendered practically fire-proof.

In the mine itself fire-proof materials should be used as much as possible. The shaft lining should undoubtedly be of fire-proof construction, and the use of concrete in shafts and main haulage ways opens up a large field for experimental work. Data can be adduced to show that a permanent fire-proof shaft lining is, after a period of fifteen years, cheaper than timber lining. In connection with mine timbers, also, the use of concrete and steel offers advantages over the wood, although concrete has certain disadvantages which sometimes render it unsuitable. The use of steel for this purpose, however, is gradually increasing.

Fire-proof construction in mines will undoubtedly grow rapidly in favour. The increasing strictness of workmen's compensation laws, the awakening of public sentiment, and lastly the increasing relative cost of wooden timbers as compared with steel and concrete, all point to the fact that fire prevention will, in the future, receive more attention than it has in the past.

## PLACER-GOLD FIELD IN SOUTHERN YUKON.

On November 1 the Daily Province, Vancouver, B.C., printed the following account of a new placer-gold field reported to have been found in southern Yukon:

Word of a new placer-gold strike at the foot of the Golden Horn mountain within 11 miles of Whitehorse has been brought down from the Yukon by recent arrivals in the city. It is said that gold in paying quantities has been found on two creeks and that on Discovery claim some of the miners have been panning $18 per day per man.

News of the strike has been kept quiet by those interested in the new venture, in order that the district could be well staked before those on the "outside" could hear of the new diggings. Whitehorse business men and miners living in the town are the principal holders of claims in the new camp which is declared to show promise of proving rich. The discovery was made on October 7.

The district is easily accessible, being about two miles from Wigan on the line of the White Pass & Yukon route. The Town of Whitehorse has received a big impetus by reason of the new strike.

There has been no concerted rush to the new Wigan diggings on account of the lateness of the season, and the fact that the discovery was kept dark, and no big excitement outside Whitehorse is being manifested, according to advices from the north.

Most of the pay is said to have been found near the surface, none of the shafts having been sunk down to bed rock so far.

Mr. Isaac Taylor, of the merchandise firm of Taylor, Drury & Taylor, of Whitehorse, informed the Province when asked for confirmation of the reports as to the new placer strike, that from the advices he had received from his business associates the prospects in the new camp were most encouraging. He said he had been told that even if gold was not found in large quantities the conditions were particularly favourable for hydraulic mining as the claims could be easily worked and there was sufficient water available in the adjoining creeks for ten sets of sluice boxes. The surface indications were promising and he understood that the pay found so far averaged from $8 to $12 a day per man.

In view of the lateness of the season Mr. Taylor expressed the opinion that little development would be carried on until next spring.

# THF METAL COBALT AND ITS ALLOYS*

By H. T. Kalmus.

The mining companies receive very little return for the cobalt content of the silver ores of the Cobalt district. There have been about 175,000 tons of silver bearing ore shipped from the Cobalt district since 1904, carrying approximately 7,000 tons of cobalt, which at a reasonable market value for metallic cobalt, should have been worth in the neighbourhood of $10,000,000. For this the mine owners received only $566,000. Much of this cobalt is lying as residues, etc., at the smelters, for practically the only market which it finds is a limited one for the use as blue colouring substance. For this purpose the smelters ship black cobalt oxide, which consumes about one-third of the present output of the camp, leaving to be cared for, the remaining two-thirds and the surplus from other years. Thus there is a potential value of many millions of dollars in the cobalt metal of Ontario which is not being realized.

Waste products running high in cobalt may be obtained in a variety of forms from the smelters, but inasmuch as the process for the production of fairly pure cobalt oxide has been very completely worked out and is being practised on a large scale by the Canadian Copper Company,† Copper Cliff, Ont., the Deloro Mining and Reduction Company, Deloro, Ont., the Coniagas Reduction Company, Thorold, Ont., and the Canada Refining and Smelting Company, Ltd.,‡ Orillia, Ont., it seemed advisable to use this oxide as an initial substance.

### Purification of Cobalt Oxide.

In much of the work to follow it is important that the influence of the metal cobalt be sharply differentiated from that of iron and nickel which are the principal metallic impurities of the original oxide. Also before undertaking the investigation of a large series of alloys of cobalt, it is important that the properties of the pure metal itself be established. For these reasons a purification of a certain amount of the oxide was undertaken. The method employed was in principle that in standard practice in the Canadian cobalt oxide plants, but the author wishes to express his indebtedness to Prof. S. F. Kirkpatrick, of the School of Mining, Kingston, for many important details.

The iron was removed from a solution of the oxide in hydrochloric acid by precipitation with marble, and a separation of the nickel was brought about by use of the differential precipitation of the hydrates of nickel and cobalt by means of a bleach soluton, and finally the sulphur was removed with sodium carbonate and hydrochloric acid.

The original oxide analyzed:

| | Per cent. |
|---|---|
| Cobalt | 70.36 |
| Nickel | 1.12 |
| Iron | 0.82 |
| Sulphur | 0.45 |

The oxide purified by this method (June, 1912), analyzed:

| | Per cent. |
|---|---|
| Cobalt | 71.99 |
| Nickel | 0.04 |
| Iron | 0.11 |
| Sulphur | 0.02 |

### Preparation of Metallic Cobalt by Direct Reduction of Oxide.

From the fairly pure cobalt oxide ($Co_2O_3$) there are several possible methods of obtaining metallic cobalt in a reasonably pure form.

(1) By reduction with hydrogen gas.
(2) By reduction with carbon monoxide gas.
(3) By reduction with aluminum.
(4) By reduction with carbon.

With the present commercial possibilities for the production of water gas, of producer gas, and, indeed, of pure hydrogen as practised by the General Electric Co., of Schenectady, N.Y., for the reduction of metallic oxides, any of these four methods might ultimately be used on a large commercial scale. Hence, an investigation of the chemical equilibria involved in these reactions has been and is being made.

### Reduction of Cobalt Oxide by Hydrogen Gas.

One set of experiments has been completed and another set is under way to determine the rate of the reaction $Co_2O_3 + 3H_2 = 2CO + 3H_2O$, in the presence of an excess of hydrogen, and at various temperatures from 500° C. to 1,100° C.

**Electric Furnace or Reaction Chamber.**—The furnace employed had a horizontal tube heating chamber 2½ inches in diameter by 15 inches in length. It operated at 25 volts and absorbed up to 12 KW. The resistor was a series of concentric carbon rings which could be pressed more or less tightly together by means of suitable adjusting screws. By this means the temperature could be controlled at will to be anything from 500° C. to 1,500° C.

**Charge and Run.**—Alundum boats were charged with a shallow layer of cobalt oxide ($Co_2O_3$), both boat and oxide having been dried to constant weight. This charge was kept within the heating chamber for various lengths of time at various temperatures in an excess of hydrogen. At the end of a definite measured time the boats were cooled and reweighed to ascertain the amount of reduction.

All the observations were made in duplicate with two boats in parallel, and concordant results were for the most part obtained. A series of observations was made, of about 20 weighings each, at the following temperatures, 585° C., 724° C., 825° C., 964° C., 1,065° C.

**Preliminary Conclusions.**—The reduction at the lower temperatures takes place much more slowly than at the higher temperatures, and at each temperature, after a short time, the rate of reduction becomes so slow that the reaction could not economically be carried further. For example, at 585° C. at the end of 15 minutes the reduction is 28 per cent.§ complete, whereas at the end of an hour it has only increased to 30 per cent.§ complete. As against this, at the higher temperature 1,065° C. at the end of 7 minutes the oxide is 89 per cent.§ reduced, and shows less than 1 per cent. further reduction during the next half hour.

Obviously from such complete data it will be possible to determine, for any given type of furnace and with a definite cost of power, what would be the most

*Extract from preliminary report of investigations at the Research Laboratory of Applied Electro-Chemistry and Metallurgy, School of Mining, Queen's University, Kingston, Ont., for the Mines Branch, Department of Mines, Canada.

†Cobalt plant recently closed down.

‡Main buildings destroyed by fire, January, 1913.

§These percentages are based upon cobalt oxide analyzing 71.99 per cent. Co which was used, and which is somewhat higher in Co than $Co_2O_3$.

economical temperature of operation for this reduction, balancing the cost of maintaining the higher temperatures against the increased rate of the reaction at those higher temperatures.

### Reduction of Cobalt Oxide by Carbon Monoxide Gas.

In a manner similar to that of the reduction of cobalt oxide ($Co_2O_3$) by hydrogen, the reduction with carbon monoxide (CO) gas at various temperatures was studied.

**Electric Furnace or Reaction Chamber.**—This furnace was identically that used for the reduction of cobalt oxide ($Co_2O_3$) by hydrogen and has been described above.

**Charge and Temperature Measurements.**—Alundum boats were charged with a shallow layer of cobalt oxide, and placed within the reaction chamber, and temperature measurements were made with a platinum, platinum-rhodium thermo-element, both just as described above under hydrogen reduction.

**Removal of Boats for Weighing.**—After allowing the reaction $Co_2O_3 + 3Co = 2Co + 3CO_2$ to proceed for a measured length of time, boats run in parallel were removed, cooled, and weighed to determine the amount of reduction. In this case, apparently contrary to that of the hydrogen reduction, there was a considerable amount of reoxidation during cooling, so that it was necessary to cool the boats in an atmosphere of carbon monoxide (CO). A special container was devised to allow the charges to be removed from the furnace and cooled, remaining throughout in a carbon monoxide atmosphere.

**Preliminary Conclusions.**—The runs with carbon monoxide are still in progress, but a sufficient number have been made to denote that the curves showing the rate of reaction at different temperatures are similar to those for hydrogen, but that carbon monoxide (CO) is a much more vigorous reducing agent. We find, for instance, that at the low temperature 585° C., reduction is nearly 90 per cent. complete at the end of 15 minutes with CO, whereas at the same temperature with $H_2$ at the end of 15 minutes the reduction was less than 30 per cent. complete.

### Reduction of Cobalt Oxide by Carbon.

The theoretical amount of powdered carbon, charcoal, or coke to reduce a charge of approximately 5 pounds of cobalt oxide was intimately mixed with it, and heated in an oil crucible furnace or in an electric crucible furnace.

In this way it was found possible to obtain a yield of metallic cobalt in the neighbourhood of 95 per cent., and in many cases between 99 per cent. and 100 per cent. At a temperature of 1,200° C., a run of about one hour serves to bring about complete reduction, while at a temperature of 900° C., 2½ hours are not sufficient.

Analysis shows that the metal obtained by carbon reduction is fairly free from carbon, running in the neighbourhood of a few tenths of one per cent. Moreover, by adding a small quantity of lime to these melts at the temperature of the electric furnace, the carbon may be almost completely removed. Some of the analyses for carbon before adding lime are given with the yields.

This method of preparation of metallic cobalt by direct reduction with carbon could be practised industrially at very low cost. We are able, in electric furnaces not especially designed for this work, to reduce enough oxide to make 15 pounds of metal in about 1 hour, absorbing 20 KW. Thus on a commercial basis the power charge for this reduction would be small.

### Properties of Metal Cobalt.

The properties of the metal cobalt and of its alloys have been and are being studied under the following headings:

Melting points;
Casting properties;
Turning, rolling, and forging properties;
Hardness;
Tensile strength;
Compressive strength;
Corrosion in acids and atmosphere;
Structure as determined by micro-photographs;
Magnetic properties;
Thermo-electric power;
Electro-motive force as electrode of voltaic cell;
Plating properties.

**Melting Point of Metallic Cobalt.**—A long series of melting point determinations was made in a General Electric Co. Arsem. Electric Vacuum Furnace, using pure alumina crucibles and a charge of about 50 grammes of metallic cobalt. The mean of a set of 6 measurements, the average deviation of the single observations from the mean being 1.8°, gives the melting point of pure cobalt to be 1,497° C.

**Casting Properties of Metallic Cobalt.**—Cobalt when prepared in a fairly pure state by reduction from the oxide with hydrogen, with carbon monoxide, or with carbon, was poured to make various sizes and shapes of castings, both in sand moulds and in iron moulds. Cobalt, similar to iron, shows a marked tendency to occlude gases in casting. We obtain perfectly sound castings by degasifying with manganese and by soaking, that is by holding the melt for about one hour at a temperature not very far above its melting point.

**Turning, Rolling, and Forging Properties of the Metal Cobalt.**—Castings of cobalt in the neighbourhood of 99.5 per cent. pure may be readily turned with the ordinary lathe tools. It is a beautiful metal resembling nickel, but tougher and more lustrous. Observations of the rolling and forging properties are being made.

**Hardness of the Metal Cobalt. Testing Machine.**—The hardness of this metal and of its alloys was tested on a Standard Olsen Hardness Testing Machine of 10,000 pounds capacity (Tinius Olsen and Co., Philadelphia, Pa.).

About 25 Brinell hardness measurements have been made with fairly pure cobalt, which vary among themselves depending upon the method of casting and upon the heat treatment of the sample. Some attempt is being made to differentiate the hardness of cobalt cast in sand moulds, in iron moulds, and to give some figures showing the effect of annealing and quenching. These data will be given in the subsequent complete publication, but for the present we may give as the mean of a number of determinations the following values:

| | |
|---|---|
| Brinell hardness, metallic cobalt, chilled from melting point | 90.8 |
| Brinell hardness, metallic cobalt, annealed from 250° C. | 77.3 |

These figures, while not final, serve to show that cast cobalt has about the hardness of wrought iron.

(To be Continued.)

# PERSONAL AND GENERAL

Mr. Phil H. Moore, lately mining engineer and manager for the mining, crushing and cement department, Canadian Allis-Chalmers, Ltd., has accepted the position of general manager of Rock & Power Machinery, Limited, head office Toronto.

Mr. J. B. Tyrrell, who has been for several weeks in England, expects to sail from Liverpool for Canada on December 13th.

Mr. H. P. Watson attended the Toronto branch meeting of the Canadian Mining Institute, November 29th, and outlined what had been done by the Mine Owners' Association in reference to the proposed Workmen's Compensation Act.

Mr. C. L. Randolph has opened an office at 150 West 57th Street, New York.

Mr. R. E. Hore has returned to Toronto after visiting mines at Cobalt and Porcupine.

Mr. C. A. Foster has sailed from England for Canada.

A meeting of the Council of the Canadian Mining Institute was held in Montreal Saturday, December 13.

A meeting of the Executive Committee of the International Geological Congress was held in Montreal, Saturday, December 13.

Mr. W. E. H. Carter is in Toronto.

Mr. A. A. Hassan left New York on December 8 to examine placer gold deposits in Arizona. His address will be Kingman, Arizona.

The Rock & Power Machinery Co. has opened offices in the Royal Bank building, Toronto. Branch offices will be at Halifax, Montreal, Sudbury, Cobalt, Winnipeg, Calgary, and Vancouver.

On Friday evening, December 5, 500 engineers attended the twenty-fifth annual dinner of the University of Toronto Engineering Society, held in the big drafting room of the 'School.' Graduates from all parts of the country gathered to do honour to Dr. John Galbraith, Dean of the Faculty of Applied Science of the University of Toronto, and to celebrate the fiftieth anniversary of his entrance at the University and the thirty-fifth anniversary of his founding of the School of Practical Science.

At a meeting held in Cobalt on November 29th, a Northern Ontario club of Michigan College of Mines alumni was formed. A banquet will be held at Haileybury on January 3rd to inaugurate the permanent organization.

A meeting of the Toronto branch of the Canadian Mining Institute was held at the Engineers' Club on November 29th. The report of the Commission, appointed by the Province of Ontario, on Workmen's Compensation, was discussed.

Mr. Ralph Scott, mine engineer at the Dome mine, Porcupine, and Miss Myrtle Harris, of Calumet, Mich., were married in Calumet on October 29th.

Mr. A. D. Acland, of Ottawa, Deputy Minister of Labour, has been at Nanaimo, Vancouver island, B.C., endeavouring to bring about a settlement of the labour dispute at coal mines in that district.

Mr. M. W. Bacon, of Butte, Montana, manager for the Stewart Mining Co., operating in Coeur d'Alene district, Idaho, has lately been to a group of mineral claims situated in the northern part of Vancouver island, B.C., which property is being developed, under option of purchase, by United States mining men. There is stated to be a large showing of copper ore on the claims, and much prospecting work is to be done under the bond.

Mr. Chas. A. Banks, manager for the Jewel-Denero Gold Mines, Ltd., operating the Jewel mine and 15-stamp mill near Greenwood, Boundary district has returned to British Columbia after having examined a graphite property in the Province of Quebec and gone thence to New York City. During his absence Mr. H. D. Quimby, who recently arrived from the United States, was in charge at the Jewel, at which both mine and mill have been worked steadily since the beginning of last July.

Mr. P. M. Collins, formerly of Butte, Montana is mill superintendent for the British Columbia Copper Co. at Boundary Falls, B.C, where the first unit of a concentrating plant is being put in with which to treat ore from the company's Lone Star and Washington mines.

Dr. Chas. W. Drysdale, of the Geological Survey of Canada, who had been for six months engaged in continuing the structural survey of Rossland camp on which R. W. Brock spent much time several years ago, left Rossland for Ottawa on December 1st. He was accompanied by Dr. B. Rose, also of the Survey, who for two or three months had been assisting him.

Mr. A. W. Davis, of the Consolidated Mining and Smelting Co.'s mining engineering staff, is in charge at the company's Sullivan Group mines, in East Kootenay, B.C., during the absence of the superintendent, Mr. C. H. McDougall, who for the last two months has been in Montreal, receiving surgical treatment for a bad knee which has incapacitated him from carrying out his ordinary duties.

Mr. S. S. Fowler, general manager for the New Canadian Metal Co., operating the Bluebell lead mine and concentrating mill at Riondel, Kootenay lake, B.C., is mourning the death of his mother, who died recently at Boston, at an advanced age.

Mr. J. D. Galloway, acting assistant to the Provincial Mineralogist for British Columbia, has returned to Victoria from a trip to mining camps in Similkameen and Boundary districts of that province.

Mr. A. H. Gracey, who is working the Venus gold mine under option of purchase, has returned to Nelson, B.C., after a short stay in Spokane, Washington.

Mr. Ronald Harris, of London, Ontario, has returned to Canada after having spent the summer in Alaska, where he was engaged in supervising the development of a gold mine.

Mr. Arthur Hickling, of London, England, managing director of the Princeton Coal and Land Co., owning a coal mine and much other property in British Columbia, has been at Princeton, Similkameen, where the company's chief activities are carried on.

Mr. Douglas C. Livingston, who, after graduating at McGill University some years ago went to Mexico and later joined the mining engineering department of the University of Idaho, Moscow, Idaho, has lost his little son, whose death occurred last month.

Mr. Anthony J. McMillan, liquidator of the Le Roi Mining Co., formerly operating in Rossland camp, British Columbia, was recently hurriedly recalled to England, owing to the serious illness of his only son and child. Mr. McMillan had been in the East a short time, investigating the affairs of the Londonderry Iron Co., of Nova Scotia, for which corporation he was recently appointed receiver.

Mr. E. G. Montgomery, assistant superintendent of the Consolidated Mining and Smelting Co.'s Centre

Star group of mines, left Rossland, B.C., on December 1st, on a six weeks' vacation trip to Montreal and lower Quebec.

Mr. J. W. D. Moodie, vice-president and general manager of the Britannia Mining and Smelting Co., Howe sound, B.C., was in New York City recently.

Mr. A. C. Seaton, formerly with the Nicola Valley Coal and Coke Co., has been appointed assistant superintendent at the Corbin Coal and Coke Co.'s colliery in Southeast Kootenay, B.C.

Mr. Chas. H. Stewart, of Messrs. Alex. Hill & Stewart, mining engineers, London, England, was expected to reach Rossland, B.C., about December 4th on a visit of inspection to the mines of the Le Roi No. 2, Ltd., for which company and the Van-Roi Mining Co., operating near Silverton, Slocan, his firm has for years been managing engineers.

Mr. R. H. Stewart, general manager for the Consolidated Mining and Smelting Company of Canada Ltd., has gone on a visit to Los Angeles, California. He will shortly proceed to Toronto to attend the annual meeting of shareholders in the Consolidated Co.

Mr. R. P. Trimble, formerly of Portland, Oregon, who for a year or two has been actively interested in arranging for the development of mineral claims in the Rocher Deboule Mountain section of the Skeena district, B.C., is at the head of a movement to prevent a Butte, Montana, syndicate from taking possession of and working a mining property on the mountain under terms and conditions that it is claimed are unfair to minority shareholders and damaging to their interests.

Mr. Frederick R Weekes has returned to New York City after having been for more than a year resident engineer at the Copper Mountain mining properties, Similkameen, B.C., which the British Columbia Co. and allied interests have been developing under option of purchase. He continues as supervising engineer, in which capacity he will visit Copper Mountain camp periodically.

Dr. Wesbrook, president of the newly-organized University of British Columbia, has arranged to deliver an address before the Vancouver, B.C., Chamber of Mines, which has a largely non-technical membership, on a subject bearing upon the relation of the university's activities to the mining industry.

Mr. George H. Aylard, general manager for the Standard Silver-Lead Mining Co., which since April, 1912, has paid $50,000 a month in dividends to its shareholders, and is reported to now have much more ore in sight in its mine near Silverton, B.C., than when it was acquired by the company nearly three years ago, spent the month of November with his family at their home in Victoria.

Mr. J. C. Edwards, superintendent of the Treasure Mountain Silver-Lead Mining Co., which is opening a mine in the district known as Summit camp, situated near the headwaters of Tulameen river, B.C., has lately been in Spokane, Washington, consulting with the directors of the company relative to continuing development work at the mine throughout the winter.

Mr. W. J. Elmendorf, general manager for the Portland Canal Tunnels, Ltd., which during the last year has been driving a long crosscut adit on a group of claims in Portland Canal mining division, British Columbia, recently made a business trip to Tacoma, Puget Sound, Washington.

## COAL MINING IN SOUTH-WESTERN ALBERTA

The following information concerning coal mining companies operating in southwestern Alberta has been published in Spokane, Washington:

**International Coal and Coke Co.**—It is stated that the output of the International Coal and Coke Co.'s mines in October was 38,800 tons of coal and 6,000 tons of coke, practically all of which was shipped immediately. The bulk of the coal shipments were consigned to places in northern part of Washington, and the coke is being taken by British Columbia mining companies for use in their smelters.

The properties, situated near Coleman, Alberta, are producing from 250 to 300 tons of high-grade coal daily, in addition to coke material. The report states that the coke orders have increased in the last 30 days from 250 to 450 tons daily, and the capacity of the coke ovens is being taxed to fill the orders. Extensive additions to the plant are under consideration, and as soon as a sufficient fund is in reserve construction will be commenced. The mines operated 26 full days during October, employing 525 men, 35 less than in the preceding month, the approach of winter having necessitated curtailment of the force.

The Canadian Pacific Railway Co. is taking the surplus output of the mines and is furnishing all the cars.

**McGillivray Creek Coal and Coke Co.**—The McGillivray Creek Coal and Coke Co., which operates mines at Carbondale, in Crowsnest district, a large portion of the output coming to Spokane, shipped more than 14,000 tons of commercial coal in September, according to a report which reached Spokane stockholders lately. This is the largest monthly production in the history of the company. The report says also that there is blocked out in the mine now, ready for immediate extraction, 400,000 tons, and that the shipments for October undoubtedly will exceed the September mark, lack of cars having curtailed consignments.

The McGillivray Creek Co., whose holdings adjoin those of the International Coal and Coke Co., has made a remarkable record during the comparatively short time the collieries have been operated. The cost of development of the mines and the installation of machinery and equipment, representing an expenditure in excess of $300,000, has been paid for out of the property's earnings and the officials of the corporation state that they expect to be able to start a surplus fund soon.

### MORE DISCOVERIES AT CHISANA.

At the end of October the Dawson News said: "Lem Gates arrived at the mouth of White river after mushing alone from Discovery, Chisana, in twelve days over a bad trail. He reports strikes on four new creeks and all are claimed to be rich. The prospectors on the benches off Bonanza and Elorado creeks are said to have uncovered pay that will go as high in places as an ounce per hour to the man. Many have claimed these benches are the hope of the camp. Pay has also been found on Frying Pan creek on the Canadian side. There are at least 400 cabins at the mouth of Johnson creek, and about the same number at the mouth of Snag. Practically the whole of the population of Donjek has moved to Snag. It was reported at Johnson creek that the Copper River & Northwestern Railway people were within ten miles of the diggings with a trail, and it was said that the packing rate to the diggings will be fifteen cents per pound when the trail shall be completed."

# SPECIAL CORRESPONDENCE

## COBALT, ELK LAKE, AND SOUTH LORRAIN

**Plans to Drain Cobalt Lake.**—There now appears no opposition to the draining of Cobalt lake. The town of Cobalt has never been actively against the scheme since it was assured that the health of the municipality would be safeguarded. All pretentions to beauty, which the lake ever had, have long ago disappeared under the tailings from the many mills. The principal opposition came when the plan was first mooted, from the township of Coleman, under whose jurisdiction the lake is. Their opposition was based mainly upon the idea of loss of revenue, the town agreeing to the scheme of draining the lake if the Cobalt Lake Co. were brought into the town. This the township strenuously opposed. Friends of both parties have been quietly working all the fall to bring them to an agreement and the directors of Cobalt Lake Co. met representatives of the township of Coleman in the last week in November. At this conference an agreement was reached whereby the township receives a certain consideration for permitting the Cobalt Lake Co. to be brought into the town. There then remained the rights of the mines round Cobalt Lake to be safeguarded. Those chiefly interested were the Nipissing, the La Rose, the Chambers-Ferland, and the McKinley-Darragh. Representatives of these mines met the solicitor and manager of the Cobalt Lake Mining Company in Cobalt the first week in December, and an agreement has finally been reached. The Cobalt Lake Mining Company engaged to supply all the mines and mills on the lake with water, and on this basis all opposition was withdrawn. Official application to drain the lake will come before the Mining Commissioner in Toronto the middle of this month. As the opposition has, in the main, been placated there is no reason to suppose that it will be any more than a formal sitting.

**The eight-hour day for underground miners** will come into force automatically in Northern Ontario without the slightest hitch. The majority of the mining companies in Northern Ontario opposed the eight-hour day strenuously, but once it was passed they resolved to abide by it without protest. All through the North preparation is now being made for the change. In Cobalt notices have been posted at nearly all the mines, stating the new hours for miners. According to these notices the working hours will be from 7 to 12, and from 1.15 to 4.15.

These hours will, of course, be from "face to face." It has also been officially announced by the mine managers' organization, to which four-fifths of the companies in the camp belong, that there will be no cut in wages when the eight-hour day goes into operation. The decision not to cut wages was arrived at early in the year, but no official pronouncement was made until the last week of November. All but a very few of the working mines have subscribed to it.

There is, therefore, every reason to suppose that the new law will go into operation automatically and smoothly on the first day of the new year. Representatives of the companies have been in other camps in Northern Ontario observing the working of the eight-hour day shift.

**Workmen's Compensation.**—The issuance of the final draft of the Workmen's Compensation Act is not likely to meet with any strenuous opposition in Northern Ontario. When Sir William Meredith visited Cobalt two years ago to obtain the opinion of the men and the employers here, he found practically no opposition to the principle that the employer should be liable for the injuries of his employees, and, in the main, there was assent to the principle that the burden of proof should lie on the employer to show that there had been wilful negligence.

The mining companies are almost ready to exchange any state of affairs for the wearisome and interminable litigation which now follows the injury of a workman. The numerous cases have always aroused an antagonism between the miners and the companies which could be entirely done away with under a well drafted Compensation Act.

**Motor Car Service and Government Telephone for Gowganda.**—The announcement of a motor car service and a government telephone line between Elk lake and Gowganda has been variously received. It is recognized on all hands, however, that to make the motor car service of any utility to the Montreal River camps, the road between Elk lake and Gowganda must be improved. There are but a few months in the summer—in a dry summer—when a motor car could be run with any regularity There is now no competition in the stage service and the traveller does not get into Gowganda in less than one day. In the winter when the roads are dry and when the sleighing is good, the time can be cut down very materially.

**Drummond Fraction.**—Work has commenced on the Drummond Fraction, the seven and three-quarter acres of lake bottom bought from the Caribou-Cobalt by the Kerr Lake and Crown Reserve. The Wright shaft of the Caribou-Cobalt has been leased and the shaft-house has been repaired and a rock house added. Before the Drummond mine was sold a drift had been run for 75 or 80 ft. on a vein of high-grade ore, so that production will commence almost at once.

The draining of Kerr lake has also exposed a promising vein on the surface. The Drummond Fraction is being worked as a separate unit by the two companies jointly.

**New Northern Customs Concentrator.**—One-half of the 80-stamp battery of the Northern Customs concentrator will be dropping on ore before December 15th, while the remaining forty will be ready about a month later. The mill has been rushed up in record time. It was during the first week in September that the first ground was broken for the foundations. A full month ago the building was housed in and awaiting the machinery. Thus only three and a half months have elapsed from the removing of the soil on the hillside at 104 to the dropping of stamps. The system of concentration to be used is identical in all essentials to that built by Mr. Bourne on the Cobalt Townsite property. The first forty stamps to be operated will drop on La Rose ore. This contract for 200 tons a day is now being filled at the old Northern Customs mill, but will be transferred to the concentrator at 104 as soon as the company is ready for it. Thirty of the other stamps will be reserved for the Chambers-Ferland, a contract having been signed recently between the two companies. This contract comes into force next May, and gives the Chambers-Ferland the privilege of using 30 stamps for five years.

The 5-Stamp Mill at Tough-Oake's Mine, Kirkland Lake, Ont.

Tough-Oake's Mine in July, 1913

**McKinley-Darragh-Savage.**—The production of the McKinley-Darragh-Savage mine for the month of October amounted to 192,749 ounces, comparing with 242,266 ounces in the previous month. Of the total 60,017 ounces came from the Savage. From No. 40 vein alone 43,000 ounces were mined during the month. On the Savage an entirely new vein has been discovered and 64 ft. of it was opened up before values became lean in the face.

**Caribou-Cobalt.**—During the month of November the Caribou-Cobalt made in profits between $17,000 and $18,000. There were mined and sent to the Dominion Reduction Company for treatment 1,500 tons of 36.6 ozs. ore. In addition to the low grade the high grade sorted and bagged amounted to between 12,000 and 14,000 ounces.

**Hudson Bay.**—The total production of the Hudson Bay mine for the month of October was 38,306 ounces. The concentrator crushed 1,742 tons of ore, the average assay of heads to mill was 23.4 and the percentage of extraction was 86.

**Downey.**—From the Downey claim just east of Silver lake in the Elk lake section there will be shipped about 11 tons of high grade ore this winter as soon as the road is good. This ore has been known to be in place for years, but till within a short time ago the claim was in litigation. The vein has now been open cut for a distance of about 30 ft. long by 15 ft. deep, and 250 sacks of high grade taken therefrom. This ore will run between two and three thousand ounces to the ton. Larry Downey, who is working the claim, is now sinking a shaft to endeavor to pick up the vein at the 50-ft level.

## PORCUPINE, SWASTIKA AND KIRKLAND LAKE

**Tough-Oakes.**—Cables from Mr. C. A. Foster in England confirm the report of the sale of the Tough-Oakes, the Burnside, the Robbins, the Wright, and other claims in the Kirkland lake area to a powerful English syndicate. It is reported that a company will be formed at once embracing all these claims with the Tough-Oakes as a nucleus.

Mr. Foster sailed from England at the beginning of the month, until he arrives full details of the deal will not be known, but it will certainly mean the interesting of a large amount of British money in Northern Ontario. The Tough-Oakes mine is being worked at the 100 and 200-ft. level. About 13 tons of $30 ore is being treated in the little mill every day, while the high grade from the vein is handpicked and sacked.

**Hollinger.**—The gross profits from the operations at the Hollinger mine for the four weeks ending November 4th were $124,495, as compared with $131,510 during the previous four weeks. The average value of all

Sinking Shaft on Gold Quartz Vein at Burnside Mine, Kirkland Lake, Ont.

ore treated amounted to $15.40, against $17.39 for the previous four weeks. Mr. P A. Robbins, general manager, states in his report the mill ran 95 per cent. of the possible running time, treating 13,401 tons, of which 310 were treated for the Acme Gold Mines. The approximate extraction 91.1 per cent., milling costs $1,407 per ton. The total cost of $5.5 per ton shows a reduction from previous results. Mr Robbins points out that this cost per ton includes everything. The actual cost for mining, milling and general charges amounted to about $4.25 per ton. Satisfactory development has continued in the mine, drilling amounting to 1,284 ft. The winze below the 425-ft. level had reached a depth of 22 ft. on November 4th. The vein is 8 ft. wide and carries $17.20 per ton at the bottom of the winze. The profits to-day minus dividends amount to $757,574.

Shaft House and Mill, Hollinger Gold Mine, Porcupine, Ont.

**Dome Lake.**—The Timiskaming and Hudson Bay Mining Company has purchased full control of the Dome Lake mine at Porcupine from the General Assets Company of Montreal and the shareholders. At a special meeting, the Dome Lake shareholders agreed to sell 250,000 shares, all of the treasury stock remaining at seventeen and a half cents per share. The General Assets, Limited, had previously sold 200,000 shares to the same Cobalt company, at the same figure, so that the latter have now 400,000 shares. The total outlay of the purchasers is $70,875. The new management lost no time in electing their new board. This board is Messrs. George Taylor, president; Angus McKelvie, vice-president; T. McCamus and C. L. Sherrill, directors. The president declares that after valuation of the property has been made, development will at once be resumed.

**McIntyre.**—Official figures from the McIntyre mines show that while ore ran $9.57 ton, the ton costs amounted to $6,133. Total production, $41,098. Detailed figures are, ore milled 4,131 tons at $9.57 per ton. The total amount of bullion shipped and on hand is $39,242. The running time was 720 hours, or 96.77 per cent. of the possible running time.

**The North Thompson claim** has been taken over by the Associated Gold Mines of East Australia. This is the same company that has the option on the Keeley in South Lorrain. The Elrich-Hamilton interests are world-wide operators. The option on the North Thompson was held by Baron Von Polenz. The new company is to be capitalized at $1,000,000 at par.

## BRITISH COLUMBIA

Production is being continued at all the larger lode mines of the Province, and the total quantity of ore produced is steadily increasing. The chief producing mining divisions or districts are Fort Steele, in East Kootenay; Ainsworth, Slocan, Nelson and Rossland, in West Kootenay; Greenwood and Hedley, in Boundary-Similkameen; and Britannia mountain, on the Coast. The larger mines are the Sullivan, East Kootenay; Bluebell, Ainsworth; Standard, Slocan; Silver King, Nelson; Le Roi, Centre Star-War Eagle group, and Josie, Rossland; Granby, Rawhide, and Mother Lode, Boundary; Nickel Plate, Hedley; and Britannia, on the Coast.

### EAST KOOTENAY.

**Fort Steele Division.**—About one hundred men are employed at the Sullivan Group mines. Much development work is being done, and production of lead ore is being steadily maintained, the output in 1913, to the end of November, being approximately 32,000 tons. The lead ore is sorted out and shipped to Trail, while the zinc-lead ore is stored to await the provision of suitable facilities for separation of the ore metals.

From 20 to 25 men are regularly employed at the St. Eugene mine, at which a small amount of development work is being done and lead-silver ore is shipped, though in much smaller quantity than in earlier years. The ore is shipped crude, as the mill is not now being operated. There is believed to be a fair prospect of finding another large shoot of ore in this mine, but at present the quantity of ore available for mining and shipment is small.

### WEST KOOTENAY.

**Ainsworth.**—The total quantity of ore from Ainsworth mines received at the smelting works at Trail during four weeks ended October 30 was 2,041 tons. Of this, 798 tons was chiefly lead concentrate from the New Canadian Metal Co.'s Bluebell mine, situated on the eastern shore of Kootenay lake, opposite the town of Ainsworth; 85 tons from Retallack & Co.'s mines near Whitewater; and 79 tons from the Utica mine, on Paddy's mountain. The shipments from Ainsworth camp proper—that is from mines in the vicinity of the town of Ainsworth—were as follows: From the Highland mine, 455 tons; No. 1 mine, 425 tons; Silver Hoard mine 199 tons. Other properties being operated were the Gallagher, near Ainsworth; Florence Mining Co.'s properties, on Princess creek; Sun, on Woodberry creek; Eagle Lode Co's Eureka mine, near Sproule's; U.S., in Jackson basin; Panama, in the mountains above Bear lake, and several others. In addition, there was considerable activity at the marble quarry, situated at Marblehead, eight miles from Lardo, which is at the north end of Kootenay lake; also, preparations were advanced toward providing another plant for dredging for placer gold on Lardo river, near Goldhill.

The Taylor hydraulic air compressor, put in on Coffee creek in the nineties, has been acquired by the Consolidated Mining and Smelting Co., which will use power from it in doing development work on several properties in the neighbourhood which it has under option of purchase. Water falling down a steel shaft forces air into storage tanks which provide sufficient pressure to admit of the air being used for power purposes. In former days of activity in Ainsworth camp air pipe lines were laid from the compressor to several mines and drills were operated by the power thus obtained.

**Slocan.**—The increasingly satisfactory development of the Surprise mine is reported, the opening of an important shoot of ore of good grade having been announced. Development work has been persisted in for years, despite many discouragements, and now it is stated that results justify all the confidence and outlay of the owners.

Recent developments in the Standard mine have shown the existence there of a large quantity of ore and of extensions of ore shoots beyond previously known limits of productiveness. The condition of the mine above No. 6 level is decidedly satisfactory, with much more known ore available for extraction than at any previous time in the history of the mine. Meanwhile No. 7 level is being advanced as quickly as possible, the purpose being to get under the ore shoot being worked in No. 6. To do this, however, will necessitate constant adit-driving for about four months longer. No. 7 is already in about 2,200 ft., but it will have to be driven between 1,000 and 2,000 ft. farther before the face will be under the productive zone in No. 6. One shoot of ore has already been passed through, but exploration of this ore body is being deferred so as not to risk interruption with the more important work of advancing the level to determine whether or not the ore shoot of so great value in and above No. 6 continues down to the level of No. 7.

In the Van Roi mine there is considerable improvement, the work of prospecting for more ore having been successful. The Van Roi concentrating plant is again being worked, and the expectation is that there will be a gradual increase in the output of ore and a corresponding enlargement of the production of silver, lead and zinc.

**Nelson Division.**—At the Silver King mine, the Dandy tunnel is being driven to connect with the main shaft of the King at the 800-ft. level, and it is expected the connection will be made by about the first of next year. Much work has been done recently in other parts of the group, chiefly in the direction of making the old workings safe for operating and developing ground not previously opened. No ore is being stoped, but that taken out in the course of development has been shipped to Trail. To the end of November about 3,000 tons had been shipped. The number of men working on this property is 70 to 75. The Consolidated Mining and Smelting Co. is at the head of this enterprise.

The British Columbia Copper Co. is working about 30 men at its Queen Victoria mine, situated about nine miles west of Nelson, near Beasley siding. Shipments of ore to the company's smelting works at Greenwood during eleven months to December 1 have aggregated about 25,000 tons. Latterly the output has been higher than during previous months, and it is expected that hereafter shipments will be maintained at from 2,500 to 3,000 tons a month. The property was purchased outright by the company about a year ago, and since then it has been worked continuously.

On the opposite side of Kootenay river, in the mountains a few miles to the southward, is situated the Eureka mine, which the British Columbia Copper Co. is developing under option of purchase. Some 27 men are employed and in the course of development work done several fair-looking bodies of ore have been opened. In past years a quantity of ore was shipped by those then operating the property, but under cost conditions that left little or no profit. The company now in possession has not attempted to ship ore in quantity, but has been giving its attention to development work, so as to determine whether or not the construction of an aerial tramway will be justified. An opportunity for securing a 3,000-ft. tramway at low cost having presented itself, advantage was taken of it, and the cables and other materials were stored at Granite, below the property. If it shall be decided to make provision for transporting ore to the railway, sites for main entries to the Eureka mine will first be determined, and thereafter construction of the tramway will be undertaken. Meanwhile further development work is being done, and ore shoots are being made accessible, so that production may be kept up after once commenced.

The Molly Gibson mine is distant from Nelson about 20 miles in an opposite direction to that of the Queen Victoria and Eureka. It is one of the properties of the Consolidated Mining and Smelting Co., which has been developing it at greater depth by driving a lower adit than that previously driven. Results have proved satisfactory, a shoot of silver-lead-zinc ore having been opened by this lower level. While not wide, this ore shoot is nearly continuous and the ore is of fairly high grade in silver and lead. The first-class ore is shipped as a crude product, while the second-class material is milled on the property and the resulting silver-lead concentrate is also sent to the company's smelting works at Trail. The high grade zinc middling is stored for treatment in the future, whenever conditions shall be favourable to its profitable utilization.

**Rossland.**—Dependable information concerning the condition of the Le Roi, Centre Star-War Eagle, and Josie groups of mines, is of most satisfactory nature. Reserves of ore in both Le Roi and Centre Star groups are larger than at any other time in recent years, and since value as well as quantity is good, prospects of the camp are decidedly gratifying. While the Le Roi No. 2 Co.'s Josie group has not had developed in its mines so large reserves of ore as have the others mentioned, the position is cheering, for ore shoots have been opened on various levels. At the deep levels, bodies of good ore have been found that promise well for later production. In the South Belt of the camp, the Richmond Consolidated Co. is crosscuting on the 200-ft. level of the Lily May mine. Employment is given to 25 men. Plant and buildings are in good condition and provide facilities for doing a large amount of work.

**Trail Creek Mining Division.**—The Canadian Pacific Railway Co. is reported to have announced an increase of ten cents a ton in the freight charge on ores in transit to the smelting works from places beyond Rossland shipping through that town to Trail. Heretofore the rate from Rossland to Trail on ore from outside mines has been 20 cents a ton; soon it will be 30 cents. The mines chiefly affected by the increase are several in Republic camp, Washington, shipping by the Great Northern Railway to Rossland, and there transferring to the Canadian Pacific Railway for the 12-mile haul thence down-hill to Trail.

**Trail**—Ore receipts at the Consolidated Mining and Smelting Co.'s smelting works at Trail during the five weeks ended November 27, were as under:

## SIMILKAMEEN.

The directors of the Hedley Gold Mining Co. have decided to push on the construction work in connection with the new power system to be established on Similkameen river, below Hedley. The building of a dam across the river will be the first work undertaken, and excavations for this have already been made. The dam, which will be constructed diagonally across the river, will be 400 ft. in length; it will be of cement concrete, reinforced by a network of one-inch cable, of which the company has an ample supply, having for years been accumulating discarded cable from its long gravity tramway running part of the way between the 40-stamp mill at Hedley and the mines of Nickel Plate mountain.

## ROBB CORLISS ENGINES.

Those who have wanted to profit from the economy of a Corliss engine, but have hesitated to install this type because its speed is too low, especially for driving a generator direct-connected, must be interested in the Robb Corliss engine. With shorter stroke, much higher speed, positive operation of valves, and complete enclosure of moving parts this type overcomes every possible objection to the old forms of the well-known Corliss engine yet at no sacrifice to the usual advantages of this valve gear—almost perfect steam distribution, independent adjustment of the events of the stroke, small clearance, and separate cylinder ports for admission and exhaust which reduce cylinder condensation.

Successful operation at speeds from 90 to 225 revolutions per minute is the principal advantage resulting from the modified Corliss valve gear as used in the Robb engine. This high speed is made possible by simplifying the valve gear so as to eliminate all springs, dash pots, latches, cams, and disengaging parts. In fact, the Robb gear contains only about half the number of working parts necessary in the usual forms of Corliss valve gears.

In addition to the higher speed, the absence of these delicate parts means a smoother running engine and so little wear on the valve gear that steam economy and good regulation are maintained for years. The economy does not fall off rapidly after a short period of operation because the valve is not under the strain caused by the continual lifting of dash pots; and the valves cover the ports so firmly and seal them so tightly that there is no chance for leakage.

In other respects the engine is designed on the lines of modern heavy-duty Corliss engines. A relatively short stroke and compact substantial frame overcome the vibration always found in the long-stroke girder-frame design. The reciprocating parts are carefully balanced.

Full pressure of steam comes very quickly into the cylinder of the engine because of the triple port opening through the admission valves; and there is free exit through the exhaust valves at the proper time because of the double port opening. The steam pressure is well taken care of by the large surfaces of the valves which are nearly balanced by carrying the metal around the top, resulting in a long life and a minimum wear of valves and seats.

Accurate machining of the ports is possible because in this type of engine the valve seats are separate bushes, which are machined before being put in place, and these renewable cast-iron linings are made of closer grained cast-iron than the cylinder castings which makes them wear very much longer. Also the valves and ports are so machined that they register accurately with each other.

A valve action that does not depend upon a releasing gear for quick opening and closing is the distinct feature of the engine. But the motion imparted to the valves is identical with that of drop cut-off gears which pick up the lifting arms then drop them. Two small links between the wrist plate and bell crank do away with springs, dash pots, latches, and cams, making a positively-driven valve gear which may be operated at high speed.

## A LARGE ELECTRIC HOIST.

During the first week of November the directors of the North Butte Mining Company, in a meeting at Duluth, voted to award to the Westinghouse Electric & Manufacturing Company, the contract for what will be the largest electric hoist in the two American continents, and one of the largest of its kind in the world. The hoisting drums, which will be 12 ft. in diameter, will be driven by a direct connected electric motor running at a speed of about 71 revolutions per minute. Power will be supplied to this motor from a motor generator set equipped with a 50-ton flywheel to secure elimination of the peaks that would be drawn from the power line during period of starting and acceleration.

Hoisting with this equipment will be done in balance, but the equipment is large enough to take care of unbalanced hoistings. Skips will be used for handling the ore and each skip will have a capacity of 7 tons of ore. Round rope 1⅝-in. in diameter will be used and the equipment is designed for a normal rope speed of 2,700 ft. per minute with a maximum of 3,000 ft. per minute. The capacity of the hoist will permit 300 tons per hour being hoisted from the 2,000 ft. level or 200 tons per hour from the 4,000 ft. level.

The system of control and power equalization used will be that commonly known as the Ilgner System, in which a flywheel driven by the motor generator set is permitted to give up some of its stored energy to supply the peak load drawn by the hoisting motor. In order to reduce the flywheel losses to a minimum, the flywheel will be encased in a smoothly finished steel housing and provided with special type of self-lubricating bearings.

The hoisting motor will be of the type used in steel mills and will be of a very heavy construction. In fact, all of the equipment has been designed with absolute reliability as the paramount consideration. The electrical equipment alone will weigh in excess of 250 tons. A number of special safety devices are included in the equipment, including electrically released brakes; automatic slow-down devices to prevent skip or cage ever going through head sheaves and a special controller to limit the speed when hoisting men.

The hoist motor will have a maximum intermittent rating of 4,500 h.p. and the motor generator set will be driven by an induction motor having a continuous normal rating of 1,400 h.p. The difference between these ratings represents approximately the amount of energy that will be supplied by the flywheel momentarily during starting. The installation is so designed that the draft of power from the power line will be practically constant throughout any cycle of hoisting.

This Granite Mountain Hoist of the North Butte Mining Company will be the largest electric hoist anywhere in the Western Hemisphere, and will be one of the largest using the Ilgner System of power equalization installed anywhere in the world. There are larger electric hoists in South Africa, a few of which use the Ilgner system of power equalization, but most of these South African hoists do not attempt to obtain power equalization.

## HOLLINGER.

The report of Hollinger Gold Mines, Ltd., for four weeks ending November 4, 1913, says, in part:

Gross profits for the four weeks amounted to \$124,-995.11. There was hoisted 13,210 tons ore, and 1,153 tons waste rock. The average value of the ore hoisted was \$15.04 per ton. The total cost of mining was \$5,055 per ton

The mill ran 95 per cent. of the possible running time, treating 13,401 tons, of which 310 tons were treated for the Acme Gold Mines, Limited. The average value of Hollinger ore treated was \$15.07 per ton; approximate extraction 96.1 per cent.; milling cost \$1,407 per ton.

The total cost of \$5.05 per ton shows a reduction from previous results. It is well for shareholders to remember that this cost includes all development, shaft sinking, timbering and other dead work. If this development cost were carried as a deferred charge to be distributed over all ore developed or made available, the total working cost would be reduced by some 70 or 80 cents. That is to say, our actual cost for mining, milling and general charges amounts to about \$4.25 per ton, but we consider it advisable at present to burden operations with the cost of work from which future benefits will be derived.

Satisfactory developments have continued in the mine. Drifting has amounted to 484 ft. The winze below the 425-ft. level had reached a depth of 22 ft. upon November 4th. The vein is 8 ft. wide and carries \$17.00 per ton at the bottom of the winze.

## COBALT ORE SHIPMENTS.

The bullion shipments for the week ending Dec. 5th were:

| | Bars | Ounces | Value |
|---|---|---|---|
| Nipissing | 140 | 165,651.73 | \$96,192.15 |
| Townsite | 14 | 10,780.00 | 6,144.00 |

# FOR SCREENING AND CONVEYING COAL

INSTALL

# "THE MARCUS"

HORIZONTAL SYSTEM

## And Simplify Your Screening, Picking, Mixing and Loading Arrangements

*WRITE FOR FULL PARTICULARS*

"THE MARCUS"
Combines Shaker Screen and Picking Table, thus Economizing in First Cost.

"THE MARCUS"
is especially adapted for Fragile Coal, reduces breakage to a minimum.

"THE MARCUS"
will convey 320 tons per hour and only absorb 7 horse power.

"THE MARCUS"
screens out small to facilitate efficient picking, yet can be mixed with large at delivery end for Mine Run Coal.

"THE MARCUS"
horizontal system greatly reduces the height of structure.

"THE MARCUS"
system makes it possible to meet the varying demands of the market by enabling the different sizes of coal to be mixed.

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

*Lindgren*—

# MINERAL DEPOSITS

By WALDEMAR LINDGREN, Professor of Economic Geology, in in charge of the Department of Geology, Massachusetts Institute of Technology; Geologist, United States Geological Survey.

883 *pages*, *6x9*, 257 *illustrations*, $5.00 (21s) *net, postpaid*

For many years Mr. Lindgren has been Geologist of the United States Geological Survey.

In this time he has come to be generally recognized as the leading authority on ore deposits.

The publication of this work on "Mineral Deposits" has been anticipated throughout the world.

It is the first book to attempt to cover within reasonable space both metallic and non-metallic minerals, except coal and oil.

—CONTENTS—

*For Sale by the*

*Canadian Mining Journal*

*44-46 Lombard St. Toronto*

# BRITISH COLUMBIA

## The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, $72,194,603; Lode Gold, $70,859,022; Silver, $33,863,940; Lead, $27,520,753; Copper, $73,723,562; Other Metals (Zinc, Iron, etc.), $1,528,403; Coal and Coke, $132,871,155; Building Stone, Brick, etc., $17,576,084; making its Mineral Production to the end of 1912 show an

## Aggregate Value of $430,137,522

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1892, inclusive, $81,090,069; for five years 1893-1897, $31,420,396; for five years 1898-1902, $77,218,073; for five years 1903-1907, $109,797,744; for five years 1908-1912, $130,611,240.

## Production During last ten years, $240,408,984

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those in any other Province in the Dominion, or any Colony in the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full information, together with mining Reports and Maps, may be obtained gratis by addressing

**THE HON. THE MINISTER OF MINES**
**VICTORIA, B.C.**
